If, as is the modern custom, painting be judged by the pictorial qualities only, then surely Titian is the greatest painter of Italy, if not of all times. All Venetian art centred in him. Certain painters of Venice and of other schools have equaled Titian in single pictorial elements, but no one united all these qualities with the same degree of excellence. His color is bright, but deep and transparent; a splendid golden tone suffuses his pictures, which only in his later work tends towards a more sombre brown. Light and shade, atmosphere and perspective are all perfectly rendered, and his rapid, sweeping handling, in place of the former detailed finish, revolutionized painting, preparing the way for Rembrandt and Velasquez. Being a Venetian, he was not as scientific a draftsman as the Florentines, though at best his drawing is good. His composition is always good, and at best it is excellent. He did not attempt, like the Tuscans, to make art the vehicle of intellectual ideas, but his grasp upon life was firmer than theirs, and his art was wider in scope. He preferred an art that was tranquil and serene, though at times—witness the "Assunta" and the "Peter Martyr"—he could be profoundly dramatic.

If Giorgione was the founder of the modern landscape, Titian did more for its development, achieving the highest perfection before Poussin and Claude. Eliminating the detail of former painters, he rendered the typical in a landscape with high poetic charm. Though he used landscape as only a setting for his figures, this setting was in itself perfect and complete. His favorite subjects were the Alps of his native Cadore and the lagoons of Venice. No one ever excelled him in the combination of powerful, sometimes merciless, realism, combined with noble and striking characterization. He was the greater painter of kings and nobles.

Bibliography. The most complete monograph on Titian is still Crowe and Cavalcaselle, *Titian: His Life and Times* (2 vols., London, 1879-81), which should, however, be supplemented by the more modern criticism of G. Morelli, *Italian Painters at Munich and Dresden*, Eng. trans.

by C. J. Ffoulkes (London, 1893); Bernhard Berenson, *Venetian Painters of the Renaissance* (New York, 1894); and G. B. Rose, *Renaissance Masters* (3d ed., ib., 1908). Also: Max Jordan, "Tizian," in Dohme, *Kunst und Künstler des Mittelalters*, No. 72 (Leipzig, 1878); G. E. Lafenestre, *La vie et l'œuvre de Titien* (new ed., Paris, 1886); Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects*, Eng. trans. by Blashfield and Hopkins, vol. iv (New York, 1896); C. Phillips, *The Earlier Work of Titian, and The Later Work of Titian*, in "Portfolio Monographs," Nos. 34, 37 (London, 1897-98); H. Knackfuss, *Tizian* (Bielefeld, 1897); *Masters in Art*, vol. i (Boston, 1900); Oskar Fischel, *Tizian* (Stuttgart, 1904); Georg Gronau, *Titian and his School* (New York, 1904); S. L. Bensusan, *Titian* (London, 1909); Charles Ricketts, *Titian* (ib., 1910). An exhaustive and really satisfactory life of Titian has not yet been written.

TITIAN, THE SPANISH. See NAVARRETE, J. F. DE.

TITICACA, tē'tē-kā'ká, LAKE. The largest lake in South America (Map: America, South, C 4), situated on the boundary of Peru and Bolivia, being about equally divided between the two countries. It lies in a large and lofty lacustrine basin inclosed between the main Andean range and the Cordillera Real, with cross ranges on the north and south. This basin has an average elevation of 13,000 feet, and the surface of the lake itself lies about 12,500 feet above the sea. The lake has a length of 130 miles with an average breadth of 30 miles. It is divided by promontories into three unequal parts, and contains several islands. The depth in some places reaches 700 feet, but large portions of it are shallow, and the shores, especially in the south, are lined with marshy tracts covered with reeds. The vegetation along the shores is otherwise scanty, and the surrounding country is bleak and treeless. The lake receives a number of streams from the surrounding mountains, and discharges through the Desaguadero into Lake Aullagas, whose waters finally evaporate in the great salt marshes in the southern part of the closed basin. In former ages the lake occupied the whole of the basin. Its surface stood then much higher, and it discharged eastward into the Amazon. The region around Lake Titicaca was one of the seats of early Indian civilization, and contains many interesting architectural remains, some of which antedate the Incan periods. The most imposing of the ruins are those of Tiahuanaco (q.v.). (See PERUVIAN ARCHAEOLOGY.) The lake was formerly navigated only by crude Indian rafts, but since the opening of a railroad to Arequipa and the Pacific coast steamboats have plied on it between the Peruvian and Bolivian ports. Consult A. F. A. Bandelier, *The Islands of Titicaca and Koati*, published by the Hispanic Society of America (New York, 1910), and A. A. Adams, *The Plateau Peoples of South America* (London, 1915).

TITIENS, tē'tyēns, TERESA. See TIETJENS.

TITIES. One of the three patrician tribes of ancient Rome, the others being the Luceres and Ramnes.

TITI (tē'tē') **MONKEY**, or TEETEE. A small South American squirrel monkey (q.v.) of the genus formerly called *Chrysotricha* or *Callithrix*, now more correctly given as *Saimiri*, but the word is often used for a marmoset. They are

gentle, beautiful, playful little creatures, in great repute as pets in their own country but too delicate to survive in cold climates.

TIT'LARK (from *tit*, from Icel. *tittr*, little bird, probably connected with Eng. *tit*, small thing + *lark*). A small, brown, terrestrial bird (*Anthus pennsylvanicus* or *rubescens*) of the wagtail or pipit family (Motacillidæ), allied to the larks, and familiar throughout North America during its migrations. It breeds, nesting on the ground, in the far north, and winters in the tropics, and in spring gives a pleasing song. A near relative is the Missouri skylark (*Neocorys*, or *Anthus, spraguei*), of the Western plains, whose habits and song, uttered while soaring in the air, closely resemble those of the skylark. In this group come the numerous European vagtails (*Motacilla*), which keep near streams and flirt their long tails incessantly, and the pipits (*Anthus*), several species of which are among the most pleasing of European summer birds, frequenting fields, open spaces, and rocky slopes, and singing much like finches. Consult Elliott Coues, *Birds of the Northwest* (Washington, 1874). See WAGTAIL.

TITLE (OF, *title*, *titre*, *tiltre*, Fr. *titre*, title, from Lat. *titulus*, title, superscription, token). The union of all the elements which constitute legal ownership of property, or the means by which a person holds property. The common-law authorities are to the effect that there are three essential elements to a complete title: possession, the right of possession, and right of property. This is technically true, but the latter two requisites are practically interchangeable, and it is customary to speak of title as consisting of possession with right of possession. (See POSSESSION.) Title to property may be vested in one or a number of persons. All titles to real estate are acquired by descent or purchase. A title by descent is one which is acquired by an heir of a deceased person by virtue of the laws of intestacy and succession. Any other source of title is said to be by purchase. The latter term is used technically, as it includes other means than a bargain and sale, as, e.g., a devise of property in a will and a conveyance by way of gift. By virtue of the statute of limitations, 20 years' adverse possession of real estate will give the occupant a good title in most States. Title to personal property is generally transferred by delivery, although a writing such as a bill of sale is effective, and a contractual meeting of the minds of the parties, by which an intention to pass title is evidenced, will also suffice. Generally six years' adverse possession of a chattel will operate as a transfer of title thereto by operation of law. Title to patentable inventions is said to vest in the inventor by virtue of original acquisition, but the real source of ownership is really derived from the protection secured by the patent laws. A title may be capable of being established in a court of law and yet have such apparent defects as not to be readily salable. A court of equity will not compel a purchaser to accept a title which is not marketable. Consult the authorities referred to under ACCESSION; POSSESSION; PROPERTY; REAL PROPERTY; ETC.; and also see OCCUPANCY; TENURE; TITLE, REGISTRATION OF; TORRENS SYSTEM; ETC.

TITLE, ABSTRACT OF. See ABSTRACT OF TITLE.

TITLE, REGISTRATION OF. A system of registration of titles to land prevailing in England

and many of the United States. The question of how to avoid the litigation and expense so often attendant upon transactions relating to real estate and the transfer of title to real estate has always been most perplexing. Many methods have been tried, varying from the early custom in most counties of England by which transfers were effected without any recording or registration, to the system of registration introduced into South Australia by Sir Robert Richard Torrens in 1857, by which titles were to be registered and in effect guaranteed by the government. (See TORRENS SYSTEM and consult authorities there referred to.) Until comparatively recent times the method prevailing in the United States consisted in the recording system by which title papers were transcribed at length on the public records of the county in which the land was situated. This form of recording was extended to deeds, mortgages, liens, foreign wills, and similar documents, and was chiefly effective in giving constructive notice to all the world of the existence of such instrument and the claim of the person recording it. This system is still in force and is being extended and made more effective in some States, notably New York, by the adoption by the registrar of uniform forms of deeds, mortgage and other papers customarily recorded, in this way greatly simplifying the search of titles. See REAL PROPERTY; RECORDING OF DEEDS; TITLE DEEDS.

TITLE, SEARCH OF. See SEARCH OF TITLE.

TITLE DEEDS. The instruments in writing which constitute the evidences of the title of the owner of real property. In England the title deeds are of great importance, and the purchaser, heir, or devisee of the land is entitled to the possession of the title deeds establishing the chain of title to his predecessor in title. Thus in England the deposit of the title deeds as security for a loan creates a lien on the land in the nature of a mortgage. Such is not the law generally in the United States, however, where the recording acts have dispensed with the necessity of having custody of the original documents of title. See ABSTRACT OF TITLE; CONVEYANCE; DEED.

TITLE INSURANCE. An agreement or undertaking by which the insurer, for a valuable consideration, contracts to indemnify the insured in a specified amount against loss or damage suffered because of defects of title to real estate in which he has some insurable interest. The business of title insurance is of comparatively recent growth. The first title insurance company was organized in Philadelphia in 1876, but the development of the business has been most rapid since about 1885. Contracts of title insurance are subject to the same rules as govern other classes of insurance contracts. The policy is usually granted upon written application, which is made a part of the policy and which contains statements or promises which are deemed to be warranties or conditions of the policy.

Generally the liability of the insurer is not limited in point of time, and the undertaking is to indemnify the insured against all loss or damage resulting from any defect in the title not known or specified in the policy, including defects in the chain of title and incumbrances of every description existing at the time the insurance is effected. When the undertaking of the policy is to indemnify against loss or damage only, the obligation incurred by the

insurer is substantially like that of a grantor whose deed contains the usual covenants of warranty. (See COVENANT.) It is not unusual for the policy of title insurance to provide that the insurer shall take the property at an appraised valuation in the event that any defect of title is discovered rendering the title unmarketable.

There are also usually provisions contained in the policy that the insured shall notify the insurer of any claim or demand against the property founded on any defect of title insured against, and that the insurer shall be permitted to bring or defend actions in the name of the insured, but at its own expense, for the purpose of establishing that the title is free from such defect. When the insured is a mortgagor, provision may be made in the policy for the protection of a mortgagee of the property by a mortgagee's clause making the loss payable to the mortgagee, or the same result may be accomplished by issuing an independent policy in favor of the mortgagee.

There is no fixed method of ascertaining the amount of premiums in title insurance as is the case in life insurance. Experience has shown that the losses under title-insurance contracts have been comparatively small, and that in fact an important benefit to be derived from the policy of title insurance in addition to the insurance features is the painstaking and exhaustive examination of the title made by the insurer. In many cases, however, the insurance feature is of great importance, since there may always be defects of title which an examination of the record title may not disclose. Many title-insurance companies possess complete records and title maps of all real estate within the territory where they do business and have other special facilities for the expert examination of titles. The prospective purchaser of real estate within such territory, by applying for title insurance, may thus procure a complete examination of the title before the conveyance is made. The policy issued may, with the consent of the insured, be transferred to a subsequent purchaser of the property. This, however, is not customary except upon the payment of an additional premium. See CONVEYANCE; COVENANT; DEED; INSURANCE; RECORDING OF DEEDS. Consult T. G. Frost, *Treatise on Guaranty Insurance and Compensated Suretyship* (2d ed., Boston, 1909).

TITLES OF HONOR. Designations to which certain persons are legally entitled in consequence of possessing particular dignities or offices. Titles of honor may be divided into those of sovereignty, superior and inferior, nobility, greater and lesser, and titles of peculiarly official significance. Superior sovereign titles are emperor and king (qq.v.) and, in Turkey and Persia, sultan (q.v.) and shah. Czar and kaiser (qq.v.), from Caesar, correspond to emperor. Inferior sovereign titles include grand duke (ranking next to king), duke, and prince (qq.v.) in some of the German states. The ruler of Monaco is also called prince. Eastern equivalents of the inferior titles are bey, khan (both post-positive), khedive, rajah (qq.v.). Greater nobility titles include, in descending scale, prince, duke, marquis, count (earl in Great Britain), viscount, and baron (qq.v.). In Great Britain there is no title prince outside of the royal family. In Austria there is no duke, except archduke (q.v.) (of the Imperial family), and in a few princely

houses, where the term remains as a subtitle, but is not used; in Germany, no viscount; in Russia, no viscount, marquis, or duke, except grand duke (of the Imperial family). Lesser nobility titles include baronet and esquire (qq.v.), peculiar to Great Britain, and knight (q.v.), chevalier, and ritter, the last three being practically equivalent terms. There are also lesser nobility titles for the chiefs of Scottish and Irish clans, and such Eastern titles as bey, effendi, and pasha (qq.v.), all three post-positive. The titles of honor having peculiarly official significance are largely such ecclesiastical, military, and governmental terms as archbishop, general, governor, etc. Courtesy titles, distinct from true titles of honor, since their validity rests in custom rather than law, are given to the sons of the British nobility. A noble takes his highest title and is permitted to set aside an inferior title, usually his second, to be assumed by his eldest son. The younger sons of dukes and marquises have the courtesy title lord (q.v.) prefixed to their given name or surname, and the daughters of dukes, marquises, and earls prefix lady. The younger sons of earls and the sons and daughters of viscounts and barons are called honorable. In Great Britain the titles duke, marquis, earl, viscount, baron, and baronet are inheritable and are in English law considered a species of property and classed as incorporeal hereditaments. Among lesser dignities are the various orders of knighthood and the knights bachelors, but these are personal and not hereditary, and the same is true of the spiritual peers and the law lords of Parliament, who are created for life only.

Certain forms of reference are used in respect to various titles. Majesty is attributed to emperor and king, and to the former often Imperial Majesty; Imperial Highness to title of child of an emperor; Royal Highness to title of child of a king (in Great Britain also grandchild of the sovereign) and to grand duke and prince reigning; Highness alone or variously qualified to prince; in Great Britain, Grace to duke, Lordship to any other peer (q.v.). See DIGNITY; FORMS OF ADDRESS; NOBILITY; PEER; PRECEDENCE.

TIT-MARSH, MICHAEL ANGELO. The nom de plume under which Thackeray published the *Yellowplush Papers* and other works.

TIT-MOUSE? (from *tit*, from Icel. *tittr*, little bird + ME. *mose*, AS. *māse*, OHG. *meisa*, Ger. *Meise*, sort of song bird). One of a family (Paridae) of small active birds allied to the nuthatches, and familiar in the United States as chickadees. The family is widely distributed and exhibits much variety in appearance and habits. Typical colors seem to be black, gray, and white, but many Old World species are distinctly marked, or suffused, with tints of blue, red, brown, or yellow, or several of these; and the Western American genus *Auriparus* (see GOLDDIT) is thus gayly colored. The fe-

TITMOUSE.

Head of an Arizona crested titmouse (*Baolophus wollweberi*).

males and young are closely like the males. These cheerful little birds are everywhere familiar, coming about gardens and roads, and nesting year after year in orchard trees, or some in garden bird boxes, as well as in the forest. Their food consists mainly of insects, and they are everywhere of great service by their consumption of these, and, especially in winter, of the eggs and hibernating larvæ of aphids and other minute pests. Most of them make nests of soft materials in holes and crannies, but some, like the European penduline tit (see Plate of PENSILE NESTS OF BIRDS in article NIDIFICATION), the long-tailed tits of the genus *Acredula*, and the Western American bush tits (*Psaltriparus*), weave bag-shaped pouches of hempen materials, or of moss or grass, suspended beneath a tree branch. The breeding habits of the whole group are interesting. Their notes are sharp, quickly repeated exclamations, varied by a few sweeter calls, and are well illustrated by the familiar chickadees (*Parus*, or *Penthestes*, *atricapillus*, *hudsonicus*, and others), which are among the most characteristic of North American resident birds. Consult A. H. Evans, "Birds," in *Cambridge Natural History*, vol. ix (New York, 1900), and American ornithologies.

TITTONI, têt-tō'nê, TOMMASO (1854-). An Italian statesman and diplomat. He was born in Rome, and was educated at the university there and at Oxford. He was elected a member of the Chamber of Deputies in 1886, was appointed prefect of Perugia in 1897 and of Naples in 1900, and in 1901 became Senator. In 1903-06 he was Minister of Foreign Affairs, which portfolio, after a short interval, he again held until 1910. He then became Ambassador to France. A volume of his speeches, *Sei anni di politica estera, 1903-09, discorsi* (1912), was translated into English as *Italy's Foreign and Colonial Policy* (1914).

TITULAR BISHOPS (from Lat. *titulus*, title, superscription, token). In the Roman Catholic church, bishops other than diocesan, who take their titles from some formerly existing but now extinct see. The practice of so designating them is due to the ancient principle of not consecrating bishops without a definitely assigned sphere of labor. With the multiplication of suffragan and missionary bishops some such system of nomenclature was naturally, therefore, adopted. When the territory occupied by the Crusaders fell once more into Mohammedan hands the expelled bishops were utilized in various parts of Europe, retaining their former titles; and these titles, with those of sees which broke away from communion with Rome in the great Eastern schism, are still employed to designate coadjutor or missionary bishops. In England until 1850, and in Scotland until 1878, the Roman Catholic bishops bore such titles, owing to legal and other difficulties in the way of assuming territorial titles. Titular bishops were formerly often known as bishops in partibus infidelium; but in 1881 Leo XIII abolished the use of this name, on the ground that many of these sees had come into the hands of states which, if not Catholic, were Christian, and that the designation was inappropriate. See SUFFRAGAN.

TIT'US. One of the most trusted and devoted of the disciples and fellow workers of the Apostle Paul. Nothing is said of Titus in the Acts, and all we know of him is contained in scattered notices in Paul's Epistles, especially

Galatians and 2 Corinthians. He was of Gentile origin (Gal. ii. 3), converted to Christianity through Paul (Tit. i. 4), and was one of the brethren taken along by Paul and Barnabas on their mission from the church of Antioch to the mother church of Jerusalem at the time of the Apostolic Council (c.49 A.D.; cf. Gal. ii. 1 and Acts xv. 2). At Jerusalem, though he was uncircumcised, he appears to have been allowed to mingle freely with members of the mother church. It is reasonable to suppose that he returned to Antioch with Paul and accompanied him thence on his third missionary journey. From the notices in 2 Corinthians we learn that he was sent by Paul from Ephesus on two, perhaps three, missions to Corinth, bearing letters and intrusted with the management of delicate and important business. In all respects he was completely successful. The Corinthians contributed liberally towards the great collection Paul was raising for the Jerusalem church, willingly obeyed Paul's injunctions in regard to cases of discipline, and evidenced most sincere love and loyalty to the Apostle. These results were supremely satisfactory to Titus, and his report to Paul, who had left Ephesus (spring of 55 A.D.) expecting to meet Titus at Troas, but, disappointed in this, had pressed on anxiously into Macedonia, so cheered the Apostle that he at once sent back the warm-hearted message contained in 2 Cor. i-iv. We know no more of Titus's movements until the time of the letter written to him by Paul. The date of this Epistle, presupposing its genuineness, must be placed between Paul's first and second imprisonments. (See NEW TESTAMENT CHRONOLOGY.) Titus had accompanied Paul to Crete, where he had been left by the Apostle to organize further the churches there planted. He was summoned thence to join Paul at Nicopolis, where Paul planned to winter. We do not know whether this plan was carried out. Titus is next mentioned in 2 Timothy (iv. 10), the last of Paul's letters, as having departed, presumably from Rome, for Dalmatia. Nothing more is said of Titus in the New Testament. The impression made by the references given is that he was a true and capable assistant to the great Apostle, one of the foremost of that circle of loyal disciples through whom Paul accomplished his great work. Tradition makes him Bishop of Crete, but of this there is no early evidence. See TIMOTHY and TITUS, EPISTLES TO.

TITUS (TITUS FLAVIUS SABINUS VESPASIANUS) (c.40-81 A.D.), Roman Emperor (79-81 A.D.). He was the eldest son of the Emperor Vespasian and Flavia Domitilla, and was born at Rome. Brought up at the court of Nero, he received an excellent training, and subsequently, as tribuns militum in Germany and Britain, and commander of a legion in Judæa under his father, proved his qualities as a soldier and a general. On his father's elevation to the Imperial throne Titus was left to prosecute the Jewish War, which he brought to a close by the capture of Jerusalem (Sept. 8, 70 A.D.) after a long siege. The news of the success was received with the utmost joy. On his return to Rome he obtained the honor of a joint triumph with Vespasian (71 A.D.). About this time Titus became his father's colleague in the Empire. He gave himself up to the pursuit of pleasure in all its forms, put to death various suspected persons very summarily, and even caused one of his guests, whom

he justly suspected of conspiracy, to be assassinated as he left the palace. When, on the death of his father (79 A.D.), he became Emperor, his first act was to put a stop to all prosecutions for *lesa majestas*, which had abounded since the time of Tiberius (q.v.). The ancient and venerated buildings of Rome were repaired; new structures, such as the Baths of Titus (see **TITUS, BATHS OF**), were erected; and the tastes of the populace were gratified by games on the most stupendous scale, which lasted for 100 days. Titus's beneficence was unbounded, and it so happened that during his brief reign there was the most urgent need of its exercise. In 79 A.D. occurred the eruption of Vesuvius, which overwhelmed Herculaneum and Pompeii and ruined numerous other towns and villages; in 80 A.D. a fire broke out in Rome, which raged for three days, destroying the Temple of Jupiter Capitolinus, which had just been rebuilt, and other public edifices, besides numerous houses; and in the tracks of these calamities followed a dreadful pestilence. Titus dealt out gifts with lavish hand to the houseless and ruined sufferers; he even despoiled his palaces of their valuable ornaments to obtain money for distribution, and schemed and planned to furnish occupation for the afflicted. He was now the idol of his subjects, the "love and delight of the human race"; but, unfortunately, in the commencement of the third year of his reign he became suddenly ill, and died at Reate, in the Sabine country. The reign of Titus saw the extension of the Roman power in Britain. Consult the article "Flavius, 49," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. i (8th ed., Leipzig, 1914).

TITUS, ARCH OF. A triumphal arch in Rome at the highest point of the Sacred Way, facing the Forum, and situated between the Temple of Venus and Rome and the Temple of Jupiter Stator. It was erected by Domitian in 81 A.D. in commemoration of the taking of Jerusalem by Titus (70 A.D.) and is adorned with fine reliefs on the inner sides of the archway, representing the triumph of Titus, and the spoils of the temple, including the seven-branched candlestick and the table with showbread. During the Middle Ages the arch was built into the fortifications of the Frangipani; and when these were demolished the arch was taken down in 1822 and rebuilt to insure its safety, the missing portions being supplied by travertine instead of the original Pentelic marble.

TITUS, BATHS OF. Extensive baths northwest of the Coliseum at Rome, built by Titus (Thermae Titianae) on the ruins of the Golden House of Nero and supplied by the Aqua Marcia. Their exact situation was long a matter of dispute, and they were generally conceived to be identical with the Baths of Trajan and to have been called by the latter name because restored by him. Excavations in 1895 finally determined their topography and showed them to be distinct from the adjoining Baths of Trajan. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

TITUS, EPISTLE TO. A letter in the New Testament, attributed to the Apostle Paul. See **TIMOTHY AND TITUS, EPISTLES TO.**

TITUS ANDRONICUS. The name of a tragedy usually included among Shakespeare's works, though it is now generally considered to have been only retouched by Shakespeare in 1589-90, on the foundation of an earlier play.

It is alluded to by Meres in 1598 among Shakespeare's tragedies; but, though a quarto edition is said to have been printed in 1594, no extant copy is earlier than the quarto of 1600. Crude as it is, it belongs to the same type of play as *Hamlet*; both are dramas of revenge, after the fashion of Kyd.

TITUSVILLE. A city in Crawford Co., Pa., 38 miles southeast of Erie, on Oil Creek, and on the Pennsylvania and the New York Central railroads (Map: Pennsylvania, B 2). It has a public library and a hospital. In August, 1859, the first oil well in the United States was sunk here, and the city is still largely interested in the oil industry. It has oil refineries, large iron and steel works, radiator works, a tannery, cutlery works, silk mills, saw and planing mills, engine works, etc. Titusville has adopted the commission form of government. The water works and the electric-light plant are owned and operated by the municipality. Titusville was settled in 1796. On June 5, 1892, Oil Creek, swollen by a cloudburst, flooded the lower part of the city. Soon afterward several oil tanks gave way. The liberated oil, covering nearly the whole surface of the flood, became ignited, and the fire and flood together destroyed about 60 lives and fully one-third of the city. Pop., 1900, 8244; 1910, 8533; 1915 (U. S. est.), 8684.

TIUMEN, or TYUMEN, tyō-mān'y'. A town in the Government of Tobolsk, west Siberia, on the Tura, at the east end of the Perm-Tiumen Railway line (Map: Asia, H 3). It is an important centre in the transit trade of Siberia and has shipbuilding yards, woolen mills, and tanneries. Pop., 1908, 33,791.

TIVERTON. A municipal and Parliamentary borough and market town in Devonshire, England, 14 miles north of Exeter (Map: England, C 6). There are important weekly markets, and great animal markets for cattle. There is a large lace factory, in which nearly 2000 hands are employed; there are also breweries and flour mills. Blundell's School, just outside the town, is one of the most important schools in the west of England. Pop., 1901, 10,382; 1911, 10,205.

TIVERTON. A town in Newport Co., R. I., adjoining Fall River, Mass., on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, D 3). Cotton manufactures and fishing are the chief industries. Pop., 1900, 2977; 1910, 4032.

TIVOLI (Lat. *Tibur*). An old town of Central Italy, Province of Rome, 19 miles east-northeast of Rome (Map: Italy, D 4). It stands on the slope of Monte Ripoli, one of the Apennines. Tivoli is walled and has a fortress. The surrounding hills are covered with olive trees. The vines of Tivoli are famed for a peculiar sort of grape, in great request for its firmness and luscious flavor, noticed as early as the time of Pliny the Elder. The stone called travertine, of which a great part of Rome is built, comes from quarries just below Tivoli. On the western slope of the town lies the famous Villa d'Este, of the sixteenth century. Within and without the city there are many monuments of antiquity. In a commanding position above the falls of the Anio stand the remains of two temples, one circular (so-called Temple of the Sibyl) and one rectangular (so-called Temple of Tiburtus), the former of which antedates the Christian era. In the neighborhood there are extensive remains of the Emperor Hadrian's magnificent villa, the

villa of Mæcenas, remains of mausoleums, aqueducts, baths, etc. The place is much visited by tourists for its waterfalls, which are lofty and very picturesque. The Anio furnishes excellent water power, which since 1892 has been utilized for electric lighting both at Tivoli and at Rome, and for ironworks at the former town. Tibur existed as a town (according to ancient tradition) long before the building of Rome, under whose dominion it fell about 335 B.C. It was a favorite place of sojourn with Horace, who mentions it repeatedly. Consult K. Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909).

TIVOLI, PLATO OF. See PLATO OF TIVOLI.

TIXTLA, tēs'tlà, or TIXTLA DE GUERRERO. A town formerly the capital of the State of Guerrero, Mexico, 5 miles east of the capital, Chilpancingo (Map: Mexico, J 9). The town is in a fertile, well-watered valley, with silver mines in the vicinity. An earthquake on April 14, 1907, destroyed Tixtla and two other towns in Guerrero. Pop., 1900, 6316; 1910, 6448.

TLACOLULA, tlä'kô-lu'lä. A town of the state of Oaxaca, Mexico, 18 miles southeast of the city of Oaxaca (Map: Mexico, L 9). Pop., 1900, 5675; 1910, 4934.

TLACOTALPAN, tlä'kô-täl'pän. A Gulf seaport of Mexico, 50 miles southeast of Vera Cruz, at the mouth of the Papaloapán (Map: Mexico, L 8). Pop., 6300.

TLALPAM, tläl'päm. A town of the Federal District, Mexico, 10 miles south of the capital (Map: Mexico, C, D 10). It is a noted summer resort and each spring at Whitsuntide its church of San Antonio de las Cuevas is visited by thousands of pilgrims. Pop., 1910, 15,448.

TLATLAUQUITEPEC, tlä-tlou'kô-tä-pék'. A town of the State of Puebla, Mexico, 42 miles northwest of Jalapa. Pop., 1900, 9829.

TLAXCALA, or **TLASCALA**, tläs-kä'lä (Mex., land of maize). The smallest state of Mexico. Area 1534 square miles (Map: Mexico, K 8). It lies within the central plateau of Mexico at an elevation of about 7000 feet above the sea. Several mountain peaks rise on the west and the south frontiers. The Sierra Malinche has an altitude of 13,475 feet. The rivers are short and unnavigable. The chief industry is agriculture, and the principal products are cereals, especially maize. The state has good transportation facilities. Pop., 1910, 184,171. Capital, Tlaxcala.

The natives of Tlaxcala were of Nahuan stock (q.v.) and spoke the same language as the Aztecs, the dominant people of the Mexican Empire, but maintained their independence in spite of repeated attempts of the Aztec emperors to subjugate them. On the arrival of Cortés in 1519 he was at first fiercely resisted by the people of Tlaxcala, but they were defeated, and, submitting, furnished a large contingent to assist in the conquest of Mexico. In recognition of their services they were accorded special privileges under the Spanish government, and on account of their loyalty and fighting qualities numbers of them were afterward colonized at Saltillo, in Coahuila, and at Izalco, in Salvador, as a check upon the hostile inroads of the native tribes. The present population of Tlaxcala is chiefly of the aboriginal stock and language. They maintain many of their ancient beliefs and customs.

TLAXCALA, or **TLASCALA**. A Mexican town, the capital of the state of the same name, 58 miles east of the City of Mexico, on a branch

of the Mexican Railway, running between Puebla and Apizaco, in the valley of the river Atoyac (Map: Mexico, K 8). The modern town, near the site of the Indian capital, has lost much of its former greatness. It contains the state house, and the ancient bishop's palace, probably the oldest Franciscan building in America, while near it are many remains of former Indian structures. The magnificent sanctuary of Ocotlán is one of the landmarks of the surrounding country. The principal exports are grain, hides, and cloth. Pop., 1900, 2715; 1910, 2812.

TLAXIACO, tlä-syā'kô. A town of the State of Oaxaca, Mexico, 63 miles northwest of the city of that name, on the headwaters of the Atoyac (Map: Mexico, K 9). It is an important commercial centre. Pop., 1910, 7847.

TLEMEN, tlēm-sën'. The capital of an arrondissement in the Department of Oran, Algeria, near the Moroccan frontier. It is 81 miles southwest of the city of Oran, with which it is connected by rail, and stands in an undulating country, everywhere irrigated and highly cultivated (Map: Africa, E 1). It is also connected by rail with its port, Rashgun, 37 miles distant. The town is accessible only from the southwest, the other sides presenting steeply escarped fronts. It is protected from the south wind by a range of mountains, 4200 feet in height, and is surrounded by the ruins of its ancient battlemented wall. It contains Roman Catholic and Protestant churches, magnificent mosques, synagogues, and a museum of interesting antiquities. The town is well supplied with spring water, and a basin under the walls 720 feet long by 490 feet wide and 10 feet deep, used for naval exhibitions by the ancient Tlemcen rulers, is now a reservoir. The district is covered with fruit trees of all kinds, of which the olive is one of the most valuable; cereals, tobacco, etc., are extensively produced. Besides the special markets, a daily market is held, at which cattle, wool, grain, and oils are sold. Ostrich feathers and cork are exported; and woolen goods, leather, saddles, slippers, and arms are manufactured. Pop., 1911, 39,874, more than two-thirds of whom were of native origin. Dating from 1002, Tlemcen has an interesting history under Berber, Arab, Spanish, and Turkish rule. It had about 100,000 inhabitants in the thirteenth century. It has been on the decline since the early part of the sixteenth century. The French ultimately occupied it in 1842.

TLIN'KIT, or **TLINGIT** (people), or **KOLOSH** (Russ., from Aleut *kalosh*, *kaluga*, little trough, in allusion to the enormous and peculiarly shaped labrets worn among them, especially by the Sitka). A group of tribes, of which the Auk, Chilkat, Henya, Huna, Hutsnuwu, Kake, Kuyu, Sitka, Stikine, Taku, Tongas, and Yakutat are still recognized. They constitute a distinct linguistic stock known as the Kolushan, occupying the coast and islands of southern Alaska from Mount St. Elias southward to the entrance of the Nass River. They are a seafaring people with strongly marked characteristics. Before the demoralization wrought by the advent of the white man they lived in permanent villages of solidly constructed houses of massive beams and great planks of cedar, each with its tall totem pole, and with corner posts also carved in totemic designs. Their canoes were hewn from cedar trunks, and their mats and cordage were woven from cedar bark fibre. They were

expert stone carvers and copper workers. They were enterprising traders and controlled the trade from the coast to the interior tribes, using dentalium shells as a currency medium and setting great store upon the acquisition of property. They had two phratries, the Raven and Wolf, with descent in the female line, but the chieftainship was elective, being usually accorded to the most generous distributor at the ceremony of the potlatch (q.v.). Slavery was an established custom, slaves from other tribes being a staple article of trade and treated by their masters with great cruelty. The dead were cremated, excepting priests, whose bodies were wrapped in mats and deposited with their sacred belongings in grave houses on commanding cliffs. Their principal mythologic hero was the Raven, who brought fire to the people and set the sun and moon in their courses. They did not flatten the head, as did the more southern tribes, but wore labrets as marks of distinction and honor, the insertion of each successive larger labret being the occasion of a potlatch distribution. They were a warlike race, strong and well built, and regarded by the Russians as of superior intellect, but have deteriorated by contact with civilization. They numbered 4426 in 1910, and derive a large part of their subsistence by labor in the salmon canneries. Consult Krause, *Die Tlinkit Indianer* (Jena, 1885). See also SITKA; YAKUTAT.

TMESIS, t'mě'sis or mě'sis. See ETYMOLOGY, FIGURES OF.

T.N.T. See TRINITROTOLUENES.

TOA, or **AITOA**. See CASUARINA.

TOAD (AS. *tādige*, *tādie*, toad; of unknown etymology). The common name applied to any one of the numerous species of tailless Amphibia belonging to the family Bufonidae and a few kindred families. More than 120 species belong to the typical genus *Bufo*, which is nearly cosmopolitan, but most numerously represented in tropical America, and absent from Madagascar, Papuasia, and the islands of the Pacific Ocean. Toads differ from typical frogs (*Raninae*) in the absence of teeth, in having the sacral diapophyses dilated, and the sternum wholly cartilaginous. Most have a short-limbed, thickset figure and warty skin, and the majority are quite terrestrial or burrowing, but some are aquatic and others arboreal or aberrantly modified. There are eight genera in the family, besides *Bufo*. Noticeable among these are the common Australian toad (*Myobatrachus gouldi*), smooth-skinned; the repulsive egg-shaped, long-tongued, termite-eating Mexican species (*Rhinophrynus dorsalis*); and the large, warty, swimming toads of the East Indian genus *Neotophryne*.

The common toad of eastern North America (*Bufo lentiginosus*) is a fair type of the group. It reaches a length of about 3½ inches, is brownish olive, with a yellowish vertebral line and some brownish spots, but is exceedingly variable. The skin of young toads is nearly smooth, that of adults very warty. It contains many poison glands from which a milky somewhat acrid fluid exudes when the animal is roughly handled. This and the urine are harmless to man, but have a protective value against predatory animals.

The food of the toad consists of worms, insects, and snails, which must be alive and moving in order to attract its notice. These are seized by the rapid darting out of the tongue.

(See FROG.) This fare is captured mainly during twilight and at night. The list of known foods embraces almost every sort of insect and larva, including many injurious to horticulture; there is no doubt that toads keep down pests. They molt the outer skin several times a year, struggling out of it, and then swallowing it. When cold weather comes they dig a hole in the ground, or find some warm, dry crevice among rocks, in a cellar, etc., and become dormant. This power of hibernation, and their ability to endure deprivation of food and water, tend to great longevity; toads under favorable conditions will live perhaps 30 years. The stories of buried toads surviving for long intervals in solid clay or rock, are usually unworthy of belief. Experiment has shown that no toad can long endure deprivation of air, water, and food, though in porous stone or moist soil they might remain alive for long periods. As soon as toads emerge in the spring their piping is heard, and they make their way to water, where fighting between males and mating begin. After a few days long gelatinous ropes of black holoblastic eggs, each about one-fifteenth of an inch in diameter, are to be found coiled or matted in warm ponds and roadside pools. Each female begins to breed when about four years old, and lays six to ten thousand eggs annually. These eggs rapidly develop into embryos, and hatch in four weeks or less, according to weather. The larvæ are considerably advanced when freed from the egg, and are provided with a peculiar temporary organ in place of the yet undeveloped mouth, by which they cling to weeds and similar supports; and with bushy external gills as breathing organs. There is no trace of limbs, but a swimming organ is present in the form of a large fin-bordered tail. Development proceeds rapidly. The true mouth is soon formed, and the tadpoles begin to feed upon the minute algæ coating the bottom and floating on the surface, and later eat animal substances. They are good scavengers for an aquarium. They keep in shallow water near shore, but are preyed upon by newts, turtles, fishes, and predaceous aquatic insects. Gradually growth advances, the fore legs appear, and later the hind legs are developed and the tail and gill tufts are gradually absorbed. (For experiments in rearing tadpoles under various food conditions, see EVOLUTION, *Polymorphism*.) By midsummer the limbs are perfected, lungs have been formed, the tail is reduced to a stump, and the tadpoles emerge as small toads. Here they encounter enemies—birds, snakes, turtles, etc.—so that a very small proportion develop into adulthood, when they have few enemies except snakes.

The common toad of the Old World (*Bufo vulgaris*) is very similar to the American toad. It inhabits almost the whole Palearctic region, eastward to China and Japan. India and the Malay Archipelago have a widely prevalent and very rough-skinned species (*Bufo melanostictus*), with the power of changing color. The green toad of the Mediterranean region. (*Bufo viridis*) is highly variable in color; and the natterjack and panther toads (qq.v.) of western Europe resemble it. The largest member of the genus is the huge agua toad of tropical America. (See AGUA.) Various more distantly related amphibians are called toads, e.g., tree toads (see HYLÆ; TREE FROG); the South American horned frogs (q.v.) of the cystignathine genus *Ceratophrys*;

the Surinam toad (see PIPA), and others. Cf. FROG; SPADEFOOT.

Fossil toads are quite rare, but are found scattered through the Tertiary formations from the Eocene upward, especially in Europe. Some very fine skeletons of toads, and even remains of tadpoles, have been found in the fresh water Miocene deposits of Germany.

TOAD BUG. Any of the curious heteropterous insects of the family Galgulidæ. They have a short, broad body, projecting eyes, and dull, mottled colors, suggesting a miniature toad. They live in moist places along the banks of streams and ponds. About 20 species are known, of which three inhabit the United States, where the commonest species is *Galgulus oculatus*.

TOADFISH, or SAPO. One of a family (Batrachoididæ) of fishes allied to the gobies, the young of which fasten themselves to rocks

A TOADFISH.

by a central disk which is soon lost. They are small carnivorous and scavenging coast fishes of all warm seas, abundant about weedy rocks and coral reefs. They have a robust form, are inactive, and resemble toads in the mingled browns and yellows of their coloration. The species illustrated (*Opsanus pardus*) inhabits the Gulf of Mexico.

TOADFLAX, RAMSTED or BUTTER-AND-EGGS (*Linaria*). A genus of plants of the family Scrophulariaceæ, distinguished chiefly by the spur at the base of the corolla and the capsule opening by valves or teeth. The species are herbaceous, natives chiefly of the colder and temperate parts of the Old World. Common toadflax (*Linaria vulgaris*) has an erect stem one to three feet high, with glaucous, linear-lanceolate leaves which thickly cover the stem, and terminal spikes of yellow flowers. It grows in fields along roadsides, etc., in Europe and America, where it has been introduced and where it is usually considered a troublesome weed. A monstrosity called peloria is sometimes seen in this plant, the flower presenting five spurs and five usually imperfect stamens.

TOADSTOOL. A fungus of the group Basidiomycetes (q.v.), whose spore-bearing body is usually a stalk bearing a cap. The name is often used in a popular way as applying to poisonous forms in distinction from the edible mushrooms, but this distinction is not one of classification. See FUNGI, EDIBLE AND POISONOUS; MUSHROOM.

TOAST (OF. *toste*, from ML. *tosta*, toast, Lat. fem. sing. of p.p. of *torrere*, to dry). Originally the name given to bread dried or scorched before the fire. As early as the sixteenth century toast formed a favorite addition to English drinks, especially sack and punch. The application of the word to a lady whose health is drunk, and thence to any sentiment mentioned with honor before drinking, is said to have originated from an incident described in *The Tatler* (No. 24, June 4, 1709), as having happened at Bath in the eighteenth century, when it was the fashion for ladies to bathe publicly, in elegant dresses made for the purpose. It happened that on a public day a celebrated beauty of these times was in the Cross Bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow, half fuddled, who offered to jump in, and swore, though he liked not the liquor, he would have the toast (meaning the lady). In the later sense, the word has been adopted both in French and German. Consult Edmund and Williams, compilers, *Toaster's Handbook* (White Plains, N. Y., 1914).

TOBA, tō'bā (opposite, so called by the Guaraní, as living on the opposite or western bank of the Paraguay). A powerful and savage people of Guaicuruan stock, the most important tribe of the Chaco region of northern Argentina. They rove along the Pilcomayo and Vermejo rivers. Their language is a dialect of that formerly spoken by the Abipone (q.v.), whom they exterminated about a century ago. They hunt and fight on horseback with the lance and bow, and are warlike and untamably hostile to all whites who attempt to enter the region. See GUAICURUAN.

TOADFLAX (*Linaria vulgaris*).

TOBACCO (Sp. *tabacco*, *tabaco*, from the Carib name, of uncertain meaning; perhaps the name of the pipe smoked by the Indians, or of the tubes into which the leaves are rolled for

smoking, or the Haitian name of the plant, or the old name of the island now called *Tobago*, near Trinidad, or the name of a province *Tobacco*, said to be in Yucatan), *Nicotiana tabacum*. A plant of the family Solanaceæ, cultivated for its leaves, which when cured are used for smoking, chewing and as snuff. It has broad leaves, terminal panicles of flowers, and two-celled, five-valved fruits (many-seeded capsules). It is a native of the Western Hemisphere, where the aborigines cultivated and used it from remote times. Its generic name is in honor of Jean Nicot, who introduced it into France in 1559 from Spain, where it had been introduced from Santo Domingo in the same year. In 1585

TOBACCO (*Nicotiana tabacum*).

it was taken to England by Sir Francis Drake, and the practice of pipe smoking introduced among the Elizabethan courtiers by Sir Walter Raleigh. Its use rapidly extended throughout Europe, and soon became extensively prevalent among Oriental nations. Tobacco was at first recommended for medicinal virtues, but soon became an article of luxury.

In America the culture of tobacco began in Virginia with the earliest settlement of the colony. It is recorded that in 1615 the gardens, fields, and even the streets of Jamestown were planted with tobacco, which immediately became, not only the staple crop, but the principal currency of the colony. The culture of tobacco was introduced into the Dutch colony of New York in 1646, though it never gained the same prominence there as farther south. Maryland, the Carolinas, Georgia, and later Kentucky, made it the leading crop almost from their first settlement. It long constituted the most valuable export of the colonies. From 1744 to 1776 the exports of the crop averaged 40,000,000 pounds a year. Its culture without the use of manure or fertilizer led to the injury of much land, and was condemned by thoughtful farmers like Washington.

As a commercial crop tobacco is now confined to rather limited areas in a few States. In the production of wrapper leaf for cigars Florida and Connecticut take the lead. Pennsylvania, Ohio, and Wisconsin produce a great deal of filler leaf for cigars. Chewing, smoking, snuff, and export types of tobacco are grown

extensively in Kentucky, North Carolina, Virginia, Tennessee, South Carolina, and Maryland, in the order named.

The United States produces more tobacco than any other country in the world, about 35 per cent of the world's crop, and exports about one-third of the product, chiefly to the United Kingdom, Germany, France, Italy, Holland, and Spain. The tobacco crop of the United States in 1915 amounted to 1,060,587,000 pounds, grown on 1,368,400 acres, the average yield being 775 pounds per acre. The crop represented a value on the farm of \$96,041,000. In 1913 the United States exported to foreign countries 444,371,661 pounds of unmanufactured tobacco, and imported for its use 66,899,275 pounds of leaf.

In addition to being the leading tobacco producer in the world, the United States is also the greatest exporter, the greatest importer, and the greatest consumer of tobacco. India is the second largest producer and likewise the second largest consumer, consuming most of its own tobacco. Russia is the third producing country, exporting and importing but little, and Austria-Hungary the fourth producing country, importing about a fourth as much as it raises and exporting about an eighth of its crop. The Dutch East Indies produce great quantities of leaf for export, and Japan nearly supplies its own needs. Germany raises an important crop but imports about two and a half times as much more. Turkey, France, Belgium, Italy, Greece, and Rumania produce considerable quantities, as do also Cuba, Porto Rico, Santo Domingo, the Philippines, and Mexico. Brazil leads among the South American countries.

Cultivation. The variety of tobacco planted depends upon soil, climate, and market demands. The plant is unusually susceptible to the effects of soil, fertilizers and climate, which affect the quality of the leaf. In the more northern regions the seed is sown in a hotbed and transplanted to the field in five or six weeks. Cultivation should be frequent and shallow and should cease when the plants begin to button. Where the production of seed is not desired the plants are topped to prevent flowering, that their whole strength may be directed to the leaves except in the case of that grown for cigar wrappers when a thin leaf is the more valued. Fertilizers affect the quality of tobacco more than the yield. Barnyard manure produces a rank growth but poor quality. Potash is the most important element to be supplied in growing tobacco, and the best forms are the carbonate and the sulphate. Nitrogen is best supplied in cottonseed meal, bone meal, and dried blood. Some types of cigar-wrapper tobacco, notably Sumatra, are grown under cheesecloth shade to improve the texture and quality of the leaf.

The crop is harvested by cutting down the stalk near the ground, or picking off the leaves. The method of curing depends upon the kind of tobacco and the use it is to be put to. In some cases heat is employed. After curing tobacco goes through the process of fermentation or ageing in which enzymes take part. This results in a reduction in the per cent of nicotine and the development of aroma.

Tobacco, owing to the high rate of duty when in any manufactured form, is mostly imported in the leaf; but small quantities are brought in, chiefly for reexport, in various states of manufacture. The cultivation and manufacture of tobacco in foreign countries are frequently made

government monopolies, and in some its cultivation is prohibited.

Classes of Tobacco. Variations in soil and climatic conditions, combined with the methods of culture and handling, give rise to certain well-defined types, and on these are based market requirements, as follows: cigar types—wrappers and binder leaf, and filler leaf; export types—dark fire-cured, and air-cured; and manufacturing types—burley, dark manufacturing leaf (including so-called onesucker variety and Virginia sun-cured), bright flue-cured (yellow tobacco), and Perique produced in Louisiana on a small scale. The requirements for cigar tobacco are very exacting, differing essentially from those for other types of leaf.

Tobacco Diseases. Among the various diseases of tobacco perhaps the best known is calico or mottled top, a Connecticut name for the mosaic disease of Holland and elsewhere. The mosaic disease is characterized by mottled light and dark green leaves a few weeks after the plants are set. As the disease progresses some of the thin areas dry out, giving a decidedly mottled appearance to the leaf. The diseased plants are usually irregularly distributed throughout the field. The cause has been the subject of much controversy, many observers claiming it is of bacterial origin, while others claim it to be due to certain enzymes which disturb the balance between the normal functions of certain cells. The spot disease is characterized by white or brown spots of various size and shape upon the leaves. In some cases the leaves resemble the spotted condition which is considered so desirable in some tobaccos, as the Sumatra wrapper leaf. The cause of the spot is not definitely known. In the seed bed tobacco plants are subject to several diseases that may be controlled by sterilizing the soil with steam. In the curing of tobacco two diseases, poleburn and stem rot, are common. Poleburn is likely to develop if long continued damp, sultry weather occurs while the plants are being cured. Certain fungi seem always present in this disease, as well as many bacteria. It may be prevented by artificial heat and ventilation. The stem rot is due to the fungus *Botrytis longibrachiatata*. It attacks the stems and veins, producing patches of velvety white fungus and causing more or less decay. To prevent stem rot the tobacco barn should be thoroughly fumigated with sulphur fumes before and after curing a crop.

Tobacco Manufactures. The principal manufactured products are cigars and cheroots, cigarettes, smoking tobacco (for pipes and cigarettes), snuff and chewing tobacco—plug, twist and fine cut. Both the cigar and cigarette manufacture have been revolutionized by machinery. Although in cigar making there is still much hand work, cigarette making is more largely concentrated in factories. The manufacture and consumption of cigarettes in the United States has grown with marvelous rapidity, the increase in the decade ending 1913 amounting to over 450 per cent. The manufacture of smoking tobacco, formerly conducted by crude, hand methods, has also been modified by machinery and a great variety of forms, blends and flavors produced. The cost has been greatly lessened by machinery for packing. Fine-cut chewing tobacco is made in much the same manner as smoking tobacco, and the making of plug chewing tobacco is a comparatively simple process. Snuff making is the most complicated of all

products. It is divided into two classes, dry and moist, each varying greatly in quality.

The internal revenue receipts from tobacco and the tobacco industry in the United States approximate \$100,000,000 a year.

Indian tobacco (*Lobelia inflata*) has nothing in common with this subject. See LOBELIA.

Tobacco has been used as a sedative or narcotic over a larger area and among a greater number of people than any similar substance, opium ranking next, and hemp third. Tobacco leaves, when submitted to chemical analysis, yield nicotine, which is its most characteristic constituent, albumin, a gluten-like substance, gum, resin, malic and citric acids, and a large amount of inorganic constituents, 100 parts of the dry leaf yielding from about 19 to 27 per cent of ash, in which potash, lime, and silica preponderate. Nicotine (q.v.), the alkaloid contained in tobacco and considered a violent poison, does not appear in tobacco smoke. It is split into pyridine and collidine. Of these the latter is said to be the less active and to preponderate in cigar smoke, while the smoke from pipes contains a larger amount of pyridine. The question of the effect of tobacco on the human body is an old one, often discussed with a diversity of opinion and without definite conclusions. Studies made on man and the lower animals have helped to demonstrate important facts.

If tobacco possesses, like alcohol, opium, tea, coffee, etc., the power of arresting oxidation of the living tissues, and thus checking their disintegration, and if it also produces a nervous excitement which an immature body is unable to control, it follows that the habit of smoking must be most deleterious to the young, causing in them impairment of growth, premature manhood, and physical degradation. Smoked just after a meal tobacco is said to act as a digestive stimulant, and as a food when other forms of nourishment are not procurable. In some persons smoking increases, in others diminishes mental activity. Of special interest has been the action of tobacco upon the heart. And here nicotine seems to be the chief factor to be considered. It has been proved that this alkaloid affects the ganglion cells, interposed between the centre of the nervous system and the nerve endings in the heart, through the vagus and the sympathetic, thus effecting depression or acceleration of the action of the heart (tobacco heart), and constriction or dilation of the blood vessels. These changes, when becoming permanent, can be dangerous in their final results, upon circulation, respiration, and digestion. In affections, therefore, of these systems, as well as in nervousness, and in diseases of the nose, mouth, and throat, and of the eye (through the smoke) tobacco should be avoided. Otherwise, moderate use of tobacco by a healthy, mature person seems to be harmless, if not beneficial.

The different kinds of tobacco exert a different influence on the smoker according to the amount of noxious ingredients which they contain. Those which yield a small proportion are termed mild tobaccos. The use of tobacco in medicine has been entirely discontinued.

Matthewson, "The Export and Manufacturing Tobaccos of the United States, with Brief Reference to the Cigar Types," in United States Bureau of Plant Industry, *Bulletin No. 244* (Washington, 1912); Carl Werner, *Textbook on Tobacco* (4th ed., New York, 1914).

TOBACCO-BOX SKATE. The common small American skate (*Raja erinacea*). See Plate of RAYS AND SKATES.

TOBACCO HEART. An irritable condition of the heart occurring in many persons who use tobacco to excess. Irregularity of cardiac action and debility are the chief symptoms, which clear up promptly on discontinuing the habit. See TOBACCO.

TOBACCO PESTS. The tobacco flea beetle (*Epitrix parvula*) is generally distributed throughout the United States. It is a minute, oval, reddish-brown species occurring upon many solanaceous plants, which appears in July, attacking the tobacco leaves, which soon become spotted. The spots become holes and the leaf is practically destroyed. In the larval state the insect feeds upon the roots. The small holes eaten by the beetles become entrance points for bacteria, which start a leaf disease often more injurious to the plant than the actual work of the beetles. The so-called horn worms, or horn blowers, of tobacco are the larvæ of two sphingid moths (*Protoparce carolina* and *Phlegethontius celeus*), large green caterpillars with oblique white stripes on the sides of the body, and the anal end of the body armed with a horn. These larvæ live upon tobacco leaves, transform to pupæ under ground, and the moths issue in May or June. The eggs are laid singly on the under side of the tobacco leaf just at nightfall. There are two generations each summer in a

bud worm. (See Colored Plate of AMERICAN MOTHS.) The adult is a small greenish moth, and the larva is found in the bud of the plant about the time it is ready to top. They transform to pupæ under the surface of the ground.

TOBACCO BUD WORMS.

a, moth of the true bud worm (*Heliothis rheixia*); b, caterpillar of same; c, buds injured by false bud worm (*Heliothis armiger*).

A true bug (*Dicyphus minimus*) damages the second crop in late tobacco by puncturing the leaves and sucking the cell sap. Infested leaves become yellowish, somewhat wilted, and the older ones eventually split in places, becoming ragged. The bug, when immature, lives on the under side of the leaves, but the adults live both above and below. The eggs are deposited singly in the tissues of the leaf and hatch after four days. One entire generation is produced in 15 days. Several other sucking bugs puncture tobacco leaves, but are not serious enemies of the crop, except, perhaps, the green bug (*Euschistus variolarius*).

The tobacco leaf miner or split worm (*Phthorimæa operculella*) hatches from eggs laid upon the leaves by a minute grayish moth, and bores between the surfaces of the leaf, making a flat mine often of considerable size. This insect is a cosmopolitan species and works upon potatoes as well as upon tobacco, boring into tubers as well as leaves. Several species of cutworms (q.v.) damage the tobacco plant early in the season. A mealywing (q.v.) (*Aleyrodes tabaci*) damages the leaves of tobacco in Europe and in the southern United States. The common mealy bug (*Dactylopius citri*) affects the plant, as also do several species of plant lice. Tobacco thrips (*Thrips tabaci*) is an enemy of tobacco in Bessarabia. It occurs upon plants in the United States, especially upon onions, but has not been found upon tobacco.

Most of the insects mentioned may be destroyed by spraying the plants with an arsenical mixture. Nearly all of them feed upon solanaceous plants, and a good plan is to allow a few weeds of this family—*Solanum nigrum* or *Datura stramonium*—to grow near the field which is to be planted to tobacco. These weeds act as traps for nearly all early tobacco insects, and they can be treated with heavy doses of Paris green for the leaf-feeding species, and with a spray of kerosene emulsion and water for the sucking bugs. Large numbers can thus be killed, greatly to the protection of the young tobacco plants.

Dried tobacco is attacked and frequently ruined, even after having been made up into cigars and cigarettes, by the so-called cigarette beetle (*Lasioderma serricorne*), an insect which works not only in tobacco, but in many other dried herbs as well as certain dried foods. It is a cosmopolitan species, and multiplies rapidly

TOBACCO BEETLES.

a, tobacco flea beetle (*Epitrix parvula*), greatly enlarged; b, leaves, as damaged by this flea beetle; c, green bug (*Euschistus variolarius*).

large part of the tobacco-growing region. Two insects, both larvæ of noctuid moths, are known as bud worms in tobacco fields. They are *Heliothis armiger* (also known as bollworm (q.v.), corn-ear worm, and tomato-fruit worm), which preferably lives in the ears of corn until the grain becomes hard, and therefore works in tobacco usually towards the end of the season, and *Heliothis rheixia*. The latter is the true

throughout the greater part of the year, feeding both as larvæ and as adults. The drug-store beetle (*Sitodrepa panicea*) and the common rice weevil (*Calandra oryza*) also feed upon dried tobacco. These insects are destroyed by fumigating the rooms or the establishments in which they occur with bisulphid of carbon or hydrocyanic acid gas.

All of the species above mentioned occur in the United States, although several of them are cosmopolitan. In Europe 144 species are recorded as occurring in tobacco fields. The most important of these, among the species which do not occur in America, is a tenebrionid beetle (*Opatrum intermedium*), which injures the plant by attacking the stems under ground. Consult L. O. Howard, *The Principal Insects Affecting the Tobacco Plant* (Washington, 1900).

TOBACCO PIPE. An implement for the smoking of tobacco. The use of a pipe for smoking herbs of various sorts dates from a period when these plants were burned in a container and the smoke employed for sacrifices or for healing. Aside from the specimens discovered in ancient sites in Europe, the greatest prehistoric distribution of the pipe is in America. Here the widespread primitive form is a drilled tube of stone, wood, bone, or pottery, in the form of a large cigar holder, evidently taking its shape from that of a tube of cane. This type is found almost exclusively west of the Mississippi, and its early use was for blowing out smoke and not for drawing it into the mouth. This form, when put into clay, shows a later transition towards the modern pipes by bending the stem. In the eastern United States the prehistoric pipe shows considerable modification of the original tube, and some of the varieties are the monitor pipe with the bowl set on a flat base perforated as a stem, hour-glass pipes, biconical pipes, etc. The peace pipe or calumet (q.v.) descends from the monitor form. The red stone called catlinite, commonly used for calumets, came into use in historic times. The Alaskan Eskimo pipe is of Asiatic form, with a very small cavity in a mushroom bowl attached to a stem, while the Labrador Indian pipe is of a well-marked type, consisting of a separate bowl of stone beautifully worked and a short stem. Numerous examples of sculptured pipes have been found in Ohio and Illinois, and have been attributed to the so-called mound builders. The tomahawk pipe was introduced through trade by the French, English, and Spanish, and certain tribes affected a certain style of this pipe.

The ethnographic study of the pipe or its modification and adaptation to their uses by different peoples shows not only that the spread of the pipe into different environments has given rise to a great number of inventions connected with this utensil, but that their forms, materials, and artistic conceptions have taken upon themselves racial or tribal individuality, as, e.g., Turkish and Chinese pipes. Most of the inventions have grown out of the desire to cool the smoke and relieve it of acrid principles, giving rise to the great class of water pipes widespread in Asia and Africa, as the hookah or narghile, and the ornate Chinese water pipe, and in other countries resulting in absorbing bowls, as the meerschau, clay, brier root, or other substances, as well as devices for condensing the nicotine in a receptacle below the bowl, as in the German *lange Pfeife*. The same result is attained by the long stem of the pipe and by the long coiled tube of

the narghile. The opium pipe of China is a special development with a large bowl having a small aperture, and a large flute-shaped stem designed for the inhalation of a small quantity of fumes from a pellet of burning opium. The hemp pipe of India is a form of water pipe in which tobacco or a mixture of tobacco and hemp may be smoked. The Chinese and Japanese prefer a pipe with a very small bowl in which a pellet of finely shredded tobacco is smoked. The Koreans use a larger bowl with an extremely long stem. In Africa the water pipe is rudely made of a cow's horn perforated for stem and bowl holder. It is said that a Kaffir lacking a pipe will often dig a small hole in the ground in which he puts tobacco, fit a stem in position below it, and, lying on his belly, enjoy a smoke. Consult: Nadaillac, *Les pipes et le tabac* (Paris, 1885); McGuire, *Pipes and Smoking Customs of the American Aborigines* (Washington, 1897).

TOBACCO WORM. See TOBACCO PESTS.

TOBAGO or TABAGO. An island of the British West Indies, belonging to the Colony of Trinidad, and situated 22 miles northeast of the island of that name (Map: West Indies, G 5). Area, 114 square miles. It is of volcanic origin and is mountainous, with peaks rising about 2000 feet above the sea. The climate is warm, and the rainfall on the windward side amounts to 66 inches. The chief products are cotton, sugar, tobacco, coffee, rubber, and cacao, the bulk of which are exported. Pop., 1901, 18,750; 1911, 20,749, chiefly negroes. The chief town, Scarborough, had, in 1911, 729 inhabitants. The island was discovered by Columbus in 1498. It was successively held by the British, Dutch, and French, and was finally ceded to Great Britain in 1814.

TOBERENTZ, tō'be-rēnts, ROBERT (1849-95). A German sculptor. He was born in Berlin, and studied at the Academy there and then under Schilling in Dresden. From 1872 to 1875 he was in Rome. After his return to Berlin he became a follower of Begas, in whose manner he executed, among other works, the bronze figure of a "Shepherd Resting" (1878, National Gallery). In 1879 he was appointed director of a master studio connected with the Breslau Museum, and after living in America in 1885-89 returned to Berlin in 1890 and became professor in 1895. He completed the "Luther Monument" of Paul Otto, in Berlin, modeled the equestrian statue of Frederick Barbarossa for the Kaiserhaus at Goslar, and made the statue of Frederick the Great for the Royal Palace in Berlin.

TOBIN BRONZE. See ALLOY, *Bronze*.

TOBIT, BOOK OF (Gk. *Tōpētē, Tōbeit, Tōpēlō, Tōbeith*, from Heb. *Tōbiyāh*, Yahwe is good). One of the deutero-canonical books (q.v.) of the Old Testament. The personage around whom the story of the book centres is Tobit of the tribe of Naphtali, who was carried away to Assyria by Shalmaneser. Here he obtains an official position with the King, but loses it under Sennacherib, and because he has buried certain Jews killed by order of the King, he flees from Nineveh. His nephew, Achicharus (see ACHIKAR), pleads with the successor of Sennacherib, and under Esarhaddon Tobit returns to Nineveh. Again he buries the dead, and while in an "unclean" condition he sleeps outside the wall of his courtyard and loses his eyesight. In his misfortune he is supported by his nephew Achicharus, but, taunted by his wife, Anna, he sends

his son Tobias to collect an outstanding debt in Raga in Media. Tobias takes with him as guide one Azarias (in reality Raphael, the angel). On the way Tobias is attacked by a fish, whose heart, liver, and gall he takes at the command of Raphael. They come to the house of Raguel, a kinsman of his, and Tobias marries Sarah, the only daughter of Raguel. By burning the heart and liver of the fish in the bridal chamber the evil spirit, Asmodeus (q.v.), who has already killed seven husbands of Sarah, is driven away. The debt collected, the three return to Nineveh, and Tobias applies the gall of the fish to his father's eyes and their sight is restored. Tobit dies at Nineveh and is buried there; Tobias dies at Ecbatana, yet not before he has heard of the destruction of Nineveh by Nebuchadnezzar. The book was probably written in the first half of the second century B.C. It is very generally held that it was composed in Egypt, on account of the flight of the demon to Egypt, and the dependence upon the Achikar story which was known to Egyptian Jews in the fifth century B.C., and possibly the stories of Khons and of the Grateful Dead. But it is not certain that, in the original text, the demon fled to Egypt, and the matter does not seem to have any real bearing on the place of composition; the story of Achikar is likely to have reached the Jews in Yeb from Syria or Mesopotamia in its earlier Aramaic form (see *ACHIKAR*; *ELEPHANTINE PAPYRI*). The similarity to the story of Khons is very slight, and that of the Grateful Dead has not been found at all in Egypt. Tobit appears to have been written originally in Hebrew or Aramaic, and such terms as Ather and Athuria speak in favor of the Aramaic. In the Ptolemaic period, however, the Jews in Egypt wrote in Greek; an Aramaic book is more likely to have been written in Palestine. The geographical error of placing the Tigris between Nineveh and Ecbatana seems to exclude an origin in Adiabene, Media, or Mesopotamia. The emphasis upon the wickedness of exposing the dead, and the virtue of burying those that are exposed in public places, cannot be accounted for by the example of the patriarchs in Genesis; it is manifestly a protest against the Mazdayasnian custom of exposing the dead and the prohibition against burying them. The Greek manuscripts present three divergent types: Codex Vaticanus and Codex Alexandrinus probably represent the earliest, Codex Sinaiticus a somewhat later, and some minuscules as well as the Oxyrhynchus papyrus 1076 a mixed text. The Aramaic versions are made from the Greek, as are also the Latin, Hebrew, Syriac, and Ethiopic translations. Consult: A. Neubauer, *The Book of Tobit* (Oxford, 1878); Theodor Nöldeke, in *Monatsberichte der Berliner Akademie* (Berlin, 1879); J. Rendel Harris, in *American Journal of Theology*, vol. iii (Chicago, 1899); Max Löhr, in E. Kautzsch, *Die Apokryphen und Pseudepigraphen des Alten Testaments* (Tübingen, 1900); D. G. Simpson, in R. H. Charles, *Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913). See *APOCRYPHA*; *DEUTEROCANONICAL BOOKS*.

TOBLER, tō'blēr, ADOLF (1835-1910). A Swiss Romance philologist, born at Hirzel, Canton of Zurich, and educated at the universities of Bonn and Paris. In 1867 he became professor at the University of Berlin, and in 1881 a member of the Imperial Academy of Sciences. His

monographs on philological subjects are many, and his researches have contributed greatly to the knowledge of Old French syntax. In 1895 a Festgabe was presented to him by his pupils and friends. His publications include: *Gedichte von Jehan de Condet* (1860); *Mitteilungen aus altfranzösischen Handschriften* (1870); *Li dis dou vrai aniel* (1871; 2d ed., 1884); *Vom französischen Versbau alter und neuer Zeit* (1880; 4th ed., 1903; French trans., 1885); *Uguçon des Laotho* (1884); *Girard Pateg* (1886); *Vermischte Beiträge zur französischen Grammatik* (five series, 1886-1912; French trans., 1905); an edition of *Li proverbe au vilain* (1895). The first *Lieferung* of his monumental *Altfranzösisches Wörterbuch* appeared in 1915 (Berlin) under the editorship of E. Lommatzsch.

TOBLER, TITUS (1806-77). A Swiss Oriental scholar. He was born at Stein, Canton of Appenzell, studied and practiced medicine, traveled in Palestine, and, after taking part in the political affairs of Switzerland, settled in 1871 at Munich. His principal work is *Topographie von Jerusalem und seinen Umgebungen* (1853-54), which was supplemented by *Beitrag zur medizinischen Topographie von Jerusalem* (1855); *Planographie von Jerusalem* (1858); *Dritte Wanderung nach Palästina* (1859); *Bibliographia Geographica Palestinae* (1867). Consult H. J. Heim, *Titus Tober: Palästinafahrer* (Zurich, 1879).

TOBOGGANING (from North American Indian *otobanask*, *odabagan*, sled). Coasting upon smooth slopes of snow or ice upon a special sled with no runners beneath its flat surface. It seems to have been improvised by the Indian hunters, who used it to bring in their game over the snow. With them it was simply a strip of bark turned up at the front and braced by strips or pieces of wood running both crosswise and along the edges. Among the Eskimos it was made from strips of whalebone. It is of the same primitive pattern to-day, except that in some cases a light rail runs along its sides. For recreation purposes it is usually made of thin strips of ash, maple, or hickory, slightly oval on the bearing surface, placed side by side and fastened at the ends, the under surface being highly polished. The ordinary toboggan is about 18 inches wide and 6 to 8 feet long. The steersman sits crouching, one leg bent, the other stretched behind him to be used as a rudder, for which purpose his moccasin has a hard leather steering tip. In some cities, especially Montreal, chutes are constructed for this sport. See *COASTING*.

TOBOLSK', Russ. pron. tō-bōl'y'sk. A government of west Siberia (Map: Asia, J 2). Area, estimated at 539,659 square miles. The surface is flat with the exception of the northwestern part, which is covered with offshoots of the Ural Mountains, attaining an altitude of over 4000 feet. The larger part of the north belongs to the region of tundras and is practically uninhabited. The southern part is somewhat undulating and consists to a large extent of forest land and vast steppes, well watered and with a rich black soil which makes that part of the government one of the richest agricultural regions in the Empire. The chief waterway is the Obi (q.v.), which, with its great tributary, the Irtysh (q.v.), drains almost the entire region. Lakes are very numerous and some of them are salty. The climate is con-

tinental and severe, the average annual temperature varying from 24° F. at Berezov (q.v.) in the north to about 32° F. at Tobolsk in the south. Considerable quantities of grain are exported. Wheat and rye are the principal products. Dairying is a growing industry and the export of butter exceeds \$1,500,000 per annum. The manufactures are chiefly paper, cloth, spirits, leather, and glassware. Of the population, estimated at 2,005,500 in 1914, the non-Russian element numbered only about 100,000, composed chiefly of Tatars, Ostiaks, Samoyeds, and Voguls.

TOBOLSK. The capital of the government of the same name in west Siberia, situated on the Irtysh, 172 miles north of Tiumen, the terminal of the North Siberian Railway (Map: Asia, H 3). It is well built and has a picturesque appearance with its Kremlin and numerous churches. The proximity of marshes makes the town unhealthy. Its importance has greatly diminished since the construction of the Trans-Siberian Railway, but it retains commercial importance, owing to its position at the junction of the Irtysh and the Tobol. Its chief industries are fishing and fur making. Tobolsk was founded in 1587 and is the ancient capital of Siberia. Pop., 1910, 21,405.

TOBY, M. P. See LUCY, SIR HENRY.

TOBY, UNCLE. A leading character in Sterne's *Tristram Shandy*. He is a retired sea captain, simple, kindly, and gallant, said to have been modeled on Sterne's father.

TOCANTINS, tō'kân-têns', *Portug. pron.* tō'kân-têns'h', Rio. A large river of Brazil (Map: Brazil, H 3). It rises in the southern part of the State of Goyaz, and flows northward, emptying into the Atlantic Ocean through the large estuary known as the Rio Pará (q.v.), which communicates with the estuary of the Amazon. The total length of the Tocantins is about 1700 miles. About 600 miles from its mouth it receives the Araguayá (q.v.), which flows nearly parallel with, and exceeds in length, the main river from the point of confluence. The Tocantins is obstructed in several places by rocky reefs formed by spurs of the cordillera which it skirts. The last of these, the Falls of Itaboca, are situated below the confluence of the Araguayá, only 130 miles above the estuary, and completely obstruct navigation. Small steamers, however, ply on the upper reaches, though the country along the banks is very sparsely populated and its resources almost undeveloped.

TOCCATA, tōk-kā'tā (It., touched). In music, a term originally applied to compositions written for keyed instruments, thus having a somewhat more restricted meaning than sonata, a composition for any instrument. The oldest toccatas preserved are some written for the organ by Claudio Merulo (published 1598). They generally begin with full chords which gradually give way to passage work among which small fugato sections are interspersed. The modern toccato does not materially differ from that of Merulo.

TOCCOA, tōk'ô-â. A city and the county seat of Stephens County, Ga., 93 miles northeast of Atlanta, on the Southern Railway (Map: Georgia, C 1). Toccoa is both a summer and winter resort, being noted for its springs of chalybeate and sulphur waters, and for the famous Toccoa Falls, with a perpendicular descent of 186 feet. There are manufactories of

cotton goods and yarns, furniture, and cottonseed oil. Pop., 1900, 2176; 1910, 3120.

TOCHER, tō'gēr (Ir. *tochar*, Gael. *tochradh*, dowry, portion). In the Scotch law, an ancient name for money or property given or settled by a father on his daughter at her marriage.

TOCHIGI, tō'chê-gê. A town in the Prefecture of Tochigi in central Hondo, Japan, 55 miles by rail north of Tokyo (Map: Japan, F 5). It is of some industrial importance and had in 1908 a population of 26,301.

TO'CORO'RO. A Cuban trogon (*Priotelus temnurus*), named from its cry. It breeds in holes abandoned by woodpeckers, and is remarkable for the concave outline of the end of its short tail.

TOCQUEVILLE, tōk'vèl', ALEXIS CHARLES HENRI CLÉREL DE (1805-59). A French statesman and political philosopher, born at Verneuil, in the Department of Seine-et-Oise. At the Restoration his father was made a peer of France. His mother was a granddaughter of Malesherbes, the academician, political writer, and magistrate, who defended Louis XVI at the bar of the Convention. Alexis de Tocqueville studied law, was admitted to the bar in 1825, traveled in Italy, and on his return became an assistant magistrate at Versailles. In 1831 he gave up his appointment at Versailles, and with his colleague there, Gustave de Beaumont, accepted a government mission to America, to study the working of the penitentiary system. The commissioners, after their return to Europe, published their report (*Du système pénitentiaire aux Etats-Unis*, 1832; Eng. trans., Philadelphia, 1833), an admirable work, which modified all the ideas previously entertained in France regarding prison discipline. An important result of his travels was his great work *De la démocratie en Amérique*, published in 1835. In his introduction he sought to show that a great democratic revolution had for centuries been going on in Europe. There is a general progress towards social equality. In France it has always been borne on by chance, the intelligent and moral classes of the nation never having sought to guide it. In America he found that the same revolution had been going on more rapidly than in Europe, and had indeed nearly reached its limit in the absolute equality of conditions. There, accordingly, he thinks we may see what may sometime happen in Europe. The work made a profound impression. Its author was elected to the Academy of Moral Science in 1836 and to the French Academy in 1841.

In 1835 De Tocqueville visited England, where he received an enthusiastic welcome from the leaders of the Whig party. In 1837 he was defeated as a candidate for the Chamber of Deputies from Valognes, but two years after he was elected by an overwhelming majority, and ranged himself with the Moderate Opposition party. After the February Revolution he was a formidable opponent of the Socialists and extreme Republicans, as well as of the partisans of Louis Napoleon. He became, in 1849, vice president of the Legislative Assembly, and from June to October in the same year was Minister of Foreign Affairs. During that time he defended the policy of the expedition to Rome, on the ground that it would secure liberal institutions to the states of the Church. After the coup d'état of December, 1851, he retired to Tocqueville, where he devoted himself

to agricultural pursuits. In 1850 appeared his second great work, *L'Ancien régime et la révolution*. In June, 1858, he took up his abode at Cannes, where he died. De Tocqueville's *Ouvrages et correspondance inédites* were published (1860) by his friend de Beaumont, who prefixed a biographical notice. His *Mémoires* are a valuable contribution to the history of the revolution of 1848 and the coup d'état. An English translation, *The Recollections of Alexis de Tocqueville*, was published in New York in 1896. Consult: H. Jacques, *Alexis de Tocqueville* (Vienna, 1876); Bryce, "The Predictions of Hamilton and de Tocqueville," and H. B. Adams, "Jared Sparks and Alexis de Tocqueville," in *Johns Hopkins University Studies in History and Political Sciences*, series 5, vol. ix, and series 16, vol. xii (Baltimore, 1887 and 1904); Henry Sidgwick, "Alexis de Tocqueville," in *Miscellaneous Essays and Addresses* (New York, 1904); also *Correspondance entre A. de Tocqueville et Arthur de Gobineau* (Paris, 1908).

TOCUYO, tô-kô'yô. A town of the State of Lara, Venezuela, 180 miles southwest of Caracas, on the Tocuyo River. The valley of this river is one of the richest agricultural and grazing districts of the Republic, producing in abundance sugar cane, wheat, coffee, and cacao. Besides exporting these products Tocuyo has wool and leather manufactures, salt works, and household weaving. Tocuyo was founded in 1535. Pop. (est.), 4775.

TODAS, tô'dáz. A people of the Nilgiri Hills in southern Hindustan, considered to be of Dravidian stock. They are tall, well-built, dolichocephalic, with prominent nose, features approaching the Caucasian, full beard, black hair, and rather light-brown skin. They live a simple pastoral life and are concerned almost solely with the care of the dairy. They form a typical polyandrous community in which when a woman marries it is understood that she becomes the wife of her husband's brothers. Consult Marshall, *A Phrenologist Among the Todas* (London, 1873), and W. H. R. Rivers, *The Todas* (ib., 1906).

TODD, ALPHEUS (1821-84). A Canadian author and librarian. He was born in London, England, and went with his parents to Canada in 1833. In 1856 he became principal librarian and constitutional adviser to both Houses at Ottawa, and he expended £10,000 abroad in purchasing books for the parliamentary library. Upon confederation in 1867, he was appointed librarian to the Dominion Parliament. His writings on constitutional law and parliamentary government, which take high rank, include: *The Practice and Privileges of the Two Houses of Parliament* (1839); *Brief Suggestions in regard to the Formation of Local Governments for Upper and Lower Canada, in Connection with a Federal Union of the British North American Provinces* (1866); *On Parliamentary Government in England* (1867); *On Parliamentary Government in the British Colonies* (1880).

TODD, CHARLES BURR (1849-). An American historian, born at Redding, Conn. In 1895 he was secretary of the committee appointed by Mayor Strong for the printing of early records of New York City. He wrote: *A General History of the Burr Family* (1879; 4th ed., 1902); *History of Redding, Conn.* (1880; 2d ed., 1907); *The Story of Washington, the National Capital* (1897); *The Real Benedict*

Arnold (1903); *In Olde Massachusetts* (1907); *The Washington's Crossing Sketch Book* (1914).

TODD, DAVID (PECK) (1855-). An American astronomer, born at Lake Ridge, N. Y., and educated at Amherst College. He was assistant to the United States Transit of Venus Commission in 1875-78, and his reductions of the observations were the first derived from the American photographs. He took charge of the Lick Observatory observations of the transit of Venus in 1882. He led eclipse expeditions to Japan in 1887 and 1896, to West Africa in 1889-90, to the Dutch East Indies in 1901, to Tripoli in 1900 and 1905, the Mars expedition to the Andes in 1907, and an expedition to Russia in 1914. His publications include: *A Continuation of De Damoiseau's Tables of the Satellites of Jupiter to the Year 1900* (1876; also extended back to 1665), used by American and foreign nautical almanacs; *A New Astronomy* (1897; new ed., 1906); *Stars and Telescopes* (1899); *Lessons in Astronomy* (1902).

His wife, MABEL LOOMIS TODD, daughter of Eben Jenks Loomis (q.v.), wrote on astronomy, travel, anthropology, etc., and edited the *Poems and Letters* of Emily Dickinson.

TODD, HENRY ALFRED (1854-). An American Romance philologist, born at Woodstock, Ill. He was educated at Princeton (A.B., 1876), at Paris, Berlin, and Madrid (1880-83), and at Johns Hopkins (Ph.D., 1885), where he taught for several years. After holding the chair of Romance languages at Stanford in 1891-93, he became professor of Romance philology at Columbia. In 1910, with Raymond Weeks (q.v.) and other scholars, he founded the *Romanic Review*, the first learned review in English devoted entirely to the Romance languages. As a member of the advisory council of the Simplified Spelling Board, Todd took a prominent part in the reform of English orthography. In 1906 he was president of the Modern Language Association of America. Among his publications are *La panthère d'amour*, an allegorical poem of the thirteenth century, the first text to be edited by a foreigner in the series of the Société des Anciens Textes Français (1883); *Guillaume de Dole*, in which he showed that the so-called *Roman de la rose* of the Vatican is the unique text of an important poem antedating by about 40 years the first part of the celebrated *Roman de la rose* (1887); *La naissance du Chevalier au Cygne*, an important French poem of the twelfth century, embodying the earliest form of the Lohengrin legend (1889).

TODD, JOHN (1800-73). An American Congregational minister. He was born at Rutland, Vt., and graduated at Yale College in 1822, and at Andover Theological Seminary in 1826. He was pastor successively at Groton and Northampton, Mass., at Philadelphia, and at Pittsfield, Mass. He was one of the founders of Mount Holyoke Female Seminary (later College). He had a vigorous and original mind, much practical shrewdness and wit, and fine descriptive power. Some of his works had a large circulation, especially *The Student's Manual* (1835; 20th ed., 1853). Dr. Todd wrote many books for children and young people. His complete works appeared in London (new ed., 1882, 6 parts).

TODD, ROBERT BENTLEY (1809-60). A British physician, born in Dublin, and educated there at Trinity College. The first part of his

Cyclopædia of Anatomy and Physiology was published in 1835 and the entire work was completed in 1859. Todd was professor of physiology and general and morbid anatomy at King's College, London, from 1836 to 1853. Todd was known for his pioneer work in the treatment of fevers and inflammations. He published several medical works.

TODDY CAT. See PALM CIVET.

TOD'HUNTER, ISAAC (1820-84). An English mathematician. He was educated at University College, London, and at St. John's College, Cambridge. He was elected fellow of St. John's in 1845, and the rest of his life was devoted to mathematical writing and teaching, and to the study of philosophy and of languages. He was a fellow of the Royal Society (1862). Todhunter's textbooks were the most popular ones ever published in England. They include, besides a number of elementary textbooks: *Differential and Integral Calculus* (1852); *Analytical Statics* (1853); *Analytical Geometry of Three Dimensions* (1858); *History of the Progress of the Calculus of Variations During the Nineteenth Century* (1861); *History of Probability* (1865); *History of the Mathematical Theories of Attraction* (1873); *Researches on the Calculus of Variations* (1871); *Treatise of Laplace's, Lamé's, and Bessel's Functions* (1875); *History of the Theory of Elasticity* (posthumous, 1886). Consult: *Proceedings of the London Mathematical Society* (London, 1884), with list of writings; *Proceedings of the Royal Society*, vol. xxvii (ib., 1884).

TODHUNTER, JOHN (1839-). An Irish author and scholar, born in Dublin, Ireland. He graduated in medicine at Trinity College, Dublin, in 1866, and continued his medical studies in Vienna and Paris. After practicing his profession for a time in Dublin, he became professor of English literature in Alexandra College, Dublin (1870-74). After traveling on the Continent and in Egypt, he finally settled in London. His work includes: *Laurella and Other Poems* (1876); *Forest Songs* (1881); *The Banshee and Other Poems* (1888); *Three Irish Bardic Tales* (1896); *Heine's Book of Songs* (1907), a translation. His dramas include: *Alcestis* (1879); *Rienzi* (1881); *Helena in Troas* (1885); *A Sicilian Idyll* (1890); *The Poison Flower* (1891); *The Black Cat* (performed in 1893). His prose comprises: *The Theory of the Beautiful* (1872); *A Study of Shelley* (1880); and *A Life of Patrick Sarsfield* (1895).

TODI, tō'dē. A town in the Province of Perugia, Italy, situated on an abrupt hill near the Tiber, 23 miles south of Perugia (Map: Italy, D 3). Its Etruscan origin is shown in its ilapidated walls and numerous tombs. Its fine remains of the Roman period include a temple or basilica, a theatre, and amphitheatre. The Romanesque cathedral has a huge tower and frescoes by Lo Spagna. The Renaissance Church of Santa Maria della Consolazione, a massive structure surmounted by a slender, soaring dome, is simple but wonderfully impressive. The splendid Gothic Palazzo Comunale contains a small picture gallery. Todi, the Umbrian Tudor, was the scene of the decisive victory of Narses over the Goths in 552. Pop. (commune), 1901, 16,561; 1911, 17,032.

TODLEBEN, FRANZ EDUARD IVANOVITCH. See TOTLEBEN, F. E. I.

TOD'MORDEN, locally tāmôr-den. A mar-

ket-town in Lancashire, England, on the border of Yorkshire, 6 miles north-northeast of Rochdale. Cotton manufactures form the staple industry; coal abounds in the neighborhood, and there are foundries and machine works. Pop., 1911, 25,404.

TODY (from Lat. *todus*, sort of small bird). Any of several species of small West Indian birds forming the family Todidae, and related to the kingfishers, bee eaters, and motmots (qq.v.). They are less than three inches long with a short tail and long bill. The plumage is brilliant, grass-green, carmine-red, and white. They breed in holes in banks and lay white eggs. The best-known species is the common green tody (*Todus viridis*) of Jamaica, a familiar and useful little bird, often called robin redbreast by English residents. The name tody is incorrectly applied to rollers, barbets, and other highly colored tropical birds, even in the East Indies. See Plate of WRENS, WARBLERS, ETC.

TOE, WRV. See HALLUX VALGUS.

TOFT, ALBERT (1862-). An English sculptor. He was born in Birmingham, and at first worked as a modeler with Wedgwood and Sons. He studied at the Newcastle-under-Lyme School of Art, and at the Royal College of Art, London, and first attracted favorable attention with his "Fate-Led" (1892; Walker Art Gallery, Liverpool). This was followed by "The Sere and Yellow Leaf" (1892); "The Oracle" (1894); "The Goblet of Life" (1894); "Spring" (Birmingham Museum); "Hagar" (1899); "Victory" (1900); and the "Spirit of Contemplation" (1901), perhaps his best effort. His ideal statues, although realistic in conception, show considerable imaginative quality, and the modeling is vigorous and sure. In another field are memorials to Robert Owen, Queen Victoria (Nottingham), and King Edward (Birmingham), the Welsh National War Memorial, and busts of several noted men. Toft also did good work as a medalist and decorative sculptor, and published *Modeling and Sculpture* (1911).

TOGA (Lat., mantle). The principal outer garment of the Roman citizen, worn over a shirt (*tunica*). For ordinary citizens the toga was pure white in color (*toga virilis, toga pura*); boys, and most of the magistrates, wore togas with a border of crimson (*toga prætexta*). At a triumph (q.v.), the victorious generals appeared in a toga entirely of crimson embroidered with gold (*toga picta*), worn over a tunica of similar character (*tunica palmata*). Candidates for public office presented themselves in togas freshly cleansed and artificially whitened (*candida*, shining). On the other hand, persons in mourning for any reason wore carelessly arranged and soiled togas (*sordida*), or even those artificially darkened (*pulla*). Its material was wool, closely woven, and fulled, with a combed nap, making it (at least in late Republican and early Imperial days) cumbersome, expensive, and (except in winter) too heavy. The shape of the toga, like its size, the elaboration of its folds, and the way it was worn, varied at different times. It was less voluminous in earlier days. By the beginning of the Empire it must have been fully twice as long as the wearer was tall, of elliptical shape, folded lengthwise, hanging over the left shoulder (with the fold towards the neck) so that the end rested a few inches upon the floor in front. The rest of the garment was passed around the back, under the right arm, and thrown backward over the left

shoulder, so that the end hung down behind, but cleared the ground. The folds were most carefully and systematically arranged (later, pins or clasps were used), the end depending in front was raised to clear the floor, and the slack (*nodus, umbo*) allowed to hang down over the mass of folds (*sinus*) that crossed the front of the body towards the left shoulder. It gave place under the Empire, except on formal occasions, to lighter and more convenient garments, chiefly of foreign origin. Consult the article "Toga" in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891); H. W. Johnston, *The Private Life of the Romans* (Chicago, 1903). See COSTUME.

TOGASASTI. See TAGOSATI.

TOGGLE JOINT (probably connected with ME. *toggen, tuggen, to tug*). A mechanical appliance acting on the principle of the inclined plane. Let *ad* and *ag* represent the arms of the toggle joint, with the joint at *a*. Then, if the arms are brought to a perpendicular, the end *d* being stationary, the point *a* will move through the arc *ab* to *b*, and at each point in the arc in the direction of a tangent at that point. As the point *a* approaches *b* the tangent will

become more and more horizontal, and at last perpendicular to the arms *ad* and *ag*. When they form one and the same straight line the weight *w* will have been raised to twice the height *bc*. The form in the figure here presented is given to show more clearly the action of the knee and elbow joints in man, but that which is more frequently used, particularly in mechanical presses (to which the appliance is peculiarly adapted), makes the ends *d* and *g* of the arms approach

each other, applying the power at a making *ac* the perpendicular. It will be seen that on the application of power the motion of the point *a* will at first be quite rapid (when the material to be pressed, such as hay or cotton, is loose), becoming slower and slower as the points *d* and *g* approach each other, so that when both arms become very nearly perpendicular the weight or resistance will move very slowly; but the power will be extremely great, and adapted to the resistance offered by the greatly compressed bale. See INCLINED PLANE.

TOGHRA, tō'grā. A term in Turkey for the cipher or signature of the Sultan reigning over the Ottoman Empire. This cipher, changing with every reign and with the name of the ruler, displays the Arabic characters which make up his name and title in a whorl-like form, which reads from right to left. It appears on the coinage of the realm, on postage stamps, the Imperial buildings, and in any place where a coat of arms would be displayed in a European monarchy.

The word *Toghra* is derived from the Turkish verb *toghramak*, to cleave, to cut, to mark, having in this respect a derivation not unlike that of the English phrase "to make his mark," used of signatures.

A legend, often quoted, represents the Toghra, whose convolutions are not unlike those on the thumb, as having been made by a sultan dipping his thumb in ink, which some ingenious

calligrapher modified into a cipher of the royal name. But the date of this legend, which is associated with the illiterate Othman who founded the Ottoman dynasty, falls some two centuries later than the use of the word for the royal sign manual. Under a Seljuk sultan, Malik Shah, better known as Jalal din (1072-1104), a Persian poet, Abou Esmail Hosein (1063-1121), bore the title of Toghrayi. A contemporary speaks of him as the officer whose duty it was to write upon firmans and other instruments the Sultan's signature, which was accepted as written by the Sultan himself.

It is not uncommon for an Oriental ruler to affect an inability to write. The Emperor of China simply made his mark with a vermilion pencil. The Sultan of Morocco—often in cases where he, as with Mulai Hassen, was one of the best-educated men in the Empire—placed a scroll at the end of the documents he signed.

The Toghra was selected anew by each ruler and has analogies to the French paraph. It seems to be the case that the Turkish sultans originally made their mark. This was succeeded by an intricate calligraphic cipher, giving the name and title. In time this came to be accepted as signifying a ruler's assent, and, as the English Chancellor affixes the royal seal, so the Toghrayi performed the same office.

TOGO, tō'gō, or TOGOLAND. A territory in West Africa, bounded by Dahomey on the east, the Gulf of Guinea on the south, the Gold Coast Colony on the west, and the colony of Upper Senegal and Niger on the north (Map: Africa, E 4). Area, estimated at about 33,700 square miles. The low sandy coast rises towards the interior, which is mostly undulating and traversed by the Aposso Mountains, entering from northern Dahomey. The chief rivers are the Mono, the Dako, the Sio, and the Haho. There are many coast lagoons. The climate is moist and unhealthful. Togo possesses abundant natural resources. Extensive coconut plantations have been established along the coast, and good crops of corn and rice are raised. Tobacco and coffee are also cultivated. The chief products for export are palm kernels, palm oil, rubber, ivory, and copra. The imports and exports amounted in 1913 to 10,631,000 and 9,138,000 marks respectively. The chief ports are Lome, which is also the seat of administration, and Little Popo. There are 327 kilometers of railway: Lome-Anecho (Little Popo), 44 kilometers; Lome-Palime, 119 kilometers; Lome-Atakpame, 164 kilometers. The native population is estimated at 1,032,000; white population, Jan. 1, 1913, 368, of whom 320 were German. Togoland was declared a German protectorate in 1884. On Aug. 7, 1914, it was seized by British and French forces. See WAR IN EUROPE.

TOGO, HEIHACHIRO, COUNT (1847-). A Japanese admiral, born in Kagoshima, of a Samurai family. He entered the navy in 1863, fought in the Civil War of 1868, and afterward received training on the British ship *Worcester*, and at the Naval College, Greenwich. As captain of the cruiser *Naniwa* in 1894 he precipitated the war with China by firing upon and sinking the Chinese transport *Kowshing*. At the end of the war he was made rear admiral, and in 1900 became vice admiral with his station at Maizuru. As commander in chief of the combined Japanese fleet he delivered the first great blow of the Russo-Japanese War by

his torpedo attack on the enemy's fleet at Port Arthur on the night of Feb. 8-9, 1904. For his career in the war, see RUSSO-JAPANESE WAR. In 1912 he was admiral of the fleet, and he also held the post of chief of the naval general staff. Togo was honored with the British Order of Merit.

TOGUE, tōg. See NAMAYCUSH.

TOILERS OF THE SEA. See TRAVAILLEURS DE LA MER.

TOKAIDO, tō-kī'dō. An ancient division of Hondo, the principal island of Japan, occupying the eastern part of the island. It developed later than the western and southern parts of the island, but since the triumph of Yoritomo (q.v.) at the end of the twelfth century it has been dominant, ruling Japan from Kamakura and Yedo (Tokyo). It is now the most populous and richest part of Japan.

TOKAIDO. A name applied to the great highway which connects Tokyo with Kyoto. It is 323 miles long. Starting from Nihombashi (Jap., Bridge of Japan) in Tokyo, it skirts the Bay of Tokyo and the Pacific, climbs the Hakone Mountains across the peninsula of Idzu, again follows the coast line through many large towns to Kuwana, 247½ miles from Nihombashi, where it turns inland to Lake Biwa and Kyoto. Here in the days of the Tokugawa régime the daimyos from the centre and west of Japan traveled with their trains of armed men to and from their enforced residence in Yedo. The sides of the road were planted with lines of great cedars. By the completion of the railway between the cities its importance has diminished.

TOKAJ (*Ger. pron. tō'koi*), **TOKAY**, tō'ki. A town in the County of Zemplin, Hungary, at the confluence of the Bodrog and Theiss, 41 miles north of Debreczin (Map: Hungary, G 2). In the vicinity are sapphire and carnelian deposits and salt works. Tokaj is celebrated for its wines from vineyards 138 square miles in extent, producing over five million gallons annually. Pop. (town), 1910, 5321, mostly Magyars.

TOKAT, tō-kāt' (*Arm. Evtoghia*). The capital of a sanjak in the Vilayet of Sivas, Turkey in Asia, 125 miles northeast of Kaisarieh (Map: Turkey in Asia, C 2). It is in a hilly region, abounding in fine scenery, and is well laid out. The chief features of interest are the Byzantine castle and the old Roman tombs. The town is the commercial centre for a section producing fruit, hemp, corn, and tobacco, and has manufactures of cotton cloth, dyestuffs, copper wares, and leather. A number of copper smelters are operated in the suburbs of the town. Pop., about 30,000, the majority being Mohammedans. During the Middle Ages Tokat, the ancient Dazimon, was an important trading centre. It was the scene of an Armenian massacre in 1895.

TOKIO. See TOKYO.

TOKOL'OGY. See OBSTETRICS.

TÖKÖLYI, tē'kēl-yi, or **TÖKÖLI**, IMRE (EMERICH), COUNT (1656-1705). An Hungarian patriot. He belonged to a Lutheran family and was born at the Castle of Késmárk, in the County of Zips. His father, Count Stephen, was implicated in the conspiracy of Zrinyi, Rákóczy, and Frangipani against Leopold I of Austria; and after his death, and the execution of Zrinyi and others, young Tökölyi sought an asylum in Poland, where he had large pos-

sessions. After vain endeavors to recover from the Emperor his patrimonial estates he obtained the support of Apafi, Prince of Transylvania, and in 1678 he took the lead in the insurrection in Hungary. He captured a number of towns, and even penetrated into the heart of Moravia. The Turkish Sultan, Mohammed IV, espoused his cause, and in 1682 declared him Prince of Hungary under Turkish suzerainty. Tökölyi joined Kara Mustapha in the great onslaught on Austria in 1683, but after the disaster to the Turks at Vienna many of his followers fell off from him, and in 1685 he was imprisoned by the Turks. He was soon released and unsuccessfully resumed operations. In 1689 he was made Prince of Transylvania by the Sultan, and invaded that country with a Turkish army, but was forced back into Wallachia. He took part in the subsequent campaigns against Austria, and after the Peace of Karlowitz he was made by the Sultan Prince of Widdin and resided as his pensioner at Constantinople, where he died.

TOKUGAWA, tō'kōō-gā'wā. The name of the great family which ruled Japan for more than two centuries and a half (1600-1868). Its founder was Ieyasu, one of the five generals from the east of Japan who restored peace after centuries of feudal strife and anarchy. He claimed descent from an early Emperor through the Minamoto family, and took their hereditary title "shogun" (general) (q.v.). He made Yedo, or Tokyo, then an obscure village, the capital of Japan, reformed the laws, and established the system which was characteristic of Japan and made it unique in the eyes of foreigners. Ieyasu retired in 1604 to Shidzuoka, but continued to rule through his son until his death in 1616. His descendants were shoguns to the number of fourteen. The greatest of them was Iemitsu, his grandson, who ruled from 1623 to 1649. Most of the Tokugawa shoguns were weaklings and debauchees. The fifteenth shogun resigned his powers to the Emperor in 1868 and retired to Shidzuoka. Since that time the family has exerted no political power.

TOKUSHIMA, tō'kōō-shē'mā. The capital of the Prefecture of Tokushima, in Japan, near the coast in the northeastern part of the island of Shikoku (Map: Japan, D 6). It is the largest city on the island, and is beautifully situated. Pop., 1908, 65,561.

TOKYO, tō'kē-ō, or **TOKIO** (formerly YEDO) (Jap., Eastern Capital). The capital of Japan, situated on the southeast side of the main island, Honshiu, or Hondo, on the Bay of Tokyo (Map: Japan, F 6). Tokyo is the largest city of Japan and succeeded Kyoto as the capital upon the Imperial restoration in 1868. The city covers about 30 square miles, and is exceedingly irregular in outline, being, indeed, a number of towns grown together rather than a single city laid out according to design. It is divided into two unequal parts by the river Sumida. The eastern portions along the river and fronting the bay are level and low, the western rise into considerable hills with a dense population in the valleys which separate them. The chief feature is the palace inclosure within the grounds of the ancient castle. These grounds under the old régime were very extensive and were surrounded by an outer wall and moat more than two and a half miles in length. This wall has been leveled in part and the moat filled up. Within was a second moat and wall, and even a third in

parts. The old residence of the shogun within the third wall was burned in 1872 and has been replaced by the palace of the Emperor, in a mixed Japanese-European style of architecture. It stands in the ancient and beautiful park called Fukiage. The palace was first occupied by the Emperor in 1889. Much of the area inclosed by the outer wall and moat was occupied in the past by the mansions of the feudal barons, but these are now destroyed and in their place are the various buildings devoted to the use of the government, in European style and devoid of especial interest. To the east of the castle is the distinctively commercial portion of the city, with banks, warehouses, shops, hotels, restaurants, newspaper offices, and dwellings. A long main street, variously named in different parts and without any general designation, passes through this part of the city from northeast to southwest. It is broad, with rows of trees, a tramway, electric lights, and rows of low buildings of stone and brick in a semi-European style. From it lanes and streets diverge in all directions, for the greater part lined with small wooden buildings, inexpensive and without pretension. Mingled with them are storehouses made of mud or clay, and incongruous modern buildings. Of late years some of the streets have been straightened and widened, wooden bridges have been replaced by iron ones, and many improvements have been introduced. Nevertheless the old styles of shops and dwellings are in so vast a majority that this part of Tokyo is still essentially as in the centuries past.

In the northern part of the city is the arsenal, with the beautiful garden attached which formerly belonged to the mansion of the barons of Mito. Not far away is the ancient building used as a library which was once the great Confucian College. Farther to the north on the site of the town mansion of the Baron of Kaga is the Imperial University. (See TOKYO, UNIVERSITY OF.) Farther to the east is the great park, Ueno, with the mortuary shrines of eight of the shoguns of the Tokugawa family, and the Imperial Museum filled with objects of great interest. Still farther to the east is the great temple of the goddess of mercy, Kwannon Sama, with a park, many shrines, a pagoda, rows of shops, and innumerable places of amusement. Across the river Sumida the eastern portion of the city embraces the two districts called Honjo and Fukiage, a quiet region known to visitors chiefly for its displays of flowers, the cherry blossoms at Mukojima, the wistaria at Kameido, and the iris at Horikiri, and for the great wrestling matches at the temple E-ko-in. On the west bank of the Sumida was the Foreign Concession, but since the abolition of extraterritoriality foreigners are permitted to live in all parts of the city. In the same district, on the shore of the bay, is the Imperial park known as Enryo-kwan. In the southern part of the city is the park called Shiba, with the magnificent mortuary shrine of the second shogun, and the almost equally fine shrines of six others. Beyond the park, still following the line of the bay, is the Temple of Sankakuji, famous for the little cemetery containing the tombs of the 47 Ronins. To the west of the palace are many large residences surrounded by gardens and high walls. In the suburbs there are many delightful resorts, especially Meguro, Oji, Futago, and Ikegami. The

city is protected against fire by a well-organized fire department. It has also an excellent police system. The affairs of the city are administered by a mayor, a municipal council, and a municipal assembly. Tokyo has few industrial interests, although there are numerous factories in the neighborhood. It is unfavorably situated for commerce. Trade is carried on by way of Yokohama. Pop., 1898, 1,440,121; 1908 (city), 2,186,079; 1912, 2,099,000; 1920, 2,173,162.

Originally an obscure hamlet called Yedo (gate of the inlet) stood on the seashore in the district of the city now called Asakusa, while most of the busiest parts of the present city were covered with the waters of the bay and of lagoons. Near Yedo a rude castle was built in the fifteenth century, but the place continued without importance until towards the end of the sixteenth century, Tokugawa Ieyasu took possession of it, and in 1603 made it the seat of his government of the Empire. He retained the ancient name Yedo, but made it speedily the most important city in Japan.

The records of the city contain accounts of many terrible catastrophes. It was repeatedly destroyed in conflagrations, until in recent times the building of rows of brick and stone houses has furnished efficient barriers. It has also suffered greatly from earthquakes and from epidemics, while terrible storms have destroyed thousands of dwellings. After the weakening of the house of Tokugawa, in 1863, the requirement of residence for the barons was relaxed, and the population fell off greatly. But after the fall of the shogunate on Sept. 13, 1868, it was made the eastern capital, and its name was changed accordingly to Tokyo. It was opened to the residence of foreigners in 1869. Though nominally only the eastern capital, yet, as the residence of the Emperor, the meeting place of the Diet, and the seat of the government in all departments, it is in reality the only capital of the Empire, Kyoto retaining an empty title merely.

TOKYO, UNIVERSITY OF. A Japanese university founded in 1868 by the union of two older schools, as one of the results of the great political and social revolution of that year. It has grown with the growth of modern Japan. At first officered largely by foreigners, these have been gradually superseded by Japanese, for the most part trained in Europe and the United States. The university is a government institution. Its administration is vested in a president and a board of councilors, two from each college, named by the Minister of Education, for a term of five years. The colleges comprise law, medicine, engineering, literature, science, and agriculture. Two degrees are given, one for work in course, the other for special distinction. The university includes an observatory and a library. There were 5354 students in 1912-13, nearly half the number being in the college of law. The library in 1912 contained 491,082 volumes, of which 267,718 are in Japanese and Chinese, and 223,364 in foreign languages, and some 100,000 pamphlets. Consult C. F. Thwing, *Universities of the World* (New York, 1911).

TOLA, to'la. See KERMES.

TOLA. See INDIA, *Weights and Measures*.

TO'LAND, JOHN (1670-1722). A deistical writer. He was born near the village of Redcastle, in the County of Londonderry, Ireland. He was brought up as a Roman Catholic, but in

his sixteenth year was a Protestant. He entered the University of Glasgow in 1687, but removed to that of Edinburgh, where he took the degree of master of arts in 1690. Thence he passed to Leyden, where he entered upon theological studies. On his return to England he resided for some time at Oxford, where he was already looked upon as a free-thinker. *Christianity not Mysterious*, which he published in London in 1696, and in which he fully avowed his principles, created a sensation in the theological world. In the following year Toland returned to Ireland, but his book was burned publicly by order of the Irish Parliament. Finding it necessary to flee from Ireland, Toland returned to London, where he published a defense against this judgment of the Irish Parliament; but he soon afterward turned his pen from theological to political and literary subjects. His *Life of Milton* (1698) was attacked as containing heresy, and he defended himself in *Amyntor* (1699). A pamphlet entitled *Anglia Libera* (1701), on the succession of the house of Brunswick, led to his being received with favor by the Princess Sophia at the court of Hanover, and to his being sent on a kind of political mission to some of the German courts. In 1705 he openly avowed himself a pantheist. In this course he was emboldened by the patronage of Harley, by whom he was sent abroad to Holland and Germany in 1707. He returned to England in 1710; and having forfeited the favor of his patron, or at least having separated from him (1714), he engaged as a partisan pamphleteer on the side of Harley's adversaries. During this period he published *Nazarenus* (1718) and *Pantheisticon* (1720). His later life was spent in obscurity and poverty. Consult Leslie Stephen, *History of English Thought in the Eighteenth Century* (3d ed., 2 vols., New York, 1902).

TOLBOOTH, tɒl'boʊth' or -boʊth'. A massive structure, dating from various periods, on Castle Hill, Edinburgh, removed in 1817. It served as a Parliament House, a court, and a prison. It figures in Scott's *Heart of Midlothian*.

TOLDY, tɒl'di, FERENCZ (1805-75). An Hungarian literary historian. His real name was Schedel. He was born in Ofen, and was educated at Budapest as a physician. In 1830 he founded with Paul Bugát, at Budapest, the *Orvosi Társ*, the first Hungarian medical journal, and from 1833 to 1844 he was assistant professor of dietetics at the university. From 1835 to 1861 he was secretary of the Hungarian Academy, and in 1836 he founded the great Kisfaludy literary society, of which he became president in 1841. After 1849 he devoted himself entirely to the history of Hungarian literature, and in 1861 was appointed professor of that subject in the university. His works in German and Hungarian include: *Handbuch der ungarischen Poesie* (2 vols., 1828); *Kulturstände der Ungarn vor der Annahme des Christentums* (1850); *A magyar nemzeti irodalom története* (History of the Hungarian National Literature, 3 vols., Budapest, 1851-53); *A magyar költészet története* (History of Hungarian Poetry, 1855; 3d ed., 1875); *Marci chronica de gestis Hungarorum* (1867); and *A magyar költészet kézikönyve* (Handbook of Hungarian Poetry, 2 vols., 1857; 2d ed., 5 vols., 1872). Consult the eulogies of Toldy by Greguss and Szasz in the *Annals of the Kisfaludy Society* (new series, xi), as well as the notice

by P. Gyulai in the *Annals of the Academy* (1876).

TOLE'DAN RITE. See MOZARABIC LITURGY.

TOLEDO, tó-le'dó; *Sp. pron.*, tó-lá'thō. The capital of the Province of Toledo, Spain, 42 miles south-southwest of Madrid, on the Tagus (Map: Spain, C 3). The hundred-towered city, situated on a bold promontory, bordered on three sides by a bend of the Tagus and surrounded by a lofty wall, preserves almost unchanged its mediæval appearance. The Tagus is spanned by the bridge of San Martín, a well-constructed specimen of the military architecture of the Middle Ages, and the thirteenth-century bridge of Alcántara; the walls are pierced by a number of gates, of which the most beautiful is the Arabic Puerta del Sol. The houses of the city cluster in the form of a semicircle around the Alcázar. The streets are winding, narrow, and steep. Among the many interesting churches are the Gothic cathedral dating from 1227, with its forty chapels and library of ancient manuscripts; the cloister of San Juan de los Reyes, a gift of the Roman Catholic sovereigns; Santa María la Blanca, first a mosque, then a Jewish synagogue of the twelfth century, and now after many vicissitudes a church; and El Tránsito, another synagogue dating from 1366, and given by the Roman Catholic sovereigns to the Knights of Calatrava. Many former convents are devoted to the services of the state as prisons and hospitals. The city hall with two towers and classic façade dates from the fifteenth century. There are a beautiful theatre, and a provincial library containing 70,000 volumes, housed in the archbishop's palace. Toledo is the seat of an archbishop who bears the title of primate of all the Spains—one of the few survivals of the period when the city was the centre of Spanish national life. It is largely untouched by modern industrial life and exists as a survival of the golden age of Spanish chivalry. The climate is rather unhealthy and the surrounding region largely barren and cheerless. The city has manufactures of spirits, beer, chocolate, varnish, church ornaments, cloth, silk goods, pottery, brick, and fans. But the most famous establishments of Toledo are those devoted to the manufacture of arms, for even before the time of Roman domination Toledo blades were famous. The present government factory dates from 1777; within recent years establishments for the manufacture of cartridges have been added. There are also several private establishments for the manufacture of arms and ammunition. Pop., 1900, 20,201; 1910, 22,274.

Nothing certain is known of the origin of Toledo. Under the name of Toletum it is mentioned by Livy in connection with the date 192 B.C. After the period of Roman sway it fell first into the power of the Alani, and a little later came under the control of the Visigoths, of whose kingdom it became the capital. From 400 to 701 A.D. it was the meeting place of eighteen Church councils which exercised a great political as well as religious influence on Spain. Under the Arabs it was a city of great importance. After the dissolution of the Caliphate of Cordova it was the seat of a short-lived Mohammedan kingdom. Alfonso the Valiant of León and Castile conquered this state in 1085 and gave the name of New Castile to the region. The town became an important place of residence for the Castilian monarchs. In

the War of the Communes (1520-21) Toledo espoused the popular cause. In 1808 it took part in the national uprising against the French, and in 1810 and 1813 suffered much from the vandalism of their armies. Consult Hannah Lynch, *Toledo*, in the "Mediæval Towns Series" (New York, 1899); A. F. Calvert, *Toledo: An Historical and Descriptive Account* (ib., 1907).

TOLEDO. A town of Cebú, Philippines, situated on the central part of the west coast, 39 miles from Cebú. Petroleum and natural gas are found in the region. Pop., 1903, 12,929.

TOLEDO, tō-lē'dō. The county seat of Lucas County, the fourth largest city in Ohio, on the Maumee River at its entrance into Maumee Bay, 9 miles from Lake Erie (Map: Ohio, D 2). The city covers 30 square miles; its northern boundary extends to within 2 miles of the Michigan State line. It is the terminus of a number of railroads, among which are the Pennsylvania, the Hocking Valley, the Clover Leaf, the Pere Marquette, and the Grand Trunk. In all there are 17 railroads operating 22 divisions, 12 electric interurban, and five passenger steamship lines connecting with Detroit, Mackinaw, Duluth, and Chicago.

Situated at the west end of Lake Erie and at the foot of the upper chain of the Great Lakes, Toledo is the natural receiving point of the ore traffic from the Lake Superior region, and of grain and lumber from the Northwest. Likewise it is the natural distributing point for Ohio and Virginia coal to the north and northwest. Its harbor is one of the finest on the Great Lakes. The government channel is 400 feet wide and 21 feet deep through the bay, and from 700 to 1400 feet wide to the dock farthest up the river. Of the 35 miles of river front, 15 are lined with docks. In 1915, 4500 freighters loaded and unloaded in the harbor. Federal statistics for 1915 show that 7,114,483 bushels of grain and 46,318,804 tons of ore were received in Toledo. The city's export of soft coal in 1915 exceeded 4,000,000 tons.

Industrially Toledo is second to Cleveland among Ohio cities. In 1915 there were 2000 establishments employing about 40,000 people. The most important industry is the manufacture of automobiles, one plant alone employing 15,000 persons. There is also a large bottle manufactory with an annual output of 1,300,000,000 bottles. Other important products include plate glass, wagons, malleable castings, elevators, springs, baby carriages, scales, atomizers, wheelbarrows, electrical apparatus, linseed and castor oils, pig iron, coffee, flour, sugar, and women's clothing. The city has 420 miles of streets, 230 of which are paved, 116 miles of electric street railway, 312 miles of water mains, and 262 miles of sewers. There are 12 large parks and 41 triangular parks, covering 1024 acres. A 25-mile boulevard connects the parks and surrounds the city.

Toledo's prominent buildings include an art museum of white marble, Scott and Wait high schools, a new post office, a courthouse, Second National Bank, Newsboys' Building, the Toledo Club, St. Francis de Sales School and Chapel, State Hospital for the Insane, and the Cherry Street Bridge. The public-school system includes two high schools and 43 elementary schools. The teaching corps numbers 900. Toledo is one of the five cities maintaining a munic-

ipal university. The university had, in 1915, 36 instructors, and 150 full-time and 700 part-time students. There are 16 parochial schools, the Ursuline and Notre Dame academies, and St. John's College, maintained by the Roman Catholic church. The public library contains 100,000 volumes. There are 110 Protestant and 23 Roman Catholic churches.

A charter which went into effect on Jan. 1, 1916, makes the mayor, vice mayor, and council the only officers elected by the people and subject to the recall. The heads of all departments and all boards are appointed by the mayor, to whom they are directly responsible. They include a director of law, finance, public service, public safety, public welfare, and public utilities. The mayor also appoints the university trustees, and the civil service, city plan, and public efficiency commissions. The city's annual expenditure for maintenance approximates \$2,000,000, the bonded debt interest about \$397,000. The water works are municipally owned. The water is taken from the Maumee River, and passes through several filtrations.

Toledo is the outgrowth of two sparsely settled townships, Port Lawrence in 1817, and Vista in 1832. Originally it was the hunting grounds of the Indians, and later the theatre of important historical incidents in connection with the Indian War, conducted in the region of northwestern Ohio by Mad Anthony Wayne. Near the original site was fought the battle of Fallen Timbers which ended all savage warfare in the Northwest. The city was named in 1835 after the old Moorish capital in Spain. The village was incorporated in 1836. With the opening of the Wabash and Erie canal in 1843 and the Miami and Erie canal in 1845, the town developed rapidly. Pop., 1900, 131,822; 1910, 168,497; 1915, 205,000; 1920, 243,109 (exclusive of West Toledo, Rossford, and other outlying districts). Consult Harvey Scribner, ed., *Memoirs of Lucas County and the City of Toledo, from the Earliest Historical Times down to the Present* (2 vols., Madison, Wis., 1910).

TOLEDO WAR: A boundary controversy which arose in 1835 between the State of Ohio and the Territory of Michigan. Congress in the Ordinance of 1787 had reserved the right to form new States out of that part of the territory northwest of the Ohio River lying north of an east and west line drawn through the southerly bend or extreme of Lake Michigan. At this time the southern extreme of Lake Michigan was unknown, and was supposed to be much farther north than it actually was. Ohio was admitted as a State in 1803, the above line being described in the act as its northern boundary, though the State constitution claimed more territory. When in 1805 Michigan Territory was organized, and, later, Indiana and Illinois became States, the most confused ideas existed on the boundary question. A survey was made by order of Congress in 1817 which established the present line. The old line had included in Michigan the city of Toledo, and this was the main point in dispute. In 1835 Ohio laid claim to all within the new line, known as the Harris line, and proceeded to organize townships therein. Michigan declared the intention of resisting such invasion, and the militia of both sides were called upon to maintain the alleged rights of their respective governments. An opinion of the United States Attorney-General B. F. Butler (q.v.) (1795-1858),

favored Michigan; President Jackson sent out a peace commission with no result, and serious conflict seemed imminent. In September, 1835, the Michigan troops occupied Toledo to prevent the formal organization of Wood County by Ohio officers. The latter, however, accomplished their purpose secretly and withdrew. The trouble was finally settled by the admission of Michigan into the Union on condition that she accept the Harris line, while as a makeweight that State was given the upper Wisconsin Peninsula, which afterward proved from its mineral wealth to be far more valuable than the disputed territory.

TOLENTINO, tō'lēn-tē'nō. A town in the Province of Macerata, Italy, on the Chienti, 30 miles south-southwest of Ancona (Map: Italy, D 3). The cathedral has a good portal by Rosso. The churches of San Catervo and San Francesco possess noteworthy frescoes and reliefs. There are manufactures of machinery, silks, woollens, wine, and olive oil, and stone quarries. Tolentino was the scene of Murat's defeat by the Austrians on May 2-3, 1815. Pop. (commune), 1901, 12,872; 1911, 14,254.

TOL'ERATION (Lat. *toleratio*, from *tolerare*, to endure, tolerate; connected with Gk. *τλῆναι*, *tlēnai*, to bear, endure, Skt. *tul*, to lift up, weigh). The recognition of the right of private judgment; specifically, such recognition, on the part of the government, in matters of faith and worship. By governmental toleration is granted not only the liberty of holding and putting into practice varied religious opinions, but of teaching and defending them publicly. But thereby no permission is given to violate the rights of others, or to infringe laws designed for the security of the governing power or for the protection of decency, morality, or good order. See **LIBERTY**, **RELIGIOUS**.

TOLIMA, tō-lē'mā. A department of south Colombia, South America (Map: Colombia, B 3). Area, about 10,080 square miles. It lies between the Central Cordillera and the Magdalena River. Agriculture is carried on chiefly in the central part, where coffee, sugar, cacao, rice, and tobacco form the chief products. Stock raising is important. The mineral deposits include gold, silver, copper, lead, and sulphur. The climate along the river is tropical, but it is cold in the upper mountain regions. There are no good means of communication. Pop., 282,426. Capital, Ibagué (q.v.).

TOLIMA. A quiescent volcano in Colombia rising from the Central Cordillera of the Andes, 75 miles west of Bogotá. It is the highest peak in the country, having an altitude of 18,325 feet.

TOLL (A.S. *toll*, *tōl*, OHG. *zol*, Ger. *Zoll*, toll, tax; probably from Lat. *telonium*, from Gk. *τελώνιον*, customhouse). In law, a charge or duty paid for some service, or the license to use something, generally in the nature of a public franchise. The right to exact toll is almost entirely created by statute, and generally is only granted to persons who maintain some public convenience, as a ferry, bridge, or turnpike. The setting forth of facts which establish a bar to the maintenance of an action by reason of lapse of time is sometimes described as a toll of the Statute of Limitations. See **FERRY**; **FRANCHISE**; **HIGHWAY**.

TOLL, tōl, EDUARD, BARON VON (c.1850-1902). A Russian scientist and explorer. He began arctic research with Bunge (1885-87), investigating the Post-Tertiary fauna of the Jana and

adjacent regions. In an expedition to the New Siberian Islands (1893) he found the body of a mammoth in the Jana delta. He commanded the *Sarja* expedition, which wintered (1901-02) on the west coast of Kotelnoi Island. The explorations of F. G. Seeberg and Von Toll disclosed extensive Post-Tertiary fauna on this island. Many specimens, mammoths, reindeer, etc., were superimposed on enormous ice cliffs, 70 feet thick in places, remnants of the Ice age. The two explorers started south in November, 1902, and perished en route. Their records were found the next year by Kolehek on Bennett Island. Consult Emma Toll, *Die Russische Polarfahrt der Sarja* (Berlin, 1909).

TOLL, tōl, JOHAN CHRISTOPHER, COUNT (1743-1817). A Swedish statesman and soldier, born at Mölleröd in Skåne. He participated in the coup d'état of Gustavus III in 1772, after which he played an important part in the government, especially as the efficient head of the War Department. In the war with Russia (1788), begun against his advice, he was unjustly accused of neglect of the country's defense. Under Gustavus IV also he was active as a public officer and diplomat and for many years was Governor-General of Skåne.

TOLLENDAL, BARON DE. See **LALLY**, T. A.

TOLLENS, tōl'ens, BERNHARD (1841-). A German agricultural chemist. Born at Hamburg, he received his doctorate in philosophy at Göttingen in 1864, became an assistant at Heidelberg in 1865, and studied at Paris (1868) and at Coimbra (1869). Returning to Göttingen in 1870, he was professor and director of the university agricultural-chemical laboratory from 1873 until his retirement in 1911. He was editor of the *Journal für Landwirtschaft* and author of *Kurzes Handbuch der Kohlenhydrates* (1888; 3d ed., rev., 1914).

TOLLENS, tōl'lēns, HENDRIK CAROLUSZON (1780-1856). A Dutch poet, born in Rotterdam. He was the son of a merchant and himself was engaged in commerce till 1846. His early work followed French models and ideas. His first original works were poems (1802), followed by *Lucretia* (1805) and other historical tragedies and works of much strength. His subsequent productions were mainly lyric and more distinctively national and simple. These poems, gathered under various titles (1808-53), show powers undiminished to the last. He won wide popularity through the national song *Wien Neerlandsch bloed*. His best work is *Tafereel van de overwintering op Nova Zembla* (Picture of the Wintering on Nova Zembla, 1819). A complete edition of his works appeared in 12 volumes (Leeuwarden, 1855-57). Consult Schotel, *Tollens en zijn tijd* (Tiel, 1860).

TOLL ROADS. See **HIGHWAY**; **ROAD**.

TOLOSA, tō-lō'sā. The former capital of the Province of Guipúzcoa, Spain, 16 miles south-west of San Sebastián, in the valley of the Oria and on the Irun-Burgos line of the Northern Railway (Map: Spain, E 1). It contains the church of Santa María, the Palacio Idiaquez, and two handsome paseos. During the nineteenth century it was an important Carlist centre. Its principal manufactures are paper, woollens, steel, brassware, and malt liquors. Pop., 1900, 8100; 1910, 9747.

TOLSTOY, ALEXANDER IVANOVITCH OSTERMANN. See **OSTERMANN-TOLSTOY**, A. I.

TOLS'TOY, Russ. *prom. tōl-stoi'*, ALEXEI KONSTANTINOVITCH, COUNT (1817-75). A Russian

author. He was born in St. Petersburg and studied at Moscow. After seeing diplomatic service and traveling extensively, he took part in the Crimean War and subsequently held a high position at the court. He wrote lyric and epic poetry and one novel, *Prince Serebriany* (trans. by J. Curtin, 1893), after the manner of Sir Walter Scott. His chief literary achievement, however, was his dramatic trilogy, *The Death of Ivan the Terrible* (1866; Eng. trans. by F. Harrison, London, 1869), *Czar Fiodor Ivanovitch* (1868), and *Czar Boris* (1870).

TOLSTOY, DMITRI, COUNT (1823-89). A Russian statesman. After serving in the ministry of the navy, he became procurator of the Holy Synod in 1865 and Minister of Public Instruction in 1866. His preference for the classical languages in the intermediate schools and his petty tutelage over the universities brought him such widespread enmity that he was obliged to resign his education post in 1880. He was appointed president of the Academy of Sciences in 1882 and served as Minister of the Interior in 1883-85. He was the author of a history of the finances of Russia to the reign of Catharine II (1847) and of *Le catholicisme romain en Russie* (1863-64).

TOLSTOY, LIOV, (LEO) NIKOLAEVITCH, COUNT (1828-1910). A famous Russian author and one of the world's greatest novelists. He was born on his father's estate at Yasnaya Polyana in the Government of Tula, Aug. 28, 1828. In 1843 he studied Oriental languages at the University of Kazan, but soon found linguistic study uncongenial and took up law. He received his diploma in 1848, "knowing literally nothing," as he declared later. He lived on his estate until 1851, when his brother, an artillery officer, induced him to visit Caucasia. Charmed by the life there, he joined an artillery regiment and in 1853 was attached to the army of the Danube during the Crimean campaign. During this period he published *Childhood* (his maiden work), *The Incurtion*, *Boyhood*, *The Morning of a Landed Proprietor*, and *The Cossacks*. He took part in the defense of Sebastopol, embodying his experiences in *Sebastopol in December of 1854*, *Sebastopol in May of 1855*, and *Sebastopol in August of 1855*. These sketches immediately placed Tolstoy among the great writers of the day. They painted the horrors of war, with its false and real heroes, in the spirit of that cruel, cold-blooded realism which is the chief trait of Tolstoy's unique art. At the end of that war Tolstoy resigned and went to the capital. A visit abroad in 1857 shattered his faith in modern civilization, and *From the Memoirs of Prince Nekhlyudov* was an indignant protest against the poverty and ignorance in modern society. He settled on his estate at Yasnaya Polyana and devoted himself to teaching peasant children. Finding himself deficient in educational knowledge, he went abroad (for the second time) to study German methods of education, which, however, served only to intensify his doubts and disappointment. He questioned the right and wisdom of all compulsory education and maintained that the pupil's interest must alone determine the curriculum. About this time work on *The Decembrists*, a long novel, of which only three chapters appeared, led Tolstoy to the study of the reign of Alexander I, and his interest gradually centred on the great Napoleonic campaign. Thus he came to write his *War and Peace* (1864-69), a colossal prose epic, reflecting

the whole range of Russian life at the beginning of the nineteenth century.

Again the elemental forces of the common people in contrast to the artificiality of the upper classes are lovingly dwelt upon. With the artistic exposition is intertwined a new philosophy of history, which in the last analysis is but old fatalism in a new guise. After this the above-mentioned pedagogical pursuits absorbed Tolstoy's energies until in 1875-76 *Anna Karenina* appeared in the *Russian Herald*. This great work deals with the unlawful relations of the social lion, Vronsky, and Anna, wife of Karenin, the bureaucratic official. The great questions of human life which centre about marriage are here treated with inimitable mastery, force, and naturalness. The novel has a second plot—the life of the rationalist landed proprietor, Konstantin Levin, and his wife, Kitty. Amid perfect home surroundings Levin is discontented and even contemplates suicide, until he is "regenerated" through contact with the common people and finds new strength in manual labor. According to Tolstoy's own statements this work contained much autobiographical material.

After this philosophical and social questions took complete possession of Tolstoy, and for more than a decade he gave to the world a series of religious, social, and philosophical treatises, such as *Commentary on the Gospel*; *Letter on the Census* (1883); *Confession: My Religion*; *What Shall we then Do?* a few short stories written for the people; *The Death of Ivan Ilyitch* (1885); and the dramas *The Power of Darkness* and *Fruits of Culture*. Works of literary art were also produced at this period. *The Kreutzer Sonata* (q.v.), its intent misunderstood, raised a storm of indignation on both sides of the Atlantic. *What is Art?* (1898), a great philippic against art as commonly understood, was a brilliant contribution to the literature of the subject, although its author left the question raised by the title unanswered for many of his readers. It contains ideas of great depth and breadth, interspersed with paradoxes, and affords an interesting illustration of the thoroughness with which Tolstoy entered upon his work. It involved a minute study of every writer of any consequence on the subject. In 1899 *Resurrection*, a new work of fiction, appeared. Its central figure, Nekhlyudov, while acting as a juror, recognizes in the culprit the woman whom he had betrayed in his youth. Torn by remorse, he finally comes to the conclusion that he is the real cause of the woman's guilt and downfall and wishes to expiate his former wrongdoing by accompanying her to Siberia and sharing with her all the hardships of exile. All the bitterness that had welled up in the heart of the author seems to have found free utterance in this work, which is a powerful arraignment of all existing institutions. In 1900 his drama, *The Living Corpse*, appeared. In March, 1901, the Holy Synod issued the excommunication which had been hanging over his head for 30 years.

In 1862 Tolstoy married Sophie Andreévna Behrs, of Moscow. One of his sons, Lioy Liovitch, who inherited literary inclinations, attracted attention by his sketches in periodical publications. Another son, Ilya, wrote *Reminiscences* of his father. In 1910, in pursuance of a long-delayed plan to end his days in solitude, Tolstoy suddenly fled his estate, but contracted

pneumonia on his journey and died, Nov. 20, 1910, at a small railroad station (Astapovo).

Tolstoy has the same power of psychological analysis that characterizes Dostoyevsky (q.v.), whom he greatly excels, however, in range and variety. Dostoyevsky never gets beyond the narrow circle of the middle classes, while Tolstoy is equally at home in all walks of life. He draws, with the same firm and unerring hand, the rulers of men's fates, courtiers, generals, petty officers, common soldiers, great noblemen, peasants, prisoners in the dungeons and on their weary march to Siberia, men, women, children, and everywhere he fathoms the depths of human character. There is in Tolstoy none of Dostoyevsky's nerve harassing for the sake of satisfying the author's abnormal bent. The great reformer is actuated by nothing but the desire to get at truth, and his conscience can never rest until he succeeds. Hence Tolstoy's works, although depicting the genesis and growth of controlling passions in a masterly manner and containing scenes that are fascinating, possess none of those elements of piquancy that attract many to the works of the realistic school.

Coming to know his peasants through his pedagogical work among them, he became a great believer in the salutary influence of labor. His community work during the famines of 1873 and 1891 gave him an impulse for the simplification of life, and soon the foreign periodicals were filled with sensational pictures and descriptions of Tolstoy in a cheap blouse or smock, girded with a rope, with his hands on a plow, tilling his estate at Yasnaya Polyana. Gradually he dispensed with all unnecessary comforts of life and did cobbling and other manual labor for himself, preaching *Karma* (q.v.) and the doctrines of Lao-tse. (See *TAOISM*.) The principle of simplification was carried into his religious beliefs: all teaching not coming from Christ himself was ruthlessly discarded, and his gospel was newly constructed. The doctrine of Christian humility was carried to an extreme in his famous championship of non-resistance, especially remarkable side by side with individualism of an extreme kind. All human institutions—kingly power, state, church, judiciary, jury, army, even marriage—were ruthlessly criticized as standing in the way of the natural development of the powers of the individual. Always allowing his logic to lead him as it would, Tolstoy had to denounce his own literary achievements along with all products of civilization, as begotten of idle fancy and human craving for the plaudits of the world. In 1905 and 1906 he addressed to the Czar notable letters advocating universal suffrage, representative assemblies, and other reforms.

Bibliography. Tolstoy's works have been repeatedly collected and published in translations as well as in the original. Biryukov's (24 vols., Moscow, 1913) is the most authoritative complete Russian edition. Collected translations in English have been made by N. H. Dole, I. Hapgood, and others (22 vols., New York, 1902) and Leo Wiener (24 vols., Boston, 1904-05). A complete translation of Tolstoy's plays, including the posthumous works, has been made by L. and A. Maude (2 vols., New York, 1914). A vast literature has grown up about Tolstoy. Among the best lives and studies in English are: C. E. Dupuy, *Great Masters of Russian Literature*

(New York, 1886); G. H. Perris, *Leo Tolstoy, the Grand Mujik: A Study in Personal Evolution* (London, 1898); D. S. Merezhkovsky, *Tolstoy as Man and Artist* (New York, 1902); E. A. Steiner, *Tolstoy the Man* (ib., 1904); Aylmer Maude, *The Life of Tolstoy* (2 vols., ib., 1910; 4th ed., 1911); J. A. T. Lloyd, *Two Russian Reformers: Ivan Turgenev and Leo Tolstoy* (ib., 1911); Romain Rolland, *Tolstoy* (ib., 1911); I. L. Tolstoy (his son), *Reminiscences of Tolstoy* (ib., 1914); Constance Garnett, *Tolstoy: His Life and Writings* (London, 1914). Interesting briefer studies of Tolstoy will be found in Matthew Arnold, *Essays in Criticism* (2d series, London, 1889); Ivan Panin, *Lectures on Russian Literature* (New York, 1889); W. D. Howells, *My Literary Passions* (ib., 1895); E. W. Gosse, *Critical Kit-kats* (London, 1896); G. K. Chesterton, *Varied Types* (New York, 1903); P. E. More, *Shelburne Essays* (1st series, ib., 1904); Maurice Baring, *Landmarks of Russian Literature* (London, 1910); W. L. Phelps, *Essays on Russian Novelists* (New York, 1912); M. de Vogüé, *The Russian Novel* (London, 1913); E. A. Steiner, *Tolstoy: The Man and his Message* (New York, 1914).

TOLTEC, or **TOLTECA**, tól-tā'ká (people of Tollan, the modern Tula). An early cultured people of Mexico, the subject of considerable historical controversy. According to the general Mexican tradition they were the most ancient civilized race of Mexico, preceding the arrival of the ruder Aztec, who derived their own best culture by absorption from the Toltec. Their capital was at the now ruined city of Tollan or Tula, whence their dominion extended over all the central plateau, eastward to the Gulf and southward to the Maya border. After some centuries of flourishing existence their Empire fell to pieces through internal dissensions and the invasion of barbarous northern tribes about the close of the tenth century, the survivors from war and famine being either incorporated by the conquering Aztec or driven southward to become the culture pioneers among the southern tribes as far as Guatemala. The entire subject of Toltec history is so interwoven with myth and disfigured by exaggeration and uncertainty of dates that it is difficult to arrive at any conclusion, but enough remains to indicate that the Toltec had an important historic existence, either as a distinct race finally absorbed by conquering invaders from the north, or, which is more probable, as the advance guard of the Nahuatl stock (q.v.), preceding the arrival of the Aztec by several centuries.

Archæological research has lifted ancient Mexican history out of the obscurity of its confused traditions. Three great layers are recognized. The lowest is called the Archaic, the middle one is called the Toltec, and the top one the Aztec. According to such a classification the Toltec is given a broader significance than in tradition. The Archaic epoch seems to have been brought to a close by the rise of the Maya. The Toltec shows a close connection with the Maya and flourished apparently from the fourth to the twelfth century of the Christian era. Among the great cities of the Toltec period were Tula, San Juan Teotihuacan, and Xochicalco in the valley of Mexico, and possibly La Quemada, Chalchihuites, etc., in Zacatecas and Durango.

TOLU, tō-lō', BALSAM OF. See CHEWING GUM.

TOLUCA, tò-lō'kā. The capital of the State of Mexico, Mexico, 34 miles southwest of the city of that name, on the National Railways of Mexico (Map: Mexico, J 8). It is a clean, well-built city, with an altitude of 8761 feet and a cool and healthful climate. Its Institute and state buildings are interesting. It is a busy commercial and manufacturing centre, with breweries, cotton mills, and oil and flour mills. It is well known for its drawn work. In the vicinity is the extinct volcano Nevado de Toluca, a snow-capped peak 15,155 feet high. Tradition assigns the city a Toltec origin; it was an important Aztec pueblo called Tollán at the time of the conquest. Pop., 1900, 25,940; 1910, 31,023.

TOM, MOUNT. A mountain peak on the west bank of the Connecticut River, in Hampshire Co., Mass., about 4½ miles northwest of Holyoke (Map: Massachusetts, B 3). It is 1214 feet high and affords a wide view of the Connecticut valley. It is a finely kept park, the summit reached by a mountain railway.

TOMAH. A city in Monroe Co., Wis., 42 miles by rail east by north of La Crosse, on the Chicago, Milwaukee, and St. Paul Railroad (Map: Wisconsin, C 5). The chief industrial establishments are a large saw mill and bridge works of the railroad. A government Indian industrial school is situated here. Pop., 1900, 2840; 1910, 3419.

TOM'AHAWK (Algonquian *tomehagan*, Mohegan *tumnahegan*, Delaware *tamoihecan*, tomahawk). In general, the hatchet, axe, or spiked club made and used by the American natives. The club form usually ended in a ball bearing a celt or spike of bone. The early white traders adapted the European hatchet to these forms from which developed the type now seen in collections. Practically all of these metal tomahawks are of white manufacture and design. In early colonial literature the tomahawk became a symbol of war; hence the phrase "bury the hatchet." For bibliography, consult *Handbook of American Indians* (Washington, 1907).

TOMAHAWK. A city in Lincoln Co., Wis., 23 miles north of Merrill, on the Wisconsin River, and on the Chicago, Milwaukee, and St. Paul, and the Marinette, Tomahawk, and Western railroads (Map: Wisconsin, D 3). There are pulp, paper, and saw mills, woodworking factories, and a tannery. Bradley Park is of interest. Pop., 1900, 2291; 1910, 2907.

TOMASZOW, tòm'a-shōv. An important manufacturing town in the Government of Piotrkov, Russian Poland, 41 miles northeast of Piotrkov. It has extensive textile mills, with an annual output valued at over \$3,000,000. Pop., 1912, 30,000, including many Germans and Jews. Tomaszow was occupied by the Germans in the Great War which began in 1914. See WAR IN EUROPE.

TOMATO (Sp., Port. *tomate*, from Mexican *tomatl*, tomato), *Lycopersicum esculentum*. A semivinelike annual herb of the family Solanaceæ, native to South America in the region of the Andes. It was formerly called love apple and was considered poisonous. It is now widely cultivated in all temperate regions and considered one of the most wholesome and important garden vegetables. The numerous varieties vary much in form from the red currant forms to the small yellow pear-shaped varieties and the larger red sorts. The red sorts with smooth round fruits somewhat flattened at the ends

and varying from 2 to 4 inches in diameter are most in cultivation. The tomato is propagated from seed and in greenhouses often by cuttings. In the temperate regions these are usually started in the greenhouse, hotbed, or cold frame, and the plants transferred to the field when the weather is warm and all danger from frost is past. The plants thrive best in a sandy soil, well fertilized. They are set in the field about 5 feet apart each way and in garden culture are often trained to stakes to keep the fruit off the ground. In the United States the large markets are supplied with tomatoes practically all the year round, the winter crop being grown in Florida and Texas. Also, more tomatoes are grown for canning than any other vegetable. Over 10,000,000 cases, of 24 cans each, are packed annually. Maryland, New Jersey, Indiana, Delaware, and Florida are the leading States in production. Italy has recently developed a new industry in the production of tomato-seed oil which is used for making soap. Tomato rot is caused by various fungi, e.g., *Phytophthora infestans*, *Macrosporium tomato*, attacks the green fruits of the tomato usually at the blossom end and first shows as a small black spot, which increases rapidly until half the fruit is a soft, black, sunken mass. *Fusarium lycopersici* attacks the ripe fruit, covering it with a thick, white mold, which later becomes reddish. It also causes a wilting of the plants. This disease is less common than the others. Repeated sprayings with Bordeaux mixture or other fungicide have been recommended as checks. Diseased fruits should be removed and burned. A stem-end rot of the fruit, that is attributed to over watering and excessive use of certain nitrogenous fertilizers, has been reported as of wide occurrence. The bacterial blight (*Bacillus solanacearum*) attacks also the egg-plant and potato. The leaves become yellow, and the stems wilt and later become brown or black, the plant being destroyed. Spraying for the disease itself appears to have little effect, but preventing insect attack is thought to act as a check. The leaf blight (*Cladosporium fulvum*), often a more serious pest, appears as brownish spots on the under side of the leaves and yellow on the upper. As the disease progresses the leaves curl up and finally drop from the stem. A leaf-spot disease (*Septoria lycopersici*), sometimes troublesome, causes numerous spots to appear on the leaves and young stems, ultimately destroying them. Consult: W. W. Tracy, *Tomato Culture* (New York, 1907); L. H. Bailey, *The Forcing Book* (8th ed., ib., 1909); "Tomato Growing in the South," in United States Department of Agriculture, *Farmers' Bulletin No. 642* (Washington, 1915). See VEGETABLES.

TOMATO INSECTS. Many of the insects that attack the tomato also live upon other members of the family Solanaceæ. Among the most common are blister beetles, plant lice, flea beetles, and cutworms, descriptions of which will be found under their respective titles. Others are discussed under POTATO INSECTS; TOBACCO PESTS; STALK BORER. The bollworm (q.v.) is sometimes seriously troublesome. See illustration under COTTON INSECTS.

TOMB (OF. *tombe*, *tumbe*, Fr. *tombe*, from Lat. *tumba*, from Gk. *τύμβος*, *tymbos*, sepulchral mound, grave, tomb; connected with OIr. *tomm*, little hill, Skt. *tunga*, vaulted). A chamber or structure for the burial of the dead. In all

ages the belief in immortality and the desire to honor the dead have led to the bestowal of the highest efforts of art upon their burial places. The ancient belief in the intermediate shadowy existence in the tomb of the *ka* or double of the deceased led also to the decoration of the tomb interior with pictured or carved doubles of the appurtenances of mundane life for the delectation of this imprisoned shade, as in the tombs of Egypt and Etruria.

Tombs may be either excavated or structural. Those cut in the rock are called hypogæa. Of these the most noted are those which honeycomb the west bank of the Nile in Egypt, some having roomy chambers with open porches in front; others, more numerous, penetrating deep into the cliffs (that of Seti I extending 800 feet) with a complex of descending passages, chambers, and pits. Other rock-cut sepulchres are in the Valley of the Kings, near Jerusalem; at Petra in Syria, where are Roman hypogæa with elaborately carved façades; the tomb of Darius at Naksh-i-Rustam in Persia; and many Etruscan tombs with less elaborate façades at Cære, Vulci, Corneto, etc. In Lycia, besides hypogæa with carved fronts, there are many tombs above ground hewn each from a single block into the semblance of a timber-framed structure. The splendid Sidon sarcophagi in the Constantinople Museum, shaped like small shrines or temples, almost deserve to be called tombs on account of their size and architecture. Intermediate between the rock-cut and structural tombs are such subterranean or buried structures as the hive-shaped Pelasgic tombs of Mycenæ, e.g., the so-called Treasury of Atreus.

Structural tombs in the open air follow usually the type of a tumulus, shrine, temple, tower, or of a canopy over a solid *podium* or pedestal. The Pyramids of Egypt are the grandest examples of the first type. (See PYRAMID.) The Romans sometimes built circular tombs surmounted by a cone or tumulus of earth or masonry—tombs of Cæcilia Metella, of Augustus, and of Hadrian; the last named, on the Vatican side of the Tiber, over 200 feet in diameter, but like the others destitute of its mound, is now known as Castle Sant' Angelo. The Greeks attempted little in sepulchral architecture except in Asia Minor, where the magnificent tomb of Mausolus (whence mausoleum, q.v.) in Caria was accounted one of the Seven Wonders. The Romans, whose tombs were impressive, perfected the canopy or tower type, as in good examples at Saint-Rémy and Vienne in France, Igel, near Treves, Mylassa in Asia Minor, and many other places. They lined the highways beyond their city gates with tombs of various types and often of great beauty, and in the fourth century developed, in examples like the tomb of St. Helena, the circular tomb with a dome, which was in the Middle Ages adopted by the Moslems and perfected, first on a small scale, but with great richness of detail, in the hundreds of domed and minareted tombs at Cairo known as tombs of the Khalifs, and later in such majestic structures as the tombs of Soliman, Shah Zadeh, and Khurrem at Constantinople, of Humayun at Delhi, and of Mahmud at Bijapur, and in the incomparable Taj Mahal (q.v.) at Agra. Syria abounds in tombs of all types, mostly dating from the early Christian centuries, though not a few belong to the Roman dominion, e.g., the Tomb of Absalom at Jerusalem, the tombs at Palmyra, etc.

In early Christian times and the Middle Ages the practice of interment within the church edifice became common, springing from that of erecting the altar over the tomb or sarcophagus of a martyr (altar tomb). Throughout the Middle Ages the decoration of indoor tombs assumed a great variety of shapes, the most common type being that of a sarcophagus bearing on the cover a recumbent figure of the deceased, under a richly wrought canopy borne by twisted shafts or clustered columns and pointed arches and embellished with sculpture and often with mosaic. These tombs were sometimes free-standing, sometimes set against a wall, or even set high up upon the wall, especially in Italy. Both kinds are to be seen imitated in the celebrated open-air tombs of the Scaligers at Verona, and there are beautiful variants of them in the English cathedrals of York, Salisbury, and Exeter. The bronze shrine of St. Sebaldus at Nuremberg is a late Gothic example of the canopy tomb. The Renaissance adopted these types, but altered their details and filled the churches of Italy, France, England, Germany, and Spain with splendid monuments, some of great refinement and beauty, others marvelously rich and even ostentatious, to the memory of the great dead. The fifteenth-century wall tombs of Italy are especially beautiful, and such churches as Santa Croce at Florence, Santi Giovanni e Paolo at Venice, Santa Maria del Popolo at Rome, and Westminster Abbey became great repositories of sepulchral art. Sculpture played an increasing part in these works, and in the seventeenth and eighteenth centuries was employed in allegorical groups, often theatrical and vulgar.

In modern cemeteries, besides the ordinary graves with stones or obelisks, are to be seen tombs shaped like classic shrines, and occasionally more elaborate structures fronted or surmounted by well-wrought groups of allegorical sculpture. Among important mausolea may be mentioned the impressive dome of the Invalides at Paris, serving as the tomb of Napoleon, and the massive Grant mausoleum in New York. Neither of these compares in splendor, however, with some of the Oriental tombs mentioned above. Modern sepulchral art is inferior to mediæval, Renaissance, or Oriental art. The modern preference is to erect imposing monuments to the dead in the frequented squares of populous cities, rather than over their quiet graves in remote cemeteries. Consult: Tosi and Becchio, *Altars, Tabernacles, and Tombs* (Lagny, 1843); E. W. Trendall, *Designs for Monuments, Cenotaphs, Tombs, and Tablets* (London, 1856); Brindley and Weatherly, *Ancient Sepulchral Monuments* (ib., 1887); Lawrence Weaver, *Memorials and Monuments, Old and New* (New York, 1915); and for Greek and Roman tombs, O. M. Stackelberg, *Die Gräber der Griechen in Bildwerken und Vasengemälden* (Berlin, 1837); Rossi, *Roma sotterranea cristiana* (Rome, 1887-88); M. de G. Davies, *Five Theban Tombs* (Oxford, 1913). See BURIAL; CAMPO SANTO; CEMETERY; CENOTAPH; NECROPOLIS; PYRAMID; SEPULCHRAL MOUND.

TOMBIG-BEE RIVER. One of the chief rivers of Alabama (Map: Alabama, A, B 4). It rises in the northeast corner of Mississippi and flows in a south-southeasterly direction with numerous abrupt windings. After a course of 450 miles it joins the Alabama River to form the network of channels composing the Mobile

and Tensas rivers, which empty through several arms into Mobile Bay. The largest tributary is the Black Warrior, which drains the north central part of Alabama. The Tombigbee is navigable to Aberdeen, Miss., 410 miles from Mobile Bay.

TOMB OF THE SCIPIOS. See **SCIPIOS**, **TOMB OF THE**.

TOM BROWN'S SCHOOL DAYS. A noted story of life at the famous Rugby School under the rule of Thomas Arnold, by Thomas Hughes (1856), and continued in *Tom Brown at Oxford* (1861).

TOMBS, SIR HENRY (1824-74). An English soldier, born at sea and educated at the India Company's Military College at Addiscomb. In 1841 he entered the service of the East India Company as second lieutenant and soon distinguished himself. In the Sepoy Mutiny he won the Victoria Cross by his gallant conduct at the siege of Delhi in 1857. Afterward he took part in the capture of Lucknow, the relief of Shahjahanpur, and in an expedition to Shakabad. In 1863 he was made brigadier general and in 1867 major general. During his later years he was in command of several important expeditions in India, but in 1872 resigned his command and returned to England, where he died. Consult: F. W. Stubbs, *History of the Bengal Artillery* (2 vols., London, 1877); G. B. Malleson, *History of the Indian Mutiny* (ib., 1878-80); and Field Marshal Earl Roberts, *Forty-one Years in India* (ib., 1898).

TOMBS, THE. The city prison of New York, erected in 1838, and so named from its massive and gloomy appearance. It was torn down in 1898 and replaced by a larger building.

TOMBS OF THE MEDICI. See **MEDICI**, **TOMBS OF THE**.

TOMCOD. One of the small codfish of the genus *Microgadus*, as *Microgadus tomcodus* of the Atlantic coast, or *Microgadus proximus* of the Pacific. They are very abundant and of considerable importance as food. See **PLATE OF COD-FISH AND ALLIES**.

TOM CRINGLE'S LOG. A sea yarn by Michael Scott, which first appeared in *Blackwood's Magazine*.

TOME, tō-mă'. A seaport of Chile, 12 miles north of Concepción, and a shipping point for grain. Municipal pop., 1903, 6358.

TOME. An old settlement on the Rio Grande, Valencia Co., N. M. It was settled early in the sixteenth century by 70 Spanish families. For a century it was the most important place in the Rio Grande valley, and for a time was the seat of government of the colony. Sept. 7, 1708, the town was sacked by the Comanche Indians, who killed half of the inhabitants and carried many others into captivity. Pop., 1910, 512.

TOME (tōm) INSTITUTE. See **JACOB TOME INSTITUTE**.

TOMELLOSO, tō'mēl-yō'sō. A town in the Province of Ciudad Real (La Mancha), Spain, in the District of Alcázar de San Juan. The town dates from the sixteenth century and is well built. The chief industry is the cultivation of the vine and of cereals, and there are manufactures of spirits, leather goods, and cloths. Pop., 1900, 13,917; 1910, 17,733.

TOM JONES. A well-known novel by Henry Fielding (1749).

TOMLINE, tōm'līn, SIR GEORGE PRETYMAN (1750-1827). An English divine, Pretymán by

name, who assumed the cognomen of Tomline on falling heir to an estate in 1803. He was born at Bury St. Edmunds and was educated in that town and at Pembroke Hall, Cambridge, where he formed the acquaintance of the younger Pitt—as his tutor in 1773—which was the making of his own career. In 1783 he became private secretary to Pitt, when that statesman was made First Lord of the Treasury, and his mathematical ability was serviceable to his patron. Tomline was made dean of St. Paul's and Bishop of Lincoln in 1787, and received the see of Winchester in 1820. In 1821 appeared his memoir of Pitt. This work was disappointing in that it took no notice of Pitt's career after 1793 and made scant use of opportunities the writer had to depict the inner history of the time.

TOMLINSON, CHARLES (1808-97). An English scientist, born in London, studied at Wadham College, Oxford, and under George Birkbeck, the founder of the London Mechanics' Institute. For a while he had a school with his brother Lewis, at Salisbury. Becoming known for original investigation, he was called to London, where he was appointed lecturer on experimental science at King's College School. In 1872 he was elected to the Royal Society, and in 1874 he took a leading part in founding the Physical Society. As a scientist Tomlinson made valuable contributions to the knowledge of the surface tension of liquids. His last years were devoted to literature, and in 1878-80 he held the Dante lectureship at University College, London. Besides several works on mechanics and the useful arts, he published: *The Sonnet, Its Origin, Structure, and Place in Poetry* (1874); a translation of Dante's *Inferno* (1877); *The Literary History of the Divine Comedy* (1879); *Dante, Beatrice, and the Divine Comedy* (1894); and a volume of original *Sonnets* (1881).

TOMLINSON, EVERETT TITSWORTH (1859-). An American author, born at Shiloh, N. J. He was educated at Williams College, and served as principal of the high school at Auburn, N. Y., in 1881-83, and as head master of the preparatory department of Rutgers College in 1883-88. After 1894 he wrote many popular stories for boys, usually with historical setting.

TOMMASEO, tōm'mă-ză'ō, NICCOLÒ (1802-74). An Italian poet, critic, philosopher, and lexicographer, born at Sebenico, in Dalmatia. He went to Padua to study law, but turned to literature. In Florence he collaborated on Viesseux's *Antologia*, which the government suppressed in 1832. Tommaseo, having to leave Florence, went to Paris, where he endeavored to make the French better acquainted with his countrymen, through various writings, e.g., *Dell'Italia* (1835). In 1838 he took up his abode in Corsica, and there made a collection of popular songs, *Canti popolari corsi, toscani, greci e illirici* (1841). He returned to Venice, where he was permitted to stay from 1839 to 1848. In January, 1848, he was arrested because of his liberal opinions, but the Manin (q.v.) insurrection freed him. After the fall of Venice in 1849 he went to Corfu, going thence in 1854 to Turin, where he began the publishing of his great *Dizionario della lingua italiana*. He passed his last days in Florence, refusing the honors and positions offered him as a venerable patriot of arisen Italy.

As a philologist he possessed vast and accurate erudition. His aim in all his writings, religious, moral, and pedagogical treatises, political essays, philological, literary, and critical works, poems, and ballads is constantly educational. These reveal vigor and acuteness. As a critic of literature he is hampered by classic prejudices and an inborn polemical spirit. Among his other most valuable contributions are: *Il dizionario estetico* (1840), *Bellezza e civiltà* (1857), *Ispirazione e arte* (1858), and *Storia civile nella letteratura* (1872), besides a noteworthy *Commento alla commedia*. Consult P. Prunas, *La critica, l'arte, e l'idea sociale di Niccolò Tommaseo* (Florence, 1901), and B. Croce, "N. Tommaseo," in *La Critica*, vol. x (Naples, 1912).

TOMMASI, tòm-mă'zè, DONATO (1848-1907). An Italian chemist and electrician, born in Naples and educated at Paris and at the University of Brussels. He took as his specialty electrochemistry, a branch of science in which he made valuable investigations. His discoveries include various methods for separating and extracting metals by electricity (1892) and an accumulator which has been much used on railways. His publications include: *Traité théorique et pratique d'électrochimie* (1889); *Traité des piles électriques et des accumulateurs* (1890); and *Manuel pratique de galvanoplastie* (1890).

TOMMY ATKINS. The popular name for a private soldier in the British army. It had its origin in the government usage of the fictitious name of Thomas Atkins to designate the place of the soldier's signature in such documents and army forms as were to be signed by him.

TOMOCHICHI, tō'mō-chē'chē (one who makes a bird fly upward) (c.1642-1739). A noted chief of the Yamacraw, a detached band of the Creek confederacy, in the early period of Georgia colonization. He was a native of the lower Creek town of Apalachukla near the site of present Columbus, Ga. He had incurred the displeasure of the confederacy and withdrew with his immediate followers and established himself on the Savannah River at Yamacraw Bluff, now a part of Savannah. Here he concluded a treaty of friendship with Governor Oglethorpe, and through his influence a treaty was made in 1733, at Savannah, with the lower Creeks, by which the latter ceded all their claims from the Savannah to the Altamaha. In 1734, with a retinue, he accompanied Oglethorpe to England. A monument to him was erected in Savannah.

TOMPA, MĪHÁLY (1817-69). A Hungarian poet, born at Rimaszombat and educated at Saros-Patak. He served in the Honved army in the revolution of 1848, and in 1852 he became a minister at Hanva, where he remained until his death. In 1847 he was elected to the Kisfaludy Society and in 1858 to the Hungarian Academy. His first work was *Népregék, Népmondák* (Pest, 1846), a collection of popular tales. His *Szűhay Mátýás* (1847), a comic story in verse, was crowned by the Hungarian Academy. His complete works were published in 1884 (5 vols.). Consult Ferenczy, *Mihály Tompa* (Kaschau, 1878), and Kont, *Geschichte der ungarischen Litteratur* (Leipzig, 1906).

TOMP'KINS, DANIEL D. (1774-1825). An American political leader and Vice President of the United States. He was born in Fox

Meadows (Scarsdale), Westchester Co., N. Y., graduated at Columbia in 1795, and in 1797 was admitted to the bar. In 1804 he was elected to Congress, but before taking his seat was appointed by Gov. Morgan Lewis to the vacancy on the State Supreme bench caused by the promotion of Judge Kent to the chief justiceship. In 1807 he became the candidate of the Clintonian Republicans for Governor to succeed Morgan Lewis, who had been renominated by the Livingston party with strong Federalist support. He was elected over Lewis by 4085 majority and was reelected four times, serving 10 years. During his third term an attempt to secure a charter from New York State for the Bank of America was accompanied by a wholesale bribing of the State Legislature. After the lower house had sanctioned the charter, on March 27, 1812, Governor Tompkins prorogued both houses—a power then granted by the constitution, but never before exercised. The charter was granted at the next session of the Legislature, but Tompkins' action had increased his popularity. During the War of 1812 Governor Tompkins recruited and equipped 40,000 militia in New York State, providing funds for this raised partly on his personal security. On a recommendation made in his last message to the Legislature in January, 1817, the New York Legislature passed a law setting all slaves free on and after July 4, 1827. From 1817 to 1825 he was Vice President of the United States. Consult De A. S. Alexander, *Political History of the State of New York* (3 vols., New York, 1906-09).

TOMP'SON, BENJAMIN (1642-1714). An American poet, born at Braintree, Mass. He was educated at Harvard College and became a school teacher in Cambridge. He is known by his poem on King Philip's War, *New England's Crisis* (1675).

TOM'S. A former London coffeehouse in Covent Garden, a fashionable resort, and the headquarters of a club founded in 1764, which among its 700 members included many noted names of the day. Tom's was taken down in 1865.

TOMSK, tòmsk. A government of West Siberia (Map: Asia, K 3). Area, about 331,159 square miles. The southern and southeastern parts belong to the region of the Altai Mountains and contain many snow-clad peaks, some of them 11,000 feet high. The Kuznetsky Alatau, along the eastern frontier, is densely wooded and rises to about 6000 feet. The remainder of the region is mostly low and consists of vast densely wooded marshes and open steppes. The region is watered mainly by the Obi (q.v.) and its tributaries, including the Irtysh (q.v.). The climate is severe and unhealthy in the lowlands. The mineral deposits of the Altai Mountains are being gradually opened up and give promise of great abundance. Agriculture is the principal occupation, and the output of cereals is far above the local demand. Stock raising is also an extensive industry. Manufactures are undeveloped, but the trade with Mongolia is on the increase and there is considerable navigation on the Obi. The trade with European Russia also shows an increase since the construction of the Trans-Siberian Railway. Pop., 1914 (est.), 3,919,800, of whom the natives (Tatars, Samoyeds, Ostiaks, etc.) numbered only about 75,000, the remainder being Russians.

TOMSK. The capital of the Siberian government of Tomsk and the intellectual centre of Siberia, situated on the Tom, a tributary of the Obi, and connected by a short line of 54 miles with the Trans-Siberian Railway (Map: Asia, K 3). It is one of the finest cities of Siberia, with electric lighting and street railways, but without an adequate water supply and unsatisfactory in its sanitary arrangements. Its importance dates from the year 1824, when gold was discovered in its vicinity. The university, established in 1888, has two faculties of medicine and law, 987 students, and a library of 226,000 volumes. The commerce is very extensive, Tomsk being one of the chief distributing centres of Siberia. Pop., 1911, 112,083.

TOMS RIVER. The county seat of Ocean Co., N. J., 35 miles southeast of Trenton, at the head of Toms River and Bay, and on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, D 4). It is a summer resort. Farming, especially cultivation of cranberries, fishing and oyster planting, lumbering and yacht building, are leading industries. Pop., 1915, about 2000. Early in the Revolutionary War a small blockhouse was erected to protect the salt works here. On March 24, 1782, this blockhouse, occupied by Capt. Joshua Huddy and 25 men, was attacked by a larger force of Loyalists under Capt. Evan Thomas and Lieut. Owen Roberts and was captured. Immediately afterward the village itself was almost totally destroyed. Consult a pamphlet by Striker, *The Capture of the Old Blockhouse at Toms River, New Jersey* (Trenton, 1883).

TOM THUMB. See STRATTON, CHARLES SHERWOOD.

TOM-TOM. See TAM-TAM.

TON. See WEIGHTS AND MEASURES.

TON. See MEASUREMENT OF SHIPS FOR TONNAGE.

TONALITY (from *tonal*, from *tone*, OF. *ton*, from Lat. *tonus*, from Gk. *róvos*, tone, sound). In music, the grouping of certain chords around a central tonic chord. The principle rests upon the relationship which various chords bear to one another. Briefly stated, a tone is related in the first degree to all tones forming consonant intervals with it; in the second degree to all tones forming dissonant intervals with it. Thus we can establish the relationship of D to C by means of the chord of the dominant seventh d-f#-a-c, which is the dominant of G major, which, in turn, is the dominant of C major.

The relationship of single tones becomes intelligible only through the agency of chords. It is sufficient to recognize only two degrees. Since, when considering the relationship of chords, each chord is considered a tonic chord, it will perhaps be best to speak of triads. A sharp distinction must be made between similar and dissimilar triads. If a major triad is followed by another major, or a minor triad by another minor, the two major triads are similar, as are also the two minor triads. But if a major triad is followed by a minor, or vice versa, the two triads are dissimilar. It must also be borne in mind that when speaking of major triads all intervals are reckoned upward; when speaking of minor triads all intervals are reckoned downward. A triad is related in the first degree to all similar triads whose fundamental tone is related in the first degree to the fundamental tone of the original triad. Thus,

the triad of C major is related in the first degree to the similar major triads of G, F, E, Ab, Eb, A. It is also related in the first degree to the dissimilar minor triads whose fundamental lies a fifth below any of the tones of this C major triad. These are F, A, C, a fifth below C, E, G, respectively. To these must also be added the triad built upon the mediant, which in a major key is always a minor triad, and vice versa. Hence every triad is related to 10 other triads in the first degree. In the case of a minor triad similar relations exist.

All triads other than the 10 just mentioned are related to the original triad in the second degree. Here the degree of affinity may be more or less remote. Consult: H. Riemann, *Musikalische Syntaxis* (Leipzig, 1877); id., *Skizze einer neuen Methode der Harmonielehre* (ib., 1880); id., *Systematische Modulationslehre* (ib., 1887). See COMMA; CONSONANCE; DISSONANCE; HARMONY, Chords; KEY.

TONAWANDA. A city in Erie Co., N. Y., 9 miles by rail north of Buffalo, on the Niagara River and the Erie Canal and on the New York Central and the International railroads (Map: New York, B 4). It is connected with North Tonawanda by two bridges. The prominent features of the city include the armory, the high school, the public library, and a park. Tonawanda is an important lumber market and is also interested in manufacturing; the chief products being steel, lumber, roofing, and paper boards. Pop., 1900, 7421; 1910, 8290; 1915 (State census), 9147; 1920, 10,068.

TONBRIDGE, pronounced Tunbridge. A market town in Kent, England, on the Medway, 29 miles southeast of London (Map: England, G 5). The manufacture of toys, boxes, and articles of wood in Tonbridge ware, a mosaic veneer of beech, holly, etc., is a specialty. A notable feature is the remains of a mediæval castle which stands on the Medway, near the entrance of the town. Among other structures are the parish church and the grammar school, founded in 1553. Pop., 1901, 12,736; 1911, 17,247.

TONE. In music, the name given to the larger intervals in the diatonic scale, so called in contradistinction to the semitones (q.v.), or smaller intervals. Theoretically some of the intervals called tones are larger than others, and none of them are equal to two semitones; thus, in the scale of C, the intervals CD, FG, and AB are all equal; but DE and GA, which are also called tones, are smaller; and the semitones, EF and BC, are larger than half even of the larger tones. In instruments, however, which are tuned according to the equal temperament (q.v.), all the tones are made equal, and each equivalent to two semitones.

TONE, THEOBALD WOLFE (1763-98). An Irish revolutionist. He was born in Dublin, where he was educated, graduating at Trinity College. He was called to the Irish bar in 1789. He was one of the founders of the first club of United Irishmen at Belfast and similar organizations in other parts of Ireland and agent of the Roman Catholic committee (1792); was implicated in Jackson's treasonable designs with the French government in 1794, but was allowed to go to Philadelphia, U. S. A., in 1795. In the following year, however, he went to France for assistance and returned suddenly to Ireland, recalled by rumors of a revolt. In the expedition to Bantry Bay he was adjutant general to

the commander Hoche, but the fleet was driven off the coast and scattered. In 1798 he again set sail for Ireland with a small French expedition and was captured by an English fleet off Lough Swilly. Having been sentenced to be hanged, he cut his throat, dying a few days later. Consult *The Life of Theobald Wolfe Tone, etc., with his Political Writings*, edited by his son, W. T. W. Tone (2 vols., Washington, 1826), and Harry Graham, *Splendid Failures* (London, 1913).

TONE COLOR. In music, the quality of the tone of musical instruments or of the human voice. See CLANG TINT, EXPLANATION OF.

TONER, JOSEPH MEREDITH (1825-96). An American physician, born in Pittsburgh, Pa. He graduated at Jefferson Medical College in 1853 and two years afterward settled in Washington, D. C., where he founded the Providence Hospital and became identified with several other similar institutions. In 1871 he gave the fund which established the well-known Toner lectures. He was president of the American Medical Association and of the American Health Association in 1874 and was vice president of the International Medical Congress of 1887. Toner was one of the very few American physicians who took an interest in the history of medicine, and his *A Century of American Medicine* (1876) still remains a standard work. His publications include, besides: *Compulsory Vaccination* (1865); *Annals of Medical Progress and Medical Education in the United States* (1874); *Medical Men of the Revolution* (1876).

TON'GA ISLANDS, or FRIENDLY ISLANDS. A group of Polynesian islands in the Pacific Ocean, about 350 miles southeast of Samoa, extending from lat. 15° to 23½° S. and from long. 173° to 177° W., the Fiji Islands being to the northwest (Map: Australasia, L 4). The Tonga Islands form a native kingdom, but are under the protection of Great Britain. They number about 100, but only Tongatabu, Eua, and Vavau are of any importance, the first being low, the others of moderate height. Area, about 390 square miles. The islands lie generally in a long north and south chain and form the subgroups of Tonga, Nomuka, Haapai, and Vavau, but the outlying islands Niua-tobatabu or Keppel Island, Tafahi or Boscawen, and Niuafoou are included in the Kingdom of Tonga. The residence of the native King and seat of government is at Nukualofa in Tongatabu (Holy Tonga). The eastern islands are of coral limestone formation, low and comparatively level. In the Tonga subgroup is the largest and most fertile island of all, Tongatabu. It is in the south and contains about 140 square miles. It has about half the population of all the Tonga Islands. The western row of islands are volcanic, high, and steep. Of these Late and Tofoa are active, and Kao (about 2850 feet high) is extinct. The climate of the Tonga Islands is oppressive and humid. The annual rainfall is heavy, over 75 inches. Serious earthquakes are not infrequent, and small islands rise suddenly at times and as suddenly disappear. A hurricane wrought havoc in Vavau in 1900. The flora is rich, especially in palms. The native fauna is comparatively insignificant; there needs to be mentioned only the large fruit-eating bat (*Pteropus tonganus*).

The main islands are covered with luxuriant vegetation. The soil is rich. The land is leased, not sold; and as its tenure is not assured, im-

provements are both meagre and poor. Copra and fungus are exported, and tapa and mats are made. The imports, mostly from Australia and New Zealand, amounted to £81,044 in 1913-14 and include draperies and foods; the exports amounted to £82,321, consisting mainly of copra and green fruit. There is regular steam communication with the neighboring British possessions. There are many good harbors. The revenue in 1913 amounted to £32,489 and the expenditures to £39,103. There is no debt. The population was given in 1911 as 23,900, nearly all natives, and among the most civilized of the Polynesians. They are agriculturists and adept seafarers. While eager to learn and imitate, they lack qualities necessary to success.

The Tonga Islands were discovered in 1643 by Tasman. He gave to Tongatabu the name of Amsterdam and called Eua and Nomuka respectively Middleburgh and Rotterdam. In 1781 the Spanish navigator Maurelle discovered Vavau and several of the neighboring islands. In 1789 Lieutenant Bligh, of the *Bounty*, visited Nomuka. In 1791 Captain Edwards, in the *Pandora*, made two visits to the group. In 1796 a mission was established at Tongatabu. This was the first missionary enterprise on the island, but was abandoned a few months later owing to the violence of the islanders. In 1822 the first Wesleyan missionary landed on the island. The mission was, however, not fully established until 1826. All the natives are now Christians—many Methodists, some Roman Catholics. In 1773 and in 1777 they were visited by Cook, who explored them, and gave them the name of Friendly Islands on account of the attitude of the natives. Before the breaking out of the civil wars early in the nineteenth century the islands were under the rule of two reigning families. During this political upheaval the local hereditary chiefs declared their independence, but were united under the wise rule of George I, who in 1875 introduced a sort of constitutional government, allowing the chiefs a share in the administration. Treaties were concluded with Great Britain, Germany, and also, in 1888, with the United States. The privilege of building a naval station was abandoned by Germany in 1899 in favor of Great Britain, which country declared its protectorate over the group in that year. The present ruler, King George II, is assisted by a Legislative Assembly, meeting every three years, composed partly of hereditary nobles and partly of members elected on a property qualification. There are a cabinet, a Privy Council, and judiciary.

TON'GALAND, or AMATONGALAND. A district of Zululand and accordingly of Natal

in southeast Africa (Map: Cape of Good Hope, L 6). It forms the northern neck of Zululand. Area, 1280 square miles. The Lebombo Mountains border it on the west. The country is generally level and low. The climate is very unhealthy. The inhabitants are Zulu-Kafirs, the Amatonga. The possession of Tongaland was strongly desired by the Boers, since it would have furnished them an outlet to the sea and a haven. Great Britain was eager to frustrate their plans, however, and declared Tongaland under British protection, June, 11, 1895. It was annexed to Zululand (q.v.), Dec. 27, 1897. This action embraced also the small possessions of the Sambana and Umtegiya chiefs, which formed the narrow portion of Tongaland west of the Pongola River. Zululand, including Tongaland, was annexed to Natal, December, 1897.

TONGAS. See TLINKIT.

TONG-HAK, *tong-häk'* (Sinico-Korean, Oriental culture). The watchword of a revolutionary party in Korea (Chosen), founded in 1859 by a native Korean scholar named Choi. They were prominent in a rebellion preceding the Sino-Japanese War of 1894-95. See KOREA.

TONGKAH. See SALANG.

TONGKING', **TONKIN'**, or **TONQUIN**, *tōn'kän*, *Fr. pron. tōn'kän*. A French protectorate in French Indo-China (q.v.), situated just south of the tropic of Cancer, bordering the Gulf of Tongking (Map: French Indo-China, D, E 2). Area, estimated at 46,000 square miles. Tongking has a heavily forested plateau in the north. The eastern part is tilled and contains slate and limestone. The protectorate is traversed in a southeasterly direction by the navigable Red River (q.v.), or Song-ka, its delta district covering some 5000 square miles. This district, traversed by many streams, is especially fertile and well tilled. The climate for the greater part of the year is hot and humid. Storms are frequent in summer. The flora in the southwest resembles that of India; that of the northeast is akin to that of southern China. Nuts and tropical fruits abound.

Copper, iron, and coal are mined. The soil is very fertile, and the cattle industry is prominent. Opium, cacao, sugar, tea, cotton, corn, coffee, and tobacco are cultivated. Rice, the staple crop, equals the best in the world. Furniture, glass, silk, cottons, indigo, paper, oil, and sugar are manufactured. The commerce has rapidly increased. The imports consist largely of machinery, metals, and textiles. The main exports are rice and animal products. The leading commercial points are Haiphong (the chief port, possessing a fine harbor), Kwang-yen, and Nam-Dinh. A railway extends from Haiphong to Hanoi. From Hanoi a line runs to Lungchow, another to Yünnanfu, and a third southward along the coast to a point a little beyond Vinh. The Yünnan line carries a large transit trade. There are ocean cables to Hué and Hongkong. The largest city is Hanoi, the seat of the resident superior of Tongking, as well as of the Governor-General of French Indo-China. There are 21 provinces and four military territories. The local budget for 1914 balanced at 8,994,000 piasters (piaster = 0.469).

Estimates of population vary widely; an officially published estimate relating to 1911 is 6,118,000. Europeans, exclusive of the military, number upward of 6000. The race is Annamese. Besides these, who dwell largely in the delta region and who are taller and darker than their

kindred in Cochin-China and Annam, the interior contains a number of more or less primitive peoples, such as the Thos (q.v.) of the Claire River basin, the Muongs (q.v.) of the Black River valley, and others who belong to the Thai (q.v.). The Chinese number upward of 35,000. Several hundred thousand of the inhabitants profess Roman Catholicism. Tongking was an independent state before it came under the control of Annam in 1802. In 1873 the first military expedition of the French was sent into the territory, but by agreement the next year they retired. In 1882 the French government, having conceived the design of securing the delta of the Red River for French commerce, sent an expedition against the predatory Black Flags, a Chinese soldiery, representing a remnant of the Taiping rebels. The French sailed up the Red River and occupied the citadel of Hanoi. Annam lent her support to the Black Flags, whereupon in August, 1883, the French fleet under Courbet bombarded Hué and compelled Annam to accept a French protectorate and to allow France to prosecute her designs with regard to Tongking. The French pushed their operations with success, but soon had to face a war with China, to whose suzerainty Annam was still nominally subject. This conflict, which lasted a year (1884-85), left France in virtual possession of Tongking. In 1887 Tongking was made a part of French Indo-China.

TONGKING, GULF OF. An arm of the South China Sea extending northward between French Indo-China on the west and the Chinese island of Hainan together with the Lei-chau peninsula on the east (Map: French Indo-China, E 2, 3). It is 150 miles wide and 300 miles long and receives the Red River. Its depth is everywhere less than 300 feet.

TONGUE (AS. *tunge*, Goth. *tuggō*, OHG. *zunga*, Ger. *Zunge*, tongue; connected with OLat. *dīngua*, Lat. *lingua*, tongue). A symmetrical muscular organ, extending from the hyoid bone forward and downward to the lips in front and occupying the buccal cavity. The superior surface, borders, and anterior third of the inferior surface are free, while the remaining parts are attached to adjacent parts by the investing mucous membrane and subjacent structures. At certain points this membrane, on leaving the tongue, forms distinct folds, containing fibrous or muscular tissue, which act to a certain extent as ligaments of the tongue. The most considerable of these folds is termed the frænum (or bridle) of the tongue and connects its anterior free extremity with the lower jaw. It acts as a strong ligament and limits the backward movement of the tip of the tongue. In rare cases this ligament extends abnormally to the tip, so as to interfere with speech and mastication, and the child is said to be tongue-tied; recourse must be then had to division of the frænum, popularly known as cutting the tongue.

Other folds of mucous membrane (the glosso-epiglottid folds) pass from the base of the tongue to the epiglottis, while from the sides of the base, passing to the soft palate, are seen two

folds on either side, known as the pillars of the fauces. (See PALATE.) The superior surface of the tongue is divided into two symmetrical lateral parts by a median longitudinal furrow beginning at the tip and extending back about two-thirds of the tongue's length. The various kinds of papillæ which are seen on their surface are described under TASTE. At the back of the surface, just behind the circumvallate papillæ (papillæ vallatæ), are large mucous glands, extending into long and capacious canals and helping to secrete the fluid that moistens the tongue. On the inferior surface, the longitudinal furrow, which extends from the tip to the frænum, is deeper than on the upper surface; on each side of it veins are seen running forward; and immediately beneath the tip is a cluster of mucous glands, known as the glands of Nuck (Dutch anatomist, 1650-92). The posterior extremity, or base, is flattened and extended laterally before it is inserted into the hyoid bone.

The muscles of the tongue are usually divided into two groups, viz., the extrinsic muscles, which attach the tongue to certain fixed points external to it and move it on them, and the intrinsic muscles, which pass from one part of the tongue to another, constitute its chief bulk, and move it

on itself. These intrinsic muscular fibres run vertically, transversely, and longitudinally and are so interlaced as mutually to support one another and to act with the greatest advantage. By the action of the various muscles the upper surface of the tongue may be made concave or convex or may be pressed against the roof of the mouth; the tip may be protruded straight

out or laterally, upward and downward, and to any recess (as e.g., a hollow tooth) within the mouth where food might lodge; and the whole organ may be drawn back. The nerve supply to the tongue is motor and sensory. The motor nerve is the hypoglossal. The sensory nerves are the lingual (or gustatory) branch of the fifth, which confers sensibility on the mucous membrane of the anterior two-thirds of the tongue; the lingual branch of the glossopharyngeal, which confers ordinary sensibility and the sense of taste on the posterior third of the tongue; the chorda tympani, which is the special nerve of taste for the anterior two-thirds of the tongue.

The functions of the tongue are gustation, prehension (in man and monkeys this function is supplied by the hand), mastication, insalivation, deglutition, and speech; and in the case of the Gasteropoda, trituration of the food.

The tongue is subject to several diseases, among which may be mentioned glossitis, or inflammation of the tongue, tuberculosis, and syphilis; new growths, usually malignant in nature; certain affections which the mucous membrane of the tongue shares with the skin, such

as herpes, lichen, and leucopacia. It is also subject to excoriations, ulcers, and fissures. Macroglossia is a term applied to certain chronically enlarged conditions of the tongue. It is a condition often found in cretins and is probably due in this case to lymphangioma. Hypertrophy and also cancer may attack the tongue.

Tongue in Diagnosis. The tongue furnishes a valuable index in the diagnosis of disease and presents certain characteristic appearances in many morbid conditions. An inspection of this

organ is an important part of any clinical examination, and its condition should be noted with reference to color, size, muscular tone, mobility, dryness, and special sensation. The tongue is pallid in anemia and bluish in cyanosis. It is large and tender in glossitis, bright red and studded with brilliant points in scarlet fever (the strawberry tongue). It is apt to be flabby, indented by the teeth, and coated in diseases of the gastrointestinal tract. It is ulcerated in aphthous fever, thrush, stomatitis, the secondary stages of syphilis, mercurial poisoning, etc. It is coated with brown fur (sordes) and tremulous in profound septic conditions, such as typhoid fever and pyæmia. The elongated and pointed tongue is supposed to indicate irritation of the stomach and bowels, whereas the broad flabby tongue indicates atony and sluggish action on the part of the same organs. In acute diseases with dryness of the tongue, improvement sets in when the tongue becomes moist, and this is nearly always considered a favorable symptom. Spasm, tremor, and one-sided paralysis of the tongue are seen in various nervous diseases. Tremor is a frequent symptom of acute and chronic alcoholic poisoning. See ALIMENTARY SYSTEM.

TONIC (from Gk. *τονικός*, *tonikos*, relating to tone, from *τόνος*, *tonos*, tone, sound, tension, strength, cord). An agent or medicine that promotes nutrition and, in common parlance, gives tone to the system. It is a rather vague term, since any medicine which corrects a pathological condition in the body will make the patient feel better and stronger, e.g., a cholagogue, by stimulating the flow of bile and clearing out the intestines, may act as a tonic. Tonics are to a certain degree stimulant, but their effect is supposed to be more permanent without producing obvious stimulation. Most tonics act primarily through the nervous system; their effect upon the muscular system becomes secondary. They are of especial value during convalescence from wasting fevers. Typical medicines of this class are iron, quinine, strychnine, and the vegetable bitters. Those acting especially on the heart are digitalis, squill, and convallarin; those given for anemia are iron, manganese, arsenic, and cod liver oil; those acting especially on the stomach are cinchona, nux vomica, and other simple bitters. Strychnine is of peculiar value as a tonic, acting both on the spinal cord and general circulation. For the general nervous system, in addition to these drugs, phosphorus, small doses of quinine, and the valerianates are supposed to be peculiarly efficacious. Most of these drugs are described at length under their own titles. More important than drugs, however, as tonic agents, are baths, massage, and exercise in the open air. Sea bathing, shower baths, sponge baths, spinal douches, and various medicated baths are most powerful tonics in suitable cases. See BATH; EXERCISE; HYDROTHERAPY.

TONIC, or **KEYNOTE**. In music, the note which forms the basis of any scale or key and on which a piece of music written in that key naturally closes. The tendency of modern harmony is to conceive the tonic not as a single tone, but as a triad built upon that tone. See KEY; TONALITY.

TONICA, *tô-ně'ká*, or **TUNICA**. A peculiar tribe, constituting a distinct linguistic stock, who lived, when first known to the French (about 1700), on the lower Yazoo River in Mississippi,

near its junction with the Mississippi, where a mission was established. Probably at an earlier period they had lived at the Tunica Old Fields in the county bearing their name in the northwestern corner of the same State. They made an alliance with the French, but were hostile to most of their Indian neighbors, particularly the Chickasaw, and in 1706 nearly exterminated the Huma in a massacre near New Orleans. Subsequently they removed to the east bank of the Mississippi, about opposite Pointe Coupée, below Red River, where they still lived in 1802, numbering then 120. In 1817 they were settled about 90 miles up Red River, where about 25 persons were found near Marksville, La., in 1886 by Gatschet, who obtained the first vocabulary of their language. In 1910 they numbered 43. Consult J. R. Swanton, *Indian Tribes of the Lower Mississippi Valley and Adjacent Coast of the Gulf of Mexico* (Washington, 1911).

TONIC SOL-FA. Various attempts have been made at different times to introduce a musical notation which dispenses with the staff and its lines and spaces. Jean Jacques Rousseau suggested, but afterward discarded, a notation where the notes of the scale were indicated by the Arabic numerals. A system similar to Rousseau's in its leading features, called the tonic sol-fa, has, through the influence of its principal promoter, the Rev. John Curwen (who obtained his main principles from the writings and practice of Miss Glover of Norwich), been brought into use to a considerable extent in singing schools in England. It proceeds on the principle of giving the chief prominence to the fact that there is in reality but one scale in music, which is raised or lowered according to the pitch of the key. This method is a revival of the old solmization system invented by Guido d'Arezzo, but it admits the interval of the seventh, excluded by Guido. For the complicated music of modern masters the tonic sol-fa is as inadequate as Guido's solmization had been found. It also favors the system of unequal temperament, directly opposed to the fundamental principle of equal temperament, without which the achievements of modern music would have been impossible. It is of value as an educational system, since it can be taught quickly and produces better immediate results than the usual notation.

TONITE. See EXPLOSIVES.

TONK. A native Rajputana state in central India. Area, 2553 square miles. Pop., 1911, 303,181. Capital, Tonk.

TONK. The capital of the native Rajputana State of Tonk, central India, near the river Banas, 55 miles south of Jaipur (Map: India, C 3). It is defended by a mud fort and a wall. Pop., 1901, 38,641; 1911, 53,764.

TONKA, *tôn'ká*. The Chinese name of Puket (q.v.).

TONKA BEAN; also called **TONGA** and **TONKIN BEAN**. The seed of a tall leguminous tree, *Dipteryx odorata*, found in Venezuela, Guiana, and neighboring regions. The seeds are about the size of almonds, though somewhat longer, and are covered with a shining black skin. They are very fragrant from the presence of cumarin and are used in perfumery, ground as sachet powder, and extracted with alcohol as a flavor in cookery, in tobacco manufacture, soap making, etc. The fluid extract has been used as an adulterant or cheap substitute for vanilla; but the former contains cumarin, while true

vanilla contains vanillin. The native name of the tree is cumara.

TONKAWA, *tông-kă'wá* (from Hueco Indian *tonkaweya*, many staying together). A peculiar tribe, apparently constituting a distinct linguistic stock, originally occupying the country about the lower Colorado and Guadalupe rivers in southeastern Texas. They were noted for cannibalism. The Tonkawa roved about, built circular thatched houses, lived by hunting and wild fruits, and were at war with almost all their neighbors, by whom they were despised as man-eaters. According to their tradition they came from the south. In 1760 some of them were attached to the San Antonio missions. In 1849 they were reported to number 600 or 700, who had been driven to the upper Brazos on account of depredations among the American settlements near the coast. In the fall of 1855, with other small Texas tribes, a part of them, to the number of 170, were gathered upon a reservation on the Brazos, a few miles below Fort Belknap, but they were removed in 1895 to a new reservation on the Washita, near the present Anadarko, Okla. Here they remained until the outbreak of the Civil War, when, thinking that they were about to enter the Confederate service, other tribes took the opportunity to wipe out old scores. A force of about 200 Shawnee, Delaware, Caddo, and other Indians attacked the agency and the neighboring Tonkawa village near Anadarko in October, 1862, and killed one or two of the agency employees and 137 out of about 320 Tonkawa men, women, and children. The Tonkawa made a stout resistance and inflicted severe loss upon the enemy. The survivors led a vagrant existence in northern Texas, most of the men enlisting as scouts against the Comanche, Kiowa, and other wild tribes. In 1875 they were reported to number but 119 and were in poor condition. In 1882 they were put in charge of a special agent, who reported them as numbering then only 98. Two years afterward they were removed to a reservation in northern Oklahoma. In 1910 they were reduced to 42 and derived their principal income from the leasing of their surplus lands.

TONKS, OLIVER SAMUEL (1874-). An American professor of art, born at Malden, Mass. He was educated at Harvard (A.B., 1898; A.M., 1899; Ph.D., 1903) and was a fellow of the American Classical School at Athens in 1901-02. In 1902-03 he served as assistant curator of the department of classical art at the Museum of Fine Arts in Boston. He was instructor in Greek at the University of Vermont in 1903-04, lecturer at Columbia in 1904-05, and preceptor in art and archaeology at Princeton in 1905-11. In the latter year he became professor of art at Vassar. Besides contributing to the *NEW INTERNATIONAL ENCYCLOPEDIA*, he collaborated in writing *The Art Museum and the Public School* (1912).

TONKÜNSTLER-SOCIETÄT. One of the oldest musical societies of Vienna. Founded in 1771, reorganized in 1797, in 1865 it was once more reorganized and, in recognition of the generous gifts of the composer, renamed Haydn-Societät.

TONLE SAP, *tôn'lä sâp'*, or **TALE SAP**. A lake of central Cambodia, connected with the Mekong by an arm of that river known also as the Me-Sap (Map: French Indo-China, D 4). The lake acts as a great reservoir. During the summer monsoon the waters of the Mekong back

up through the Me-Sap, bringing the length of the lake to about 120 miles; during the dry season the lake is drained by the same arm to about 80 miles in length. During high water navigation is maintained from Saigon to Battambang in western Cambodia. Approaching shores divide the lake into sections, the Caman Dai in the northwest and the Caman Tieu in the southeast.

TON MILE. See RAILWAYS.

TON'NA, CHARLOTTE ELIZABETH (BROWNE) (1790-1846). An English author, born at Norwich. She was twice married, first to a Captain Phelan and after his death to Lewis H. J. Tonna, an English writer. She began her literary career in Ireland, writing under the pseudonym of Charlotte Elizabeth. Her works were largely of a religious nature and evinced considerable hostility towards the Catholic church. She was connected with various magazines and wrote numerous religious tracts, novels, poems, and short stories for children. Consult *Works of Charlotte Elizabeth*, with an introduction by H. B. Stowe (3 vols., New York, 1844-45).

TONNAGE (formerly also *tunnage*, from *tun*, *ton*, from OF. *tonne*, pipe, *tun*, ML. *tunna*, OHG. *tunna*, Ger. *Tonne*, *tun*). The carrying capacity or weight of a ship expressed in tons. There are four ways of expressing it: gross tonnage, net tonnage, dead-weight tonnage (or dead-weight carrying capacity), and displacement (q.v.) tonnage. The gross tonnage of a ship is ascertained by dividing by 100 the whole interior capacity (expressed in cubic feet) of the hull of a ship and her inclosed deckhouses; this method presumes that an average cargo of light-weight freight will require not far from 100 cubic feet for each ton of actual weight. Net tonnage is derived from the gross tonnage by deducting the capacity of all spaces not used, or capable of being used, for cargo or passengers. The dead-weight tonnage is the actual weight of cargo a vessel can carry without immersing her too deeply for safety. Displacement tonnage is the weight of ship and cargo or contents when immersed to some fixed depth. For war vessels the displacement tonnage is usually given for an arbitrary condition called "at normal draft," which is assumed to be the average seagoing condition, with about two-thirds of all fuel and stores. Full-load displacement is the condition when all fuel and stores are on board. For merchant vessels the displacement is usually given for the full-load condition, i.e., when the ship is immersed to her Plimsoll mark. (See *LOAD-LINE MARKS OF VESSELS*.) In freighting ships 40 cubic feet of merchandise is considered a ton; but if that bulk exceeds 2240 pounds (or, in the United States, frequently 2000 pounds) the charge is made by weight. For merchant vessels of ordinary type the displacement is greatest, gross tonnage next, then net tonnage. Dead-weight carrying capacity is always greater than the net tonnage and is usually greater than the gross tonnage; but it is less than the full-load displacement by the weight of the ship and contents exclusive of the cargo.

Each of the great ship canals of the world has a tonnage measurement of its own upon which the laying of the tolls is based. The result so obtained is approximately the same as the net register tonnage determined by American and British rules, but there are some additions. By the rules of measurement that have been adopted for the Panama Canal all vessels except war-

ships are required to present a certificate showing gross and net tonnages as determined by the rules under which they were measured and registered. Warships are required to furnish a curve or table of displacement from which may be derived the displacement corresponding to any mean draft. The measurement of the underdeck space is the same as is provided by the British and Suez Canal rules for vessels having double bottoms with the inner bottom horizontal; but by the American rules the double-bottom spaces intended for carriage of oil fuel and feed water are added. The space for feed water is, however, deducted from the gross tonnage independently of the allowances for engine and fire rooms. See **DISPLACEMENT**; **MEASUREMENT OF SHIPS FOR TONNAGE**; **PANAMA CANAL**; **SHIP-BUILDING**.

TONNAGE AND POUNDAGE. Certain duties on wine and other merchandise, which began to be levied in England in the reign of Edward III. They were at first granted to the crown by the vote of Parliament for a limited number of years and renewed on their expiration. Originally fluctuating in amount, tonnage and poundage came to be fixed at 3s. on every tun of wine and 5 per cent on all goods imported. In the reign of Henry V they were first conferred on the King for life; and, the same course being followed with his successors, the sovereign began gradually to consider them as his proper right and inheritance, and the vote of Parliament as but a formality expressive of the popular recognition of his prerogative. It was usual to levy these duties during the period intervening between a sovereign's accession and his first Parliament, and this was done by Charles I as by his predecessors. The Commons, however, in Charles's first Parliament accorded these imposts not for life, but for a year only; and the House of Lords objecting to this departure from previous usages and rejecting the bill, an attempt was made to levy tonnage and poundage by the royal authority alone, a proceeding which aroused the opposition of the Commons. Charles was, in 1620, induced to pass an act renouncing the power of levying these or any other imposts without parliamentary sanction. On the restoration Charles II obtained a grant of tonnage and poundage for life, but by three several statutes of Anne and George I these imposts were made perpetual and mortgaged for the public debt. The duties were abolished in 1787.

TONOMETER (from Gk. *τόνος*, *tonos*, tone, sound, tension, strength, + *μέτρον*, *metron*, measure). An instrument for measuring tension, as of the eyeball or of the blood pressure as transmitted by the ventricles of the heart. Hamer's tonometer consists of a tube of metal, with a peg or small rod projecting and so arranged that a coiled watchspring matches its tension against the tension of the body to which the peg is pressed. Roy's tonometer consists of a tube containing oil in which a cylinder plays, carrying a registering index.

TONQUIN, *tôn-kên'*. A division of French Indo-China. See **TONGKING**.

TÖNSBERG, *tëns'bërg*. One of the oldest towns of Norway, in the Amt of Jarlsberg and Larvik, on a fjord of the same name, 45 miles south of Christiania (Map: Norway, D 7). The seal and whale fisheries employ a large proportion of its male population. Pop., 1900, 8620; 1910, 9719.

TON'SIL. One of a pair of small ovoid bodies situated between the pillars of the soft palate, one on each side of the throat, corresponding in position with the angles of the lower jaw. The tonsil has about 12 spaces within its substance, from which smaller follicular depressions extend into its structure, and is classed with the ductless glands. It is frequently inflamed after infection by entrance of germs into the crypts and follicles described. Severe suppurative disease about the tonsil causing swelling and displacement of it is termed quinsy (q.v.). See **PALATE**.

TONSIL, **NASOPHARYNGEAL**, or **LUSCHKA'S**. See **ADENOID**.

TON'SILLI'TIS. See **PHARYNGITIS**; **QUINSY**.

TON'SON, **JACOB** (c.1656-1736). A famous London publisher. He opened his shop at the Judge's Head in Chancery Lane, near Fleet Street, in 1677. Towards the close of the century he moved to Gray's Inn Gate, taking into company with him his nephew, Jacob Tonson, and in 1710 to the Shakespeare's Head in the Strand. For Dryden Tonson published several plays, the translation of Vergil (1697), and *The Fables* (1699). He was also helped by Dryden to start the famous *Miscellanies*, of which the first appeared in 1684. With this prestige he became the popular publisher among the next generation of authors. He bought out the rights in Milton's *Paradise Lost* and from his press issued Rowe's edition of Shakespeare (1709) and Pope's in 1725. About 1700 he joined in forming the famous Kit-Cat Club, of which he was made secretary. About 1703 he bought a house at Barn Elms on the Thames and built a room for the club.

TONSTALL, **CUTHBERT**. See **TUNSTALL**, **CUTHBERT**.

TON'SURE (Lat. *tonsura*, a shearing, from *tondere*, to shear). A religious observance of the Roman Catholic and Oriental churches, which consists in shaving or cutting the hair as a sign of the dedication of the person to the special service of God and commonly to the public ministry of religion. Probably it first arose in reference to the monastic rather than the clerical life. Jerome disapproved of the tonsure for clerics. Paulinus of Nola, in the end of the fourth or beginning of the fifth century, alludes to it as then in use among the Western monks, and it speedily passed from them to the clergy. The form of the tonsure was different in different churches. That of the Roman church, called the tonsure of Peter, consisted in shaving the crown as well as the back of the head, so that there remained a circular ring or crown of hair. In the Scottish (or Irish) tonsure the entire front of the head was shaved, leaving the front bare as far back as the line from ear to ear. This tonsure was called the tonsure of John and sometimes of Simon Magus. The Greeks and other Orientals shaved the entire head. Originally the tonsure was merely the symbol of admission to the clerical state (see **CLERK**), but about the seventh century it came to be used as a distinct and independent ceremonial. Consult E. L. Taunton, *The Law of the Church* (London, 1906).

TONTI, **HENRI DE**. See **TONTY**, **HENRI DE**.

TONTINE, *tôn'tën* (Fr., from It. *tontina*, from Tonti). A tontine exists whenever several persons are united in a group on such terms that on the death of any member of the group certain specified advantages previously

enjoyed by him are distributed among the surviving members. The principle has been employed in many kinds of transactions, of which the most important are government loans and life insurance. The application of the tontine principle to government loans began in the later Middle Ages. The idea was introduced into France about the middle of the seventeenth century by an Italian named Lorenzo Tonti, but it had already long been known in Italy and Germany. It was one of numerous devices adopted by various states to induce the public to subscribe to government loans. The first French loan on this principle was made in 1689 and the last one in 1759. Existing tontines were wound up in 1770 and life annuities substituted for their privileges. The English government made less use of tontines than the French. The earliest one was organized in 1692 and the third and last in 1789. There were a few Irish tontines in the eighteenth century. In England none of the loans was fully subscribed, though offered on favorable terms.

A subscriber to a tontine loan was the buyer of a life annuity, which increased in amount with the death of any member of the class to which the subscriber belonged. On the death of the last survivor the obligation of the government terminated. In most cases the subscribers were divided into classes according to age, the right of survivorship prevailing only among the members of the same age class. Sometimes the amount of the annuity at the beginning varied for the different classes. Thus, in the first English loan the annuity increased from class to class, being slightly over 4 per cent for those under 20 years of age and more than 5½ per cent for those over 60. Occasionally there were other limitations: the first English loan, which did not classify subscribers according to age, provided that when the number of survivors was reduced to seven the right of survivorship should cease. On the third loan it was stipulated that no single annuity should exceed £1000. Usually the subscriber to a loan had the privilege of naming any other person as the recipient of the life annuity, with the natural result that a large proportion of the annuitants were young. The feature of a tontine loan which was relied on to attract subscribers was the great return secured by those investors who lived longest.

It is obvious that a tontine loan is an unwise fiscal measure. As to ordinary life annuities, it is fairly safe for the government to assume that premature deaths will largely offset exceptionally long lives, but in the case of a tontine there is no such balancing. It is not the average duration of life of the group which determines the amount of interest which the government will have to pay, but a much more uncertain thing, the duration of the longest life.

The application of the tontine principle to life insurance has taken two forms. Under the old or full tontine plan, in use before the days of surrender values, an insured person who allowed his policy to lapse recovered nothing from the company. The gain which the company had made on his policy was put to the credit of the other insured of the same class. At the end of the tontine period all such profits were distributed among the members of the group still holding policies. After the introduction of surrender values, partly under legal compulsion and partly by the voluntary action of the in-

surance companies, the so-called semitontine plan was adopted. Under this there is a similar division of surplus among those members of the group whose policies are in force at the end of the tontine period, but the surplus to be divided is comparatively small. It arises chiefly from two sources—an expense rate so low that some part of the loading of the premium is saved, and an interest rate on investments higher than that assumed in calculating reserve values. A person taking out a semitontine policy enters into an agreement with the company that the profit thus arising on his policy shall be put into a pool along with the corresponding profit on other policies of the same class, and that at the end of the tontine period—usually 10, 15, or 20 years—the pool shall be divided among those members of the class whose policies are still in force.

The question of the desirability of applying the tontine principle to life insurance has been the occasion of much discussion. That the full tontine plan was a bad one cannot be questioned, but the evils arose more from the absence of surrender values than from the tontine method of distributing the surplus. For the semitontine plan the purely financial argument would seem, on the whole, favorable. In all forms of life insurance the indemnities paid on the policies of those dying early are partly at the expense of those whose policies run a longer time. The distribution of the surplus on the tontine principle is at least a partial reparation. It ought always to be clearly understood that the larger return to those whose policies are kept in force to the end of the tontine period necessarily means a smaller return to those who die or whose policies terminate before that time. The weightiest objection to tontine insurance is a moral one. It is introducing additional uncertainty into the transaction of life insurance, where the speculative element is already large.

Private tontines were by no means uncommon down to the end of the eighteenth century. They were frequently taken up to raise money for purposes requiring large investments of capital. Large buildings in many cities of the United States were erected in that way. At the present time they are almost unknown, partly because the abundance of capital has made it unnecessary to resort to them, partly because the large element of uncertainty involved in them is inconsistent with the spirit of modern business.

TONTY, or **TONTI**, *tôn'té'*, HENRI DE (c.1650–c.1704). A companion of La Salle (q.v.) in the exploration of the Mississippi valley. He was a native of Gaeta in Italy and at an early age entered the military service of France. In July, 1678, he went with La Salle to Quebec. In the autumn of 1679 Tonty sailed up along the eastern shore of Lake Michigan and met his chief at the St. Joseph River. In March, 1680, he was left by La Salle in command of Fort Crèvecoeur in the Illinois country. Forced to flee by a mutiny among his soldiers, he made his way to Green Bay, where he passed the winter of 1680–81 and in May met La Salle at Michilimackinac. In 1682 he was with La Salle in the memorable voyage down the Mississippi, and in May of that year he was dispatched to Mackinac for supplies. In December Fort St. Louis was erected at Starved Rock on the Illinois, and Tonty was left in charge. In 1685 he took part in an expedition of the Illinois Indians against the Senecas, and in 1687 he was

with Denonville in the expedition against the English colonies. In February of the preceding year he had descended the Mississippi in search of La Salle. He continued to live among the Illinois Indians till 1702, when he joined Iberville in Louisiana. Spurious memoirs were published under his name at Paris in 1697 under the title *Dernière découverte de la Salle dans l'Amérique septentrionale*. His real memoirs were published by Margry in *Origines françaises des pays d'outre-mer* (Eng. ed., New York, 1906). Consult J. C. Parish, *The Man with the Iron Hand* (Boston, 1913), and C. B. Reed, *Masters of the Wilderness* (Chicago, 1913).

TOOELE, too-el'ē. A city and the county seat of Tooele Co., Utah, 35 miles southwest of Salt Lake City, on the San Pedro, Los Angeles, and Salt Lake and the Tooele Valley railroads (Map: Utah, B 2). There are large smelting and refining works, saw mills, a creamery, and a flour mill. Tooele has a Carnegie library. Pop., 1900, 1200; 1910, 2753.

TOOKE, took, JOHN HORNE (1736-1812). An English etymologist and politician. He was born in London, his father being John Horne, a poulterer. He was educated at Westminster and Eton and at St. John's College, Cambridge. He entered the Church strongly against his own wish and in 1760 became curate at New Brentford. In 1763 he traveled in France for a year as the tutor of the son of John Elwes, and two years later, while acting again as a tutor, he met John Wilkes (q.v.) and visited Voltaire (q.v.) at Ferney. When Wilkes stood as a candidate for the County of Middlesex in 1768, Tooke zealously aided him, but the pair afterward quarreled. Tooke still, however, continued to meddle in political affairs and ventured to encounter Junius, with whom some have even sought to identify him. In 1773 he resigned his living at New Brentford and, besides continuing his legal studies, commenced the study of philology. About this time he rendered some important private service to William Tooke of Purley in Surrey, who intended to make him his heir. In consequence he adopted in 1782 the surname of Tooke, by which he is now known. In 1777 he was fined and imprisoned for having published in 1775 an advertisement in which he accused the King's troops of barbarously murdering the Americans at Lexington. While in prison he penned his celebrated *Letter to Mr. Dunmug* (dated April 21, 1778), in which are to be found the germs of his *Diversions of Purley*. On his release Tooke made repeated attempts to gain admission to the bar, but was refused on the ground of his clerical orders. Afterward he returned to political writing, and in a *Letter on Parliamentary Reform* advocated universal suffrage. In the struggle between Pitt and Fox he wrote pamphlets on the side of the former, but soon got to hate Pitt, as he had learned to hate many other public men. In 1786 appeared the first volume of his famous *Epea Pteroenta, or the Diversions of Purley*, vol. ii (1806), a work on the analysis and etymology of English words. As a philologist Tooke was among the first to realize the necessity of studying Gothic and Anglo-Saxon. But his passion for politics soon drew him from literature into public life, and in 1801 he entered Parliament for the borough of Old Sarum; but he made no figure there. The best edition of the *Diversions of Purley* is that of Taylor (London, 1840). Consult Alexander Stephens,

Memoirs of John Horne Tooke (2 vols., London, 1813), and J. A. Graham, *Memoir of John Horne Tooke* (New York, 1898).

TOOKE, THOMAS (1774-1858). A British economist. He was born in St. Petersburg. In 1804 he became partner in a prominent Russian house in London; later he became director of the Royal Exchange Assurance Corporation, president of the Calhamie Dock Company, member of the managing board of the London and Birmingham Railway. He was a member of the first great factory commission and president of the commission appointed to inquire into the evils of child labor in factories. From his practical experience in the Russian trade Tooke developed a strong antipathy to governmental interference in foreign commerce. He was author of the *Merchants' Petition in Favour of Free Trade*, presented to Parliament in 1820. He was chiefly interested, however, in questions relating to money and banking. In these subjects he is regarded as one of the best authorities of the times. He was the leading opponent of the quantity theory of money and was a harsh critic of Paul's Banking Act of 1844. He was author of several works on currency problems, of which the most important are his *On the Currency in Connection with the Corn Trade, and on the Corn Laws* (1820); *Considerations on the State of the Currency* (1826); *An Inquiry into the Currency Principles and the Connection of the Currency with Price* (1844); *A History of Prices, 1793-1856* (1838-57), six volumes, the last two written in collaboration with W. Newmarch.

TOOKE, WILLIAM (1744-1820). An English historian, born at Islington, London, and educated there at an academy. Taking holy orders in 1771, he became chaplain to the English church at Kronstadt in Russia and three years later chaplain to the English merchants at St. Petersburg. Coming into possession of a fortune, he resigned in 1792 and returned to London, where he devoted the rest of his life to literature. His most valuable work was in Russian history, based upon research in the Imperial Library at St. Petersburg. It embraces mainly *The Life of Catharine II*, partly a translation from the French (1798); *A View of the Russian Empire during the Reign of Catharine II and to the Close of the Present Century* (1799); *A History of Russia from the Foundation of the Monarchy by Rurik to the Accession of Catharine II* (1800). He published numerous miscellaneous books, as *The Loves of Othniel and Achsah* (1769), a Chaldee romance; *Varieties of Literature* (1795); *Lucian of Samosata*, from the Greek, with the comments of Wieland and others (1820). His son, WILLIAM TOOKE (1777-1863), took a prominent part in founding University College, London, and also the Society for the Diffusion of Useful Knowledge. He was also a member of the Royal Society and president of the Society of Arts. He edited the poems of Churchill, compiled *The Monarchy of France* (1855), and published a volume of verse.

TOOLE, JOHN LAWRENCE (1830-1906). An English comedian, born in London. He made his debut in London at the Haymarket Theatre in 1852. Upon the opening of the new Adelphi Theatre by Benjamin Webster in 1858, Toole became the leading comedian, and there, in 1862, he appeared in his great part of Caleb Plummer, in Boucicault's dramatization of *The Cricket on the Hearth*. In 1868 he played the

Artful Dodger at the Queen's Theatre, with Henry Irving as Bill Sykes. He visited America in 1875 and in 1890 made a successful trip to Australia. He opened Toole's Theatre (the Folly Theatre reconstructed) in February, 1882, and managed it as a home of comedy for a number of years. Consult: Toole's *Reminiscences*, chronicled by Joseph Hatton (London, 1888); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886); Scott, *The Drama of Yesterday and To-Day* (London, 1899).

TOOMBS, ROBERT (1810-85). An American statesman, born at Washington, Ga. He studied at the State University at Athens and graduated (1828) at Union College, Schenectady, N. Y. He studied law at the University of Virginia and began practice in Wilkes Co., Ga. After service against the Creeks in 1836 and several years in the Georgia Legislature as a States' Rights Whig, he was elected to Congress in 1844 and held his seat for four terms, until 1853, when he was elected to the United States Senate and in 1859 reelected. He opposed the Mexican War and the annexation of territory by force, aided in the adoption of the Compromise of 1850, opposed the Nashville Convention, and helped secure the famous Georgia Platform. As an impassioned political speaker he had few equals. The movement of secession had his full approval; and it was chiefly his influence, in opposition to the more conservative views of his lifelong friend, Alexander H. Stephens, that led his State to pass its ordinance of secession, to which there was a strong opposition, especially among the old line Whigs. On the election of Davis Toombs was offered the office of Secretary of State and with reluctance accepted it for a short time, on his resignation receiving a commission as brigadier general. He served in the second battle of Bull Run and at Antietam and later was made brigadier general of the Georgia militia. After the war he lived for some time abroad; then from 1867 he carried on a successful law practice at his old home, being especially serviceable to Georgia by winning his contention that railroads should pay taxes like other property. He was noted for his brilliant wit, his legal sagacity, and his benevolence. He opposed the Reconstruction measures and never took the oath of allegiance. He is mainly remembered as an unrelenting Southern partisan. Consult: W. P. Trent, *Southern Statesmen of the Old Régime* (New York, 1897); U. B. Phillips, *The Life of Robert Toombs* (ib., 1913); W. W. Hicks, *Tributes and Memories* (Boston, 1914).

TOON (Hind. *tūn*, *tun*, from Skt. *tunna*, *toon*), or **TOONA** (*Cedrela toona*). A tree of the family Meliaceæ, one of the largest timber trees of India, occurring also in Australia, where it attains a height of 150 to 180 feet and a diameter of 5 to 7 feet. Hooker mentions one which he measured in India which was 30 feet in girth at 5 feet above the ground. The flowers are used in India for dyeing. The tree, sometimes called bastard cedar, occurs at 4000 feet on the Himalaya and is found in the farthest south of the East Indies. The bark contains considerable tannin and is used to produce a kind of purplish leather. The wood is soft, durable, easily worked, and extensively used in housebuilding and for furniture. The timber called in English markets *Maulmain cedar* is exported from India in considerable quantities.

TOOROP, tō'rōp, JAN (1860-). A Dutch East Indian painter, of Norwegian, Dutch, and Javanese ancestry. He was born at Porworedjo (Java), was educated at Batavia and in Delft, Holland, and after 1881 studied art at the academies of Amsterdam and Brussels and also in London and Paris. In the latter city he joined the post-Impressionist movement and after his return to Brussels helped to found the radical Société des Vingt. Later he introduced the new phase of art into Holland. The brutal realism, power, and strength of his early work are well illustrated in his "Broeck-in-Waterland," "The Wave," and "Melancholy." Afterward his ideas became more intricate and mystically symbolical. His treatment of line, though archaic, is masterly, and he often displays great decorative skill and delicacy of handling. Characteristic examples of his later manner are: "The Sphinx"; "The Three Brides"; "Our Time"; "With the Sower"; "Nirvana"; "Rustic Trinity." He also painted many dainty portraits of children and produced lithographs and etchings.

TOOTH. See **TEETH**.

TOOTHACHE TREE. See **ARALIA**; **ZANTHOXYLUM**.

TOOTH-BILLED PIGEON. An extraordinary member of the pigeon tribe (*Didunculus strigirostris*), native to Samoa and alone representing a separate family (Didunculidæ). This species, known to the Samoans as *manu-mea*, or redbird, is about 1 foot long and glossy greenish black, with a chestnut tinge on the upper parts and brown on the wing quills and abdomen. Its most striking characteristic is a great orange-colored, hawklike, toothed bill, suitable for gathering the bananas and other large fruits upon which it lives. It was originally wholly terrestrial in its habits, spending its time on the wooded mountain sides, where it roosted on rocks and stumps and nested on the ground, rarely gathering into parties. It was hunted for food. This circumstance, the fact that it laid but a single egg, and the introduction by white settlers of cats, rats, and guns led not only to its speedier destruction, but to an interesting change in habits, since it soon resorted much more to tall trees than previously and placed its nest on high branches. See Plate of **PIGEONS**.

TOOTH FUNGI. See **BASIDIOMYCETES**.

TOOTH SHELL. See **TUSK SHELL**.

TOPALIAS, LAKE. See **BEOTIA**.

TOPAZ (Lat. *topazion*, *topazus*, from Gk. *τοπάσιον*, *τόπαζος*, *topaz*; possibly connected with Skt. *tapas*, heat). A mineral aluminium fluosilicate, crystallized in the orthorhombic system. It has a vitreous lustre and may be colorless, yellow, green, blue, or red. Topaz occurs in gneiss or granite associated with beryl, mica, tourmaline, etc., and occasionally with apatite, cassiterite, and fluorite, and also in certain talcose rocks, mica slate, rhyolite, and in alluvial deposits and drift. The crystallized varieties, owing to their hardness, are valued as gems, and the best of these come from Ceylon and other parts of India, the Urals, Minas Geraes, Brazil, and in the United States from various localities in Maine, Colorado, and Utah. The most popular color for topaz gem stones is a rich orange yellow somewhat resembling the color of sherry wine. Rose topaz is a delicate rose pink in color. The name "topaz" was applied by Pliny and others to yellow crystals,

probably chrysolite. Among the ancients it was regarded as symbolical of friendship; when worn as an amulet it was said to drive away sadness, strengthen the intellect, and bestow courage; mounted in gold and hung around the neck, it dispelled enchantment. It is the birthstone of November. The true Oriental topaz is the yellow sapphire, and the Saxon, Scottish, Spanish, smoky, and false topaz are yellow varieties of quartz. See GEMS.

TOPE, *tōp* (Hind. *tōp*, from Pali, Prak. *thūpa*, from Skt. *stūpa*, mound, accumulation). The vernacular name of Buddhist monuments, in the form of tumuli, intended for the preservation of relics or as memorial mounds commemorating some religious event. In Ceylon they are called dagabas; the designation more generally employed by Indian archaeologists is *stupa*, from the Sanskrit, of which *tope* is merely a dialectic corruption. Not only the Buddhists erected these monuments, but the Jains, their rival sect, did likewise. No Jain specimen appears to have been preserved. The oldest *topes* are in the form of a hemisphere or sometimes an ellipse, solidly constructed of brick, stone, and masonry, resting on a base similarly constructed and surrounded by a stone railing, which was modeled after a prototype of mud and served to mark off the processional path for the worshippers to follow in circumambulating the mound. The domical *stupa* has been thought to owe its shape to an original earthen tumulus, but it may have been derived from the curved roof of bamboos built over a primitive circular hut shrine constructed of perishable materials. (Cf. V. A. Smith, *History of Fine Art in India*.) The elevation of the dome tended in course of time to rise higher and higher until gradually it assumed a tower-like form and was even further developed in the Chinese pagoda. In the case of the *tope* the cupola is crowned by a small structure generally quadrangular, but sometimes in the shape of a reversed stepped pyramid, over which is a roof shaped like an extended parasol. Sometimes there are several parasols, and their multiplication and varied arrangement led to variations of form in the *tope* itself. This was in many cases made of pyramidal form, especially in China, where the superposed stories took the form of a tower and the cupola type wholly disappeared; while the *topes* of the Mongols, the *ssuvurghans*, are pyramids erected on a low quadrangular base. The top of the pyramidal *topes* always carries some metal ornament, frequently gilt, resembling a parasol, a needle, a trident, or a rising flame. The height of these buildings varies from a few feet to 300; while the circular Abayagiri *tope* in Ceylon is 360 feet in diameter. If erected in a cave temple, the *tope* generally stands at the end of a long hall especially cut out for it, but sometimes also in the sanctuary of the cave temple itself; if erected overground, it stands always in the vicinity of a temple or convent.

In the interior of the *tope* is the cell or chamber (*dhātugarbha*) containing the box of relics with their accompanying "seven precious things"—gems, gold, silver, coral, etc. The box itself generally consists of an outer case of stone, clay, or bronze, which incloses a silver cylinder, and within this a golden cylinder containing the relics, both bearing commemorative inscriptions. In some cases the relics were placed not within but under the *tope*. The cupola form represents the water bubble, the

Buddhistic symbol of the hollowness of mundane existence, while the parasol is the emblem of the royal dignity possessed by a Buddhist saint. The number of stories in *topes* of pyramidal or tower-like form had likewise a symbolical import. Thus, only the *topes* of the most accomplished Buddhas had 13 terraces, to show that these Buddhas had passed beyond the 12 causes of existence; three terraces imply the three worlds of desire, of form, and of absence of form; five, the steps of Mount Meru; and so on.

The *topes* generally occur in groups, of which the most important is the Bhilsa group in Central India, to which belongs the famous Sanchi *tope*, and near it are two minor groups, at Sonari and Satdhara. In Bengal is that of Sarnath, 128 feet high. The great *tope* at Amravati is the most interesting for the wealth and beauty of its sculptures. Others are at Gandhara, Teleabad, and Menikalya, and in Ceylon at Tuparamaya, Ruanwalli, Abayagiri, Anuradhapura, etc. In 1909 near Peshawar was discovered the ruins of a famous *stupa* erected by King Kanishka (c.1 A.D.) containing in a reliquary casket a part of Buddha's remains, which have since been ceremoniously transferred to Burma. The sculptured rails are described under INDIAN ART. Consult: Koepfen, *Die Religion des Buddha* (Berlin, 1857); James Fergusson, *History of Indian and Eastern Architecture* (London, 1876); A. Foucher, *L'Origine grecque de l'image des Buddha* (Paris, 1913).

TOPE. A small European shark (*Galeorhinus galeus*). It is represented on the Western American coast by the so-called oil or soup-fin shark (*Galeorhinus zyopterus*), about 6 feet long and gray with black-edged dorsals. The name is also given to the related small dog shark (*Mustelus canis*) of the North Atlantic. See Plate of LAMPREYS and DOGFISH.

TOPEKA. The capital of Kansas and the county seat of Shawnee County, 65 miles west of Kansas City, on the Kansas River and on the Missouri Pacific, the Union Pacific, the Atchison, Topeka, and Santa Fe, the Leavenworth and Topeka, and the Chicago, Rock Island, and Pacific railroads (Map: Kansas, G 4). It is situated on rolling prairie land, at an elevation of over 800 feet, and covers an area of about 16 square miles. Beautiful shade trees and handsome residences add to the city's attractiveness. The most notable structures are the State Capitol and the Kansas Memorial Building, both in the heart of the city. Other noteworthy edifices are the public library (containing 32,000 volumes), the United States government building, the State printing plant, State museum, the county courthouse, and the city hall and auditorium. The Melan Arch Bridge possesses considerable architectural merit. Topeka is the seat of Washburn College (Congregational), opened in 1865, and of the College of the Sisters of Bethany (Protestant Episcopal), opened in 1861. The State Insane Asylum and the State Reform School are also here. The prominent local charitable institutions include the Provident Association, the Santa Fe Railway Hospital, the St. Francis Hospital, the Jane C. Stormont Hospital and Training School for Nurses, Christ Hospital, Detention Hospital, the Methodist Old Peoples' Home, and Ingleside, a home for aged women.

The industrial interests are centred chiefly in the extensive shops of the Santa Fe Railroad

and in the manufacture of flour and butter. Of the smaller establishments the most important are foundries and machine shops, lumber mills, and manufactories of boilers, trusses, woolen goods, etc. The 1914 census showed the total capital invested in all industries to be \$14,186,000; the value of their output amounted to \$19,742,000. Considerable wholesale and jobbing business is carried on in Topeka. The commission form of government was adopted in 1910. The electric-light plant and the water works are owned by the municipality. The city spent in 1913 for maintenance and operation \$581,000, the chief items being: schools, \$251,000; interest of debt, \$114,000; streets, \$35,000; fire department, \$63,000; and police department, \$31,000. Pop., 1900 33,608; 1910, 43,684; 1915 (State census), 46,747; 1920, 50,022.

Topeka, laid out in 1854, was one of the Free State towns founded by Eastern antislavery men; immediately after the passage of the Kansas-Nebraska Bill. In 1856 an antislavery convention adopted here the Topeka Constitution, in pursuance of which the Topeka government was established, to be soon broken up by the United States troops. During this year Topeka became notorious for the raids made by its citizens on proslavery settlements. In 1857 Topeka was chartered as a city, becoming a city of the first class in 1881. It was made the capital of the State in 1861. Consult: Giles, *Thirty Years in Topeka: A Historical Sketch* (Topeka, 1886); Z. L. Potter, *Industrial Conditions in Topeka* (New York, 1915), and D. O. Decker, *Municipal Administration in Topeka* (ib., 1915), both published by the Russell Sage Foundation.

TOPELIUS, tō-pā'lē-ūs, ZACHARIAS (1818-98). A Swedish-Finnish poet and novelist, born at Kuddnäs, near Ny Karleby. He was educated at the University of Helsingfors, where, after gaining the doctorate (1847), he was professor of the history of Finland and the North from 1853 to 1878. As a lyric poet he was second only to Runeberg, and his children's stories have been translated into many languages. His publications include: *Ljungblommor* (Flowers of the Heath, 3 parts, 1845-54); *Efter fjentio år* (After Fifty Years, 1851), a play; *Fältskärns Berättelser* (Tales of an Army Surgeon, 5 vols., 1853-67); *Läsning för Barn* (Children's Stories, 8 parts, 1865-96); *Boken om vårt land* (1875; 9th ed., 1899); *En resa i Finland* (A Journey in Finland, 2d ed., 1885); *Blad ur min tänkebok* (1898; 3d ed., 1900). His collected works were published at Stockholm, 30 vols. (1899-1910).

TOPETE Y CARBALLO, tō-pā'tā ē kār-bā'-lyō, JUAN BAUTISTA (1821-85). A Spanish admiral and politician, born at San Andrés de Tuztla, Mexico, son and grandson of Spanish admirals. He entered the navy at the age of 17 and became midshipman in 1843 and lieutenant two years later. From 1846 to 1849 he served in Cuban waters and subsequently was on duty in the Mediterranean. He was promoted to the captaincy of a frigate in 1857 and during the war with Morocco in 1859 was chief of staff to the fleet. About this time he formed political affiliations with the Union Liberal party under O'Donnell and in 1862 was elected to the Cortes from Cadiz. He was on the Pacific station during the conflict with Peru and Chile in 1865-66 and was severely wounded in the bombardment of Callao in May of the latter year. Made brigadier on his return and placed in command

of the port of Cadiz, he took an active part in the political conspiracies of the times and by his pronunciamiento of Sept. 17, 1868, gave the signal for the outbreak of the revolution which drove Isabella II from the throne. He sent a ship to bring back the general, who had been deported to the Canaries (see SPAIN) and after he had been joined by Prim and Sagasta won over the city of Cadiz to the revolution. In the provisional government Topete assumed the portfolio of Marine. He favored the election of the Duke of Montpensier to the throne and laid down his post when the choice fell upon Amadeus of Savoy. In 1872, however, he resumed office under Serrano and during the latter's absence from the capital presided over the Ministerial Council. In the revolution of 1873 he was imprisoned for a short time, but regained influence under the presidency of Serrano, who placed him once more at the head of the navy. With Serrano he fought against the Carlists in the north. On the accession of Alfonso XII Topete retired from active participation in politics. In 1879 he was made a life Senator and in 1881 became vice admiral. His services were rewarded with grand crosses in many orders. He died at Madrid, Oct. 29, 1885.

TÖPFFER, tēp'ēr, RODOLPHE (1799-1846). A Swiss novelist and draftsman, born in Geneva, son of the landscape and genre painter Adam Töpffer (1766-1847), under whose instruction he devoted himself to art. His eyesight failing, he took up teaching in 1825, established a boarding school, and in 1832 became professor of aesthetics at the Academy of Geneva. His novel *Le presbytère* (1839) attracted universal attention. *The Nouvelles genevoises* (1838), *Nouvelles et mélanges* (1840), *La bibliothèque de mon oncle* (1843), and *Rose et Gertrude* (1845) are hardly less delightful than the humorous sketches of travel, *Voyages en zigzag* (1848) and *Nouveaux voyages en zigzag* (1853), illustrated by himself. A little archaic in style, his work is simple, artistic, sound, and witty, with a childlike fancy and sentiment. Among his best productions are the seven little novels in pictures: *Mr. Jabot*, *M. Crépin*, *M. Pencil*, *Le docteur Festus*, *Histoire d'Albert*, *Les amours de M. Vieux-Bois*, and *M. Cryptogame*, published together in *Collections des histoires en estampes* (Geneva, 1846-47). Consult Georg Glöckner, *Rodolphe Töpffer: sein Leben und seine Werke* (Zerbst, 1891), and Hermann Wolterstorf, *Essai sur la vie et les œuvres de Rodolphe Töpffer* (Magdeburg, 1894).

TOPHET, tō'fēt (Heb. *tōpheth*). A place in the valley of Hinnom, south of Jerusalem, associated with the worship of Molech (2 Kings xxiii. 10; Isa. xxx. 33; Jer. vii. 31-32, xix. 6, 12-14). It is probably a loan word of Aramaic origin, *tephath*, meaning "fireplace," given a pronunciation *tōpheth*, to suggest *bosheth* (shame). See HINNOM, VALLEY OF; MOLECH.

TOPHI. See CONCRETION.

TOPI, TANTIA. See TANTIA TOPI.

TOPINARD, tō'pē'nār', PAUL (1830-1911). A French anthropologist, born at Isle-Adam (Seine-et-Oise). He spent 10 years in the United States, returned to study medicine in Paris, and established himself there in 1869, but after 1871 gave up his practice in order to study anthropology under Broca. He became curator for the Société d'Anthropologie in 1872, assistant director of the anthropological laboratory in the Ecole des Hautes Etudes, professor in the school of anthropology (1876), and secretary general

of the Société d'Anthropologie after Broca's death in 1880. He also succeeded Broca as editor of the *Revue Anthropologique*, was commissioner for the section of anthropology at the Exhibition of 1889, and in that year was admitted to the Legion of Honor. His publications include: *Etude sur la taille considérée suivant l'âge, le sexe, l'individu, les milieux et les races* (1865); *Etude sur les races indigènes d'Australie* (1872); *L'Anthropologie* (1876); *Des anomalies de nombre de la colonne vertébrale chez l'homme* (1877); *Eléments d'anthropologie générale* (1885); *Science et foi—l'anthropologie et la science sociale* (1900).

TOPINISH. See SHAHAPTIAN STOCK.

TOP/LADY, AUGUSTUS MONTAGUE (1740-78). A clergyman of the Church of England. He was born at Farnham, Surrey, and was educated at Westminster School and Trinity College, Dublin (B.A., 1760). He was ordained priest in 1764 and became rector of Broad Hembury in 1768. In 1775 failing health necessitated his removal to London, where he died of consumption, Aug. 14, 1778. He was the great champion of Calvinism in the Church of England and wrote much against the Methodists, with vigor of language and argument, but often with undue asperity of style. He is best known as the author of the popular hymn "Rock of Ages, Cleft for Me" (1775). He edited for several years the *Gospel Magazine*. His controversial works, mostly in reply to Wesley, are numerous. The best was *The Historic Proof of the Doctrinal Calvinism of the Church of England* (1774). His works were published with memoir (6 vols., 1794; 2d ed., 1825); the best edition of his poetry is by D. Sedgwick (London, 1880). Consult Thomas Wright, "Augustus Toplady and Contemporary Hymn-Writers," in *Lives of British Hymn-Writers*, vol. ii (ib., 1911), containing a bibliography.

TÖPLER, tēpl'ēr, AUGUST (1836-1912). A German physicist. He was born in Brühl on the Rhine, was educated in Berlin, and after various minor appointments became professor at the Polytechnic School in Riga in 1864 and in 1868 professor of physics in Graz, where he built the Physical Institute. In 1876 he was called to the professorship of physics in the Polytechnic Institute in Dresden, a position which he filled until 1900. He devised numerous forms of apparatus, especially in connection with optical and electrical phenomena. The electrical machine and the vacuum pump that bear his name are perhaps the best known of his inventions. Besides numerous papers he wrote *Optische Studien nach der Methode der Schlierenbeobachtung* (1865).

TÖPLITZ, tēpl'its. A town of Austria. See TEPLITZ.

TOP MINNOW. One of the minnows of the extensive genus *Gambusia*. They are small viviparous fishes inhabiting still waters in the Southern States, Mexico, and Cuba and keeping near the surface of the water. See MINNOW, and Plate of KILLIFISHES AND TOP MINNONS.

TOP SHELL. A mollusk of the scutibranchiate family Trochidae, so called because the shell, when reversed, often presents a striking similarity in shape to a boy's top. When ground and polished they are extremely beautiful and are largely used as ornaments. The operculum is horny, circular, multispiral, and has a central nucleus; and these operculæ were formerly

highly valued in the East to serve the purpose of an artificial eye. These mollusks dwell in great numbers and variety along all weedy coasts and feed upon marine herbage.

TOPSY. A young slave girl in *Uncle Tom's Cabin*.

TORAH, or **THORAH,** tō'rā (Heb. *hā-tōrah*, law, direction, Babylon. *tertu*, oracle, divine revelation). The Hebrew term technically applied to the Pentateuch. Besides the term Torah there is also used *Tōrath Mōshc*, i.e., Law of Moses, on the basis of the tradition which ascribes the whole Pentateuch (the historical as well as the legal portions) to Moses. Traces of the original sense of Torah as oracle are to be found in various passages of the Old Testament. Consult Haupt, "Babylonian Influence in the Levitic Ritual," in the *Journal of Biblical Literature*, vol. xix (Boston, 1900), and Zimmern, *Beiträge zur Kenntnis der babylonischen Religion* (Leipzig, 1896-1900).

TORBANEHILL (tōr'ban-hil') **MINERAL.** See TORBANITE.

TORBANITE, tōr'ban-it, **TORBANEHILL MINERAL,** or **BOGHEAD COAL.** A dark-brown variety of cannel coal found at Torbanehill, near Bathgate, Scotland. It contains over 60 per cent of volatile matter and is extensively used for the extraction of burning and lubricating oils, paraffin, and illuminating gas.

TOR/BERT, ALFRED THOMAS ARCHIMEDES (1833-80). An American soldier, born at Georgetown, Del. He graduated at West Point in 1855. He took part in the Peninsular campaign, and in August, 1862, became commander of a brigade of the Sixth Corps, which he led during the campaigns of northern Virginia and Maryland, participating in the second battle of Bull Run and in the battles of South Mountain and Antietam. He was commissioned brigadier general of volunteers in 1862 and by his gallantry at Gettysburg earned the brevet of major in the regular army. In April, 1864, he was transferred to the cavalry and was placed in command of the First Division of the Army of the Potomac. He commanded at Hanovertown, Winchester, Kearnyville, Milford, Luray, Mount Crawford, Gordonsville, and elsewhere. He was brevetted major general of volunteers in 1864 and in the regular army in 1865. He was mustered out of the volunteer service in 1866 and resigned his commission in the regular army. In 1869 he became United States Minister to the Central American States, in 1871 went as Consul General to Havana, Cuba, and in 1873 was transferred as Consul General to Paris. This last office he held until 1878. He was drowned in a wreck off Cape Canaveral, Fla.

TORCELLO, tōr-chē'lō. A small town and island in the lagoon of Venice, Italy, 6 miles northeast of Venice. The seventh-century Byzantine cathedral, Santa Maria, has a gorgeous twelfth-century mosaic representing biblical scenes. The Santa Fosca Church is also architecturally interesting. There are two small museums of antiquities. Pop., 1911, 147.

TORCH DANCE. Specifically a ceremony held at certain European courts, especially that of Prussia, upon the marriage of any member

TOP SHELL (*Trochus niloticus*).

of the ruling house. Ministers of state and privy counselors take part as well as members of the royal family. A striking feature is a march or procession by the bride and bridegroom accompanied by their relatives and led by the ministers and counselors, in pairs, all carrying lighted wax candles. The rite is probably a survival from the early fire-worship ceremonials, which appeared in Europe during the Middle Ages.

TORCHON. See LACE.

TORCH RACE. See LAMPADEPHORIA.

TORDENSKJOLD, tór'den-shöld, PETER (1691-1720). A Norwegian-Danish naval officer and national hero. He was born at Trondhjem, his family name being Wessel. Appointed a lieutenant in the royal navy in 1711, he proved to be a most successful scout and harrier of the Swedish coast. Later, in command of a sloop of war of 20 guns, he was equally successful, never hesitating to attack, and either capturing the enemy or escaping by excellent seamanship. In 1716 he was given noble rank under the title of Tordenskjold (thunder shield). Later in the year, with only seven ships, he captured and destroyed the Swedish fleet of 44 ships in the Dynekil, thus compelling Charles XII to raise the siege of Fredrikshald. He was then only 25 years old. After becoming rear admiral in 1718, he captured Marstrand and partially destroyed the principal Swedish squadron and was then made vice admiral (1719). In 1720 he was killed at Hanover in a duel with Col. J. A. Staël von Holstein, who had been in Swedish service. For nearly 200 years principal vessels of the Danish and Norwegian navies have borne his name.

TORDESILLAS, tór'dá-sel'yás, CONVENTION OF. See DEMARCATION, LINE OF.

TORELL, tó-rél', OTTO MARTIN (1828-1900). A Swedish naturalist, born at Varberg. He studied medicine and the natural sciences at Lund, where he gained the doctorate (1853), and then traveled through Scandinavia, Switzerland, and Iceland engaged in scientific investigation. In 1858 and in 1861 he accompanied Nordenskiöld to Spitzbergen. In 1866 he was appointed professor of zoölogy and geology at Lund. From 1870 to 1897 he was chief of the Swedish Geological Survey. His map of Sweden ranks with the best that have been made. Besides many papers on the Ice age and upon animal life in northern Europe and North America, he wrote an account of the Swedish expeditions to Spitzbergen of 1861, 1864, and 1868. He traveled through most of the European countries and in North America.

TORELLI, tó-rél'lé, ACHILLE (1844-). An Italian dramatist, born at Naples. Of his numerous works, many of Goldonian imitation in the Neapolitan dialect, the best is *I mariti* (1867). In 1878 he was made director of the San Carlo Theatre at Naples, and later librarian of the library of San Giacomo.

TORELLI, GIUSEPPE (c.1660-1708). An Italian violinist and composer, one of the earliest masters of the *Concerto grosso* (q.v.). He was born in Verona. This form of music remained in favor until the time of Handel and prepared the way for the modern symphony. With Corelli, Torelli was the principal musician of his time. He became connected with the church of San Petronio at Bologna (1685), joined the Accademia Filarmonica of that city, and in 1698 was concert master to the Margrave of Branden-

burg. In 1701 he returned to Bologna, where he died.

TORELLI-TORRIANI, -tór'rè-ä'né, MARIA (1846-). An Italian novelist, born at Novara. Under her pseudonym, Marchesa Colombi, she published many tales of "veristic" sentimentalism, of which *La gente per bene* (1877) and *In Risaisa* (1877) are typical.

TO REMAIN BIBLE. See BIBLE, CURIOUS EDITIONS OF.

TORENO, tó-rá'nó, FRANCESCO DE BORJA QUEIPO DE LLANO Y GAYOSO, COUNT OF (1840-90). A Spanish statesman. He held various portfolios, was twice President of the Chamber of Deputies, effected many important reforms in matters concerning scholarship, the historical archives, and public works, and was frequently consulted by the three sovereigns under whom he served.

TORENO, JOSÉ MARÍA QUEIPO DE LLANO RUIZ DE SARAVIA, COUNT OF (1786-1843). A Spanish statesman and historian, father of the above-mentioned Count of Torenó. He had much to do with framing the constitution of 1812, held various portfolios during the minority of Isabella II, and was for a while Prime Minister. His principal work is the *Levantamiento, guerra, y revolución de España* (1836-38), which appears in vol. lxi of *Biblioteca de autores españoles*, where it is preceded by a life of the author by Antonio de Cueto.

TORFÆUS, tór-fé'ús, THORMODUS, or THORMODR TORFASON (1636-1719). An Icelandic antiquary. He was born at Engö, Iceland, was educated at the University of Copenhagen, and in 1662 returned to Iceland by command of Frederick III to collect saga manuscripts. In 1667 he was appointed royal antiquary and in 1682 royal historiographer for Norway. He translated several Icelandic works into the Danish language and was the author of *Historia Vinlandiæ Antiquæ* (1705), *Greenlandia Antiqua* (1706), and *Historia Rerum Norvegarum* (4 vols., 1711).

TORGAU, tór'gou. A fortified town of the Province of Saxony, Prussia, on the left bank of the Elbe, 31 miles east-northeast of Leipzig (Map: Germany, E 3). The castle of Hartenfels (1481-1544), one of the largest Renaissance edifices in Germany, was once the residence of the electors of Saxony. It is now used as barracks. There is a museum of Saxon antiquities. Gloves, glass, druggists' sundries, cigars, and biscuits are manufactured. Frederick the Great here defeated the Austrians in 1760. Pop., 1900, 11,807; 1910, 13,493.

TORIES. See LOYALISTS; WHIG AND TORY.

TORII, tó-ré-ë (Jap., bird rest, or, less probably, gateway). An archway formed by two upright posts and two horizontal beams, placed before the Shinto shrines in Japan. It is supposed that the Torii was originally a perch for sacred fowl who were to herald the approach of day.

TORLO'NIA. A princely Roman family. Its founder, GIOVANNI TORLONIA (1754-1829), was a poor cicerone of Rome, who grew enormously rich in manipulating assignats during the French Revolution and as banker for many kings and princes. He was made a grandee of Spain, and Duke of Bracciano by the Pope. His three sons married into the highest families, the eldest succeeding to the dukedom, the youngest, ALESSANDRO, becoming Prince of Civitella-Cesi and Duke of Ceri, and acquiring immense wealth, of which he made charitable use. He acquired

fame by successfully draining Lake Celano (Fucino), thereby restoring to cultivation 36,000 acres of land.

TORMENTIL (Fr. *tormentille*, from ML. *tormentilla*, *tormentella*, tormentil, from Lat. *tormentum*, torment). A popular name for *Potentilla tormentilla*, formerly called *Tormentilla officinalis*, common on European moors and heaths. Its large woody roots have been used as an astringent and for staining leather. It also supplies material for a red dye sometimes used in Lapland. The leaves are ternate, the leaflets lanceolate and inciso-serrate, the stems ascending and forking, the flower stalks axillary and terminal, and the flowers yellow.

TORNA'DO. See WIND.

TORNEÅ, tór-ně-å. A town in the Government of Uleåborg, Finland, Russia, situated on the Torneå, near the north end of the Gulf of Bothnia (Map: Russia, B 1). Pop., 1910, 1716. About 33 miles north is the mountain of Avasakra (1573 feet), which is visited by many tourists at the summer solstice, when the sun is visible continuously for almost two days.

TORNEÅ. A river, forming the boundary between Russia and Sweden. It rises in the Torneå Lake near the Norwegian boundary and flows southeast through Sweden, then south on the Russian boundary, entering the Gulf of Bothnia after a course of 250 miles (Map: Sweden, G 3). Near its mouth is the town of Torneå (q.v.). Its chief tributary, the Muonio, forms the northern part of the boundary.

TORO, tō-rō. An ancient town of Spain, in the modern Province of Zamora in León, on the right bank of the Duero, 38 miles southwest of Valladolid, on the Medina del Campo-Zamora Railroad (Map: Spain, C 2). It contains numerous religious houses and palaces, most of which have been allowed to fall into a state of decay, and the collegiate church of Santa María la Mayor, dating from the reign of Alfonso VII. There are brandy distilleries, vineyards, tanneries, and woolen manufactories. Pop., 1900, 8187; 1910, 8288.

TÖRÖK-SZENT-MIKLÓS, tē-rēk-sēnt-mē'-klōsh. A commune of the County of Jász-Nagykun-Szolnok, Hungary, 66 miles southeast of Budapest (Map: Hungary, G 3). The extensive plain in which it is situated is noted for its production of cereals and live stock, and in the commune itself there is some manufacture of brick and of agricultural implements. Pop., 1900, 21,881; 1910, 23,074.

TORONÉ, COUNT OF. See BASILE, G. B.

TORONTO. The capital of the Province of Ontario, Canada, on the north shore of Lake Ontario, opposite the mouth of the Niagara River and 333 miles southwest of Montreal (Map: Ontario, F 6). It is situated on the north side of a spacious inlet called Bay of Toronto, has a water frontage of about 10 miles from east to west, and extends inland from south to north about 6 miles, extreme width. The harbor or bay, about 5 miles long and 1 mile in width, is protected by a sandy islet, which extends into the lake in a south and west direction to a distance of 5 miles. The port accommodates the largest vessels that pass through the Welland Canal, and the passenger traffic employs a fleet of fast steamers. Canada's three transcontinental railways pass through the city, and one of them, the Canadian Northern, has its head offices located here.

The site of the city rises gently north from

the lake shore for about 3 miles, where it ascends abruptly. The limits of the city have been extended on the hill, which has become a beautiful residential section. Toronto is brick-built. In general characteristics it is American, but the spirit and ideals of the people are thoroughly British. The city possesses many beautiful edifices, comprising chiefly office and educational buildings, churches, and public buildings. It has numerous attractive private homes. A group of four office buildings, ranging from 12 to 20 stories in height, form the hub of the business section, on the corners of King and Young streets. The most conspicuous group of buildings, for their beauty, is located in Queen's Park, about a mile from the water front, and comprises the Provincial Legislative Building and the University of Toronto. The former occupies a commanding position at the head of the broad University Avenue. To the west and north are situated the various edifices of the university, arranged in a wide circle. This is the premier seat of learning of the Dominion. Chief among these edifices is the main Arts building, a Norman structure. In the circle stands the new Knox College (Presbyterian), collegiate Gothic in architecture, while Victoria College (Methodist) and Wycliffe College (Anglican) are located in the vicinity. Other fine educational buildings are McMaster University (Baptist), Trinity College (Anglican), Upper Canada College, and St. Andrews College. The new \$2,000,000 Technical School, a massive imposing structure, is one of the best-equipped schools of its kind in the world. Other notable buildings are the City Hall, with its stupendous 300-foot clock tower; Casa Loma, the residence of Sir Henry Pellatt, situated on the brow of the hill north of the city, a castle of old-English type; and the Government House, the home of the Lieutenant Governor of the Province, situated in Rosedale.

Toronto is distinguished for its churches, of which it has 263. The principal are St. James Cathedral (Anglican), a fine building in early English, erected in 1852; St. Michael's Cathedral (Roman Catholic); St. James and St. Andrews (Presbyterian); the Metropolitan Methodist Church, noted for its huge organ; Jarvis Street Baptist; Bond Street Congregational; St. Paul's and church of the Ascension (Anglican). Toronto maintains an excellent free-library system, including a reference library, a handsome structure situated on College Street, and 19 branches, with 231,000 volumes. It has three colleges of music, the Hambourg Conservatory, the Toronto Conservatory, and the Toronto College of Music, and possesses creditable art galleries, the John Ross Robertson historical collection at the College Street branch of the Public Library, and the Art Museum of Toronto collection at the Grange. The new Royal Ontario Museum on Bloor Street contains an important collection of historical and geological relics. The city is the hospital centre of Ontario, and in addition to the new \$2,000,000 General Hospital there are the Western, Sick Children's, Wellesley, St. Michael's, Orthopaedic, and Victoria, all imposing and well-equipped buildings. Six daily newspapers are published, the oldest of which, the *Globe* (Liberal), was founded in 1846. The others are the *Daily Star* (Liberal), the *Daily News*, the *Mail and Empire*, the *World*, and *Telegram*, the four latter being Conservative.

The city possesses 55 parks, several of them large and beautiful, having a total area of 1879 acres. Chief of these are High Park (335 acres), Exhibition Park (235 acres), and Humber Boulevard (129 acres), all within the city limits and equipped with splendid driveways. Exhibition Park is the home of the Annual Canadian National Exhibition, continuing two weeks each year, and one of the greatest of its kind in the world. The yearly attendance aggregates 1,000,000 people. It is famous for its agricultural, industrial, and art exhibits. Ontario's noted breeds of live stock are shown there. Riverdale Park possesses a zoölogical garden, with a valuable collection of animals. There are two amusement parks—Hanlan's Point, on the Island, and Scarborough Beach, at the eastern extremity of the city. The Island provides Toronto with another extensive, well-wooded park. It is the lungs of the city and lends itself to aquatic sports, for which Toronto is noted. Toronto has commodious armories, which are the headquarters of the city's three volunteer regiments.

The city possesses water, gas, electric-light plants, and street-railway systems. It draws its light and much of its heat and power from Niagara Falls, at an exceptionally low rate of cost, through the medium of a private company and the Ontario Hydro-Electric Commission, a public institution. The phenomenal growth of the city has necessitated the erection of a new Union Station. Being the second financial and commercial centre of the Dominion, Toronto has an active shipping trade. Freighters come east with grain and return to the head of the lakes with Toronto manufactures for delivery in north-west Canada. In 1914, 2961 vessels with a tonnage of 3,040,000 tons arrived at the port. In 1916 the city was engaged in an elaborate programme for public improvements, involving an expenditure estimated at \$350,000,000. Its per capita debt is the lowest of all large cities in Canada. A thousand acres of marsh on Toronto Bay has been reclaimed and is available for manufacturing plants.

Toronto is the chief distributing centre of the most productive province in the Dominion, especially in grain, fruits, and live stock, the latter involving a turnover of \$50,000,000 a year. Manufacturing is important and widely diversified, the farm-implement industry and publishing business being the most notable. In normal times all industries employ 75,000 men. It is famous for its departmental stores, which do a Dominion-wide trade. It is a large wholesale centre, including dry goods, leather, footwear, and fruit. Its five packing establishments make it the Chicago of Canada. A new civic abattoir is a successful municipal enterprise. Manufacturing establishments number 1620, employing capital amounting to \$215,000,000 and producing yearly manufactures worth \$230,000,000, which represent one-eighth of Canada's total industrial output. Its iron and steel foundries are important, and its chief products are machinery, lumber, wall paper, stationery, clothing, ships, cabinet ware, iron rails, stoves, pianos, bicycles, carpets, brewery and distillery products, and drugs. It is an important insurance and banking centre. Clearings for 1915 aggregated \$1,886,000,000. The city has an active mining-stock exchange as well as a large industrial-stock exchange.

The name Toronto is of Indian origin, meaning

"a place of meeting," and was probably given by the Indians in 1749, when the French, who possessed the country at that time, built a fort and traded with them. British traders soon appeared from the New England colonies, and in the war between France and Britain, in 1759, which gave the country to Britain, the fort was destroyed in order to prevent English occupation. Governor Simcoe founded the present city in 1794, naming it York and making it the capital of Upper Canada. It was occupied and burned in 1813 by the United States forces. It was created a city in 1834, when its population had grown to 9000, and then became known once more as Toronto. It suffered severely during the rebellion of 1837 and also from fire in 1849 and 1904, the loss in property in the latter disaster being \$8,000,000. Pop., 1871, 59,000; 1881, 96,196; 1891, 181,215; 1901, 208,040; 1911, 376,538. Consult C. B. Robinson, *History of Toronto and County of York* (2 vols., Toronto, 1885), and S. M. Wickett, "Municipal Government of Toronto," in *University of Toronto Studies: History and Economics*, vol. ii (ib., 1902).

TORONTO. A village in Jefferson Co., Ohio. 9 miles north of Steubenville, on the Ohio River, and on the Pennsylvania Railroad (Map: Ohio, J 5). Sewer pipe, brick, pottery, and glass are manufactured. The place was first settled in 1790 and was incorporated in 1878. Pop., 1900, 3526; 1910, 4271.

TORONTO, UNIVERSITY OF. An institution of higher education at Toronto, Canada, established in 1827 as King's College. The opening of the college was delayed for 14 years, and not till 1842 were the faculties of arts, medicine, law, and divinity established. In 1849 the institution assumed its present title, and in 1853 the faculties of medicine and law were abolished and the functions of the institution were divided between the two newly organized corporations of the University of Toronto and University College. By the Federation Act of 1887 the faculty of University College consists of professors in classical languages and literature, ancient history, Oriental languages, English, French, German, and moral philosophy. All other portions of the arts course were assigned to the faculty of the University of Toronto, the lectures of which are open to the students of University College and of all federating institutions. A faculty of medicine was established in 1887; in 1888 the Ontario Agricultural College was affiliated, and subsequently the Royal College of Dental Surgeons, the College of Pharmacy, the Toronto College of Music, the School of Practical Science, and the Ontario Veterinary College became parts of the university. Federated with the university are Victoria University, St. Michael's College, Trinity College, Knox College, and Wycliffe College. The attendance in 1914-15 was 4428, and the whole number of instructors in the university and University College was 401. The library contained about 135,000 volumes and 50,000 pamphlets. The total assets of the institution on June 30, 1915, were valued at \$6,696,219, of which \$5,521,899 represented the lands, buildings, and equipment. The income for the year 1914-15 was \$916,895.

TORP, *tōrp*, ALF (1853-). A Norwegian philologist, born in Stryn. He studied at Christiania University under Sophus Bugge (q.v.) and at Leipzig under Georg Curtius (q.v.). In 1894 he became professor of comparative phi-

logy and Sanskrit at Christiania. Among his works are: *Beiträge zur Lehre von den geschlechtlosen Pronomen in den indogermanischen Sprachen* (1888); *Den græske Nominalflexion* (1890); with H. S. Falk: *Dansk-Norskens Lyd-historie* (1898); *Dansk-Norskens Syntax i historisk Fremstilling* (1900); *Etymologisk Ordbog over det Norske og det Danske Sprog* (2 vols., 1901-06; Ger. trans., 2 vols., 1910-11); *Gamalnorsk Ordbok med Nynorsk Tydning* (1909), with K. M. Hægstad. He also wrote on the ancient languages of Asia Minor and Etruria and on Greek inscriptions.

TORPE'DO (Lat. *torpedo*, numbness, cramp-fish, torpedo, from *torpere*, to be numb, stupid). A naval torpedo is an explosive device designed to destroy or injure a ship by blowing a hole in her hull at or below the water line. It consists essentially of the explosive charge, the fuse (which ignites the charge), and the case containing these.

Torpedoes have hitherto been divided into two classes, fixed and moving. The uncontrolled drifting torpedo was a forbidden weapon on account of the danger to noncombatant and neutral shipping. But its manifest naval advantages under certain circumstances caused improvement in its design, and a convention of the Second Hague Conference of 1907 permits the laying of drifting torpedoes under the designation of "unanchored contact mines," provided they automatically become inoperative one hour after the person who lays them ceases to control them. Unanchored contact mines were much employed during the Great War. In some cases, notably in the Dardanelles, the one-hour provision was not followed, though the mines may have been adjusted to become harmless after a longer interval had expired.

The classification of the drifting torpedo as a mine calls for a slight change in nomenclature. Instead of *fixed* and *moving*, we should be more accurate if we adopted the terms *non-propelled* and *propelled*. Nonpropelled torpedoes are fully described under the head of MINE, SUBMARINE, the designation "torpedo" now being confined to some form of the propelled type.

Propelled torpedoes are (1) controlled or (2) uncontrolled. The controlled type are (a) spar, (b) towing, and (c) dirigible—the last-named class being either (1) locomotive or (2) self-propelled. The uncontrolled type includes (1) automobile, (2) projectile, (3) rocket.

Controlled torpedoes have long since passed out of favor, though attempts to develop a self-propelled torpedo steered by wireless apparatus have been made and some degree of success was obtained. The other types are all obsolete, and, so far as known, no attempt was made to use them in the Great War.

The spar torpedo was secured at the end of a spar rigged out from the bow or side of a boat or ship. Torpedoes of this kind were used with considerable success in the Civil War against vessels at anchor or operating in narrow waters. The searchlight and the rapid-fire gun rendered them obsolete. The Harvey towing torpedo and its modifications were towed by a boat or ship, its shape and steering vanes keeping it well out on the quarter of the ship using it. Its defects were apparent from the start, and it was never much used. The locomotive torpedo carried its own machinery, but received power from an external source. Nearly

all were electrically driven through wires leading to the source of power and unreeling as the torpedo advanced; but the Brennan was propelled by two ordinary steel wires reeled up on drums within the shell. By hauling on these wires the screws were made to rotate and develop considerable speed. The self-propelled controllable torpedoes carried their own source of power—usually compressed air or carbonic-acid gas—and were all electrically steered through a small cable.

The projectile type of uncontrolled torpedoes was fired from a submarine gun. It received its most successful development in the hands of Ericsson, but he was unable to give it a reliable range of more than 150 yards, and this prevented its use. Rocket torpedoes are propelled by the reaction of gas escaping from the rear end of the torpedo. The surface type could be used only on very smooth water; the submerged type lacked speed; both carried very small explosive charges, were erratic, unreliable, and never had much vogue.

The class of propelled torpedoes most in use is the automobile or fish type. There are many varieties in service, each nation having developed its own or purchased its supply from the Whitehead Company. The Howell torpedo needs a passing notice. Its propelling power consisted of a heavy bronze flywheel driven at high speed up to the instant of discharge. The energy thus stored was utilized to drive the propellers and the gyroscopic force employed to keep the torpedo on its course. A fairly high speed was attained, but more important than this was its inherent strong directive force which made it much more accurate than the Whitehead. It continued to be used until a small gyroscope was added to the Whitehead type for steering purposes, and then the greater speed of the latter caused the Howell to be dropped.

The Whitehead was the first successful automobile torpedo and the most widely used. The details of the latest type are secret, but they differ but slightly from those shown in the accompanying plans. The torpedo shell is in three sections, consisting of the war head, the air flask, and the afterbody. In Fig. 1 *A* is the war nose, which is screwed into the head over the primer seat and carries a firing pin and releasing screw; *B* is the war head (an exercise head without explosive charge or war nose is used in ordinary torpedo target practice); *C* is the air flask, a forged steel cylinder which is much thicker than the other parts of the shell; *P* is the guide stud for holding the torpedo in position in the tube; *Q* is a strengthening band to support the guide stud; *V* is the balance chamber; *F* is the engine compartment; *G* is the afterbody; *H* is the tail frame which carries the rudders; *1* is the firing pin; *2* is one blade of the releasing screw; *3*, the war head, containing the explosive charge of wet gun-cotton, and *4* the priming charge of dry gun-cotton in a hermetically sealed case which is inserted in the front end of the war head before screwing in the war nose. The releasing screw is then in the locked position. As the torpedo moves ahead the blades of the releasing screw cause it to revolve and unscrew until the firing pin is unlocked. If the torpedo then strikes any object, such as a ship, the firing pin is driven in and explodes the charge. In Fig. 2, *6* and *8* are the charging and stop valves for

charging the air flask with compressed air at about 2500 pounds per square inch; *T* is the depth regulator which connects by the bell-crank lever *M* to the regulator spring, which presses against the hydraulic piston (16); the hydraulic piston receives the water pressure on its after side, as the engine room (*F*) is opened to the sea, and operates small levers pressing against a lever that is pivoted on a pendulum (17), and the motion is transmitted through the rod *N* to a crank and thence to the steering engine (18), which moves horizontal rudders (not shown) by means of the rod 24; *D* is the operating valve group which controls the supply of air to the engine (*W*); 10 is the starting lever; *E* is the releasing mechanism; *K* is

expanded in the engine it caused intense cold and congealed the lubricating oil to an extent that almost destroyed its usefulness. The alcohol heater obviated this difficulty and added 25 to 50 per cent to the available speed or range. It also facilitated the use of higher air pressures in the flask and in this way again improved the general efficiency. The turbine engine was not at first very satisfactory, but by carefully balancing the effort in both directions the tendency to rotate the torpedo was avoided and the new machinery was found to be much superior to the reciprocating Brotherhood engine of the Whitehead. Both the Whitehead and the Bliss-Leavitt torpedoes are used in the United States naval service.

FIG. 1. WHITEHEAD TORPEDO.

the gyroscope for steering in a horizontal plane, and 20 is the gyroscope wheel; 13 and 14 are the propellers; 15 is the bevel gear which permits the two propellers to be driven in opposite directions; and 22 are the rudders actuated by the gyroscope, which serves to keep the torpedo on the desired course. It is able to do this through the property of the gyroscope to retain its position in the plane of rotation. See GYROSCOPE.

The recent types of the Whitehead torpedo are larger than the one shown (which is the 18-inch). The most powerful are 21 inches in diameter, about 22 feet long, have larger war heads than the one shown and more engine power; also alcohol reservoirs and heaters which are located in the afterbody close to the air flask. These torpedoes have long range and small explosive charges or short range and large charges. The maximum effective range of torpedoes is now about 8000 yards, though torpedoes of 10,000 yards' range have been made. The average speed for long range is 25 knots

History. It is not unlikely that attempts to employ torpedoes or mines were made in the early days of gunpowder, but the first occasion on record in which they were used was in 1585, when an Italian engineer by the name of Gianibelli (q.v.) partially destroyed a bridge across the Scheldt at Antwerp by means of small vessels each carrying a considerable quantity of gunpowder which was exploded by clockwork mechanism. Nothing more is heard of torpedoes until 1730, when the French scientist Desaguliers made some experiments with some of the rocket type which were fired under water and with which he is said to have destroyed several boats. The first torpedoes to be used in war against ships were designed by an American, Capt. David Bushnell, who also built the first submarine torpedo boat, though not the first submarine boat. After making numerous successful experiments Captain Bushnell made three attempts to destroy British men-of-war. In the first Sergeant Lee used Bushnell's submarine boat (see TORPEDO BOAT, SUBMARINE, for

FIG. 2. PROPELLING AND STEERING MECHANISM OF WHITEHEAD TORPEDO.

or less. For short ranges (up to 2500 yards) speeds exceeding 50 knots have been attained. The short-range torpedo for submarine use has a large explosive charge, the Germans employing a type which carries 428 pounds or more of trinitrotoluol.

The Bliss-Leavitt torpedo was devised by F. M. Leavitt of the Bliss Company of Brooklyn. While in many respects similar to the Whitehead, it contained two very important improvements. First, alcohol was used to heat the compressed air, and, second, the engine was of the turbine type. The use of compressed air had always given much trouble. As the air

description and illustration) and actually got under H.M.S. *Eagle*, but failed to attach and explode his torpedo, owing to inexperience in handling his novel craft and the bluntness of the screw he tried to use. The second attack was made on H.M.S. *Cerberus* by drifting torpedoes; this failed, but one of the torpedoes was picked up by the crew of the prize schooner astern of the *Cerberus* and, exploding on board, killed three men, destroyed a boat, and injured the schooner. The third attempt, in the Delaware River, was the celebrated Battle of the Kegs, and it failed because the British ships had hauled in to the wharves to avoid the ice; but

it created much confusion and alarm among their crews. The next man to take up torpedoes seriously was Robert Fulton, who began his experiments on the Seine in 1797. His first attempts were chiefly failures, but in 1801, at Brest, he destroyed a small vessel with a submarine mine containing 20 pounds of gunpowder. This is believed to be the first vessel sunk by a torpedo, but he afterward succeeded in several instances, and where the attack failed it was owing to the movement of the vessel from above the torpedo and not to defects in the torpedo. In one instance a British brig was destroyed by two torpedoes made by him containing 180-pound charges of gunpowder fired by clockwork. In 1812 and 1813 another American, Mr. Mix, made unsuccessful attempts to blow up British ships. In 1820 Captain Johnson, an Englishman, with a submarine boat attached a torpedo to the bottom of a vessel and exploded it. In 1829 Col. Samuel Colt began his torpedo investigations, developed the electric firing of mines in 1842, using in one instance wires 40 miles long with complete success.

In the Civil War in America the torpedo came quickly to the front as a serious weapon. The few ships of the Confederates offered little opportunity for the use of torpedoes by the Federals, but the great fleet of the latter and the necessity which often compelled the vessels to operate in narrow waters gave a multitude of chances which their enterprising antagonists were quick to seize. The unsuccessful attempts were hundreds in number, but during the course of the struggle 7 Federal armor-clads, 9 gunboats, 6 transports, and 1 cruiser were sunk or destroyed, and 2 armor-clads, 3 gunboats, 1 transport, and 1 large cruiser were seriously injured. Of the latter, 1 cruiser and 1 armor-clad were attacked by boats using spar torpedoes. The only important Federal success was the destruction of the armor-clad *Albatross* by Lieutenant Cushing, who also used a spar torpedo.

While all this was going on Captain Lupuis of the Austrian navy and Mr. Whitehead began the development of the self-propelled torpedo. The idea of a small, self-propelled boat carrying an explosive charge and directed from a distance had occurred to Captain Lupuis in 1860, but it was not until 1864 upon his association with Mr. Whitehead that any craft of the sort were built. Mr. Whitehead, who was an English engineer acting as superintendent of engineering works at Fiume, took hold of the project with great interest. He soon gave up the plan of using directing wires and bent his energies to the development of a completely automatic device. In 1868 the first official trial was held before a board of Austrian officers, and its report resulted in the adoption of the weapon in the Austrian service, although the speed attained was only about seven knots. From this time to the present the improvement has been continuous, the speed rising to 50 knots and the directive force becoming almost absolutely certain when the conditions are favorable. All naval powers now use the Whitehead or some modification of it, and many (including the United States) have purchased the right to manufacture them.

Shortly after Whitehead's successful experiments Captain Harvey, R.N., brought out his towing torpedo, which had a vogue wholly unwarranted by its performance, but it was pleas-

ing from its simplicity. About 1870 Commander (later Rear Admiral) Howell, U.S.N., conceived the idea of applying the principle of the gyroscope to automobile torpedoes for the purpose not only of steering them but to afford motive power as well. His torpedo was gradually improved until in 1898 it attained a speed of about 28 knots with almost perfect directive force. As already stated, the application of the Obry gyroscopic gear to the otherwise perfected Whitehead, drove the Howell out of the field.

In 1873, while the success of the Whitehead remained uncertain in many minds, J. L. Lay brought out his first controllable torpedo, propelled by carbonic-acid gas and directed by electricity through wires paid out from a reel in the torpedo as it advanced. The Lay was followed by a host of similar inventions, the Lay-Haight, Patriek, Nordenfelt, Brennan, Sims-Edison, and others; but all are now discarded. Controlled torpedoes of the dirigible, self-propelled type and steered by wireless induction currents have been under experiment for many years. All the earlier designs apparently failed, but an American design, brought out in 1915, by J. H. Hammond, Jr., is very promising.

The first automobile torpedo fired with hostile intent was directed at the Peruvian monitor *Huascar* by the British cruiser *Shah*, but the shot failed through being fired at too long a range. In subsequent wars it has been used with increasing frequency and with moderate success. But it was not until the advent of the submarine that the full measure of its importance was reached. The ability of the submarine to approach its target closely without being discovered brought out a new type of torpedo in which the explosive charge was greatly increased at the expense of range. In the Great War almost every vessel struck by one of these torpedoes was destroyed; and, owing to the short ranges at which the shots were made, few of them missed.

The enormous gun power of modern battle-ships and battle cruisers, whereby the fighting range has greatly increased, seems to preclude the use of torpedoes by such vessels except under unusual circumstances and it is possible that very few if any will be carried in future vessels of this sort. Nor have surface torpedo boats achieved much success, though it must not be forgotten that the great battle fleets had not up to May 1, 1916, exposed themselves to any form of torpedo attack. See **TORPEDO BOAT**; **TORPEDO BOAT, SUBMARINE**; **TORPEDO DIRECTOR**; **ETC.**

TORPEDO, or ELECTRIC RAY. A ray (q.v.) of the family Narcobatidae, which inhabits warm seas and often is of large size. These rays have a broad flat body with a comparatively slender tail and are of interest because of the

electrical powers which they possess. (See ELECTRIC FISH.) There are about 15 species, of which the best known is *Torpedo marmoratus* of southern Europe. A similar species, the crampfish, or numbfish (*Torpedo occidentalis*), occurs on the Atlantic coast of the United States and is said to attain a weight of 200 pounds. The same or a very similar species is found on the coast of California. See Plate of ELECTRIC FISH.

TORPEDO BOAT. A small war vessel fitted to use the torpedo as its primary weapon of attack. The principal requirements of torpedo boats are high speed, efficient means of launching their torpedoes, and, in proportion to size, relative handiness and seaworthiness. They are of two principal types—surface boats and submarines. (See TORPEDO BOAT, SUBMARINE.) Surface boats are of three classes: (a) torpedo-boat destroyers; (b) seagoing boats; (c) harbor boats. Small torpedo boats of 5 to 15 tons were formerly carried by large ships, but these are now obsolete and few harbor boats have been built in recent years.

The destroyer, originally planned to destroy torpedo boats, has nearly supplanted them and in its development has extended over such a wide range of size and characteristics as to demand further subdivision. For instance, the *Swift*, of the British navy, is officially classed as a destroyer, though she has a displacement of 2170 tons. Moreover, there are comparatively few torpedo boats except submarines to destroy. As a defense against these, the destroyer type of vessel is quite efficient. When they are placed as a screen about a ship or fleet, whether steaming or at anchor, submarines have found it nearly impossible to get home an attack.

In order to be efficient as protectors to battleships and cruisers great seaworthiness is demanded, and this requires large dimensions. The average size of the modern destroyer which is designed to accompany the fleet is 900 to 1200 tons. Larger boats have been built, but the necessity for them is not yet fully proved. The armament of a first-class destroyer is four 4-inch guns and four to eight torpedo tubes. The speed is from 29 to 35 knots. In size destroyers range from 300 to 2170 tons, but the larger ones should be styled torpedo vessels and those below 400 tons called torpedo boats.

The modern torpedo boat is usually designed to form a part of the *défense mobile* of a coast. The displacement varies from 200 to 400 tons; the armament consists of one or more 3-inch guns and smaller pieces or of smaller pieces only; the speed is from 25 to 30 knots; usually 2 or 3 torpedo tubes are carried.

Surface torpedo boats can hope to be successful only when attacking under cover of night or of thick fog, and several should attack a ship simultaneously—from different directions if possible. If the vessel is under way and steaming at good speed, an attack from abaft the beam gives little promise of success, as the approach must necessarily be slow and the chances of discovery increase, while the torpedo may be deflected by the ship's wake and can only overtake the ship at a rate equal to the difference in speeds of ship and torpedo. The boat must, therefore, be nearer her target when she fires than if attacking an approaching ship. In the Great War torpedo boats were used chiefly as scouts against submarines.

In its earliest form the torpedo boat contained merely a large quantity of powder and was itself destroyed by the explosion. Craft of this type were used by Gianabelli at Antwerp in 1585. (See TORPEDO.) The first evolutionary step developed boats which carried torpedoes that were designed to be attached to the bottom of the enemy's ship. All of this type were submarine. (See TORPEDO BOAT, SUBMARINE.) The first surface boats appeared during the American Civil War, and the first partial success was achieved (October, 1863) in an attack by a Confederate boat on the Federal armor-clad *New Ironsides*, in which the latter was slightly injured. Practically all of the torpedo boats of the war used spar torpedoes, which were carried at the end of a long spar or boom rigged out beyond the bow, and nearly all were ordinary steam launches or pulling boats, though the boat which attacked the *New Ironsides* and one or two others were specially built craft with nearly submerged hulls. In 1873 the first fast (speed, 15 knots) specially designed torpedo boat was built by Thornycroft, of Chiswick, England, for the Norwegian government and was fitted for using the Harvey towing torpedo, then in much favor. In the next year both Thornycroft and Yarrow (of Poplar, near London) constructed boats for various foreign governments, and they built several in the ensuing year, but none for Great Britain. About the same time Herreshoff completed a very fast boat for the United States navy. In 1877 Herreshoff brought out the first boat fitted to use Whitehead torpedoes, and although many subsequent boats were designed to carry spar torpedoes, the Whitehead rapidly made its way, so that by 1880 it had practically displaced all rivals except the Howell and Schwartzkopf, which were of somewhat similar type. Consult J. T. Scharf, *History of the Confederate Navy* (New York, 1887), and Johnson, *Defense of Charleston Harbor* (Charleston, 1890). See TORPEDO; TORPEDO BOAT, SUBMARINE; TORPEDO NET, and references there given.

TORPEDO-BOAT DESTROYER. See TORPEDO BOAT.

TORPEDO BOAT, SUBMARINE. Except for purposes of naval war the submarine boat had, up to 1916, a very narrow field of usefulness. Lake's first boat was designed for exploration of the ocean bottom by furnishing a base from which divers could readily operate undisturbed by rough water, but it was not often employed. As torpedo boats, submarines are built of three types: (a) coast-defense, (b) cruising, and (c) fleet.

Coast-defense boats are small, have a very moderate radius of action, and possess inferior habitability. They are designed to operate from a base which is near at hand, so that the cruising radius and habitability can be sacrificed without loss of efficiency. The early submarines were all of this type, being small, slow, and defective in many ways. More recent boats, embodying later improvements, were specially designed to operate from a base near at hand, and sacrificed size, habitability, and cruising radius without loss of efficiency in other directions. They vary in displacement (submerged) from 250 to 600 tons, the surface tonnage being 20 to 40 per cent less. The length is 150 to 200 feet; beam, 15 to 20 feet; speed, 10 to 16 knots on the surface and 8 to 11 knots when submerged. Greater speed is desirable, but is difficult to obtain in boats of

small size. The cruising radius is 1000 to 2000 miles; the number of torpedo tubes, 4 to 8; one gun of 3-inch or 2.25-inch calibre is usually carried, supplemented by an antiaëroplane gun and perhaps a machine gun of musket calibre. The latter is almost invariably kept below until the boat has reached the surface, when it is passed up the hatch and placed on its mount. There are no quarters for officers or crew (20 to 30 in number), all possible space and weight being devoted to machinery and torpedoes. Small transoms or seats are provided for the officers and men not actually on watch or engaged in work. The propelling machinery consists of electric motors for submerged navigation and Diesel or gasoline engines for surface cruising. The current for the motors is supplied by storage batteries which are charged at the base, but the charge may be renewed by connecting up the charging apparatus to the oil engines when on the surface.

Cruising submarines are designed for long-distance, independent work. They must possess good habitability, large cruising radius, space for a number of torpedoes, and as much surface speed as it is possible to give them after satisfying these requirements. They have a submerged displacement of 800 to 1200 tons and a surface displacement of 650 to 1000 tons. The length is from 225 to 275 feet; beam, 18 to 25 feet; maximum surface speed, 16 to 20 knots; maximum submerged speed, 10 to 14 knots; cruising radius, 4000 to 8000 miles (using part of the submerging tanks for oil fuel when leaving the base); submerged radius of operation on a single charge of the batteries, 50 to 100 miles; number of torpedo tubes, 4 to 8; battery, one or more 3-inch guns, one or more antiaëroplane guns, one or more machine guns (kept below when the boat is submerged); officers and crew, 40 to 50. The machinery is similar to that of coastal submarines, though many of the larger boats are fitted with steam engines for surface cruising, as the Diesel engines have given much trouble. The principal difficulty with steam machinery is the heat radiated. This has been largely overcome by non-conducting and water-cooled jackets and the cooling effect of the expanding compressed air which has been water-cooled during compression or afterward. The engines of new boats are either Diesel, geared steam turbines, or fitted for electric drive (see SHIPBUILDING, *Marine Machinery*); the latter, when perfected, may be adopted, as it offers many advantages in connection with storage batteries and electric propulsion when the boat is submerged.

Fleet submarines were a new type which in 1916 had not yet been tested by actual service. They were expected to be able to accompany the battle fleet. They must, therefore, possess seaworthy qualities of a fairly high order, have good habitability, excellent surface speed, and a large radius of action, though fuel supplies could be obtained from the surface vessels, preferably from auxiliaries or "mother" ships. They must be efficiently armed to destroy the submarines and torpedo vessels of the enemy and to stand some punishment from guns of small craft. Owing to the novelty of their rôle, the details are not well settled and cannot be until experience has furnished its lessons. So far as known, the designs of boats building in 1916 called for displacements of 1500 to 2000

tons when submerged and 1200 to 1600 tons on the surface; the maximum surface speeds, 20 to 26 knots, submerged speeds, 12 to 15 knots; cruising radius, 3000 to 6000 miles; submerged radius on a single charge of batteries, 75 to 150 miles; number of torpedo tubes, 4 to 10; battery, two to four 4-inch guns; one or more antiaëroplane guns, several machine guns; officers and crew, 50 to 100. The propelling machinery is similar to that of cruising submarines, but of greater relative power in order to secure higher speed.

Still larger submarines, called submersible battleships, have been proposed. The designs provide for one or more armored turrets carrying heavy guns. In some of the proposals the whole vessel may be submerged; in other plans the turrets are always above water. No vessels of this sort were building so far as known in 1916.

The earlier submarines had very little reserve buoyancy and could run on the surface, with open conning towers or ventilating pipes, only when the sea was smooth. Their habitability was therefore poor, and their radius of action was more circumscribed by this fact than from all other causes. About 1900 the French brought out a type which they styled submersibles. They differed radically from previous boats, having two hulls, one inside the other. The outer hull resembled that of an ordinary torpedo boat, but with few projections from or irregularities in the general outline in order to present a smooth surface when submerged. Inside this there was a second hull of nearly circular cross section and as large as the shape of the outer boat permitted. To effect submergence water was admitted into the space between the hulls. This brought the boat to the awash condition; further submergence was effected by permitting the ballast tanks to fill. As compared with the submersible, the relative advantages of the former submarine type were: greater submerged speed and strength and more tubes in the bow (made possible by the blunt form); the disadvantages were less habitability, due to reduced buoyancy and sea-keeping qualities, and lower surface speed, due to poor form of hull. The relative advantages of the submersible were greater surface speed, superior habitability, and better sea-keeping qualities; the disadvantages were less strength of hull, reduced speed when submerged, and fewer torpedo tubes in the bow on account of fineness of form.

In the course of time the two types have approached each other in design. The submarine has been given a finer model and a superstructure whose top forms the deck. The present submersibles have only partial double hulls. It is therefore difficult to classify many recent boats. In the first submersibles the light cruising displacement was only half of that in the submerged condition. In recent French types the surplus buoyancy is about 35 per cent, in British boats about 20. Good habitability is obtained in the latter by raising the superstructure, but its width is reduced to keep the submerged displacement as moderate as practicable in order to prevent unnecessary reduction of the submerged speed. The high, roomy conning tower introduced by Lake is very generally adopted and affords support for a deck steering station high above the water, where it can be protected against spray by a

removable canvas screen similar to that of ordinary surface vessels.

Like other types of war craft, the submarine has steadily increased in size, for it was only by augmenting the dimensions that its present powers could be attained. The first American boats displaced 120 tons when submerged; the fleet submarines designed in 1915 were to have a tonnage of more than 1500. The same sort of development has taken place in other navies. The British and German boats which made long cruises in the Great War (see WAR IN EUROPE) were of 800 to 900 tons. By using part of their submerging tanks for fuel, these boats have a cruising radius of 3000 to 5000 miles. As submarines have increased in size and speed, they have become more and more expensive to build. The cost of large fleet submarines, fully equipped, is about \$1000 per ton, or more than twice that of surface battleships or cruisers.

One of the most notable changes in the equipment of recent submarines is the battery. About 1912 a short 3-inch gun was mounted on a few of the larger boats. The next step was to fit antiaëroplane guns, for the aeroplane is a deadly enemy. Later machine guns were supplied, and the larger boats were to be fitted with 4-inch guns in place of 3-inch. As a defense against the guns of similar craft and of surface boats, it is proposed to fit a protection deck in submarines. This will be just below the surface when the submarine is in ordinary cruising condition, and the space above it is to be closely subdivided. Another important addition to submarine equipment is the gyroscope compass. (See COMPASS.) Magnetic compasses are very unreliable when wholly surrounded by the hull of a vessel, and accurate steering by means of them was found to be impossible when the boat was submerged. The gyro compass has changed all this and made submerged navigation much more accurate and safe. The gyro principle may also be used to keep the boat on an even keel, laterally and transversely—now a difficult matter and requiring constant care and watchfulness.

Submarines are kept on an even keel by ballast tanks and horizontal rudders. The water is moved by compressed air acting on the surface of the water in the tanks and by pumps. The horizontal rudders are operated by hand or by motors. If gyro stabilizers are used they will automatically operate the machinery and control this work.

Submerging is effected by admitting water to the submerging tanks, and the boat is brought to the surface by expelling this water with compressed air and pumps. The time required to submerge and emerge depends on the size of the boat, the reserve displacement, and the capacity of the ejecting and pumping equipment. When in the presence of the enemy boats do not run in cruising trim, but in a condition called awash, with only the conning tower and a small portion of the hull above water. When so close that they may be observed (or attacked), they are submerged until only the periscope (q.v.) is visible. From the awash condition this takes but a few seconds. Under favorable circumstances it takes two or three minutes for a boat to emerge sufficiently to use her guns, and this is a dangerous time for her if discovered by a surface vessel or another submarine. Consequently every effort is made to shorten the interval as much as possible by carrying large

tanks of compressed air and very efficient pumps and by forcing her to the surface with the horizontal rudders. In the earlier boats submerging and emerging were almost entirely effected by the horizontal rudders, the hull being inclined at a considerable angle during the operation; this of course facilitated the filling or emptying of the tanks. Some recent boats submerge and emerge on a level keel without using the rudders; others use them, as already noted, to expedite the operations.

The chief difficulties in the way of submarine navigation are: (a) securing safety; (b) obtaining high speed on the surface and fair speed below; (c) steering a straight course and avoiding obstacles; (d) securing adequate habitability; (e) insuring stability. For submarine torpedo boats there are other difficulties, such as directing and discharging the torpedo and the slow submerging and emerging which add to the dangers of operation.

Perfect safety can never be obtained, and the frequent accidents to submarines show we are yet far from such a goal. The greatest source of trouble seems to be the storage batteries. No solution is in sight except to improve the batteries and inclose them in such a manner that the gases from them cannot escape into the hull nor collect in such a way as to permit a dangerous explosion.

High speed in surface torpedo boats is obtained through lightness of hull construction. This is not possible in submarines which must have heavy framing and thick plating to resist strong water pressure. Except by the sacrifice of every other attribute, high speed is impossible in the smaller boats; adequate size is necessary. The earlier submarines used gasoline engines for surface propulsion. For various reasons heavy oil engines replaced them. But these in turn have proved unsatisfactory, and, as already stated, steam machinery is being fitted in large boats.

The navigation of submerged vessels is exceedingly difficult. The periscope (q.v.) is nearly useless at night, and it is impossible to see clearly under water, even for a few feet, unless the vessel is absolutely at rest. The gyro compass and gyro stability gear are doing much to facilitate operations, but submarine navigation is still very uncertain and dangerous. The habitability of boats naturally increases with their size as well as through improved appliances. Large vessels can have separate compartments for sleeping and cooking and for the machinery, and ventilation is easier. The cooking and heating are done with electric stoves or waste heat from the boilers or engines. This waste heat is often a serious source of trouble, especially in small craft.

The conditions affecting the stability of an entirely submerged vessel differ considerably from those which control that of one floating on the surface. (See SHIPBUILDING.) Since the sectional area of the immersed body remains unchanged at all angles of heel and pitch, the position of the centre of buoyancy remains constant; the righting moment therefore grows very slowly as the boat heels or pitches. By suitable ballasting or arrangement of weights adequate transverse stability is not very difficult to obtain. But longitudinal stability is quite another matter. The shifting of weights (moving of men, torpedoes, and liquids in partly filled tanks) is a very serious matter, partic-

ularly in small boats. It is counteracted by horizontal rudders or quickly shifting water ballast. To do this effectively requires experience and constant attention. If the gyro stability gear can perform the duty automatically, it will add much to comfort and safety.

The difficulties experienced in discharging torpedoes are closely connected with the question of stability. In addition to the trouble of handling the torpedoes in a very contracted space and of giving them the correct direction at the moment of firing, it is necessary that the boat should be nearly horizontal when the torpedo leaves the tube, else it will take too deep a dive or rise to the surface at the beginning of its run. The shock of firing and the sudden release of weight at the bow as the torpedo leaves the tube cause much longitudinal disturbance in the boat and may bring it to the surface if not carefully counteracted, while the change in trim adds to the difficulty of maintaining a constant depth.

The torpedoes used in submarines are usually the same as those for surface boats, but the Germans (and other navies are following their lead) are supplying a short-range torpedo with a very large bursting charge—more

go to war we shall have to lock our dreadnoughts up in some safe harbor, if we can find one. (6) If by means of submarines we stop egress from the North Sea and the Mediterranean, it is difficult to see how our commerce can be much interfered with. (7) Not only is the open sea unsafe, but in narrow waters and harbors surface ships are at the mercy of submarines. (8) What we require is an enormous fleet of submarines, airships, and aeroplanes, and a few fast cruisers, provided we can find a place to keep them in safety during war time.

Admiral Scott's letter created a great sensation, both in the naval world and in the world at large, chiefly because he was the greatest living naval artilleryman. The enormous improvement in naval target practice and the accuracy of gun fire in recent years had been due to him more than to any other man. Moreover, he was regarded as an ardent advocate of the dreadnought battleship and a firm believer in the superiority of the gun over all other naval weapons.

The War in Europe of 1914-16 witnessed the first test of the submarine on an extensive scale. Opinions of naval experts differ consid-

LONGITUDINAL SECTION OF SUBMARINE TORPEDO BOAT.

than double that of the ordinary long-range type—the reduction of weight in the air flask being utilized to increase the explosive charge. As ordinary submarines must approach the enemy quite closely (except in very smooth water) in order to see clearly, it is thought by some that long-range torpedoes are not so necessary for them. See TORPEDO.

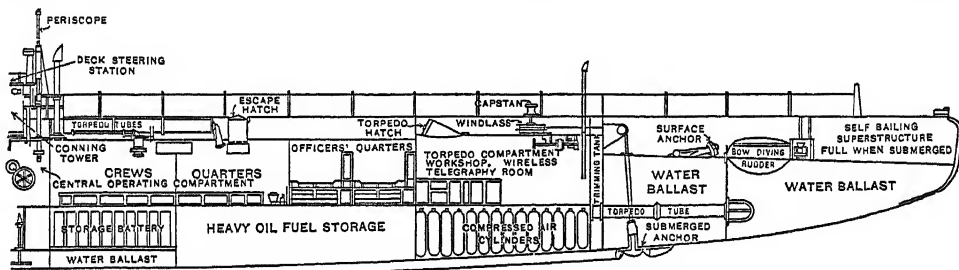

For several years the relative importance of the submarine as a weapon of war has been the subject of much speculation and discussion. A few weeks before the outbreak of the great war, on June 5, 1914, Rear Admiral Sir Percy Scott of the British navy wrote a letter to the *London Times* on the subject of the "Submarine Menace," in which he expressed himself substantially as follows: (1) Submarines have done away with the utility of surface ships. (2) As no man-of-war will dare to come within sight of a coast that is adequately protected by submarines, battleships in future will not be able to (a) attack ships that come to bombard our ports, (b) attack ships that come to blockade us, (c) attack ships convoying a landing party. (3) Nor will battleships be able to (d) bombard an enemy's ports, (e) blockade an enemy's ports, (f) blockade an enemy's fleet. (g) convoy a landing force. (4) As there will be no enemy's fleet to attack, when it is unsafe for any fleet to put to sea, this function of the battleship will cease to exist. (5) If we

erably as to how far this war demonstrated the effectiveness of the submarine for offensive purposes. During the early stages of the war the success of the German submarines in sinking a number of British and French warships led many persons to believe that the predictions of Admiral Scott were warranted. As the war progressed, however, the British authorities appear to have adopted some effective means of protecting their battleships, at least in the restricted area about the British Isles, from submarine attack. As commerce destroyers the submarines scored heavily, but their use in this connection involved serious questions of international law. The frail construction of the submarines made them vulnerable to attack even by armed merchantmen, if they were discovered before attacking. It was difficult, therefore, for the commanders of submarines to observe the accepted rules of international law, which required that noncombatants on merchant vessels should not be jeopardized, without exposing their vessels to destruction. Under these conditions German submarines sank a considerable number of belligerent and neutral merchantmen without warning, which involved Germany in serious difficulties with neutral nations, especially the United States. (See WAR IN EUROPE.) While the operation of submarines in accordance with the principles of warfare laid down for above-surface warships materially reduces their

effectiveness for offensive purposes, nevertheless, they are weapons of vast naval usefulness and, if properly handled, can greatly change the character of naval war. Indeed they have done this much already. If fitted with long-range torpedoes and handled in groups against an active fleet of battleships properly protected by destroyers and aircraft, we shall be able to form a more definite opinion of their capabilities. Up to 1916 they seem to have operated independently except in the vicinity of their own coast, though the British boats in the Baltic may be an exception.

The great dread that submarines first inspired was largely due to lack of knowledge as to means of defense against them. In the great war a screen of destroyers surrounding ships or fleets proved very effective. In the narrow waters of the English Channel heavy wire nets kept this area nearly free from submarine activity and permitted the British to transport troops and munitions of war with comparative safety. In connection with the nets the British employed small, fast motor boats armed with light guns, and these destroyed many submarines of the enemy which were caught in the nets and rose to the surface.

losing his life in the second submergence trial. In the following year David Bushnell built his first boat, with which Sergeant Lee attacked H.M.S. *Eagle* in New York harbor. Lee actually got under the ship, and the attack failed only because the screw by which the torpedo was to be attached to the *Eagle's* bottom was not sharp enough. Robert Fulton's experiments in France and America (1795-1812) demonstrated that a vessel could be built which could descend to any given depth and reascend at will. Plunging mechanism was devised about the middle of the eighteenth century, but Fulton developed the vertical and horizontal rudders and provided for the artificial supply of air. A form of periscope existed in 1692 and an improved kind was patented in 1774; in 1854 Davy still further developed it. Germany's first submarine, Bauer's *Plongeur-Marin* (Fig. 1 on Plate) was built at Kiel, 1850-51, but it was crushed by the water pressure and remained at the bottom for many years. In 1863 McClintock and Howgate built a semisubmarine hand-propelled boat for the attack on the Federal fleet, but it sank four times, each time drowning the entire crew of eight men. In the same year several larger boats propelled by engines were commenced in

LONGITUDINAL SECTION OF SUBMARINE TORPEDO BOAT.

Destroyers and patrol boats of various kinds were also successfully used, while the aeroplane proved to be an excellent detector even when the boats were some distance below the surface. In addition to signaling the enemy's position and course they assisted in the attack, and at least two submarines were destroyed by aeroplane bombs. In the protection of fleets against submarine operations they may prove a most decisive factor.

CROSS SECTION OF SUBMARINE TORPEDO BOAT.

History. When or by whom was built the first submarine boat will probably never be known. It is said that Alexander the Great was interested in submarine navigation, while subaqueous attack of vessels was studied at least as early as the thirteenth or fourteenth century. M. Delpeuch states that some English ships were destroyed in 1372 by fire carried under water. In the early part of the seventeenth century, submarine boats were numerous, and in 1624 Cornelius Drebbel exhibited to King James I on the Thames a submarine boat of his own design. By 1727 no less than 14 types of submarines had been patented in England alone. In 1774 Day began experiments with a submarine boat at Plymouth, England,

Europe, and these at intervals were followed by others designed by Hovgaard, Goubet, Zédé, Nordenfeldt, Tuck, Holland, etc. The French navy began experimenting with submarine boats about 1885. The *Gymnote* was built in 1888

BUSHNELL'S BOAT (1775).

and the *Gustave Zédé* in 1893. The *Morse* was commenced in 1894, but remained uncompleted until 1899, pending additional experiments with the *Gymnote* and the *Zédé*. In that year the

construction of submarines was actively commenced, 10 being launched in 1901. In 1886 Nordenfeldt built two large submarines for Tur-

Fife and others, *Submarines of the World's Navies* (ib., 1911); Robert Fulton, "Torpedo War and Submarine Explosions," in *Magazine of History*, extra No. 35 (Tarrytown, N. Y., 1914); Farnham Bishop, *The Story of the Submarine* (New York, 1916); also *Proceedings of the United States Naval Institute* (Annapolis, current) and various numbers of the *Scientific American* (New York, weekly).

TORPEDO DIRECTOR. An instrument designed to indicate the proper moment at which to fire a torpedo from a ship or torpedo boat. It is placed on deck, or in a port or airport giving a clear view of the enemy. The type shown in the sketch is for a bow torpedo tube on a torpedo boat; a broadside director differs chiefly in having a greater arc of train for the arm *B*. The instrument consists of a metal sector, *A*, graduated along the limb *E* into degrees of arc. On this are three movable arms, *B*, *C*, and *D*. *B* and *D* are pivoted on *A* at the centre of the arc *E*, while *C* pivots on the sliding block *G*. *B* and *C* are graduated into equal divisions, representing the torpedo and the enemy respectively. *B* is first set parallel to the axis of the torpedo tube, and the block *G* is set at the division of the scale *K*, corresponding to the speed of the torpedo. The block *H* is set at the division of the scale *L* which corresponds to the estimated speed of the enemy, and the arm *C* is swung around until parallel to the estimated course. Then the clamp screws *N* are screwed down. The direction of the enemy is therefore the direction in which the arm *B* must be in order to be hit by the torpedo moving in the direction *MP*, if the estimated speeds of enemy and torpedo are correct. The moment that the enemy is on the bearing is ascertained by looking over the sights *I* and *J*. Other means of ascertaining the direction in which to fire the torpedo are superseded by the torpedo director to a considerable extent, but it is still largely used by most navies.

TORPEDO NET. A net made of heavy wire rings connected with one another by small steel rings and surrounding a vessel of war below water as a defense against torpedoes. The net is made up in sections about 15 by 20 feet in size, and these sections join to make the total protection, which is divided into three parts, called the main defense, bow defense, and stern defense. All except the main defense are frequently omitted, and it can be carried only if the vessel is moving slowly, while no nets are of any use if the ship is moving at fair speed. The type of net most in favor is that devised by Mr. Bullivant, an Englishman in the employ of the Admiralty. The Bullivant net is made of wire rings or grommets (see **KNOTTING AND SPLICING**), 6 inches in diameter, connected to each other by galvanized steel rings. Each section weighs about 400 pounds and has a heavy piece of chain at the foot to keep it as nearly vertical as possible when the ship is under way or anchored in a current; the sections are joined to each other by stout wire lashings. The upper edge of the net has small rings sliding on a wire rope, called a jackstay, which is shackled

FULTON'S NAUTILUS (1801).

key, but little was ever done with them after they passed into Turkish hands. In 1889 Spain built the *Peral*, Portugal following with the *Plongeur* in 1892. Italy built the *Delfino* in 1895. The United States had the submarine boat under consideration for several years. The

TORPEDO DIRECTOR.

first boat ordered (about 1895) was never completed, but seven of the Holland type were ordered in 1900 and one was purchased when nearly complete early in that year.

GERMAN SUBMARINES

to the outer ends of the booms. Each of the booms is of hollow steel tubing and is about 30 feet long. The inner end is fitted with a ring which passes through another ring at the upper end of a pivot bolt which works in a lug secured to the ship's side. The outer end is fitted with two topping lifts and two guys. The booms are placed about 45 feet apart. When not in use the booms are swung in alongside and with the net landed on a sort of shelf, or if there is no shelf the net is drawn up snugly and the whole lashed to eyebolts on the ship's side. Torpedo nets are not regarded with favor by many naval officers, as they cannot be used except when the ship is at anchor, and many torpedoes are now fitted with net cutters which enable them to get through. Nets have never been carried by United States naval vessels, and experience with them in the great war and in recent experiments have confirmed the wisdom of this practice.

TORPEDO SCHOOL. See NAVAL SCHOOLS OF INSTRUCTION.

TORPEDO STATION. A torpedo supply station and headquarters for torpedo boats. The United States naval torpedo station is on Goat Island, Newport harbor. It consists of a torpedo factory, repair shops, buildings for the storage and care of reserve torpedoes, and a school for enlisted men in the construction, care, and operation of torpedoes, submarine mines, etc. Only a small part of the torpedoes used in the United States navy are made in the factory, the others being built by contract in private works. All torpedoes delivered under contract are sent there from the makers and are inspected, tested, and put into adjustment for service; also, all torpedoes which have been injured in service or need serious repairs. In addition, all necessary supplies for working torpedoes are made there, together with torpedo mines, gun cotton, primers for heavy guns, and certain other ordnance supplies and fittings.

TORQUATO TASSO, tŏr-kwă'tŏ tăs'sŏ. A tragedy by Goethe (1790) suggested by a visit to Sorrento and Sicily.

TORQUAY, tŏr-kē'. A fashionable health resort and watering place on the south coast of Devon, England, occupying a cove on the north side of Tor Bay, 23 miles south of Exeter (Map: England, C 6). Marble works and terra-cotta manufactures are its industrial specialties, and it is an important yachting station. It has a large harbor. Till about 1800 Torquay was an assemblage of fishermen's huts. Then its climate and freedom from fogs caused it to be resorted to by tuberculous patients; it soon attained European celebrity. St. John's, a fine church of modern Gothic architecture, the town hall, a museum, a theatre, and an opera house are the chief structures. Torquay was incorporated in 1892. Kent's Cavern, discovered in 1824, and the Brixham Cave, discovered in 1858, are rich in fossils and have supplied the earliest English evidences of prehistoric man. After the defeat of the Spanish Armada Don Pedro's galley was brought into Tor Bay, and an old thirteenth-century building, where the survivors were housed, is known as the Spanish barn. Torquay was the landing place of William of Orange in 1688. Pop., 1901, 33,625; 1911, 38,772.

TORQUEMADA, tŏr'kă-mă'dă. JUAN DE, also known by the Latinized form **TURRECRE-**

MATA (1388-1468). A Spanish theologian and Cardinal, born at Valladolid. He entered the Dominican Order in 1403 and completed his studies at the University of Paris in 1423. After presiding over houses of his order at Valladolid and Toledo, he was made master of the sacred palace by Eugenius IV in 1431 and employed in various important negotiations. He was made Cardinal priest in 1439, later Cardinal Bishop of Albano, and in 1464 Cardinal Bishop of Sabina. The large revenues of various preferments he devoted to church building and works of charity, but attained greater renown by his numerous theological writings, many of which dealt with the controversies of the day. He took part in the councils of Constance, Basel, and Florence and drew up the plan for the union between the Greek and Latin churches at the last named. Consult S. Lederer, *Der spanische Cardinal Johannes von Torquemada* (Freiburg, 1879), and H. C. Lea, *History of the Inquisition of Spain* (4 vols., New York, 1906-07).

TORQUEMADA, TOMÁS DE (1420-98). A Spanish Inquisitor General. He was born at Valladolid, of the same family as that to which belonged the famous theologian, Juan de Torquemada (q.v.). He entered the Dominican Order and became prior of the monastery at Segovia, a post which he held for 22 years. In 1478 the Inquisition (q.v.) was reestablished in Spain by Ferdinand and Isabella, and four years later some assistants were given to the first inquisitors. Torquemada was among these and so distinguished himself by his zeal that in 1483 he was named by Sixtus IV Grand Inquisitor for Castile and Aragon. He erected four tribunals, at Seville, Cordova, Jaén, and Villa Real, the last of which was afterward transferred to Toledo. The Grand Inquisitor was assisted by a council of theologians and jurists named by the King, but deriving their jurisdiction from the Inquisitor General in virtue of the latter's papal authority. In political and legal questions he was obliged to act only in concert with them, but in theological matters merely asked their advice. Torquemada drew up the code of procedure, which was confirmed by the Pope, though the Holy See steadily impressed upon the inquisitors the necessity of exercising charity towards those who were accused of heresy and frequently mitigated the rigor of their sentences. Torquemada took a prominent part in the expulsion of the Jews from Spain. Towards the end of his life he retired into the Dominican monastery of Avila, where he died. Consult De Molenes, *Documents inédits: Torquemada et l'Inquisition* (Paris, 1897), and H. Gaultier de Saint-Amand, *Torquemada: Essai sur l'Inquisition d'Espagne en 1483* (Saint-Denis, 1910). As a typical representative of the Spanish Inquisition, Torquemada stands convicted of wanton cruelty on the evidence of his own code of procedure and on the evidence of the Jesuit historian Juan de Mariana (q.v.) and of the later historian Juan Antonio Llorente (q.v.), who was general secretary of the Inquisition and made a careful study of its archives.

TORQUES, tŏrks (Lat. *torques, torquis*, twisted neck ring, necklace, collar, from *torquere*, to rack, twist, torment). A species of gold ornament, meant to be worn round the neck, which was much in use in ancient times among Asiatic and North European nations. It con-

sisted of a spirally twisted bar of gold, bent nearly into a circle, with the ends free and terminating in hooks or sometimes in serpents. Numerous examples have been dug up in Great Britain and France.

TORRE, tór'rá, DUKE DE LA. See SERRANO Y DOMÍNGUEZ.

TORRE DEL GRECO, tór'rá dēl grā'kō. A seaport and bathing resort in the Province of Naples, Italy, situated at the base of Vesuvius, 7 miles southeast of Naples (Map: Italy, E 4). The town has been largely rebuilt since the great eruption of Vesuvius in 1861. It manufactures wine, coral ware, lava ware, and rope. There are shipbuilding yards. The inhabitants are largely engaged in the coral, tunny, oyster, and sardine fisheries. Torre del Greco suffered severely from lava streams in 1631, 1737, 1794, and 1906. Pop. (commune), 1901, 33,299; 1911, 35,320.

TORRE DELL' ANNUNZIATA, -än-nūn'-tsē-ä'tā. A seaport in the Province of Naples, Italy, situated at the base of Vesuvius, 12 miles southeast of Naples (Map: Italy, E 4). It makes a specialty of macaroni. There are fine thermal baths. It has a government arms factory, extensive fisheries, and a trade in wine and lava products. Pop. (commune), 1901, 28,143; 1911, 25,070.

TORREDONJIMENO, -dōn-hē-mā'nō. A town in the Province of Jaén, Spain, 8 miles west of the city of Jaén, on the right bank of the Salado de Porcuna (Map: Spain, D 4). It is a well-constructed town with regular plazas and wide streets. There are gypsum quarries in the vicinity. Spirits and soap are the chief manufactures. Pop., 1900, 10,044; 1910, 12,328.

TORRENCE, (FREDERIC) RIDGELY (1875-). An American poet, born at Xenia, Ohio, and educated at Miami University and at Princeton. He was successively a librarian in the Astor and Lenox libraries, New York, assistant editor of the *Critic*, and associate editor of the *Cosmopolitan Magazine* (1906-07). He was honored with membership in the National Institute of Arts and Letters. His work includes: *The House of a Hundred Lights* (1900); *El Dorado: A Tragedy* (1903); *Abelard and Eloise* (1907), a poetic drama; *Rituals for the Events of Life* (1910); *Three Plays for Women* (1910).

TORRENS, HENRY WHITELOCK (1806-52). An English writer, born at Canterbury and educated at Charterhouse and Christ Church, Oxford. He held various positions in the civil service and in 1837 became one of Lord Auckland's secretaries, but his reputation rests upon his translation of the *Arabian Nights*. The first volume appeared in 1838. The work was never completed, but the existing fragment is considered superior to any later version. His collected works were published by J. Hume in 1854 (Calcutta and London).

TORRENS, LAKE. A large lake depression in South Australia, situated about 35 miles north of the north extremity of Spencer's Gulf (Map: South Australia, D 2). It is about 130 miles long, with an average breadth of 20 miles, but is very shallow. In the wet season it receives a number of streams from the Flinders Range, but for a large part of the year it is only a salt marsh.

TORRENS, ROBERT (1780-1864). An Irish economist. He is best known as an economist and as one of the first to state the law of diminishing returns, the modern theories of

wealth, and theory of international trade, and is credited with having proposed the separation of the Bank of England into banking and issue departments. His publications include: *An Essay on Money and Paper Currency* (1812); *An Essay on the Production of Wealth* (1821); *Letters on Commercial Policy* (1833); *On Wages and Combinations* (1834); *Tracts on Finance and Trade* (1852).

TORRENS, SIR ROBERT RICHARD (1814-84). A British colonial statesman, born at Cork, and educated at Trinity College, Dublin. In 1840 he went to South Australia, of which he became Treasurer in 1852 and, after responsible government was established, Premier and Treasurer in 1857. In the following year were passed the land laws which bear his name, whereby public registration was substituted for conveyancing. (See TORRENS SYSTEM.) In 1863 Torrens retired from Australian public life, returned to England, and in 1868 entered Parliament, where he sat for Cambridge until 1874, but failed to introduce his reform in the land laws. His publications include *The South Australian System of Conveyancing* (1859) and *Transfer of Land by "Registration of Title" as now in Operation in Australia under the "Torrens System"* (1863).

TORRENS, WILLIAM TORRENS MCCULLAGH (1813-94). An Irish politician and author, who in middle life (1863) assumed his mother's name of Torrens. He was born at Greenfield, near Dublin, was educated at Trinity College, Dublin, and was admitted to the Irish bar in 1836 and the English in 1855. In 1842 he was one of the founders of the Mechanics' Institute of Dublin. Elected to Parliament in 1847, he sat for Dundalk until 1852, was returned in 1857 for Yarmouth, but was unseated on petition, and then sat for Finsbury from 1865 to 1884. He was known for his interest in social questions. He introduced the Artisans' Dwellings Act and that by which the School Board of London was established. His publications include: *The Industrial History of Free Nations* (2 vols., 1846); *The Lancashire Lesson* (1864); *Our Empire in Asia: How we Came by it* (1872); *Memoirs of Viscount Melbourne* (2 vols., 1878); *Twenty Years in Parliament* (1893); *History of Cabinets* (2 vols., 1894).

TORRENS SYSTEM. A system of registration of titles to real estate introduced into South Australia by Sir Robert Richard Torrens in 1857 in the Real Property Act. This system of official examination and registration of titles has been adopted in England, Australia, New Zealand, British Columbia, parts of Canada, and in somewhat modified form in some of the United States and Territories including New York, Massachusetts, Illinois, California, Colorado, Oregon, Minnesota, Ohio, Washington, Hawaii, and the Philippines. The chief characteristics of the system are (1) the creation of truly indefeasible titles warranted and guaranteed by the state; (2) provisions for special proceedings by which the validity of the title is established and a governmental certificate issued attesting that fact; (3) the transfer of title to registered land by entry on the register to the exclusion of all other methods; (4) the creation of an indemnity fund to compensate those injured by the operation of the system.

England. The present English system is the result of agitation and experimental legislation of upward of 50 years. As now in force, the

English Act provides for three forms of registered titles, absolute, qualified, and possessory. The extended examination necessary to justify a certificate of absolute title and the expense attendant thereto have tended to discourage application for such titles; and the fact that a certificate of qualified title tended only to emphasize the existing defect in title had a similar effect upon applications for qualified certificates. The system has operated with considerable success in reference to possessory titles, however, in spite of the fact that the certificate issued in such applications does not affect rights existing before the time of the possession certified to and does not cut off rights to the title not yet possessory in character. In other words, such a certificate merely vests in the applicant "such title as he may have" at the time of the application.

United States. Because of the due-process clause of the Constitution of the United States, the pioneer Illinois Act of 1895 was declared unconstitutional, since it appointed a registrar of titles whose functions in effect amounted to the exercise of a judicial power. Accordingly all the registration acts now in force provide for a regular proceeding in court, brought by the person seeking to have his title registered, and effective only against persons interested upon the giving of notice as prescribed in the statute. Under the Massachusetts Act a court of land registration is established for the whole State, its sessions being held in Boston. After the completion of such a proceeding, provided the case has been properly conducted and all necessary parties served, a period, generally two years, as in the Illinois Act, must elapse before the title of the applicant becomes indefeasible. It has become customary to protect the parties during this period by the issuance of a bond. In the United States only estates in fee simple may be registered. See CONVEYANCE; DEED; REAL PROPERTY; RECORDING OF DEEDS; TITLE, REGISTRATION OF; TITLE DEEDS.

TORRES NAHARRO, tór'rás ná-här'rô, BARTOLOMÉ DE. A Spanish poet and dramatist, born at Torre de Miguel Sexmero, near Badajoz, towards the end of the fifteenth century. He lived at Rome and subsequently at Naples, where he published his collected works under the title *Propaladia* (1517) and dedicated them to Ferdinand d'Avalos, the husband of Vittoria Colonna. His plays have action, character, and plot and are of historic value. Torres Naharro is called the creator of Spanish comedy, but this title belongs rather to Juan del Encina. Torres Naharro can, however, be considered the first real master of the Romanesque drama, and he was the first Spanish writer who developed his plots and examined their effect on the public. He also

wrote ballads, sonnets, and epistles. It was some time before his plays became known in Spain, and the first Spanish edition of them did not appear until 1520. But during the following century his works were very popular, although, owing to his manner of describing the clergy, the later editions were expurgated. Consult Torres Naharro, *La Propaladia*, edition by Manuel Cañete and Marcelino Menéndez y Pelayo (with an excellent study by the latter), in *Libros de Antaño*, vols. ix and x (Madrid, 1880, 1900).

TORRES NOVAS, tór'rás nó'väs. A town of the District of Santarem, Portugal, 56 miles northeast of Lisbon (Map: Portugal, A 3). It is in an olive-producing region and has important oil mills and cotton and linen manufacturing. Pop., 1900, 10,738.

TORRES (tór'rés) STRAIT. The channel which separates New Guinea from the Australian continent (Map: Australia, G 4). It is about 80 miles in width. Its navigation is rendered difficult by coral reefs, sand banks, and islands. It was discovered by Torres in 1606.

TORRES VEDRAS, vā'drás. A town in the District of Lisbon, Estremadura, Portugal, on the left bank of the Sizandro, 24 miles northwest of Lisbon, on the Lisbon-Figueira Railroad. Pop., 1900, 6891. It carries on some trade in wine. The Lines of Torres Vedras consist of three lines of fortifications, begun by Wellington in 1809 and behind which he retired in October, 1810, before the invading army of Masséna. He held the lines against all the attempts on the part of the French and in August, 1811, forced Masséna to retreat. The first of these lines, extending from Alhandra on the Tagus to the mouth of the Sizandro on the sea-coast, was 29 miles long; the second lay from 6 to 10 miles behind the first and had a length of 24 miles; the third, situated to the southwest of Lisbon, at the very mouth of the Tagus, was very short, being intended to cover a forced embarkation if that became necessary. The entire ground thus fortified was equal to 500 square miles.

TORREY, BRADFORD (1843-1912). An American ornithologist and author, born at Weymouth, Norfolk Co., Mass. He entered business in Boston, and from 1886 to 1901 was a member of the staff of the *Youth's Companion* of that city. Among his books, marked by accurate and discriminating observation and a happy style, are *Birds in the Bush* (1885; 8th ed., 1895); *A Rambler's Lease* (1889); *Spring Notes from Tennessee* (1896); *A World of Green Hills* (1898); *Every-Day Birds* (1901); *The Clerk of the Woods* (1903); *Nature's Invitation* (1904); *Friends on the Shelf* (1906); *Field Days in California* (1913).

TORREY, CHARLES CUTLER (1863-). An American Semitic scholar, born at East Hardwick, Vt. He graduated from Bowdoin College in 1884, from Andover Theological Seminary in 1889, and from the University of Strassburg (Ph.D.) in 1892. He was afterward instructor and professor of Semitic languages at Andover until 1900, when he accepted a like chair at Yale. In 1900-01 he was director of the American School of Archaeology in Jerusalem, and in 1906 he became chairman of the managing committee of this school. He served as coeditor of the *Journal of the American Oriental Society*. His publications include: *The Commercial-Theological Terms in the Koran*

(1892); *The Composition and Historical Value of Ezra-Nehemiah* (1896); *The Mohammedan Conquest of Egypt and North Africa* (1901); *Selections from Bokhari* (1906); *Ezra Studies* (1910).

TORREY, CHARLES TURNER (1813-46). An American reformer, born at Scituate, Mass. He graduated at Yale in 1830, studied theology, and became pastor of a Congregational church in Princeton, N. J. Later he had charge of a church at Salem, Mass., but finally gave up his pastoral duties to devote himself to the abolitionist movement. He removed to Maryland, and in 1843, for writing an account of a slaveholders' convention held at Baltimore, he was arrested and imprisoned. He aided fugitives by the underground railroad and in 1844 was convicted of having attempted to help slaves to escape and was sentenced to a long term in the State penitentiary. Two years later he died in prison of consumption. His body was taken to Boston, where it was given a public funeral. He was hailed as a martyr in the antislavery cause.

TORREY, JOHN (1796-1873). An American botanist. He was born in New York State; graduated at the New York College of Physicians and Surgeons (1818); was professor at West Point (1824-27); in the College of Physicians and Surgeons (1827-55); at Princeton (1830-54); chief assayer in the United States Assay Office, New York (1853-73). In 1855 he was president of the American Association for the Advancement of Science. His best-known publications are: *Catalogue of Plants Growing Spontaneously within Thirty Miles of New York* (1819); *Flora of the Northern and Middle States* (1824); *Flora of the State of New York*. With Prof. Asa Gray he began the publication of *Flora of North America* (1838-43). His valuable herbarium and botanical library he presented in 1860 to Columbia College, in which institution he held a professorship of chemistry at the time of his death. A noted botanical club has been named for him.

TORREY, JOSEPH WILLIAM (1828-84). An American newspaper man and merchant, born at Bath, Me. He was for a time connected with the *Boston Times* and the *Carpet Bag*. In 1853 he went to Australia, where he entered a commercial house, and in 1859 to China, where he became editor of the *Hongkong Times* and the *China Mail*. He engaged in commerce, organized the American Trading Company of Borneo, and in 1865 was recognized by the Sultan as Rajah of the Marudu and Ambong districts. He retained the position until 1879, when he became Secretary of the American Legation at Bangkok. He returned to the United States in 1883.

TORREY, REUBEN ARCHER (1856-). An American evangelist, born at Hoboken, N. J. He was educated at Yale (A. B., 1875; B.D., 1878) and at Leipzig and Erlangen (1882-83). Ordained to the Congregational ministry in 1878, he was city missionary in Minneapolis, Minn., for some years and then became associated with the work of Dwight L. Moody, serving as superintendent of the Moody Bible Institute from 1889 to 1908. Besides preaching in many American cities he made a world evangelistic tour in 1902-03 and held meetings in Great Britain in 1903-05 and 1911. His writings include: *What the Bible Teaches* (1898); *How to Work for Christ* (1901); *Re-*

vival Addresses (1903); *How to Promote and Conduct a Successful Revival* (1901; new ed., 1906); *Anecdotes and Illustrations* (1907); *Studies in the Life and Teachings of Our Lord* (1909); *The Person and Work of the Holy Spirit* (1910); *The Return of the Lord Jesus* (1913).

TORREYA (Neo-Lat., named in honor of John Torrey). A genus of conifers belonging to the Taxineae, or yew tribe, and comprising four species of remarkable distribution. All of the species are very local, but very widely separated, occurring in restricted localities in Florida, California, Japan, and China. The California species known as Californian nutmeg is the largest, reaching a height of 70 feet and occasionally 100 feet.

TORREY BOTANICAL CLUB, THE. A scientific society in New York City, incorporated in 1871 and now one of the six associated societies forming the Scientific Alliance (q.v.). It has a valuable herbarium of several thousand specimens, illustrating the flora within 100 miles of New York, exhibited at the museum of the New York Botanical Garden, which is the home of the club. The membership in 1916 was about 400, of whom 300 were active members. The club publishes the *Bulletin*, *Torreya*, and *Memoirs*.

TORRIANI, MARIA TORELLI. See TORELLI. TORRIANI, MARIA.

TORRICELLI, tōr'rè-chèl'lè, EVANGELISTA (1608-47). An Italian mathematician and physicist, born at Piancaldoli or, according to some authorities, at Modigliana in the Romagna. From about 1628 he studied mathematics in Rome, under Benedetto Castelli (1577-1644), the favorite disciple of Galileo. Galileo's theories on force and motion especially engaged his attention and led to his publishing a *Trattato del moto* (1641), a meritorious work, but containing few new discoveries of consequence. He was then invited by Galileo to visit him at Florence, and aided the old philosopher, now blind, in the preparation of his *Discorsi*. On Galileo's death he was appointed his successor in the chair of philosophy and mathematics at Florence. Torricelli was the first to use a column of mercury in a tube closed at one end to balance the pressure of the atmosphere, and found that a much shorter column could be used than in the case of water, as in Galileo's experiment. This feat, actually performed in 1643 by his assistant, Viviani, furnished him with the idea of the barometer (q.v.) in which the space above the mercury in the closed tube has since been known as a Torricellian vacuum. Torricelli also effected the quadrature of the cycloid, but in this he was anticipated by Roberval. He was also the first to construct a simple microscope and improved the telescope. In 1908 was celebrated in Italy the third centenary of Torricelli's birth, and interesting memorials were published reproducing his original work.

TORRIGIANO, tōr'rè-jā'nò, PIETRO (also TORRIGIANI and TORREGIANI) (c.1472-1528). A Florentine sculptor of the late Renaissance. He was born in Florence and studied under Bertoldo in the Giardino Medici, where in a jealous rage he broke the nose of his fellow pupil, Michelangelo, thereby permanently disfiguring him. He was afterward taken by Florentine merchants to London, where he worked for King Henry VIII, executing the stately tomb of Henry VII and his Queen (1518) in Westminster Abbey.

He also designed there a bronze monument for the Duchess of Richmond, and the tomb of Dr. Young in the Rolls Chapel, Chancery Lane. Later he went to Spain, where he executed commissions for the cathedral of Seville and modeled the fine statue of St. Jerome (now in the Museum, Seville). Imprisoned by the Inquisition for destroying a statue of the Virgin for which he considered himself underpaid, Torrigiano starved to death in confinement. His work is in the light decorative style of the late Quattrocento, but shows greater emphasis on the architectonic structure.

TORRINGTON. A town in Litchfield Co., Conn., 35 miles by rail west of Hartford, on the Naugatuck River, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 2). It has a public library, the Hungerford Hospital, and a fine municipal building. Torrington is extensively interested in manufacturing. The leading products are brass articles, hardware, needles, skates, novelties, woolen goods, gasoline engines, and machine tools. Pop. (town), 1900, 12,453; 1910, 16,840; 1915 (U. S. est.), 19,153; 1920, 22,055. Torrington was settled in 1737 and was incorporated in 1740 as a town and in 1887 as a borough. (Population 1920, 20,623.) Consult Samuel Orcutt, *History of Torrington* (Albany, 1878).

TORRINGTON, FREDERICK HERBERT (1837-1917). A Canadian musician, born at Dudley, Worcestershire, England. In 1853 he became organist at St. Anne's, Bewdley, and in 1857-69 was organist at Great St. James's Street Methodist Church in Montreal, Canada. He was organist and musical director at King's Chapel, Boston, in 1869-73, and also professor in the New England Conservatory of Music; in 1873-1907 he was organist and choirmaster at the Metropolitan Church at Toronto, Canada, and conducted the Philharmonic Society there. He founded in 1886 the first Toronto musical festival and in 1888 instituted the Toronto College of Music. He also conducted Toronto musical festivals in 1895 and 1896. In 1903 he was associate conductor, with Sir Alexander Campbell Mackenzie (q.v.), of the cycle of musical festivals in that city. He was elected president of the Canadian Society of Musicians in 1892. Among his works are organ music, choruses, hymn tunes, and services.

TORRINGTON, VISCOUNT. See BYNG, GEORGE.

TOR'SION BALANCE. An instrument originally designed by the Rev. John Mitchell and after his death improved by Henry Cavendish, who used it in performing the well-known Cavendish experiment of determining the mass of the earth. The apparatus was reinvented by Coulomb and is often known by his name, having been used by him to study electrical and magnetic attractions. It consists of a horizontal rod suspended by a fine wire or, in the most recent experiments, a fibre of quartz and carrying at either end two small spheres having a mass equivalent to one gram. Adjacent to but on opposite sides of these small masses are two large spheres of lead which attract the two smaller masses and cause the horizontal rod to deflect, the movement being observed by a mirror and telescope and scale as in the case of the reflecting galvanometer. The force of attraction between two different masses can thus be ascertained, and, as the attraction of the earth for a unit mass as well as its radius is known,

we can thus determine the mass of the earth. In electricity charged conductors were substituted for the masses, and to study the strength and action of magnetic poles a long thin magnet was suspended and a similar magnet placed in a vertical position near one of its poles. The

TORSION BALANCE.

amount of force exerted was ascertained by finding the angle through which it was necessary to turn the head carrying the wire in order to keep the suspended bar at its original position. The Cavendish experiment enables the physicist to compute the mass of the earth and to determine also its mean density, which according to Boys is 5.5268.

TORSK (Norw., Dan., Swed. *torsk*, connected with Eng. *thirst*, or Cusk. A small cod (*Brosme brosme*) of the European side of the North Atlantic, taken in deep water and regarded as valuable. It is usually about 20 inches long and is distinguished by its long dorsal fin and yellow color.

TOR/SO (It., stump, trunk). An ancient statue of which only the body remains. Of such imperfect relics of classic art, the most famous is the *Torso of the Belvedere* in the Vatican, the work of Apollonios, son of Nestor, an Athenian. It is a masterpiece of the later Greek sculpture (first century B.C.), showing a thorough mastery of the treatment of the nude in all its details, though without the ideality of the best period. It represents a man of gigantic build, seated on a rough rock over which a skin is thrown. It is usually called Hercules, though Sauer prefers to consider it Polyphemus. No successful or convincing restoration has yet been made. The common story that it was discovered in the Campo del Fiore at the beginning of the sixteenth century and placed by order of Pope Julius II in the Vatican, is certainly wrong. It is only known that it was formerly in the possession of the Colonna family and was brought to the Vatican by Pope Clement VII (1523-34). Consult Loewy, *Inscripfen der griechischen Bildhauer*, No. 343 (Leipzig, 1885), and B. Sauer, *Torso von Belvedere* (Giessen, 1894).

TORSTENSON, LENNART, COUNT OF ORTALA

(1603-51). A Swedish general, born at Torstena, West Gothland, Aug. 17, 1603. He became a royal page in 1618 and attended Gustavus Adolphus in most of his earlier campaigns. When Gustavus entered Germany in 1630, Torstenson was captain of the bodyguard; and the brilliant services he rendered were rewarded with rapid promotion. In 1641, on the death of Banér, he was appointed to the command of the Swedish forces in Germany. He invaded Silesia in May, 1642, routed the Imperialists at Glogau and Schweidnitz, reduced most of Moravia, and being pressed back into Saxony by the Archduke Leopold William and Piccolomini, turned upon his pursuers (Nov. 2, 1642) and signally defeated them on the historic field of Breitenfeld. He then laid Moravia and Austria under contribution. The Emperor, Ferdinand III, despairing of protecting his territories from Torstenson, negotiated with Christian IV of Denmark to make a diversion by invading Sweden; but Torstenson with characteristic promptitude left Moravia in September, 1643, traversed Saxony, burst into Holstein, and in less than six weeks subjugated the Danish mainland. The Imperialists under Gallas followed him to aid their allies, but arrived too late and were routed and driven into Saxony, and again totally defeated at Jüterbog in attempting to bar Torstenson's return into Bohemia (1644). The Swedish general won a great victory over Hatzfeld at Jankau (March 6, 1645) and carried his arms to the Danube. The Emperor was compelled to flee from Vienna, the Saxons again joined the Swedes, and the Danes, routed at sea as well as on land, sought peace. In 1646 disease compelled Torstenson to resign the command and retire to Sweden, where he was created Count and appointed to various high offices. He died at Stockholm, April 7, 1651. Consult De Peyster, *Torstenson* (New York, 1886). See THIRTY YEARS' WAR.

TORT (Lat. *torquere*, to twist, OF. *torte*, twisted). A civil wrong. A short and exact definition of tort is not possible. Legal authorities have attempted such definition, but unsatisfactorily, as "a wrong independent of contract." Yet the assault on a passenger by the employee on a street car gives rise to an action in tort and an action for breach of the contract of transportation. The elements of a tort are that it consists of the breach of a legal duty which may have been created by contract or implied by law, and such duty must be owing to the party injured. It is distinguished from contracts in its nature in that it involves a greater amount of moral turpitude. The very names of the principal torts connote wrong, such as slander, fraud, negligence, and conversion (q.v.). An action in tort usually carries with it the right to arrest the defendant. It differs from a crime, as it is an offense against an individual, while a crime is an offense against the state. It is one of the earliest branches of law, as undoubtedly in primitive communities the settlement of active disputes was one of the first functions of authority, while contract rights, breaches of agreement, were left to the individuals. Later, as acts tended to become breaches of the peace, the state assumed them to be offenses against itself. The distinction between contracts, torts, and crimes has, even in modern communities, not been clearly held. The law of torts is itself constantly changing. With changing social conditions and the recog-

nition of altered obligations new legal duties of one individual to another are defined. Acts which were not torts have become so. For example, at common law the landlord owed little or no obligation to repair. The roof of the house might fall in or the stairs give way, and the landlord was not liable, but under modern conditions, where frequently a number of tenants dwell in a tenement house, statutes impose a duty on the landlord; the theory being that the landlord exercises supervision and control over the roof and hallways used by the tenant jointly, no responsibility resting on the individual tenant. The landlord therefore is held liable for injuries in an action in tort, for negligence in failure to make repairs, after notice. A branch of the law of tort which is not settled and is yet in process of change is that of what is known as "unfair competition." Another example of the change of the law of torts with altered social conditions is the modern recognition by statutes of the obligation of employers in regard to accidents to their employees. The essential element of legal duty should be distinguished from moral duty. Thus, a man's property may be injured by fire which a bystander could have extinguished or prevented at little risk. No cause of action would lie for the neglect of the bystander because he was under no legal obligation to act. Thus, many accidents happen and injuries result for which no remedy exists. But where a right of action does exist damages are not confined to those which the law would recognize in an action on contract, and exemplary damages may be recovered. A classification of the principal torts has been attempted on the basis of the nature of the injuries. Injuries to property are such as conversion, trespass, nuisance; to person, negligence, assault; to feelings, such as injuries to reputation, libel, slander, alienation of affection, and seduction (q.v.). As a general rule the party must elect whether to sue on a contract or a tort. An example of the same act which is both a breach of contract, a tort, and a crime, is that of the misappropriation of funds by a trustee. It is a breach of the contract of trust; it is a tort, conversion; and it is a crime, embezzlement. The law will award damages for the breach, equity will follow the misappropriated funds and allow arrest of the defendant, and the state will punish for the crime. Another act which may be given as an example is that of criminal libel. The libel may be of such a nature that it is punishable by the state as a crime, and at the same time give a right of redress to the individual in tort. See CAMPBELL'S (LORD) ACT.

TORTICOLLIS. See WRYNECK.

TORTOISE, tŏr'tūs, -tīs (OF. *tortue*, *tortugue*.

Fr. *tortue*, tortoise, from Lat. *tortus*, twisted, so called from its crooked feet; termination influenced by Eng. *porpoise*). A turtle of terrestrial habits. The term is indefinite, but usually distinguishes land chelonians from marine species, although tortoise shell is exclusively a marine product, and certain fresh-water turtles, as the terrapins, are spoken of as marsh tortoises. Its most exact application is probably to the family Testudinidae, in which the shell is always covered with well-developed horny shields. It includes the terrapins or aquatic mud turtles of the genera *Emys*, *Chrysemys*, and similar groups, in which the feet are adapted for both walking and swimming and the carapace is often ornamented by gay colors or sculpturings. Many are almost wholly terrestrial, as is the case with the common box tortoise (see TURTLE) of the United States. Near allies are the famous Greek tortoise of the Mediterranean region and many other species of the typical genus *Testudo*; also the Florida gopher. See GOPHER TORTOISE.

The most important and distinctive members of the group are the gigantic land tortoises of various oceanic islands, now extinct or nearly so. (See EXTINCT ANIMALS.) All these belong to the genus *Testudo* and differ little except in size from the other members of the family. Some of them are not larger than other large turtles, but those most noted greatly exceed any other living forms, although surpassed by the *Testudo atlas* of the early Pliocene in India, whose shell was 6 feet or more in length. Others, with shells about 4 feet in length, were its contemporaries in Europe and in North America. Their representatives survived until a recent date or still live in the Galápagos Islands, Madagascar, and the Mascarene Islands, but nowhere upon any continent.

Specimens of small species have been known to live more than 100 years and one, at least, more than 150 years. The Madagascar species (*Testudo grandidieri*) became extinct probably before that island was discovered by white men, but at least two species of the Camoros have remained until within historic times. One (the elephant tortoise, *Testudo gigantea*, see LAND TORTOISE) is now extinct in its original home, the North Island of Aldabara, but preserved in the Seychelles, and a specimen living in England in 1897 then measured $52\frac{1}{4} \times 50$ inches over the curve of its shell and weighed 358 pounds; another in St. Helena was more than a century old in 1900. Daudin's tortoise, of South Aldabara, also survives in small numbers, and several were taken to Europe in 1895, one of which, at least 100 years old, had a shell 55 inches long. Several other species, probably or surely extinct, inhabited Rodriguez and other islands of the Indian Ocean, where they were found in abundance by the early voyagers and planters, but were slaughtered for food or as curiosities.

The Galápagos Islands had several species of similar gigantic tortoises, one to each island of the archipelago, which differed from the Eastern ones mainly in having longer necks and smaller heads. Some were long ago exterminated by man or by the pigs which Ecuadorans turned loose upon the islands a century ago; others still survive in small numbers, although in 1893 and again in 1898 large numbers were taken away and distributed to zoölogical gardens in various parts of the world, New York and Washington getting several old

and young specimens. The largest collection of all living species is that at Tring Park, England, where the biggest known Galápagos tortoise (*Testudo elephantopus*) is one measuring 56×49 inches over the curve of its carapace, which was taken from Duncan Island in 1813 to Rotuma, thence to Sydney in 1880, and finally to England.

Ditmars, *Reptiles of the World* (New York, 1910), and especially John Van Denburgh, "The Gigantic Land Tortoises of the Galápagos Archipelago," in *California Academy of Sciences, Proceedings*, vol. ii (San Francisco, 1914). Cf. TURTLE; and see illustration under LAND TORTOISE.

TORTOISE BEETLE, or SHIELD BEETLE. A leaf beetle of the subfamily Cassidinae. The adults are rounded convex beetles with a curious marginal expansion of the upper surface and with the power of withdrawing the head into the thorax, which gives them a resemblance to a tortoise. Their larvæ are flattened, fringed with spines, and the anal end of the body is provided with a forked appendage which is bent forward over the back; to this are attached the cast-off skins of the larvæ and their excrement as a protective covering. A remarkable group of tortoise beetles, belonging to the genus *Porphyraspis*, cover themselves in the larval state with a dense coat of fibres of the palm tree, upon which they live, each of the fibres being many times the length of the insect's body and elaborately curved so as to form a round nest under which the larva lives. Many species have a brilliant golden-green or iridescent metallic coloring which disappears after death, but may be restored by moistening the dead insect. Several very beautiful species occur upon the morning-glory and upon sweet potato (see SWEET-POTATO INSECTS), a large species (*Physonota unipunctata*) feeds upon the wild sunflower, and a very common brick-red species (*Chelymophora argus*) feeds upon the milkweed. See Plate of BEETLES.

TORTOISE PLANT. See HOTTENTOT BREAD.

TORTOISE SHELL. The semitransparent and beautifully mottled material of the scales covering the carapace of the hawksbill (q.v.), a marine turtle found in all tropical seas. In this species the 13 shield plates do not join at the edges, but overlap posteriorly; the larger central ones are broadly triangular in outline, keeled, and 6 or 7 inches broad, and those of a large turtle may weigh eight pounds. They are rarely thick enough to serve the ornamental purposes to which tortoise shell is usually applied, but when heated in oil or boiled in water may be welded together under pressure, or molded into a form which will be retained when cooled. "In genuine articles of Oriental manufacture these welds can generally be detected, or their compound nature is indicated by the beautiful pattern, which is too regular in the imitations now common." Even the shavings and fragments are welded into serviceable pieces. The turtles are taken usually when they come ashore to lay their eggs; and the plates are

(or were) sometimes removed by roasting the living animal until they were loosened and could be torn off. This cruel process injures the shell. The proper way is to kill the turtle and then detach the plates by immersion in boiling water. In its nature and chemical composition the material closely resembles horn (q.v.). The use of tortoise shell has long been known. Julius Cæsar found great quantities of it in the storehouses of Alexandria. The Romans veneered furniture with it. In modern times, in addition to comb making, tortoise shell is made into cardcases, trays, handkerchief boxes, and various other articles of ornament and the toilet. It is used still to inlay expensive furniture, the Chinese and Japanese producing the most complicated and beautiful examples of this sort of art.

TORTOISE-SHELL BUTTERFLY. Any one of the butterflies of four or five common American genera. They are usually of medium size and have the wings on the upper side of some shade of black or brown marked with red, yellow, or orange. The commonest species in the eastern United States are the following: *Euvuessa antiopa*, sometimes called the mourning cloak (q.v.) and in England known as the Camberwell beauty. *Aglaia milberti* is common in the northern United States and Canada. Its caterpillars feed upon the nettle plants of the genus *Urtica*. *Eugonia californica* is confined to California and in the larval stage feeds upon *Ceanothus*. *Eugonia j-album*, the Compton tortoise, is a northern species whose larvæ feed upon willows.

TORTOLA. One of the Virgin Islands (q.v.).

TORTONA, tŏr-tŏ'nà. A town in the Province of Alessandria, Italy, on the Scrivia, 12 miles east of Alessandria (Map: Italy, B 2). It has a ruined castle overlooking the town. The town manufactures silk, markets grain and wine, and quarries stone. Tortona was destroyed by Frederick Barbarossa in the twelfth century for its allegiance to the Guelphic cause. Pop. (commune), 1901, 17,425; 1911, 20,151.

TORTOSA, tŏr-tŏ'sà. A fortified town of Spain, Province of Tarragona, 42 miles from the city of Tarragona, picturesquely situated on a sloping eminence overlooking the Ebro, from the mouth of which it is distant about 22 miles, and which is navigable to this town for vessels of light draft (Map: Spain, F 2). The town has a cathedral with fine carved work and marbles. There are manufactures of rope, paper, leather, soap, and pottery, of palm leaf and feather grass, but the fisheries give employment to most of the people. In the vicinity are ruins of a Roman city. Pop., 1900, 24,306; 1910, 28,097.

TORTRICIDÆ. See LEAF ROLLER.

TORTUGA, tŏr-tŏŭ'gà, or **TORTUE,** tŏr-tŭ'. An uninhabited island off the north coast of Haiti, West Indies (Map: West Indies, D 2). Area, about 80 square miles. Its surface is broken. It was formerly occupied by buccaneers and produced sugar, tobacco, etc.

TORTUGAS, tŏr-tŏŭ'gáz. A group of islands off the coast of Florida. See DRY TORTUGAS.

TORTURE (Lat. *tortura*, a twisting, torture, from *torquere*, to rack, twist, torment). The infliction of severe bodily pain either as punishment or for purpose of revenge or for the purpose of compelling the person tortured to give evidence or make confessions in judicial proceedings. Among primitive and savage peoples torture has been used as a means of ordeal (q.v.)

and as a means of punishing captured enemies. During the Middle Ages the Church made use of torture as a means of compelling religious conformity and for the purpose of extorting evidence in heresy trials. Throughout southern and western Europe the most extreme cruelties were practiced for this purpose (see INQUISITION), and it was not until 1816 that torture was finally prohibited by papal bull. Examination by torture, otherwise called "the question," has been largely used in many countries as a judicial instrument for extracting evidence from unwilling witnesses or confessions from accused persons. In ancient Athens slaves were always examined by torture, and their evidence seems on this account to have been deemed more valuable than that of freemen. No free Athenian could be examined by torture, but torture seems occasionally to have been used in executing criminals. Under the Roman Republic only slaves could be legally tortured, and, as a general rule, they could not be tortured to establish their master's guilt. Under the Empire, however, torture, besides being much used in examining slaves, might by order of the Emperor be inflicted even on freemen, to extract evidence of the crime of *læsæ majestatis*, a prerogative frequently exercised by the Roman emperors. Cicero and other enlightened Romans condemned its use. Until the thirteenth century torture seems to have been unknown to the canon law; about that period the Roman treason law began to be adapted to heresy as *crimen læsæ majestatis Divinæ*. A decree of Pope Innocent IV in 1282, calling on civil magistrates to put persons accused of heresy to the torture to elicit confessions against themselves and others, was probably the earliest instance of ecclesiastical sanction being extended to this mode of examination. Gradually the ecclesiastical courts developed from the Roman law and applied a system of torture which reached its culmination in the atrocities of the Inquisition. The influence of the Church during the Middle Ages undoubtedly contributed to the adoption of torture by the civil tribunals. It was early adopted by the Italian municipalities, but its introduction into western Europe as an instrument of judicial inquisition as distinguished from the ordeal or compurgation was slow. It first appeared in France in the latter part of the thirteenth century and in Germany in the fifteenth century and ultimately became a part of the legal system of every European nation except Sweden and England. The use of torture seems to have been repugnant to the genius of the law of England, and it never became a part of the common law, although its use by exercise of the royal prerogative was lawful both in state trials and in the case of ordinary crimes. The first instance we have of its use is in 1310, in aid of the ecclesiastical law, during the struggle between Pope Clement V and the Templars. Edward II, when applied to to sanction the infliction of torture by the Inquisitors in the case of certain Templars accused of heresy and apostasy, at first refused; but on a remonstrance by Clement he referred the matter to the Council; and on the recommendation of the Council the Inquisitors were authorized to put the accused to the torture, but without mutilation or serious injury to the person, or effusion of the blood. During the Tudor period the Council frequently assumed the power of directing torture warrants to the lieutenant of the Tower and other officers both

against state prisoners and those accused of other serious crimes; and similar warrants were at times issued under the sign manual. Under James I and Charles I torture was less resorted to and only in state trials. In 1628, in the case of Felton, the assassin of the Duke of Buckingham, the judges declared the examination of the accused by torture, for the purpose of discovering his accomplices, to be illegal. The last recorded instance of the use of torture in England was in the reign of Charles I (1640) to compel a confession of treason. The use of torture was never legal in the English colonies, and the few instances of torture in the American colonies were properly forms of execution, or the infliction of *peine forte et dure* (q.v.) as a means of compelling the defendant to plead to an indictment.

Even during the period when the use of torture was most prevalent its cruelty was recognized and its employment deplored as an evil necessary to the due administration of justice. In all ages there have been leading writers and thinkers who denounced the use of torture, not only because of its cruelty and its debasing effect upon public morals, but because of its unreliability as a means of discovering the truth, since it oftentimes led the innocent from weakness and exhaustion to plead guilty or accuse others of crimes which had not been committed. The horrors of the Inquisition and the excessive use of judicial torture from the fourteenth to the sixteenth century led to a gradual but nevertheless progressive change of public sentiment, which ultimately caused its disuse in all the countries of Europe. The use of torture was abolished in Prussia, Saxony, Austria, and Switzerland by the middle of the eighteenth century. Its use in Russia was limited by command of Catharine II in 1762 and finally abolished in 1801. In France it was abolished in 1789 (although temporarily restored by the Bourbons in 1814), in Württemberg in 1806, in Bavaria in 1807, in Hanover in 1822, and in Baden in 1831.

The instruments and methods of judicial torture have been numerous. Among the Greeks torture was inflicted by the rack (q.v.), the scourge, by thrusting the victim bent double into a vault which compelled him to retain that position until his suffering became extreme, by the injection of vinegar into the nostrils, and by the application of fire. The Romans also made use of the rack, torture by fire, the scourge, and mutilating the flesh by hooks. The wheel, upon which the victim was bound and his bones broken by the gradual application of force, was also used throughout the Middle Ages. Among the lesser tortures may be mentioned the thumbkins, boots, pincers, and manacles; and in England an instrument corruptly called the scavenger's daughter, the invention of Sir William Skeffington (or Skevington), lieutenant of the Tower in the reign of Henry VIII. This enumeration, however, by no means includes all the methods, ingenious and unspeakably cruel, by which torture was inflicted upon innumerable victims during the Middle Ages. Consult: David Jardine, *Reading on the Use of Torture in the Criminal Law of England* (London, 1837); Sir J. F. Stephen, *History of the Criminal Law of England* (3 vols., ib., 1883); H. C. Lea, *Superstition and Force* (4th ed., Philadelphia, 1892).

TORUS (Lat., *protuberance*, mattress, bed). A convex molding having a semicircular profile;

a larger form of the bead. Its principal use is in base moldings of all kinds in classic and neo-classic architecture; notably the circular tori of the Doric, Attic, and Corinthian bases. See **BASE**; **MOLDING**.

TORY (from Ir. *toridhe*, *tornidhe*, *tornighe*, pursuer, plunderer, from *torighim*, to fancy, pursue). The name of one of the historic parties in England. It was originally the term applied to Irish brigands and about the year 1680 was given as a nickname to the supporters of the Duke of York, afterward James II, when his exclusion from the succession on account of his (Catholic) religion was proposed by Shaftesbury. It was intended to imply that those who opposed the exclusion were papists. About 1830 the name Conservative began to take the place of Tory. In the United States during the Revolution the adherents of the crown were called Tories. See **LOYALISTS**; **WHIG** AND **TORY**.

TORY, HENRY MARSHALL (1867-). A Canadian educator. He was born at Guysboro, Nova Scotia, and graduated at McGill University in 1890. He studied theology at the Wesleyan Theological College, Montreal, entered the Methodist ministry in 1889, but retired in 1893. He was lecturer in mathematics at McGill in 1893-1902 and then associate professor until 1908, and in the latter year was appointed president of the newly established Provincial University of Alberta at Strathcona. He published *A Manual of Laboratory Physics* (1902).

TORZHOK, tór-zhók'. An old district town in the Government of Tver, Russia, situated on the Tvertza, 294 miles southeast of St. Petersburg (Petrograd) (Map: Russia, E 3). In its vicinity lace and gold and silver embroideries are extensively produced by peasant women. In the tenth century Torzhok was a dependency of Novgorod. Pop., 1910, 13,723.

TOSCA. An opera by Puccini (q.v.), first produced in Rome, Jan. 14, 1900; in the United States, Feb. 4, 1901 (New York).

TOSCANELLI DAL POZZO, tós'ká-nè'l'è dāl pót'sò, PAOLO (1397-1482). An Italian astronomer and geographer, born at Florence. Through the accounts of Marco Polo and other travelers he came to believe that India could be reached by an ocean voyage to the West. In 1474 he imparted his views by letter to Columbus, and also to the King of Portugal. It is doubtful if Toscanelli was the first to suggest the idea of a sea journey to the West to Columbus, although he may have strengthened Columbus' determination to carry out his plans. Consult Henry Vignaud, *Toscanelli and Columbus* (New York, 1902).

TOSCANINI, tós'ká-nè'né, ARTURO (1867-). An Italian orchestral conductor, born at Parma. He received his education at the Conservatory of Parma, studying piano, cello, and composition. Having made his début as operatic conductor at Turin, he was engaged for the Dal Verme in Milan. There his brilliant work attracted such general attention that Gatti-Casazza (q.v.), who assumed the directorship of La Scala in 1895, secured his services. In this position he found ample opportunity to display his genius as operatic and symphonic conductor. From 1908 to 1915 he was principal conductor at the Metropolitan Opera House in New York. Through consummate musicianship, a magnetic and authoritative personality, and dignified reserve, he gained a strong hold upon his artists as well as his audiences. As a builder of tre-

mendous climaxes he had no superior and few equals. He directed without score a repertory of almost 100 operas of all nationalities and schools and, in addition, an extensive concert repertory. Even during rehearsals he conducted by memory.

TOSCHI, tò'skè, PAOLO (1788-1854). An Italian engraver, one of the last representatives of the old school of line work. He was born at Parma, went to Paris in 1809 to study engraving under Bervie, with whom he remained until 1819, when he returned to Parma, founded a school of engraving, and was appointed director of the Academy of Fine Arts. His best-known engravings are from Gérard's "Entrance of Henry IV into Paris" (1818); Daniele da Volterra's "Descent from the Cross"; Raphael's "Spasimo" (Madrid); Correggio's "Madonna della Scodella," and a series of that master's Parmesan frescoes. His work is solidly and carefully executed, but without brilliancy or originality.

TOSSING THE CABER. See CABER, TOSSING THE.

TOSTI, tò'stè, SIR FRANCESCO PAOLO (1846-1916). An Italian-English song composer, born in Ortona di Mare in the Abruzzi. After studying at the Naples Conservatory he was appointed an instructor there. He resigned in 1869, went to Rome and appeared in concerts as a singer, after which he was made vocal instructor at the court, Rome. In 1875 he went to London and in 1880 was appointed singing teacher to the royal family. He was knighted in 1908. In 1913 he returned to Italy, making Rome his permanent residence. His numerous English and Italian songs have become exceedingly popular.

TOSTIG (died 1066). A powerful English earl, brother of King Harold II. He was probably the third son of Earl Godwin and shared in his father's banishment, returning with him in 1052. Edward the Confessor was very fond of Tostig, and when Earl Siward died, in 1055, Tostig received Northumbria, Northamptonshire, and Huntingdonshire. Tostig proved an able and energetic ruler, restoring security to the disordered country. But his tyranny alienated the Northumbrians, and in 1065 they declared Tostig an outlaw and chose Morkere in his place. Harold sided with the rebels against his brother, and as a result Tostig was banished, though Edward regretted it exceedingly. In 1066, when Harold had succeeded Edward the Confessor as King of England, Tostig offered his support to William of Normandy. This offer was accepted, and Tostig thereupon went to King Harald Haardraade of Norway and induced him to make an invasion into England. But on Sept. 25, 1066, King Harold met them at Stamford Bridge and totally defeated them. Harald Haardraade and Tostig were both slain. Consult E. A. Freeman, *History of the Norman Conquest*, vols. ii and iii (3d ed., Oxford, 1877). See HAROLD II.

TOTAL ABSTINENCE. See TEMPERANCE.

TOTANA, tò-tà'ná. A town of the Province of Murcia, Spain, 24 miles southwest of the town of that name (Map: Spain, E 4). A gorge divides the town into two parts, the Barrio de Sevilla and the Barrio de Triana. The town is celebrated for its oranges, the mining of saltpetre, linen spinning, and especially for its tinajas (terra-cotta jars), widely used for holding oil and wine. Water is brought to the fountains by an aqueduct 7 miles long. Pop., 1900, 13,714; 1910, 13,591.

TOTARA. See PODOCARPUS.

TOTEMISM (irregularly derived from Algonquin *ototeman*, his brother-sister kin). An association between a form of social organization and a form of worship. Complex ethnological phenomena, such as totemism, cannot be readily defined; thus, any definition of totemism, including the one proposed above, can give but an inadequate idea of the institution. A brief generalized description of the content of totemism, on the other hand, may prove of considerable service. A tribe or group of tribes which have totemism may be said to comprise a totemic complex. The essential aspects of a totemic complex are three in number:

1. The totemic tribe is subdivided into a number of social units, usually clans or gentes, but sometimes families or local groups.

2. The people of the tribe possess a set of beliefs and practices, mythological, religious, ceremonial, artistic, economic, which almost in all cases centre around certain attitudes towards animals, plants, or inanimate objects.

3. These beliefs and practices are distributed among the people of the tribe in such a way that the beliefs and practices of each social unit, usually clan or gens, while not identical with those of all the other social units, are equivalent to them. The social units are thus constituted equivalent totemic units, while the entire system is a totemic complex.

Geographical Distribution of Totemic Tribes. While by no means universal in primitive society, totemism is widely distributed. In North America totemic complexes are represented, roughly speaking, in five areas: the Pacific Northwest, the Southwest, the Southeast, the Northeast, and the Eastern Plains area inhabited by tribes speaking Siouan languages and divided into totemic gentes. While our knowledge of South America is as yet very fragmentary, totemic tribes have been reported from British Guiana and Brazil. With the accumulation of further data the totemic tribes of South America may prove to be as numerous as are those of the Northern continent. In Africa a large number of totemic communities have been recorded among the negroes of the Congo, in the central eastern area, and in several districts along the western coast. Some of the exogamous gotras of India are certainly totemic. Totemism has been found in one district in Sumatra, in the southeastern section of New Guinea, in almost all of the Melanesian Islands, and in parts of Polynesia. Practically all of the known tribes of Australia have some form of totemism.

Whatever the limitations of the scope and bearing of totemism, the wide distribution of the institution indicates that the beliefs and associations involved in totemism are peculiarly congenial to early society and must be rooted in psychological attitudes widely entertained by primitive man.

Totemism as a Universal Stage in the Development of Religion. Impressed by the wide distribution of totemic phenomena and the almost universal character of the attitudes towards animals, plants, and inanimate objects which are so common in totemism, a number of authors have attempted to represent totemism as a stage in religious evolution through which all society must have passed. Most prominent among these attempts are those of Jevons, Gomme, Wundt, and Durkheim. While Gomme was satisfied to see in totemism a peculiar combination of social form and psychic disposition which to him

TOTEM POLES, SOUTHERN ALASKA

seemed a necessary phase of religious and social development, Jevons's theory is much more ambitious. According to him totemic beliefs and rites, in addition to constituting a natural and universal outgrowth of primitive animism, also lie at the root of all animal worship, of sacrifice, of the blood covenant, of the domestication of animals. Wundt differs from Jevons in so far as he posits a stage in human development, a stage of very great duration, when totemism was unknown and the attitudes which characterize totemism remained dormant. This early period, the Era of Primitive Man, was succeeded by the Totemic Era, also of impressive duration and distinguished by a set of specific beliefs, activities, and institutions. In Durkheim's view totemism again becomes the root of all religion. He finds the birthplace of religious rites, beliefs, and concepts in the totemic institutions of central Australia. Durkheim first identifies the totemic principle, the fundamental concept underlying totemism, with *mana*, supernatural magic power, then derives it from the social setting of the individual, which in primitive Australia is constituted by the totemic clan. From the totemic principle on its conceptual side arises the belief in souls as well as the concept of deity or god, while in its dynamic aspect it becomes the forerunner of force, the scientific concept of power. The very categories of thought, such as causality, space, time, totality, find, according to Durkheim, their early prototypes in the totemic classifications of nature and its phenomena.

Theories of the Origin of Totemism. Another aspect of totemic phenomena which has received wide attention is the hypothetical origin of totemism. While differing in their specific interpretations, the different authors agree in holding that the theory of the origin of totemism which to them seems most plausible must thence have universal validity. Thus, Frazer has at different times propounded three different totemic-origin theories. The earliest one ascribes totemism to the belief in "bush souls," according to which individuals may temporarily deposit their souls in animals, plants, or inanimate objects. The second theory sees the root of totemism in the magical ceremonies of the Central Australians, which are performed by the members of each totemic clan to further the multiplication of its sacred animal. The last hypothesis, finally, known as the conceptional theory of the origin of totemism, is based on certain Australian beliefs with reference to the conception of children, according to which the visions or real experiences of pregnant women determine the totemic membership of the child. Lang claims that the first impetus towards the development of totemic ideas and practices was derived from the animal names by means of which primitive tribes so often distinguish one another. Out of the primitive speculations with reference to the origin and significance of such names totemism arose. According to Hill-Tout the totem is closely related to the personal guardian spirit, from which, in fact, it must have been derived. Haddon, finally, believes that totemism must have arisen in a state of society where local groups possessed special hunting rights and taboos with reference to different animals.

Ethnological Interpretation of Totemic Complexes. The justification of approaching totemic phenomena from the standpoints out-

lined above was sought in certain general and certain special postulates. The general postulates are those of the classical evolutionary conception, according to which culture in its entirety as well as in its special phases everywhere begins in essentially the same way and passes in its subsequent development through essentially similar stages. It must suffice to note here that the consensus of scientific opinion no longer supports this classical theory, serious flaws in which have been revealed by a more intensive study of fact as well as a more rigorous application of method. The special postulates underlying the totemic theories here discussed are that the particular traits of which totemism consists are always nearly the same; that these traits are organically, i.e., genetically, related; that they are specifically totemic traits; and that one is consequently justified in assuming the former existence of one or several of such traits which may be missing in any given totemic community at the time of investigation. All of these postulates may readily be shown to be erroneous. The totemic traits here referred to are totemic exogamy, the rule that no two individuals of a totemic clan may intermarry; totemic taboo, the prohibition to eat or kill the totemic animal; totemic names, clan names derived from the totemic animal or plant; totemic descent, the belief that the individuals of the clan have descended from their totemic animal; etc. Now, if one examines any two totemic areas, he will often discover that the above traits are by no means equally represented in the two areas. The comparison, e.g., of the totemism of some of the tribes of the American Northwest with that of some of the Central Australian tribes, reveals the fact that, while totemic names are found in both places, they do not apply to the corresponding social units; that exogamy, while represented in both areas, does not appear as a primary feature of the totemic clan, but as a derivative feature, due to the fact that the clan is comprised in a larger social unit, the phratry; that totemic taboo and descent, while represented in the Australian area, are altogether absent in the American one; and, what is still more significant, one finds that in addition to the classical totemic traits certain other traits appear in both areas: in America association of the totem with the guardian spirit, a feature not found in Australia, and a highly developed art deeply saturated with totemic ideas, whereas the totemic art of Australia is at best a passive reflection of the totemic content; in Australia magic ceremonies for the multiplication of the totemic animal, while in America similar ceremonies appear altogether apart from totemism; and a belief in the incarnation of ancestral totemic spirits, while in America the belief in incarnation exists, but again does not refer to totemic spirits. A further comparison of the results reached with the conditions in other totemic areas, in America, Africa, Melanesia, confirms the impression that, while several of the totemic traits here enumerated have a wide distribution, the various totemic groups or complexes differ often strikingly in the nature, number, and cultural significance of their totemic traits. The more extended comparison also reveals the fact, that the traits so far considered in association with totemism are by no means restricted in their distribution to totemic complexes, but occur also where there is no totemism. Thus, animal names and taboos

must be recognized as features of much wider distribution than totemism, and the same is true of the belief in animal descent; exogamy not infrequently is associated with groups that are not totemic, such as villages, or groups of individuals related by blood; and so on with the other traits. Thus, the conclusion is reached that totemic complexes are not genetically simple, but must be regarded as highly complex aggregates of features of disparate historic derivation, which, being brought together by a process of secondary association, are welded into a more or less perfectly integrated totemic system. The acceptance of the above view of totemic phenomena inevitably leads one to assume a critical attitude towards the conception of totemism as derived from one particular source, or as the most primitive form of religion, or as a universal stage in the development of religion. Being correlated with a definite form of social organization, usually a clan system, totemism may not be ascribed to tribes that are not organized on such a basis. Tribes whose social organization is of the family-village type are very numerous, nor is there any evidence that such tribes have ever passed through a clan stage; hence they never had totemism. Moreover, some tribes with clan systems have no totemism, and, in the absence of convincing evidence to the contrary, one is not justified in attributing totemism to them in the past, there being no necessary genetic connection between totemism and clan systems. Totemism not being universal, religion, which is universal, can obviously not be derived from it. Totemism, moreover, cannot be strictly conceived as a primitive institution, for it must have been unknown during that entire period designated by Wundt as the Era of Primitive Man, when the local group and the loosely articulated family constituted the framework of social organization. When totemism is considered on its religious side, one must always remember that, if that term is at all applicable to totemism, it is an altogether peculiar variety of religion, in so far as an essential aspect of totemism is constituted by its social connotations. Totemism is not a religion of the tribe but of the clan, which means that the specific content of that religion differs with each clan, the unity of the tribal complex being conditioned by the formal identity of these clan religions. Therefore, the Kangaroo clansmen of central Australia, e.g., whose particular beliefs and rites are altogether different from those of the Dingo clansmen, will nevertheless have no quarrel with the latter, although individuals of the two clans will often be represented in the same local group, in fact, in one family; therefore, also, the Kangaroo men, who may not kill nor eat the kangaroo, will remain undisturbed if the killing and eating are done by a Dingo man. It has also been observed that the totemic religion scarcely ever constitutes the whole of the religion of a people, but is accompanied by ancestor worship, or fetishism, or any other form of belief. As to the origin of totemism, it needs hardly be said that all monogenetic attempts in that direction must be summarily rejected, for an institution so complex in its composition can obviously not be assumed to have always found its beginning in one source.

Totemic Complexes and Religious Societies. Totemic communities, as complexes of historically and psychologically heterogeneous fea-

tures, display certain striking similarities to another form of socio-religious association fairly common in primitive groups, viz., religious societies. A religious society is a group of individuals who bear a common name (often derived from an animal), share a set of religious and mythological beliefs, and perform together certain ceremonies. Where the societies occur, there is always more than one such society in the tribe, while often a large part of the individuals of the tribe are grouped in religious societies. While male societies are by far the more common, female societies also occur, but almost invariably the membership of a society does not include both sexes, but is restricted to the one or the other. The geographical distribution of religious societies is rather striking. In a large number of totemic areas religious societies also occur, e.g., in the Northwestern, Southwestern, Southeastern, and Eastern Plains areas of North America, in west Africa, and Melanesia. This distribution suggests possibilities of genetic relationship. Webster has propounded a theory according to which religious societies are to be regarded as totemism in decay, as a normal stage of evolution from totemism to other forms of religious organization. In this dogmatic form the theory must certainly be rejected, but it may contain a germ of truth in so far as genetic relationship between totemism and religious societies may have obtained in individual instances. Thus, in the southwest of North America religious societies may have developed out of totemic clans, while in the Eastern Plains area, represented by the Omaha and other Siouan tribes, totemic gentes may have grown out of local groups with religio-ceremonial functions. According to recent evidence such relations between the two institutions also seem probable in certain parts of Melanesia. Of even greater interest than the geographical and the possible genetic relations between totemism and religious societies, are the similarities and contrasts of the two institutions from the theoretical standpoint. In the one case as in the other the tribe is divided into a set of social units; these units have common functions, ceremonial, religious, artistic; and these functions cluster about or grow out of certain attitudes towards animals, plants, or inanimate objects, although the latter feature is by no means so characteristic of religious societies as it is of totemic complexes. In the one case, moreover, as in the other the institution must be regarded as a complex of historically disparate traits. The similarity thus seems almost to approach identity. The contrasts, however, are equally significant. While religious societies, like clans, are social units, they are constituted social units solely by the exercise of common functions. Take away the functions and nothing remains but an aggregate of wholly unrelated individuals. Not so in the case of the clan. While it is true that with the clan also the functions determine its precise position in the culture of the group, the clan would remain a social unit even if stripped of all its functions. This is due to its social composition, for a clan is a hereditary group of individuals who are in part related by blood and in part assume themselves to be so related. This constitutes perhaps the most fundamental contrast between a clan and a religious society. Other differences are not lacking, however. The religious aspect is almost invariably more pronounced in the societies than it ever is in to-

temic clans. The societies are largely unisexual, while the clan always embraces related individuals of both sexes. The clan is a hereditary unit, while the society is usually non-hereditary, although certain offices in it may be hereditary, and a tendency towards inheritance of the society itself occurs here and there. Thus, what might be called the sociopsychological flavor of a tribal group of religious societies is quite distinct from that of a totemic complex. Therefore, while the two institutions present from the theoretical standpoint a set of similar problems, it will be profitable to keep them apart conceptually as well as for purposes of intensive study.

TOTERO. See TUTELO.

TÓTH, tót, KOLOMAN (1831-81). An Hungarian poet, born at Baja, County of Bács-Bodrog. He took part in the revolution of 1848 and published in 1852 his first collection of patriotic poems, which achieved instant success. The next year appeared *Paul Kinizsi*, composed in imitation of the *Toldi* of Arany (q.v.). Then came a number of plays, one of which, *Egy királyné* (A Queen, 1857), took the Hungarian Academy's prize. In 1860 Tóth founded the comic paper *Bolond Miska* (Foolish Michael). The same year he was elected to the Kisfaludy Society and in 1861 to the academy. The play *A nők az alkotmányban* (Women in Constitutional Life, 1871) was the first to be well received on the stage, Tóth's popularity being in the field of patriotic verse.

TOTILA (?-552). An Ostrogothic king whose real name was Baduila. He was chosen in 541 to occupy the throne made vacant by the assassination of his uncle Hildibald. He prosecuted the war against the forces of the Eastern Emperor not only with great success but also with generosity and humanity. After reducing southern Italy he laid siege to Rome, to relieve which Justinian had sent out the celebrated Belisarius. The city fell, however, in 546, and after two more years of warfare, in which he was poorly supported, Belisarius asked to be recalled. Totila thereupon ravaged Sicily, reduced Sardinia and Corsica, and harassed the coasts of Greece, but in 552 was defeated and killed at Taginæ by an army under the eunuch Narses. Consult Edward Gibbon, *Decline and Fall of the Roman Empire* (ed. by J. B. Bury, vol. iv, London, 1912), and *Cambridge Medieval History*, vol. ii (New York, 1913).

TOTLEBEN, töt'lä-ben, or **TODLEBEN**, FRANZ EDUARD IVANOVITCH, COUNT (1818-84). A Russian general of engineers. He was born at Mitau, Courland, May 20, 1818, and after studying at Riga was admitted as a student to the college of engineers at St. Petersburg. He served as a lieutenant of engineers in the Caucasus campaign of 1848-51 and in 1854 took part in the siege of Silistria. When the French and English troops undertook the siege of Sebastopol, Totleben, then a colonel, was sent to assist in its defense. The fortifications were placed under his direction. The principle on which he acted was to watch the works of the allies and to establish against them on every point a superiority of fire, by multiplying the number and increasing the calibre of his guns. The prodigious activity displayed by the Russians in making good the damage sustained by the heavy fire of the enemy filled the allied army with astonishment. Massive ramparts mounted with formidable batteries rose at each threatened point within the line of defense. In June, 1855, Totleben was wounded, and he was forced to relinquish active supervision of the defense. After the conclusion of peace, he expanded what was at first a mere engineer's report into a history of the war in the Crimea, entitled *Défense de Sebastopol*. For his services Totleben was made adjutant to the Emperor and in 1869 general of engineers. In the Russo-Turkish War of 1877-78 Totleben was intrusted with the investment of Plevna after repeated assaults on the works had been repulsed with immense slaughter. He succeeded in completely cutting off the city from all outside relief, so that finally nothing was left to Osman Pasha but to attempt to break through the lines of the besiegers, in which he failed. In April, 1878, he received the supreme command of the Russian forces in Turkey. He became Governor-General of Odessa in 1879 and commandant of Vilna in the following year. He died at Soden, Germany, July 1, 1884, and was buried in Sebastopol. (See CRIMEAN WAR.) There are biographies of Totleben by Brialmont (Brussels, 1884) and by Krähmer (Berlin, 1888).

TOTNES, töt'nēs, GEORGE CAREW, EARL OF. See CAREW.

TOTONAC. An ancient cultured nation whose territory embraced the northern portion of the present State of Vera Cruz, with the adjacent portion of Puebla, Mexico. Their language has numerous Mayan and Nahuatl affluities, but appears to be of distinct stock. They claim

to have come from the northwest about 800 years before the Spanish Conquest and to have been the builders of the remarkable ruins of Teotihuacan, about 10 miles northwest of the city of Mexico. For several centuries they had maintained their independence, but had been conquered by the Aztec emperors some time before the coming of the Spaniards. Cortés made his first landing in their territory. They were fully as advanced as the Aztecs. Their capital, Cempoalla, was about 5 miles from the seacoast, with houses built of brick and mortar, each house in the centre of a small garden watered by a constantly flowing stream, and the city itself was surrounded by fruit trees and fields of grain. Their religion was a ceremonial sun worship, and they practiced circumcision and head flattening. They still constitute an important part of the population of their former territory, retaining many of their ancient rites interwoven with those of the conquering religion.

The superbly carved stones of peculiar shapes that are commonly ascribed to the Totonac have an excellence second only to Maya sculpture. The most interesting stones are shaped like a capital U and are called sacrificial yokes, although their original use is unknown. Human and reptile motives are combined in the elaboration of these yokes. Other stones of peculiar shapes bear remarkable sculptures of birds, etc. In pottery the most beautiful objects are the so-called "laughing faces," which are infectious in their realism. All of these faces wear broad smiles. It is in the Totonac area that the art of the Archaic Mexican type seems to have first come under the influence of the Maya. The most famous ruin is that of Papantla.

TOTONICAPAN, tō'tō-nē-kā-pān'. A town in the department of the same name, Guatemala, 61 miles northwest of the capital city (Map: Central America, B 3). Its population is almost wholly native, of Quiché descent, and its industries accordingly consist of simple weaving and wood and stone work. The town was the centre of the Quiché opposition to Alvarado. Pop. (est.), 18,000.

TOTTEL, RICHARD (c.1525-94). An English publisher, compiler of the celebrated *Tottel's Miscellany*. Of his early life nothing is known. Granted in 1553 a seven years' patent to print law books, and charter member of the Stationers' Company in 1557, his patent was renewed for life in 1559. He reached a high position in the Stationers' Company, but left it in 1589 on account of ill health. Besides the law books issued, Tottel published volumes of general literature which invest him with a bibliographic interest. Among these were More's *Dialogue of Comfort* (1553); Lydgate's *Fall of Princes* (1554); Hawes's *Pastime of Pleasure* (1555); Grimald's translation of *De Officiis* (1556); and Surrey's translation (1557) of the second and fourth books of the *Æneid*—the earliest English blank verse known. The *Miscellany* appeared June 5, 1557, and contained 271 unpublished poems by Surrey, Wyatt, Grimald, Forrest, Heywood, Thomas, Vaux, and others unidentified. The verse of Surrey and Wyatt is not known to have appeared elsewhere. The *Miscellany* was the first of poetic anthologies in England.

TOTTEN, JOSEPH GILBERT (1788-1864). An American soldier, born at New Haven, Conn. He graduated at West Point in 1805 and during the War of 1812 served as chief engineer in the campaign of 1812-13 on the Niagara frontier and in

that of 1813-14 on the Lake Champlain line of operations, and participated in the battle of Queenstown Heights, the capture of Fort George, the attack on La Cole Mill, and the battle of Plattsburg. For gallant conduct in the last-named engagement he was brevetted lieutenant colonel. In 1847, during the Mexican War, he directed the engineering operations in the siege of Vera Cruz and for his services was brevetted brigadier general. During the Civil War he served as commander of the corps of engineers (1861-64), as president of a board to regulate and fix the ordnance of permanent fortifications and field batteries (1861-62), and on April 21, 1864, one day before his death, was brevetted major general, U. S. A. He was much interested in the natural sciences and was an authority on conchology. Two species of shells, the *Gemma Tottenii* and the *Succinea Tottenii*, were named in his honor. He published *Reports on National Defenses* (1851), *Essays on Ordnance* (1857), and other works.

TOTTENHAM, tōt'en-am. A town in Middlesex, England, a connecting suburb of London, 6 miles northeast of St. Paul's (Map: London, C 8), on the river Lea. The town is mainly residential, and among its public parks is the Bruce Castle Park, the site of the old Bruce estate and castle in which King Robert's father died in 1303. Alexandra Palace, a favorite metropolitan pleasure resort, is partly within the urban limits. Pop., 1901, 102,703; 1911, 137,418.

TOTTORI, tōt-tō'rē. The capital of the Prefecture of Tottori, in west Hondo, Japan, 70 miles northwest of Kobe (Map: Japan, D 6). It has manufactures of cotton and silk goods. Pop., 1908, 32,682.

TOUCAN, tōō-kān' or tōō'kān (Brazil. *toucano*, probably "nose bone," less plausibly explained as meaning "feather," or of onomatopoeic origin). A bird of the family Rhamphastidae, related to the barbets, jacamars, and puff birds (qq.v.), and not very distantly to the woodpeckers, and containing about 60 known species, all natives of tropical America and remarkable for the magnitude of the bill. They are divided into two groups, the true toucans (*Rhamphastos*) and the aracarís (*Pteroglossus*), of which the latter contains the greater number of species; the former has the larger bill, and the tail is shorter. There is a difference also in the prevalent colors, the aracarís generally exhibiting much green and yellow, while the true toucans have the ground color of the plumage usually black; the throat, breast, and rump often gayly adorned with white, yellow, and red. The colors, however, are not in general finely blended, but appear in strong contrast. The legs of toucans are short; the feet have two toes before and two behind. The form of the body is short and thick; the tail is comparatively short, rounded or even, and is turned up over the body when the bird is at roost. The base of the enormous bill is of the full width and depth of the head; it is in some species more than half the length of the body. The bill is arched towards the tip, irregularly toothed along the margins of the mandibles, and extremely cellular and light, yet strong in structure. The tongue is long, narrow, and singularly feathered on each side and takes an important part in gathering food. Toucans eat fruits with avidity, but they also seize and devour small birds, lizards, etc. They make a curious clattering noise

with their great mandibles and emit a harsh cry. They live chiefly in the depths of the South American forests, in small flocks. Almost nothing is known of their life histories, but they are supposed to lay white glossy eggs in hollows of trees, making little if any nest for them. Toucans are easily tamed and in captivity readily eat rice, bread, potatoes, eggs, meat, and other kinds of food and make amusing pets. The colors of the bill are in most species brilliant during life, but disappear from stuffed specimens. The largest species, as the touco of Argentina (*Rhamphastos toco*), are about 24 inches in length, the bill in this species measuring $7\frac{1}{2}$ inches and the tail 10 inches. One of the most familiar species is the Brazil ariel, in which the throat is yellow and the rump scarlet. See Plate of HORNED BILLS AND TOUCANS.

TOUCEY, tou'si, ISAAC (1796-1869). An American statesman, born at Newtown, Conn. He was educated privately, studied law, and was admitted to the bar at Hartford in 1818. From 1822 to 1825 he was State's attorney for Hartford County and from 1835 to 1839 was a member of the United States House of Representatives. He was again State's attorney in 1842-44 and was elected Governor by the Legislature in 1846, when the election, instead of being decided by the people, was put upon that body. From June, 1848, to March 3, 1849, he was Attorney-General of the United States. In 1850 he served in the State Senate and in 1852 in the State House of Representatives. In 1852-57 he was United States Senator and under President Buchanan he was Secretary of the Navy (1857 to March 3, 1861). It was charged by the Republicans that he had manifested sympathy with the Southern cause by sending the warships of the United States to distant stations so that they could not readily be joined for action.

TOUCH (OF. *toucher*, *tocher*, Fr. *toucher*, It. *toccare*, from Ger. **tukkōn*, OHG. *suckan*, Ger. *zücken*, to twitch). One of the five special senses; the tactile sense. The sense of touch is widely distributed, but it must be distinguished from the other varieties of common sensation—pain, and temperature perception. These are perceived through the same nerves—the sensory—but the nerve fibres which are identified with the sense of touch proper are provided with special end organs, and the sense, moreover, is exercised in any degree of perfection only in those parts where there is an abundance of special end organs. These are of two kinds: touch corpuscles, situated chiefly in the skin; and end bulbs, found mainly in the mucous membranes. The lips and genital organs, being on the border line of skin and mucous membrane, are possessed of both touch corpuscles and end bulbs. The Pacinian corpuscles are widely distributed, but their part in connection with the tactile sense is only partially understood. They are numerous as the nerves of the palmar surface of the fingers, but, when found, are situated deeply in the skin or in the subcutaneous tissue. The acuteness of the sense of touch depends to some extent on the cutaneous circulation, and this is largely influenced by the surrounding temperature. The numbness produced by the application of cold to the surface of the body is thus explained.

The acuteness of the sense of touch is commonly measured by an instrument known as the æsthesiometer and consisting of two needle

points in arms movable upon a graduated scale. A pair of compasses may be used in the same way. The nearer together the points can be separately perceived, the greater the delicacy of touch. The distance at which these two points can be separately distinguished in various parts of the body is indicated in the following table:

	Millimeter
Tip of tongue.....	1.1
Palm of terminal joint of finger.....	2.2
Palm of second joint of finger.....	4.4
Tip of nose.....	6.6
White part of lips.....	8.8
Back of second joint of finger.....	11.1
Skin over cheek bone.....	15.4
Back of hand.....	29.8
Forearm.....	39.6
Sternum.....	44.0
Back.....	66.0

It will thus be seen that the point of greatest delicacy of touch is the tip of the tongue, and the seat of the least developed tactile sense is the skin over the spinal column. The sense of touch, like all other perceptions, can be sharpened by use. This improvement is not to be explained by an increased development of the terminal organs, nor by a growth of new nerve fibres in the skin, but by a more exact limitation of the sensation areas in the brain. Many artisans acquire a highly specialized sense of touch. The delicacy of the tactile sense in the blind is well known; they are able to read fine raised letters and to make articles of delicate structure in a manner impossible to individuals who can see. See CUTANEOUS SENSATIONS; PSYCHOLOGICAL APPARATUS; PSYCHOLOGY; SENSATION; SKIN.

TOUCH. In music, a term denoting the manner in which the digitals of a keyed instrument are manipulated. Most important are the smooth legato touch and the detached staccato touch. It is of vital importance which muscles are employed in playing different passages. The muscles of the fingers, the wrist, and the arm produce very different effects, generally distinguished as tone color. Thus, when we speak of a pianist as lacking in color, it means that he employs one set of muscles almost to the exclusion of others. It is the matter of touch that produces what are called singing, velvety, or hard tones.

TOUCH IN ANIMALS. A general term for the cutaneous senses of pressure, pain, and temperature, as evidenced by the selective reactions of animals to contact, warmth, and cold.

Mammals behave as if sensitive to contact, and it is probable that the hairs which are found upon the skin of all mammals are organs of pressure. (See CUTANEOUS SENSATIONS.) The vibrissæ of rats have been shown to be highly developed forms of such pressure organs. Most mammals, moreover, appear to possess a sense of support; thus, they will not, when blinded, walk off the edge of a table. The ability of bats to avoid small wires stretched in the path of their flight depends to a great extent upon the excitability of the ears, as is shown by the result of stopping the auditory meatus. It has been suggested that the drumskin of the ear acts in this case as an organ of touch, excited by the condensations of the air which occur when the bat approaches a wire. Fish and amphibia show many responses to contact. Some fish are unequally sensitive to pressure in different regions; and some, it is thought, swim against the current of a stream in response to pressure

cues from the flowing water. See KINÆSTHETIC SENSATIONS IN ANIMALS; MECHANICAL SENSE IN ANIMALS.

In general, mammals are sensitive to thermal stimuli. Rats and squirrels have been trained to discriminate between two temperatures separated by as little as 10° C. A study of the dependence upon temperature of the breathing rhythm of the decerebrized frog makes it appear that the frog, at least in a reflex manner, is as sensitive as the human being to thermal changes. For touch in man, see CUTANEOUS SENSATIONS. Consult J. B. Watson, *Behavior* (New York, 1914).

TOUCH PAPER. See PYROTECHNY.

TOUCHSTONE, or **LYDIAN STONE.** A hard black variety of quartz or flinty jasper used for testing the purity of precious metals, especially gold. The stone originally used was a peculiar bituminous quartz from Lydia in Asia Minor. When a piece of gold is rubbed across the surface of the stone, it leaves a streak which is more or less reddish, according to the amount of copper that it contains, and by comparing the streak with those of alloys of known composition the expert can determine approximately the value of the metal. See BASANITE.

TOUCHWOOD. The decayed wood of willows and some other trees used as tinder. See AMADOU.

TOUL, *tūl* (anciently *Tullum Leucorum*). A fortified town, capital of an arrondissement in the Department of Meurthe-et-Moselle, France, 14 miles west of Nancy (Map: France, N., L 4). The former cathedral of St. Etienne is noted for its graceful proportions, octagonal towers, and thirteenth-century cloisters; the fine Gothic church of Saint-Gengoult also has elegant cloisters, in the flamboyant style of the sixteenth century, and the eighteenth-century episcopal palace is now used as the town hall. The bishopric, founded in the fifth century, was suppressed at the time of Napoleon. In the latter part of the Middle Ages and later down to 1552 Toul was a free city of the German Empire. In that year it was seized by Henry II of France. In 1790 its fortifications were reconstructed upon the Vaubanian principle. In 1814 the town was stormed by the Russians, and on Sept. 23, 1870, it was taken by the Germans after a siege of nearly six weeks. Pop., 1901, 12,287; 1911, 13,663.

TOULINGUET, *tōō'lān'gā'*. See TWILLINGATE.

TOULMIN, *tōō'l'mīn*, HENRY (1767-1823). An American jurist, born at Taunton, England. He removed in 1793 to Virginia and from 1794 to 1796 was president of Transylvania University. In 1796-1804 he was Secretary of State of Kentucky and in the latter year was appointed judge of the United States Circuit Court of Mississippi. Subsequently he served in the Alabama Legislature and assisted in framing the constitution of that State. He published: *A Description of Kentucky* (1792); *Collection of the Acts of Kentucky* (1802); *Review of the Criminal Law of Kentucky* (1804), with James Blair; *Digest of the Territorial Laws of Alabama* (1823).

TOULMIN, JOSHUA (1740-1815). An English Unitarian clergyman. He was born in London and became pastor of a dissenting congregation in Colyton, Devonshire, in 1761. In 1765 he accepted a call from a Baptist congregation in Taunton. He then turned Unitarian and

in 1804 became minister of a Unitarian congregation at Birmingham. He published many biographies, including *Memoirs of Faustus Socinus* (1777), also *A Historical View of the State of the Protestant Dissenters in England under King William* (1814), and edited Neal's *History of the Puritans* (new ed., 5 vols., 1822). A volume of sermons was published after his death (1825).

TOULON, *tōō'lōn'*. The capital of an arrondissement in the French Department of Var, a fortress of the first class, and the second naval station in France (Map: France, S., L 5). It is situated on a fine and well-protected bay of the Mediterranean, 42 miles east-southeast of Marseilles, and is partly surrounded by hills, crowned by detached forts. The old town in the southern part of the city is of uninviting appearance. Surrounding it on the north are the modern quarters embellished with wide avenues and fine buildings. In the old town is situated the only ancient building of any particular architectural value—the Sainte-Marie Majeure Church. It is Romanesque and dates from the eleventh century; it contains a handsome reredos. Besides the numerous naval and military open spaces and grounds (including the Place d'Armes) in Toulon, there are in the northern part two spacious and prominent squares—the Place de la Liberté (the finest in the new town) and the Jardin de la Ville, an attractive promenade. The most important avenue of the city, the Boulevard Strasbourg, connects the two squares, and on it are the Musée Bibliothèque (a handsome modern Renaissance edifice) and the immense Marine Hospital. The Place d'Armes, to the southeast and near the port, is the main square in the city.

The harbor has five principal basins. It connects with surrounding bays, which stretch away under hills bristling with forts, and extends past Fort de l'Aiguillette out into the great harbor or roadstead which opens into the sea. The port has an easy access and is well sheltered. The marine arsenal, an immense and complete establishment with its buildings, basins, and canals, adjoins the city on the west. It dates from the time of Henry IV and on an enlarged scale was planned by Vauban. It embraces 650 acres.

Toulon has a lyceum, the Ecole Rouvière, marine schools, a marine library, a marine botanic garden, and a marine observatory. Ship-building, iron and copper founding, lace making, fishing, and viticulture are the main industries. The vicinity produces olives and figs. The principal exports are wines, oils, and fruits. In 1912 there entered and cleared 1043 vessels of 587,948 tons. Pop., 1901, 101,602; 1911, 104,582.

Toulon is the ancient Telo Martius, noted for its dye works. It was destroyed by the Saracens in 889, and like calamities befell it in the twelfth century. It surrendered to the forces of Charles V in 1524 and also in 1536. Henry IV and Louis XIV fortified it. It repelled the allied fleets of England and Holland in 1707. In 1793 it was turned over by the Royalists to the English and their allies. It was thereupon besieged by the forces of the Convention, Napoleon Bonaparte gaining there great distinction as commander of the artillery. The town was taken in December, and its inhabitants were ruthlessly punished. Consult: Octave Teissier, *Notice sur les archives communales de la ville de Toulon*

(Toulon, 1863); G. Lambert, *Histoire de Toulon* (3 vols., ib., 1886-89); Rozet, *Essai sur la climatologie de Toulon* (Paris, 1890).

TOULOUSE, *toʊˈlooʒ*. A city of France, formerly the capital of Languedoc and the present capital of the Department of Haute-Garonne. It is situated 130 miles southeast of Bordeaux (Map: France, S., F 5). Toulouse lies in a rich valley on the right bank of the navigable Garonne. It is subject to high winds, to floods, and in summer to very hot weather. Three bridges across the river connect the city with the Faubourg Saint-Cyprien on the west bank. The noble Pont Neuf, a stone bridge of seven arches, dates from 1543. The streets of Toulouse are for the most part narrow, unattractive, and poorly paved. Two wide lines of boulevards, however—the outer one following the canals—divide the city from the surrounding suburbs, and many extensive improvements have been begun. On the extreme east is the Parc du Caousou.

In the centre of the town, in the Place du Capitole, stands the Capitole, or town hall. It dates from the sixteenth century, but has recently been almost wholly reconstructed. It possesses little architectural merit. The edifice owes its name to the city magistrates, or Capitouls, who ceased to exercise their functions about the time of the French Revolution. It is the seat of the famous Académie des Jeux-Floraux, an ancient literary institution which lends especial renown to the city. These Jeux-Floraux, or Floral Games, which date from 1324, are poetical tournaments, in which the prizes allotted on May 3 of each year consist of flowers of gold and silver. In the Capitole also are an academy of legislation, founded in 1851, and an academy of science, inscriptions, and belles-lettres, founded in 1640.

Near the Capitole are the Municipal Theatre and a square donjon, restored by Viollet-le-Duc. The latter contains the city's archives. Farther south is the museum of fine arts, occupying in part an ancient Augustine convent. In this section of the city is the cathedral of Saint-Etienne, a curious inharmonious edifice belonging to different times and architectural types.

In the extreme southern part of the city are the Jardin des Plantes and the Jardin Royal. Here splendid, spacious avenues unite in the slightly Grand Rond, which is decorated with statues. To the west is the Palace of Justice, formerly the Palace of the Parlement, with several beautiful rooms. In the vicinity stands the statue of the jurist Jacques de Cujas, a native of Toulouse. Northward is the church of Notre Dame de la Dalbade, whose square tower, splendid Renaissance portal, and interior merit mention. Prominent among the old mansions in the vicinity is the Hôtel Lasbordes—a splendid creation of Bachelier, much of whose work is to be seen in Toulouse. Farther north, near the Pont Neuf, is the church of Notre Dame de la Daurade. Not far away is the lycée, occupying part of the extensive Renaissance establishment of the merchant Bernuy, who guaranteed the ransom of Francis I after the French defeat at Pavia. In the vicinity is the Protestant church. To the north of the Capitole and connected with it by the Rue du Faur, the most important street in the city, is Saint-Sernin, the finest church in Toulouse. It is a superb cruciform Romanesque structure, begun in the eleventh century and restored under Viollet-le-Duc. The splendid

octagonal tower rises 210 feet, with tiers of triangular arches. Saint-Saturnin, the martyred apostle of Toulouse, is buried here.

At the head of the educational institutions stands the university. (See TOULOUSE, UNIVERSITY OF.) There are a splendid school of medicine, a school of fine arts, a veterinary college, an observatory, an artillery school, a museum of industrial art and antiquities, and, in addition, many learned societies which occupy now the splendid Hôtel d'Assézat, bequeathed to them in 1896. The city library has over 213,000 volumes and 1000 manuscripts.

Toulouse is a city of wealth and prominence industrially and commercially, owing to its commanding position in the south of France. The Canal du Midi (q.v.) is here joined by the Canal Latéral, and thus commerce between the Atlantic and the Mediterranean is accommodated by water, Toulouse being the centre of this traffic. Much of the commerce from interior France to Spain also passes through Toulouse. The trade of the city is very extensive in wine and grain. There are two historic mills on the river. One is known to have existed in 1182; the other traces its origin back to the ninth century. There are a national tobacco factory, iron and copper foundries, a cannon foundry, and carriage and farm-machinery works. Stained glass is also manufactured. Pop. (commune), 1901, 149,841; 1911, 149,576.

History. Toulouse, the ancient Tolosa, was long prominent before the Romans came into Gaul. It was taken by the consul Cæpio in 106 B.C., and he despoiled its great shrine of the rich treasures for which it had been famous. It became the chief city of the Visigoths in 419, and it fell into the hands of the Franks in 507. It was long important as the seat of the counts of Toulouse. In the early part of the thirteenth century it suffered terribly in the Albigensian troubles. In 1562, 4000 Huguenots were killed in Toulouse. The Protestant Jean Calas, made famous by the noble exertions of Voltaire, was broken on a wheel here in 1762 on an unjust charge. At Toulouse Soult made an unsuccessful stand against Wellington on April 10, 1814. Consult: A. L. C. A. Du Mège, *Histoire des institutions religieuses, politiques . . . de Toulouse* (4 vols., Toulouse, 1844-46); Justin Jourdan, *Panorama historique de Toulouse* (ib., 1877); *Toulouse: histoire, archéologie monumentale, facultés, etc.* (ib., 1887), published anonymously; C. Douais, *L'Art à Toulouse: matériaux pour servir à son histoire de XV^{me} au XVIII^{me} siècle* (Paris, 1904).

TOULOUSE, COUNTRY OF. A feudatory state, which played a prominent rôle among the principalities of mediæval France. It was established by Charles the Great in 778, and its rulers became hereditary about the middle of the ninth century. The dominion of the counts finally extended over the whole of Languedoc, over Rouergue, and over part of Guienne and Provence. Count Raymond IV had a distinguished share in the First Crusade (1096-99). He died in 1105. His son Bertrand established the Principality of Tripolis on the coast of Syria. Raymond VI (1194-1222) is celebrated as a patron of the Provençal poets and in connection with the Albigensian wars. Having refused to take severe measure against the Albigenses, he incurred the wrath of the Church, which let loose against him the crusading forces of Simon de Montfort, to whom Raymond's

possessions were transferred by Pope Innocent III. Raymond was unable to make head against the invaders, who overran and laid waste his country. Simon de Montfort fell at the siege of Toulouse in 1218, and not long after Raymond succeeded in recovering a part of his lands. He enjoyed his regained power, however, for only a brief time, dying in 1222. His son Raymond VII (1222-49) secured possession of most of the dominions of his house, but in 1229 he was forced to cede a large part to Louis IX of France and acknowledge him as his overlord. His daughter and heiress, Jeanne, was married to the King's brother, Alphonse, Count of Poitou, on whose death, in 1271, the County of Toulouse was united with the French crown.

TOULOUSE, EDOUARD (1865-). A French alienist and psychologist, born at Marseilles. He studied medicine in his native city and at Paris, and was physician of the insane asylums of the Seine and then head physician of the asylum at Villejuif. At the latter place he established a laboratory of experimental psychology and with N. Vaschide invented much of the apparatus there used. He was founder and editor of the *Bibliothèque de Psychologie Expérimentale* and of the *Revue de Psychiatrie* and an editor of *La Revue Scientifique*. His writings include: *Les causes de la folie* (1896); *Émile Zola* (1896); *Organisation scientifique d'un service d'aliénés* (1900); *Les conflits intersexuels et sociaux* (1904); *Technique de psychologie expérimentale* (2 vols., 1905; 2d ed., 1911), with N. Vaschide and H. Pieron; *Les légons de la vie* (1906); *Henri Poincaré* (1910); *Comment former un esprit* (1910); *Comment conserver sa santé* (1914).

TOULOUSE, UNIVERSITY OF. A French university, founded as a result of the Albigensian heresy and the crusade against Toulouse, as a bulwark of orthodoxy, by Pope Gregory IX in 1230-33. It is the first of European universities founded by deliberate purpose and thus became the model for later foundations. Its chief purpose was originally theological, but it developed into a noted school of law and eventually took up the royal as against papal interests. It was particularly rich in colleges, no fewer than 10 well-endowed foundations being enumerated. At the Napoleonic reorganization it was, like other universities, merged into the national system. It includes now four regular faculties: law, medicine and pharmacy, science, and philosophy, besides the faculty of Protestant theology of Montauban, and the two "free faculties of theology and philosophy." In 1913 it had nearly 2869 students. The university library contains over 139,423 volumes, besides 30,500 volumes at Montauban.

TOUMBEY, JAMES WILLIAM (1865-). An American forester, born at Lawrence, Mich. He graduated in 1889 from the Michigan Agricultural College and later studied at Harvard. He served as professor of biology at the University of Arizona in 1891-98 and as director of the Arizona Agricultural Experiment Station in 1897-98. For two years he was connected with the government forestry service; he then went to Yale, rising to be director of the Forest School (1910). His writings include articles and bulletins on agriculture, botany, and forestry.

TOUR, TOUR, MAURICE QUENTIN DE LA. See LA TOUR, MAURICE QUENTIN DE.

TOURACOO, or **TOURACA**. Same as Turaco (q.v.).

TOURAINE, tōō-rān'. One of the former provinces of France, corresponding to the present Department of Indre-et-Loire. The capital was Tours (q.v.). After having been under the rule of its own counts Touraine was united about the middle of the eleventh century with Anjou. With Anjou it passed in 1154 to England. It was reacquired by France half a century later, was made a duchy in 1356, and was definitively united with the crown in 1584. See "Map of France, Showing Former Provinces," under FRANCE.

TOURANE, tōō-rān', or **TOURAN**. A town of Annam, 40 miles southeast of Hué (q.v.) (Map: French Indo-China, E 3). There are large substantial markets, a silk filature, an opium farm, etc. Numerous steamers maintain communication with Europe and the adjacent ports, and there is an extensive commerce carried on in sugar, rattan, bamboo, areca nuts, silk, and cassia. Tea, coffee, and the mulberry are cultivated in the neighborhood, and coal is mined. Pop., 1913, 7853, of whom 184 were Europeans.

TOURAS'SIAN EPOCH. The name sometimes applied to an epoch of European prehistoric archaeology at the end of the Paleolithic period, just before the close of the Quaternary. It is so named from the rock shelter of Tourasse at Saint-Martory, Haute-Garonne, France. See PALEOLITHIC PERIOD.

TOURCOING, tōōr'kwān'. The capital of an arrondissement in the Department of Nord, France, 7½ miles northeast of Lille (Map: France, N., J 2). It is practically a part of the great industrial centre Roubaix. The town has a fine modern Gothic church, a large new town hall, a chamber of arts and manufactures, and schools of painting, drawing, music, and architecture. In 1866 a monument was erected to commemorate the defeat here in 1794 of the English and Austrians by Jourdan and Moreau. The wool-manufacturing output of this district represents nearly the entire output of north France. There are manufactories of velvet-pile carpets, woven goods, and furniture stuffs, also cotton, linen, and silk mills, dye works, machine shops, and a sugar refinery. Tourcoing was captured by the Germans in the War which began in 1914. It was later damaged by allied aircraft. See WAR IN EUROPE. Pop., 1901, 79,243; 1911, 82,644.

TOURGÉE, tōōr-zhā', ALBION WINEGAR (1838-1905). An American novelist, born in Williamsfield, Ohio. He graduated from the University of Rochester (New York) in 1862, receiving his degree while serving in the Federal army. He had been wounded at Bull Run and was discharged, but reentered the service, only to be taken prisoner at the battle of Murfreesboro, Tenn. Immediately after the war he became an editor and took up the practice of law at Greensboro, N. C. From 1868 to 1875 he was judge of the Superior Court of North Carolina, and was later (1881-84) editor of the *Continental* at Philadelphia. He was appointed United States Consul at Bordeaux in 1897 and was transferred to Halifax in 1903. His numerous novels were founded chiefly on his experience in the South during the Reconstruction period. The list includes: *Toinette* (1874); *A Fool's Errand* (1879), perhaps his best-known work; *Bricks without Straw* (1880); *John Eaw and Mamelon* (1882); *Hot Plovshares* (1883); *An Appeal to Caesar* (1884); *Black Ice* (1888); *Letters to a King* (1888); *Murvale Eastman, Christian So-*

cialist (1890): *An Outing with the Queen of Hearts* (1894); *The Mortgage on the Hip-Roof House* (1896). Tourgé also published several legal books, *North Carolina Code of Civil Procedure* (1878) and *A Digest of Cited Cases* (1879).

TOURMALINE, tōōr'mā-līn (Fr. *tourmaline*, from Singhalese *tourmalal*, *turamali*, *tourmaline*). A complex aluminium borosilicate, containing also chromium, iron, magnesium, and the alkalis. It crystallizes in the hexagonal system. According to composition, several varieties are distinguished, as chromium tourmaline, iron tourmaline, lithium tourmaline, magnesium tourmaline, and magnesium-iron tourmaline. It has a vitreous lustre, may be either transparent or opaque, and may be colorless as well as blue, green, red, brown, and black. Some crystals are red internally and green externally, and still others are red at one extremity and green, blue, or black at the other. Tourmaline is the most dichroitic of all gems. The mineral is usually found in granite, gneiss, or mica schist. It occurs also in dolomite, granular limestone, and in certain contact rocks near dikes of igneous rocks, also in rolled pebbles in alluvial deposits. The white or colorless tourmalines are called achroite, the black varieties aphrizite and schorl, while those of various shades of blue are known as indicolite, the red varieties as rubellite, and the green transparent specimens from Brazil are known as Brazilian emeralds. The colored crystallized varieties of tourmaline, when transparent, are highly prized as gems. They are found in Burma, Ceylon, and India, in the Urals, the Harz, and Brazil, while in the United States splendid specimens occur in Maine, especially near Paris. Specimens also occur in Massachusetts, Connecticut, New York, and California. Consult G. F. Kunz, *Gems and Precious Stones of North America* (New York, 1892). See GEMS.

TOURNACHON, tōōr'nā'shōn', FÉLIX (1820-1910). A French author, artist, and aéronaut, better known under the pseudonym Nadar. He was born in Paris, studied medicine at Lyons, and returned to Paris as a journalist. In 1849 he founded the *Revue Comique* and in 1854 published *Le Panthéon-Nadar*, a gallery of contemporary celebrities. He soon afterward engaged in experiments in aerial navigation and constructed *Le Géant*, the largest balloon hitherto made. In it he made a number of ascensions and was once carried as far as Hanover. During the siege of Paris by the Prussians he made use of his knowledge as an aéronaut to carry information to the outside country and commanded the company of aéronauts of the Place Saint-Pierre, Montmartre. Among his numerous published works are: *La robe de Déjanire* (1841; 2d ed., 1859); *Quand j'étais étudiant* (1856); *Mémoires du Géant* (1864); *Le droit au vol* (1865); *Les ballons en 1870* (1871); *Le monde où l'on patauge* (1883).

TOURNAI. See TOURNAY.

TOURNAMENT, tōōr'nā-ment (OF. *tournoyement*, *tournoiement*, from *tournoier*, to joust, tilt, tourney, wheel about, from *tourner*, to turn, from Lat. *tornare*, to turn in a lathe, from *tornus*, from Gk. *τόρνος*, compasses, carpenter's chisel). A knightly sport of the Middle Ages, in which combatants engaged one another with the object of exhibiting their courage, prowess, and skill in the use of arms. It existed first probably in France, whence it spread to Germany and England and afterward to the south of Europe. A tournament was usually held on the invita-

tion of some prince, who sent a king-of-arms or herald through his own dominions and to foreign courts. The intending combatants hung up their armorial shields on the trees, tents, and pavilions around the arena for inspection, to show that they were worthy candidates for the honor of contending in the lists in respect of birth, military prowess, and character. The combat took place on horseback, or at least was always begun on horseback, though dismounted combatants frequently continued it on foot. The usual arms were blunted lances or swords; but the ordinary arms of warfare, called arms à l'outrance, were sometimes used by cavaliers who were ambitious of special distinction. The prize was bestowed by the lady of the tournament on the knight to whom it had been adjudged, he reverently approaching her and saluting her and her two attendants. The period when tournaments were most in vogue comprised the twelfth, thirteenth, and fourteenth centuries; and the place where the most celebrated English tournaments were held was the tiltyard near St. James's, Smithfield, London. The Church at first discountenanced tournaments, some of its decrees prohibiting persons from engaging in them under pain of excommunication and denying Christian burial to a combatant who lost his life in one. The Church seems, however, to have looked with more favor on these combats after the middle of the thirteenth century. During the fifteenth and sixteenth centuries tournaments continued to be held, but the alteration in the social life and warfare of Europe had changed their character, and they are rather to be regarded as state pageants than as real combats. The death of Henry II of France, in 1559, consequent on the loss of his eye at a tournament, led to their general abandonment, both in France and elsewhere.

Military Tournaments. The modern military tournament embraces all the personal skill in the use of arms of the ancient chivalric tournament and has much of its pageantry. New inventions and contact with many nations have incorporated into military necessities and pastimes many novelties unknown in ancient times, and these find their supreme exposition in the national tournaments of both America and England. There is no mystery about the origin of the modern military tournament; data, place, and reason are all available. In 1873 the staff of the Military Gymnasium, Aldershot, gave an exhibition of military exercises at the Albert Hall in London in aid of the widows and orphans of the British soldiers killed in the Zulu War. It was of necessity very limited in its functions; but the next year a fully organized competition in the use of weapons of offense and defense, between all branches of the service, cavalry, infantry, artillery, engineers, and hospital corps, was held. The programme was (and still is) practically divided into two parts: one coming strictly within the line of military duty, such as feats of strength and skill with sword, lance, sabre, and bayonet, and horsemanship, including riding and driving; the other division consisting of sports and pastimes, such as tent pegging, mounted wrestling, etc. To such an extent did the desire to compete extend in Great Britain that it has become necessary to impose the restriction of passing through and obtaining the first place in merit in a district tournament as a condition precedent to competition at the national tournament. The peg used in tent pegging

is an ordinary wooden tent peg 3 inches broad and 1 foot long, driven nearly perpendicular into the ground until less than one-half of it is in sight. The trooper rides at the gallop, strikes it if possible, and, without relaxing the grasp of his lance or the speed of his horse, wrenches the peg out of the ground and carries it away on his lance point.

In America the military tournament held each year in Madison Square Garden, New York, has become a recognized institution. It differs from the British tournament in that the latter consists of competitions as well as of exhibition performances, while in America it is made up entirely of exhibition work. The tournaments have been regularly held since 1897. Consult: Dillon, "Tilting in Tudor Times," in *Archæological Journal*, vol. lv (London, 1898-99); A. Schaer, *Die altdeutschen Fechter und Spielleute* (Strassburg, 1901); J. L. Weston, *The Three Days' Tournament: A Study in Romance and Folk-Lore* (London, 1912); K. G. T. Webster, "The Twelfth-Century Tourney," in *Anniversary Papers*, by colleagues and pupils of G. L. Kittredge (Boston, 1913).

TOURNAY, tōōr'nā', or **TOURNAI**. The capital of an arrondissement and the largest town in the Province of Hainault, Belgium, 48 miles south by west of Ghent, on the Scheldt River, here spanned by several bridges (Map: Belgium, B 4). The most striking edifice is the twelfth-century cathedral of Notre Dame in the Romanesque style. The nave, dating from 1146, and the façade with its porch and sculptures are of special interest. Other architectural features of the town include the twelfth-century belfry, the church of Saint-Quentin in the Transitional style, the church of Saint-Brice, with the tomb of Childeric, and the church of Saint-Jacques. The thirteenth-century bridge, the art gallery, the museum of natural history, and the old monastery buildings, now utilized as the municipal headquarters, are also noteworthy. The public library has 60,000 volumes. Manufacturing is the principal industry, the town being noted for its carpets and high-grade porcelain. Cotton and woolen goods, linen, and liquors are also produced. Pop., 1900, 35,004; 1910, 37,523. Tournay, the ancient Civitas Nerviorum or Turnacum, was for a time the capital of the kingdom of the Franks. A bishopric was founded here in 484. The town was at various times and for long periods a possession of France, which finally relinquished it in 1748. It is famous for the gallant defense made by its garrison, under the Princess d'Epinoy, against Alexander of Parma in 1581.

TOURNEFORT, tōōrn'fōr', JOSEPH PITTON DE (1656-1708). A French botanist, born at Aix, Provence. After having explored the flora of his native district, he was sent, at the King's expense, to Spain, Portugal, England, and Holland, the Grecian Archipelago, and Thrace, the shores of the Black Sea, and Asia Minor, and other parts of the East, adding many species to the list of known plants. He published several botanical works and a *Voyage to the Levant* (1717). His botanical system, which maintained its ground till the time of Linnaeus, was of great use in promoting the progress of botany, but he rendered still greater service to science by grouping plants in general and is regarded, therefore, as the founder of genera.

TOURNEUR, TURNOUR, or TURNER, tēr'nēr, CYRIL (?1575-1626). An English dramatist.

He found employment in the Low Countries and served as secretary to Sir Edward Cecil in the expedition to Cadiz (1625). He is the author of two plays, *The Atheist's Tragedie* (written probably about 1603, published 1611) and *The Revenger's Tragedie* (published 1607). The latter is a powerful though lurid tragedy, in praise of which Swinburne's fine rhetoric has taken a free rein. Tourneur also wrote elegies and other nondramatic pieces. Consult his *Plays and Poems* (ed. by J. C. Collins, 2 vols., London, 1878); the two plays edited, with Webster, by J. A. Symonds ("Mermaid Series," ib., 1888); and A. C. Swinburne, "Cyril Tourneur," in *The Age of Shakespeare* (New York, 1908).

TOURNEUX, (JEAN) MAURICE (1849-). A French litterateur and bibliographer, born in Paris. His work is noted for erudition combined with charm of style. He published bibliographies of Prosper Mérimée (1876) and Théophile Gautier (1877); *Diderot et Catherine II* (1899); *Eugène Delacroix* (1902); *J. B. Perronneau* (1903); *Table générale de la Revue d'histoire littéraire de la France, 1894-1898* (1900); *La Tour* (1904); *Léon Sapin* (1906); *Bibliographie de l'histoire de Paris pendant la révolution française* (5 vols., 1900-13).

TOURNIQUET, tōōr'nī-kēt (Fr. *tournequet*, turnstile, *tournequet*, from *tourner*, to turn). An instrument for compressing an artery of the thigh or arm, either for the purpose of preventing too great a loss of blood in amputation, or checking dangerous hemorrhage from accidental wounds, or stopping the circulation through an aneurism.

The common tourniquet consists of three parts, viz., (1) a pad to compress the artery, (2) a strong band which is buckled round the limb, and (3) a bridgelike contrivance over which the band passes, with a screw whose action raises the bridge and consequently tightens the band.

To prevent the loss of venous blood during an amputation, it is customary to elevate the limb to a vertical position or to strap it with an elastic bandage for several minutes before the tourniquet is applied. The older forms of tourniquet are now almost universally replaced by a simple rubber strap or piece of rubber tubing which is passed several times around the limb under tension and fastened. This general type is known as Esmarch's tourniquet.

TOURS, tōōr. A city of France, the capital of the Department of Indre-et-Loire. It is 145 miles by rail southwest of Paris, in the rich level valley of the Loire, on the left bank of that stream, and extends 2 miles southward to the Cher (Map: France, N., F 5). The pleasant situation and the equable climate attract many English and American families as sojourners. Two great lines of boulevards, extending throughout the city, cross at its geographical centre, where the modern Palace of Justice adorns a fine square. In this square stands Fournier's bronze statue of Balzac. Saint-Gatien, the stately French-Gothic cathedral of Tours, rises in the northeastern part of the city, near the river. It dates from 1170, was finished about 1550, and is exceptionally complete as to execution. The flamboyant turreted façade is profusely decorated, and the rose window is of an exquisite pattern. Near the centre of the city are the striking detached towers of Saint-Martin and Charlemagne—remains of the celebrated church of Saint-Martin marking the site of the tomb

of the saint. The church was rebuilt about the twelfth century in splendid proportions. The structure was torn down in 1802, making way for a street. Near by is the new basilica of Saint-Martin. The ruined château Plessis-lès-Tours, identified with the life of Louis XI, lies just southwest of Tours. Besides the statue of Balzac should be mentioned the statues of Descartes and Rabelais and also the Renaissance fountain.

The city has an art school, a large and a small seminary, the Collège de Saint-Louis de Gonzaga, and a drawing school. The public library contains 170,000 volumes and 2007 manuscripts. In the archiepiscopal palace is a museum of archaeology, paleontology art, coins, etc. The Museum of Tours, near the river, has some 500 pictures of small value and collections of sculptures, enamels, antiquities, etc. The city has manufactures of steel, machinery, iron implements, silk stuffs, corsets, leather, confectionery, painted glass, pottery, and chemicals. There are printing works. The trade is very active, both by rail and by river. Pop. (commune), 1901, 64,695; 1911, 73,398.

History. Tours, named from the Gallic tribe of Turones, was an active ally of Vercingetorix against the Romans. It was later the Roman Cæsarodunum. The place became at a very early date the seat of an important bishopric, which soon rose to the rank of an archbishopric. Numerous councils were held here. Tours was taken by the Visigoths in 473 and by Clovis in 507. It is famous for the momentous battle fought in the direction of Poitiers in 732, when Charles Martel (q.v.) repulsed the vast invading army of the Saracens. The city was the capital of Touraine (q.v.). It rose to great importance under the Valois kings, Louis XI in particular favoring the city, which for a time was a great seat of the silk manufacture. The States-General were repeatedly assembled here. In October, 1870, the Government of National Defense was organized at Tours, whence it was removed in December to Bordeaux. The Germans occupied the city from Jan. 10 until March 8, 1871. Consult: Eugène Giraudet, *Histoire de la ville de Tours* (2 vols., Tours, 1873); P. C. A. Grandmaison, *Tours archéologique* (ib., 1879); Casimir Chevalier, *Tours capitale* (ib., 1896); Paul Vitry, *Tours et les châteaux de Touraine* (Paris, 1905); Chanoine Boissonnot, *La cathédrale de Tours: histoire et descriptive* (Tours, 1909).

TOURS, BERENGARIUS OF. See BERENGARIUS OF TOURS.

TOURS, MARTIN OF. See MARTIN OF TOURS.

TOURVILLE, too'r'vêl', ANNE HILARION DE COTENTIN, COUNT DE (1642-1701). A French admiral. He was born at Tourville, near Coutances, Nov. 24, 1642. He entered the French navy and became a captain at 25, having distinguished himself by service against the Turks and Algerians. In 1669 he participated in the French expedition for the relief of Candia and fought with distinction at Agosta, off the coast of Sicily, in April, 1676, and received the command of a squadron with which in June of the following year he won a decisive victory over the allied British and Dutch off Palermo (June 2). He became lieutenant general of marine and from 1682 to 1688 saw active service against the Barbary pirates, varied by his share in the bombardment of Genoa in 1684. In 1689 he was made a vice admiral and commanded the French fleets in the operations against England

and Holland. In June, 1690, he entered the English Channel at the head of a powerful fleet and inflicted a disastrous defeat on the united English and Dutch armament near Beachy Head. In 1692, Louis XIV having decided upon an invasion of England on behalf of James II, a fleet was assembled at Brest under Tourville in order to protect the descent. With 44 ships of the line Tourville assailed an Anglo-Dutch fleet of 82 vessels under Lord Russell off Cape La Hogue and after a desperate fight was decisively beaten (May 29). Tourville, however, suffered no discredit for this defeat, in which his talents and courage were abundantly displayed. In 1693 he was made a marshal of France and in June defeated a British-Dutch fleet under Sir George Rooke off Cape St. Vincent, capturing 27 ships of war and merchant vessels and destroying 45 others. He was subsequently charged with the defense of the Mediterranean coasts of France, but saw no active fighting. He died in Paris, May 28, 1701. Fraudulent *Mémoires* in Tourville's name were published in 1742-58. Consult Delarbre, *Tourville et la marine de son temps* (Paris, 1889).

TOUSSAINT, too'sān', ANNA LOUISA GEERTUIDA (1812-86). A Dutch novelist, born at Alkmaar, of parents descended from French Protestant refugees. In 1851 she married the architectural painter Jan Bosboom (1817-91) and thenceforth lived at The Hague. The reputation won with her first works, *Almagro* (1837), *De Graaf van Devonshire* (1838), and *De Engelschen te Rome* (1839), was enormously increased on the appearance of *Het huis Lauernesse* (1841; 10th ed., 1885), an historical romance of the Reformation, which was translated into several languages. Among her other historical novels, dealing mainly with English, Dutch, and Spanish scenes, the Leicester trilogy, *Leycester in Nederland* (1846), *De vrouwen uit het Leycestersche tijdvak* (1849-50), and *Gideon Florensz* (1854-55), is the most remarkable. Subsequently she was eminently successful with modern character delineations, of which *Majoer Frans* (1874) is an excellent example. Fine artistic workmanship distinguishes her dialogue tale *Raymond de schrijnwerker* (1880). Her collected works were published in 25 volumes (Arnhem, 1880-88). For her life, consult Jan ten Brink (Amsterdam, 1886).

TOUSSAINT, FRANÇOIS DOMINIQUE, called L'OUVREURE (1743-1803). A Haitian soldier and statesman. He was born near Cape François in the island of Haiti in 1743 and was a full-blooded negro, his father and mother both being African slaves. He was coachman and afterward assistant to the overseer of his master's sugar plantation and acquired some little education, which he used to good advantage. When the French Revolution broke out, he was the overseer of his master, a planter named De Libertat. A decree of the French Constituent Assembly, May 15, 1791, gave to all free persons of color the privileges of French citizenship, but the white planters of Haiti did everything in their power to delay the application of the decree. On Aug. 23, 1791, the slaves became a factor in the problem by rising in a fierce insurrection. Toussaint took part in the uprising and won a prominent place among the leaders of the insurrection. The revolt was temporarily suppressed, but the repeal by the French Assembly in May, 1792, of the Decree of 1791, reopened the civil war. For a while Toussaint

took service with the Spaniards in the east of the island, with whose aid he overran a part of the French territory. Commissioners from France attempted to settle the troubles of the island and finally proclaimed universal freedom in August, 1793. This won Toussaint over to the side of the French Republic, and he came to the front as the recognized leader of his race. The English at this time had seized Port au Prince and were besieging the French Governor, Laveaux, in Port de la Paix. Toussaint went to his assistance, and it was Laveaux who by his exclamation, *Mais cet homme fait ouverture partout*, gave Toussaint the surname *l'Ouverture*, by which he has since been known. In 1796 Toussaint was made commander in chief of the French forces on the island and signalized himself in the following year by compelling the surrender of the English who had invaded Haiti. Hédouville, the French Commissioner, had succeeded in stirring up dissension between the negroes and the mulatto element, and in 1799 a fierce civil war was waged between the blacks under Toussaint and the mulattoes under Gen. André Rigaud. Toussaint succeeded in crushing his opponent, December, 1799. By January, 1801, he had brought the whole island under his power. He now became virtually a dictator, but ruled the island with moderation and firmness and with justice towards the different classes of the population. He had an administrative council of nine, eight of whom were white men. A constitution was drawn up, providing for free trade and naming Toussaint life President. After the Treaty of Amiens had freed him temporarily of danger from England, Napoleon proclaimed the reestablishment of slavery in the island. Toussaint replied by a declaration of independence in July, 1802. Napoleon sent General Leclerc with 30,000 men to reduce the Haitians to submission. Leclerc was joined by many of Toussaint's enemies, among them being Rigaud and the future rulers, Pétion and Boyer. Toussaint was treacherously arrested, taken to France, and imprisoned without trial in the Château Joux, near Besançon, where he died, April 27, 1803, from cruelty and neglect. Consult his *Mémoires, précédés d'une étude historique et critique* . . . by Saint-Remy (Aux Cayes, Haiti, 1853); J. R. Beard, *Toussaint L'Ouverture: A Biography and Autobiography* (Boston, 1863); T. P. Gragnon-Lacoste, *Toussaint L'Ouverture, général en chef de l'armée de Saint Domingue, surnommé le premier des Noirs* (Bordeaux, 1877), based on the *L'Ouverture* family papers; Victor Schoelcher, *Vie de Toussaint L'Ouverture* (Paris, 1889); C. W. Mossell, *Toussaint L'Ouverture: The Hero of Saint Domingo* (Lockport, N. Y., 1896); also Wordsworth's poem, "To Toussaint L'Ouverture."

TOUSSAINT-MAIZEROT, RENÉ. See MAIZEROT.

TOUT, tout, THOMAS FREDERICK (1855-). An English historian, born in London, and educated at Balliol College, Oxford (M.A., 1882). He was a fellow of Pembroke College and also professor at St. David's College, Lampeter, until 1890, when he was appointed to the chair of mediæval and modern history in Manchester University. In 1912-13 he lectured at Oxford. His publications include: *History of England for Schools* (2 vols., 1890, 1898), with Prof. York Powell; *Analysis of English History* (1891); *Edward the First* (1893); *The Empire and the Papacy* (1898); *History of Great Brit-*

ain (3 vols., 1902-06); "Germany and the Empire," in *Cambridge Modern History* (vol. i, 1902); *History of England, 1216-1377*, vol. iii of Longman's *Political History of England* (1905); *The Place of the Reign of Edward II in English History* (1914).

TOWAGE (from *tow*; connected with AS. *tēon*, Goth. *tiuhan*, OHG. *zogan*, *ziohan*, Ger. *ziehen*, to draw, Lat. *ducere*, to lead). Assistance in propelling or drawing rendered by one vessel to another. Towing is usually done by tugs, but the service may be performed by any sort of vessel. Where such service is rendered to vessels which have been injured it becomes salvage (q.v.). A vessel thus assisted is commonly referred to as a tow. A tug is not held to the strict responsibility of a common carrier and is liable only for lack of reasonable skill in such service and for negligence. The master of the tug is obliged to see that the tow is properly made up, having regard to the voyage to be made; must have skill in navigation and be reasonably familiar with the course to be followed. The master of the tow must follow all reasonable orders of the master of the tug as to steering, etc. A tug should not abandon a tow except in cases of extreme necessity, and, in general, it may be said that it must seem inevitable that the tug will be lost unless the tow is abandoned in order to justify that course. The charges for towage constitute a maritime lien upon the tow, which will follow it until paid. All questions of towage are governed by admiralty law. Consult the authorities referred to under ADMIRALTY LAW. See RULES OF THE ROAD.

TOWANDA. A city and the county seat of Bradford Co., Pa., 80 miles northwest of Wilkes-Barre, on the Susquehanna River, and on the Lehigh Valley and the Susquehanna and New York railroads (Map: Pennsylvania, J 2). It has a public library and fine high-school and courthouse buildings. Towanda is known primarily for its industrial interests, which include flour, planing, and silk mills, a foundry and machine shop, dye works, and manufactories of talking machines, cut glass, toys, and furniture. Towanda was settled in 1770 and first incorporated in 1828. Pop., 1900, 4663; 1910, 4281.

TOWER (AS. *tur*, from Lat. *turris*, Gk. *ῥῦπς*, *tyrris*, *ῥῖπς*, *tyrris*, tower). Generally, a building higher than its horizontal dimensions. In antiquity the tower was used chiefly as a lookout or for defense and occasionally for light-house purposes, though the form of those buildings is not accurately known. In connection with ancient and mediæval fortifications the term is applied to structures but little higher than the adjacent walls. A special form of fortress tower was the keep or donjon (q.v.). In mediæval Italy strong lookout towers were often erected by powerful families in the cities, and those of Bologna (Garisenda, Asinelli, etc.) and San Gimignano are still standing. The civic belfries of Bruges, Ghent, and other Flemish cities were not merely bell towers, but visible tokens of municipal or communal liberties and privileges. In the Far East the tower is associated with the double purpose of commemoration and religious sacrifice, in such buildings as the stupa and tope (q.v.) of southern Asia and the paoh-tah or octagonal tower of China. The lofty wooden pagodas connected with the temples of Japan are emblematic and commemorative features of the temple group and no more.

(For the wide use of the tower in Mohammedan architecture, see MINARET.) The round towers of Ireland, long the subject of animated controversy, have such small window openings that it is evident they were not intended as bell towers. They are very slender, high, and costly in comparison with the humble churches which stand near them; and the soundest conclusion seems to be that they were intended partly as watchtowers, partly as places for the deposit of valuables in the case of sudden forays. In the Christian world the tower appears in Italy at an early time and at least as early as the eighth century, perhaps in the sixth, in the two round bell towers at Ravenna of San Apollinare Nuovo and San Apollinare in Classe. In Italy the detached and separate tower (see CAMPANILE) held its own until the complete disappearance of mediæval architecture in the fifteenth century, and many of the civic towers of the Italian cities rival those of the great churches; but in northern Europe it is found incorporated with the main structure of the church at a period at least as early as the eleventh century. The tower generally stands upon the ground, with its vertical lines easily seen from foundation to summit; and this remains true throughout the Middle Ages, except for the central towers of the cruciform churches. The last-named towers are built over the open interior and are supported on four great arches or groups of arches, spanning the four sides of the crossing of nave and transept. Nearly all of these towers were originally designed to carry lofty spires (q.v.), but in many cases these were never built.

The complete Gothic cathedral was intended to have seven towers—two to the west front, four to the transept fronts, and one over the crossing. (See BELL TOWER; BELFRY; CAMPANILE; LEANING TOWER; MINARET.) These mediæval towers and spires are among the most impressive and beautiful features of the Old World architecture. The Renaissance developed several types of tower and steeple, especially in England after 1650, whence the Wren-Gibbs type was carried into American Colonial church architecture. There are a few fine Renaissance towers in Italy, notably that of San Giorgio Maggiore at Venice; hardly any in France or Germany. Modern towers of note (apart from such monuments as those of Bunker Hill and Washington) are not numerous. The loftiest is the Eiffel Tower at Paris (1889), of steel, 300 meters (980 feet) high, used as a scientific observatory; the tower of the Sacré Cœur on Montmartre, Paris; the Victoria Tower of the London Houses of Parliament; and the church towers completed in modern times in Germany. (See SPIRE.) Some tall office buildings (q.v.) in the United States are really lofty towers. Consult: Charles Wickes, *Spires and Towers of Mediæval Churches of England* (3 vols., London, 1859); Conrad Sutter, *Thurm und Turmform* (*all Stile und Länder*) (2d ed., Berlin, 1895); A. P. Heywood, *Bell Towers and Bell Ringing* (New York, 1914); W. G. Rice, *Carillons of Belgium and Holland* (ib., 1914). See LEANING TOWER.

TOWER, tou'ër, CHARLEMAGNE (1848-1923). An American capitalist and diplomat, born in Philadelphia. He was educated at Harvard. From 1882 to 1887 he was president of the Duluth and Iron Range Railroad and managing director of the Minnesota Iron Company. He

then removed to Philadelphia, where during the next 10 years he was an officer in various important corporations. He was United States Minister to Austria-Hungary from 1897 to 1899 and was Ambassador to Russia from 1899 to 1902 and to Germany from 1902 to 1908. He published: *The Marquis de La Fayette in the American Revolution* (2 vols., 1895); *Catalogue of a Collection of American Colonial Laws* (1890); *Essays Political and Historical* (1914).

TOWER, WILLIAM LAWRENCE (1872-). An American zoölogist, born at Halifax, Mass. He was educated at the Lawrence Scientific School (Harvard), the Harvard Graduate School, and the University of Chicago (B.S., 1902), where he taught thereafter, becoming associate professor in 1911. He did important experimental work in heredity, investigating especially the laws of heredity in beetles and publishing *An Investigation of Evolution in Chrysomelid Beetles of the Genus Leptinotarsa* (1906). He published also *The Development of the Colors and Color Patterns of Coleoptera* (1903) and, with Coulter, Castle, Davenport, and East, an essay on *Heredity and Eugenics* (1912).

TOWER, ZEALOUS BATES (1819-1900). An American soldier, born at Cohasset, Mass. He graduated with first honors at West Point in 1841, served under General Scott in the Mexican War, led the storming column at Contreras, and was wounded at Chapultepec. At the outbreak of the Civil War he was chief engineer in the defense of Fort Pickens. In November, 1861, he was made brigadier general of volunteers and on Aug. 30, 1862, was severely wounded at Manassas. After recovering he was superintendent of West Point from July until September, 1864. He then became chief engineer of the defenses of Nashville, Tenn., and his skillful work at that place contributed to the total defeat of General Hood in December, 1864. He was brevetted major general in the United States army in March, 1865, and in November of that year became lieutenant colonel in the Engineer Corps. He was promoted colonel in January, 1874, and retired in 1883.

TOWER BRIDGE. A drawbridge spanning the Thames just below the Tower of London, opened in 1894. The carriage way, at a height of 29½ feet, consists of two approaches of 270 feet and a central span of 200 feet, with a rising draw formed by twin bascules, which can be raised in a minute and a half. There is an elevated footway above the draw, which is used when the draw is open, 142 feet above the river, reached by elevators and stairs. The Gothic towers are of steel and masonry. The cost was over £1,000,000.

TOWER CLOCKS. See CLOCK.

TOWER HILL. An elevation northwest of the Tower of London, formerly the public place of execution for persons sentenced for treason. Here many of the most noted men of England were put to death, their bodies being buried in the adjacent chapel of St. Peter ad Vincula.

TOWER OF BABEL. See BABEL, TOWER OF.

TOWER OF LONDON. In feudal days a powerful fortress and long afterward a state prison of gloomy memories. It is now a government storehouse and armory. It is a collection of buildings in the form of an irregular quadrilateral on the north bank of the Thames, and on the east side of the city of London. The space occupied is between 12 and 13 acres of rising ground, and the whole is surrounded by a broad

but shallow moat, now dry. The moat is bordered within by a lofty castellated wall, with massive flanking towers at frequent intervals. Within this wall rises another of similar construction, but of greater height, within which are the various barracks and armories; and in the centre of all is the lofty keep or donjon known as the White Tower. This last-named building, erected by the Bishop of Rochester in the time of William the Conqueror, is the most interesting in the whole structure. Its walls are in parts 16 feet thick and of solid masonry. The White Tower was the court of the Plantagenet kings, whereas the various other towers are principally noteworthy on account of the illustrious prisoners who have been confined in them. The southeast angle of this tower is occupied in its upper part by the chapel of St. John, the oldest place of worship in London, a perfect example of the early Anglo-Norman style. The rest of this tower is occupied by the old state apartments and the royal Armory, which contains a collection of ancient and mediæval arms and armor, the latter exhibited in complete suits on wooden figures of men and horses. Some of these figures represent English kings arrayed in the armor which the kings actually wore while living. The Wakefield Tower contains the Jewel Office, in which are exhibited the magnificent crown jewels, sceptre orb, and some of the royal gold service. To the Jewel Office and the Armory visitors are admitted on payment of a small fee. In the northwest corner of the quadrangle is St. Peter's Chapel, now the garrison church.

Early writers have alleged that Julius Cæsar built the Tower of London as a Roman fortress. The spot was in fact occupied by some structure before the time of William the Conqueror, as is shown by the massive foundations discovered in the course of later erections; but of the nature of these earlier buildings we know little. The White Tower, already mentioned, is the beginning of the historical Tower of London. During the reigns of the first two Norman kings the Tower seems to have been used as a fortress merely. In Henry I's time it was already a state prison. That monarch and his successors gradually increased the size and strength of the ramparts and towers, until the whole became a great feudal stronghold. The kings frequently lived there, holding their courts, and often sustaining sieges and blockades at the hands of their rebellious subjects. On the accession of Queen Elizabeth, however, the Tower ceased to be a palace. Of the long list of executions for political offenses which it witnessed, those occurring during the war which began in 1914 were the first after those of the rebellion of 1745.

In 1841 a fire broke out in the Bowyer Tower, and extended to the armories, causing the destruction of numerous modern buildings and many thousand arms. At present the Tower of London is in charge of the War Department and contains arms and accoutrements for the complete equipment of a large army. The mint and public records were formerly kept in it, but have now been removed to more suitable buildings. The government of the Tower is vested in a constable, who has great privileges and is usually a military officer of long service and distinguished rank, whose position is honorary; the deputy constable, also an officer of repute, is the actual governor. He has under him a small staff and the corps of yeomen of the guard, more

commonly known as beefeaters. See BEEFEATER.

Dixon, *Her Majesty's Tower* (2 vols., New York, 1901); Violet Brooke-Hunt, *Prisoners of the Tower of London* (London, 1901); Lord Gower, *The Tower of London* (2 vols., ib., 1901-02); William Benham, *The Tower of London*, "Portfolio Monographs," No. 47 (ib., 1906); C. G. Harper, *The Tower of London: Fortress, Palace and Prison* (ib., 1909); Richard Davey, *The Tower of London* (ib., 1910); Rene Francis, *The Tower of London* (Philadelphia, 1915).

TOWER OF THE WINDS. An octagonal building, north of the Acropolis of Athens, belonging to the second or first century B.C., 42 feet high and 26 feet in diameter, bearing on the upper part of each side the sculptured symbol of a wind. It was originally surmounted by a bronze weathercock in the form of a Triton. Besides indicating the direction of the wind, the exterior walls were marked to serve as a sundial, and there appears to have been within the tower a water clock, the method of operating which has not been clearly ascertained. It is also called the Clepsydra of Andronicus Cyrrhestes.

TOWER SHELL. One of the elongated, tightly coiled shells of the gastropods of the family Turritellidæ, allied to *Vermetus* (see WORM SHELL), about 131 species of which are known from the warmer seas, and many fossil forms. Most of them are covered with a brownish epidermis, which, when removed, exhibits a delicately sculptured and often finely colored surface. Only the lower part of the spiral is occupied by the adult animal, the distal half of the shell being partitioned off.

TOWER SHELL.

TOWERS OF SILENCE. The structures upon which the Parsis (q.v.) and Ghebers (q.v.) expose the bodies of their dead to be devoured by vultures, or sometimes dogs, in accordance with the precepts of their religion as taught by Zoroaster (q.v.). The prescription for building these structures is as old as the Avesta (q.v.), where they are called Dakhmas. The best modern specimens are to be seen on Malabar Hill, Bombay, India, and across the Bombay harbor at Oran; there is also one near Teheran and another near Yezd in Persia, where the ruins of a deserted tower are likewise to be seen. Though the older shape of the Dakhmas seems to have been rectangular, the modern towers are circular. The best constructed are of massive stone or of bricks covered with cement. They are 20 or 30 feet high, 75 to 100 in diameter, and they resemble huge gas reservoirs in form, with a small door at one side for the entrance of the bodies. The top is open to the sky; the floor below is built of large slabs of stone; in each slab is a slight depression, called a pavi, in which the body is laid for the "heaven-sent birds" to devour. Small ducts lead from every pavi into the central pit where the bones are placed after they have been denuded of flesh by the vultures, which is often accomplished in a few hours. From this central well there run four drains, at right angles, to carry away any deposit that might remain and conduct it through quicklime, sand, and other absorbents lest the earth

might be defiled by its contact. Herodotus (*Hist.*, i, 140) alludes to this method of disposing of the dead in ancient Iran, and the Zoroastrians, who still keep up the practice, maintain that it is a solution of the sanitary question. Consult: D. Karaka, *History of the Parsis* (2 vols., London, 1884); Modi, *A Tower of Silence* (Bombay, 1885); id., *Funeral Ceremonies of the Parsees: Their Origin and Explanation* (2d ed., ib., 1905); A. V. W. Jackson, *Persia Past and Present* (New York, 1906).

TOWHEE. See CHEWINK.

TOWLE, tōl, GEORGE MAKEPEACE (1841-93). An American historian and journalist, born in Washington, D. C. He graduated at Yale in 1861 and at the Harvard Law School in 1863 and practiced law in Boston. He was United States Consul at Nantes (1866-68) and at Bradford, England (1868-70), was managing editor of the *Boston Commercial Bulletin* (1870-71), foreign editor of the *Boston Post* (1871-76), and later was connected with *Appleton's Journal*, the *Art Journal*, and the *Youth's Companion*. His works include: *History of Henry the Fifth, King of England* (1866); *The Eastern Question* (1877); *Principalities of the Danube* (1877); *Beaconsfield* (1878); *Young Folks' Heroes of History* (1878-82); *Modern France, 1851-79* (1879); *Certain Men of Mark* (1880); *England and Russia in Asia* (1885); *England in Egypt* (1885); *Young People's History of England* (1886); *Young People's History of Ireland* (1887).

TOWN (AS. *tūn*, OHG. *zūn*, Ger. *Zaun*, hedge, inclosure; connected with Ir. *dūn*, Welsh *din*, hill fort). The name applied generally throughout the United States to small municipalities or urban communities between the village and the city. In New England it more often denotes a quasi-corporate area, either urban or rural, constituting a subdivision of the county, which elsewhere is usually called the township or supervisor's district. (For the urban town, see MUNICIPALITY, OR MUNICIPAL CORPORATION.) The New England town is the most important local administrative unit in the governmental system. The centre of political activity is the town meeting, which meets usually once a year and may be attended by all the legal voters of the town. It discusses measures of common interest to the town, elects the town officers, and votes the taxes for the ensuing year. The government of the New England town is therefore a pure democracy and the only real example of the kind in the American political system. The town meeting governs through a body of officers, varying according to the needs of the community. These are usually the selectmen, varying in number from three to nine, who are the executive magistrates of the town, the town clerk, treasurer, constables, tax assessors, overseers of the poor, and school trustees. In some towns there are such officers as field drivers, pound keepers, fence viewers, measurers, sealers, etc. In England the word "town" applies to the small municipalities as in the United States, although the word "borough" is used to designate certain of the old towns. See TOWNSHIP. Consult: Edward Channing, *Town and County Government in the English Colonies of North America* (New York, 1884); J. A. Fairlie, *Local Government in Counties, Towns and Villages* (ib., 1906); Bryce, *American Commonwealth* (new ed., 2 vols., ib., 1910); C. A. Beard, *Readings in American Government and Politics* (ib., 1914).

TOWN CROSS. See CROSS.

TOWN, ITHIEL (1784-1844). An American architect, born at Thompson, Conn. In partnership with Alexander J. Davis he opened an office in New York City in 1829, and with him designed the old State capitol (demolished) of Connecticut at New Haven, the capitols of Indiana and North Carolina, the former city hall at Hartford, Conn., and several interesting churches in New Haven and Hartford. Town built also several government buildings at Washington and a number of bridges, including one over the James River near Richmond, Va. His works represent the transition from the expiring Georgian style to the Greek and Græco-Roman types of the Classical Revival in America. They reveal a refined taste both in composition and in detail. He was one of the original members of the National Academy of Design, New York. A large part of his extensive library on art went to Yale College. His publications include *Description of Improvements in the Construction of Bridges* (1821) and *Atlantic Steamships* (1838).

TOWNE, HENRY ROBINSON (1844-1924). An American manufacturer, born in Philadelphia. He studied at the University of Pennsylvania in 1861-62 and then became a draftsman for the Port Richmond Iron Works. In 1863-66, for the national government, he had charge of work on gunboats and monitors. In 1868 he became associated with Linus Yale in the manufacture of locks and after Yale's death in 1868 became president of the Yale & Towne Manufacturing Company at Stamford, Conn. In 1889 he was president of the American Society of Mechanical Engineers and in 1908-13 of the Merchants' Association of New York. He wrote *A Treatise on Cranes* (1883) and *Locks and Builders' Hardware* (1904).

TOWNELEY, CHARLES (1737-1805). An English archaeologist and collector of classical antiquities. He was born at Burnley, Lancashire, was educated at Douai College and under the tutorship of John Tuberville Needham. Upon visiting Rome and Florence, in 1765, he became interested in antiquities, which, after receiving advice from Winckelmann and other archaeologists, he began to collect in 1768. In 1772 he bought two houses in Park Street, Westminster, London, where he deposited his collection. He made frequent visits to Rome and until 1780 continued to add to his acquisitions, including the Nollekens (q.v.) collection. In 1786 he was chosen a member of the Society of Dilettanti and in 1791 trustee of the British Museum. After his death his marbles and terra cottas were purchased by the British Museum for £20,000, and in 1814 his bronzes, coins, gems, and drawings were also acquired. His collections in the Museum are described and illustrated by Ellis, *Townley Gallery* (London, 1846).

TOWN HALL. A building for the legislative and administrative business of a town or city, containing usually the public offices of the mayor and various municipal administrations, and the chambers for the meetings of the legislative bodies of the city (aldermen, council, etc.). In small towns court rooms and a jail are added, and a large public hall is also often provided. A belfry and clock tower is a feature of nearly all French, German, Flemish, and British town halls and of many of the more notable American examples. The French include a *salle des mariages* in their town halls and treat with es-

pecial effectiveness the entrances, lobbies, and grand stairways.

The oldest examples of the town hall in Europe belong to the Middle Ages. They date from the time of recognition of the right of municipal self-government, of which they are the expression. In southern France the town hall of Saint-Antonin (twelfth century) is one of the oldest in Europe. In Italy there grew up by the thirteenth century almost as many states as cities, each of which provided itself in time with one or more municipal buildings according to its particular form of administration. Of these the greater part date from the late thirteenth and the fourteenth centuries, some of the most important being those at Cremona (1245); at Siena the superb red-brick Palazzo Pubblico with its slender tower (1289); at Pistoia the two palaces del Podestà and del Comune (1294-1385); at Florence the vast Palazzo Vecchio (1298), with its impressive tower overhanging the street; the Doge's Palace at Venice; the elegant Palazzo del Consiglio at Verona (1473). The Renaissance added but few to the Italian list. In Germany the *Rathaus*, or municipal council house, appears in the fourteenth century (e.g., Brunswick), but the finest and most numerous examples belong to the Renaissance, as at Bremen, Cologne, Lübeck, Altenburg, Augsburg, and Nuremberg, with picturesque towers and high gables. Very notable are the sumptuously ornate Belgian town halls of the fourteenth and fifteenth centuries at Brussels, Louvain, Ghent, Bruges, Courtrai, Arras in France (destroyed in the Great War), and Oudenarde, and the fine Renaissance structure at Antwerp. But few mediæval town halls remain in France, that of Compiègne being the finest (late fifteenth century).

The Renaissance gave France the fine town halls of Beaugency, Rheims, Rouen, Lyons, and Paris, the last two now replaced by modern edifices, recalling the original structures. The Paris example is the largest and most splendid of modern town halls, especially in its interior decorations. In Great Britain it was not until the nineteenth century that the town hall became important; it forms one of the most interesting and successful subjects of recent architectural design, as, e.g., at Sheffield and at Oxford. The town hall at Hamburg is the finest of recent German works in the same line, far superior to the modern Gothic town hall at Vienna.

In the United States the Philadelphia city hall is the largest and ugliest of modern examples; that at New York, dating from 1809, one of the most refined and elegant. The earlier town halls of the United States follow Colonial or "Greek revival" models; the later ones are in the style of the French Renaissance or in what may be called the neo-Roman style. Early in the twentieth century the tower or skyscraper type came into use for town halls (e.g., Los Angeles, Cal.) and municipal offices (Municipal Building, New York). See MUNICIPAL ARCHITECTURE.

TOWNLEY, JAMES (1714-78). An English clergyman and dramatist, born in Barking, near London. He was educated at the Merchant Taylors' School, London, and at St. John's College, Oxford. After holding various preferments in the Church, he was appointed, in 1760, head master of the Merchant Taylors' School and in 1772-77 was vicar of Hendon in Middlesex. He

is best remembered as the author of the satirical farce *High Life below Stairs* (Drury Lane, Oct. 31, 1750), which has been translated into French and German and has been performed throughout the world. It was formerly attributed to Garrick. Two other farces written by Townley did not succeed. Consult J. Genest, *Some Account of the English Stage*, vol. iv (Bath, 1832).

TOWNLEY, JAMES (1774-1833). An English minister of the Wesleyan denomination. He was born in Manchester. He was president of the Wesleyan Conference in 1829. As a scholar he was second only to Adam Clarke in the denomination. His most important work was *Illustrations of Biblical Literature, Exhibiting the History and Fate of the Sacred Writings, Including Notices of Translators and Other Eminent Biblical Scholars* (3 vols., 1821; 2 vols., 1842).

TOWN PLANNING AND HOUSING.

Town planning, or city planning, and housing are so closely related that one cannot be considered without reference to the other. But since city planning (q.v.) has been treated in the article under that title, reference to it here will be merely incidental. Housing, as the term is now understood, has to do with all dwellings. Until comparatively recently the attention of housing workers was concentrated upon the dwellings of the poor. Even in America, where class distinctions are not so generally recognized, it began with the same attitude of mind, as indicated by the word "tenement" in the legislation. But the change in the United States has been more rapid than in Great Britain. In the United States it was early found that the popular distinction between tenement house and apartment house was not tenable when requiring minimum standards. Here, as everywhere, it was the poor who suffered most from bad housing conditions. As is not the case in England, the poor in the metropolis, to whom attention was first directed, lived in tall, row tenement houses. Consequently it was they for whose benefit the earliest efforts were made. But when the first really effective law was drafted, the New York Tenement House Law of 1901, it was found that the minimum requirements for certain fundamentals, such as light and air, were greater than were provided by the builders of many expensive apartment houses. Since the words "tenement house" as used in this law include "any house or building, or portion thereof, which is rented, leased, let, or hired out, to be occupied, or is occupied, as the home or residence of three families or more living independently of each other, and doing their cooking upon the premises, or by more than two families upon any floor, so living and cooking," they cover the most expensive apartment houses as well as the cheapest tenements. The result is that "new law" tenement houses, i.e., erected since the enactment of the Law of 1901, on the lower east side are better lighted and ventilated than many "old law" apartment houses in fashionable districts.

The long struggle to secure effective housing legislation in New York attracted attention throughout the country, and many other cities enacted tenement-house legislation based upon that of the metropolis, though the worst of their housing was to be found not in multiple dwellings but in unsanitary shacks and hovels. Once these cities had passed beyond the purely imitative stage and had begun to study their

needs, they discovered that what they required was not tenement-house regulation applicable only to the type of dwelling prevalent on Manhattan, but housing regulation applicable to all dwellings. The first American city to act upon this discovery was Columbus, Ohio, which in 1911 passed an ordinance that covers one and two-family houses as well as tenement houses. Since then the application has been made still wider, and the later codes cover "any house or building or portion thereof which is occupied in whole or in part as the home, residence, or sleeping place of one or more human beings, either permanently or transiently." (Housing Ordinance, Grand Rapids, Michigan, 1914.)

Relation of Town Planning and Housing. Further study of the housing problem showed that even this was not sufficient. Regulation of individual houses, essential as it is, cannot alone produce housing of the standard now demanded. So the housing worker has been drawn into city planning. The size and shape of lots are matters of first importance to him, for these influence the type and character of the dwelling; and size and shape of lots are largely determined by the size and shape of blocks, i.e., by the direction and arrangement of streets. Many other problems of city planning also have a direct effect upon housing, as, e.g., that of transportation. Good and cheap transportation makes larger areas accessible and so permits of spreading out the population in houses of good type; inadequate or expensive transportation causes the population to crowd near the centre and raises land values so that only closely packed and multiple dwellings will yield a profit.

The fundamental trouble in the past, that which it is most anxiously sought to prevent in the future, is land overcrowding. This has been almost universal in cities. The convenience of living near the centre, even with modern means of transportation, is the temptation which leads first to overcrowding the land with buildings until adequate open space even for lighting and ventilating the rooms is sacrificed, then to the erection of high multiple dwellings that pile one family above another.

Fortunately the superintensive use of land by the erection of multiple dwellings is not universal. In some countries the multiple dwelling is almost unknown. Even on the continent of Europe Holland and Belgium, despite their dense populations, have escaped it, while in the British Isles England remains essentially a nation of families living in single houses, though Scotland has followed the French tradition and put its people into high tenement houses or lands. The United States and Canada in recent years have shown an inclination to follow continental precedents, but, except in the neighborhood of New York and in New England, where the wooden "three-decker" has obtained a strong foothold, our cities are not of a predominantly tenement character, while some, even among the oldest, like Philadelphia and Baltimore, have refused to welcome the multiple dwelling.

In none, however, have we escaped other ills which go with unregulated growth. Philadelphia packs its little houses together so closely that in some of the oldest districts there is scarcely room for a narrow passageway to the doors of dwellings that occupy what once were

back yards. There is no space here, either indoors or out, for proper toilets, several families being compelled to use one convenience, often a filthy privy, placed at the far end of the narrow passageway and directly under the windows of the end houses. Baltimore, Washington, many of the Southern cities, even Chicago, have alley dwellings placed on the rear of lots. Unsanitary conditions; filthy dilapidated privies, surface drainage for all household waste water, decaying accumulations of garbage and other refuse, windowless rooms, cellar dwellings, room overcrowding, prevail to an extent which no city will believe until investigation has produced facts and pictures. (Consult lists of reports on housing conditions in American cities, *National Municipal Review*, October, 1912, and January, 1914.) Even in small cities, in towns, in villages these conditions abound.

American cities and towns are in no way peculiar in this respect. Descriptions of conditions found in neglected sections of European cities and towns, and in those of Australia, might, with change of names, almost be substituted for the descriptions of those found in America. The results of ignorance and neglect, of taking the profit of the moment without regard for the future, have everywhere been the same.

Housing Movement in Europe and America. Public concern for housing is not wholly modern, though the thorough study we are now giving it and the effective measures we are beginning to use are comparatively recent. Eberstadt, in his *Handbuch des Wohnungswesens*, states that in Rome in the later period of the Empire a population of between one and two millions was huddled in tenement barracks of many stories. There were 46,602 of these at one time as against 1780 patrician houses. The northern barbarians who overran the Empire were not accustomed to the closely packed cities of the south, but what they found they adopted, and during the Middle Ages, urged by the necessity for keeping their increasing populations behind expensive city walls, even the towns of Germany subdivided their lots and made houses narrower and narrower, clinging to the single family house despite pressure of population. The time came, however, when these old houses must be shared by two or more families, and finally, in the sixteenth century, the tenement house was introduced from Italy to become the characteristic dwelling of the middle and lower classes.

From early times there have been building regulations both on the Continent and in the British Isles. But these dealt chiefly, as do present American building codes, with the protection of property. The need of light and air and cleanliness was scarcely recognized until modern times. So the cities grew more crowded and cleanliness was scarcely recognized until the industrial era, with its great expansion of urban populations, made conditions in towns so unendurable that serious attention was given to making cities fit for people to live in.

England, as the first industrial nation, was perhaps the first to feel the need for regulation which would safeguard the dwellings of its people. Writers with a social vision like Dickens, statesmen like Disraeli, saw the menace to the nation if conditions were not bettered. Parliament passed a series of acts giving greater and greater powers to public offi-

cials in the regulation of private property until in the Housing and Town Planning Act, etc., 1909, was enacted a constructive measure which made possible the prevention of future slums by permitting local authorities to town-plan undeveloped areas and impose regulations which would maintain wholesome standards. This act, it was admitted, met but part of the problem, leaving as it did the already built upon areas to be dealt with only according to the fragmentary legislation of the past. Germany was more prompt than England to recognize the social significance of the industrial era. As it came to Germany later than to England, Germany had the advantage of seeing its effects before these had become a part of the national life. Moreover, the nearly universal military service of German youth brought more vividly to the attention of the authorities the evil effect of bad housing in the rapidly growing industrial cities. So regulation of urban development and of housing was quicker and more effective than in England. The results of German thoroughness in this as in other phases of municipal life have been recognized by both American and English students who have frequently called attention to the non-existence in German cities of the sordid, depressing slums of American and British industrial centres. But Germany has not yet solved its housing problems, as men like Rudolph Eberstadt, Bernhard Dernburg, and Werner Hegemann freely admit. "Berlin," e.g., houses "nearly one-half of its population in one-room dwellings in tall tenements crowded around one or more internal courts."

The Germans have come to see that the fundamental defect in their housing is the type of building, the barrack tenement which they adopted from Italy in the sixteenth century. Their first efforts in town planning and housing reform accepted this type. The desire there was to produce an imposing, a beautiful, and sanitary city. Wide boulevards, impressive public buildings and open spaces, and model tenements engaged their attention. Now they see that wide paved residence streets impose burdens on abutting property which practically necessitate high multiple dwellings, that wide spaces between streets lead to the building of rear tenements about interior courts, and that the model tenement, no matter what advantages it may offer in the way of kindergartens for the children of the tenants or common rooms for the tenants themselves, is not to be compared in social value with the single family house.

Unfortunately, however, the coming of the tenement raises land values so that the single family house becomes economically impossible. Land in German cities is 8 or 10 times as costly as in corresponding sections of English cities, where the single family house is the rule. (Pehlmann.) Yet the Germans have set themselves to the task of encouraging the erection of single family houses and discouraging the erection of tenement houses. They have begun by seeking regulations which will limit the height of dwellings and the proportion of the lot that may be occupied, thereby reducing the value of a particular lot, but spreading this value over areas which under the system of close tenement building would lie undeveloped for many years.

The improvement of housing conditions is a matter of public concern in all countries of

western Europe, but the examples of Germany and Great Britain may be taken as illustrative.

In America the housing awakening dates back to about 1910, though in some of the older cities, notably New York, housing reform has been a vital issue since the middle of the nineteenth century. In 1900 Governor Roosevelt appointed a commission, headed by Robert W. deForest, which secured the enactment of a law which worked almost a transformation in the plans of multiple dwellings and provided for effective enforcement by the creation of a Tenement House Department. One and two-family houses were not included in its scope—a matter of increasing importance, since the city extended its boundaries to take in Brooklyn, Queens, and Richmond. This part of the problem was being approached along city-planning lines and in the proposal to district the city, applying different regulations to the different districts.

METHODS USED

As the housing problem is most complicated, many methods are used in its solution. Among these are: regulation, setting definite minimum standards; districting or zoning, setting progressively higher standards for new developments; the creation of garden suburbs or villages; the building of improved dwellings on a limited dividend basis; and the social management of wage earners' dwellings.

Regulation. Regulation is recognized as an essential in all the countries where serious efforts to improve housing are being made. In America it first took the form of tenement-house legislation. Later laws, however, cover all dwellings and include: general provisions; dwellings hereafter erected, light and ventilation, sanitation, fire protection, alterations, maintenance, improvements, requirements and remedies.

After the enactment of the New York law (which applies only to cities of the first class) in 1901, New Jersey enacted (1904) a similar law applying to the whole State. Since then other States (Connecticut, Massachusetts, Indiana, Pennsylvania, California) have enacted laws which apply to all or a large proportion of their cities, and many cities have adopted local ordinances of secured State laws of local application.

Districting. Such general regulations must necessarily be based upon existing conditions in the worst sections of a city or in the worst city of the State. State legislation therefore usually provides that any city may raise the standards it sets. It is proposed that city ordinances be similarly supplemented by districting or zoning regulations which will permit of progressively higher standards being required in new districts or those further removed from the old crowded centres. One of the most promising features of regulation by districts is the power it gives to establish new industrial centres, so relieving the pressure upon the old centre and permitting an increasing proportion of the population to live in homes of good type within easy distance of their work. This is a form of regulation which has been applied in part in several cities, but was not thoroughly worked out until 1916, when a New York City commission submitted a plan for districting the metropolis. So far the efforts have been

confined to height regulation and to setting aside certain areas for residence purposes and forbidding their invasion by business or industry.

Garden Suburbs. Simply to apply regulations, which at best are negative, is not sufficient, so the creation of garden suburbs or villages is being undertaken. In these the latest lessons of city planning are applied to secure not only economy and convenience, but also all those attributes of pleasant living which may be grouped under the word "amenities." To the Englishman, accustomed to closely packed towns where solid lines of brick buildings run unbroken to the open country, most of the smaller cities and towns of the United States and the suburbs of the larger cities, with their detached houses and yards, are garden cities and suburbs. The limit of 8 or 10 or 12 houses per acre, which he sets, is one that is scarcely approached in good American developments. But in the planning of the area and the architecture of the houses America is only beginning, as at Forest Hills Gardens (New York) and Roland Park (Baltimore), to realize the possibilities.

Improved Housing. Improved housing includes the garden suburb or village, though, as used in America, the term has generally been confined to the erection and social management of dwellings, often in the older sections of cities, without reference to the town planning which is a characteristic of the garden community. The chief features of improved housing are careful planning of dwellings so as to promote in every way the welfare of the tenants, financing on a limited-dividend basis (usually 5 per cent) so that excess income is used for the improvement of the dwellings or the reduction of rent instead of the profit of the owners, and social management, which, while aiming to secure a fair return upon the investment, also seeks to establish a friendly and helpful relationship between tenant and owner.

In all of these respects the builders of improved dwellings have been of far greater service than is indicated by the number of people for whom they have provided. Alfred T. White, who in 1877 erected his first group of dwellings in Brooklyn, by his demonstration of the fact that dwellings could be planned so as to secure abundant light and air and provide proper sanitary conveniences and yet pay a fair return upon the investment, brought about one of the most important advances in local housing regulation. (Tenement House Law, 1879.) In Washington and in Philadelphia the plans of the improved houses have been used by other builders. But the full benefit was not secured owing to the lack of an organized propaganda such as that conducted in England by the Garden Cities and Town Planning Association, which has spread the idea from one end of the country to the other.

Housing by Employers. Aside from the limited-dividend companies are a considerable number of corporations which have provided for the housing of their employees. Some of these have built villages about their plants which rival in beauty the much better known villages of the Cadburys (Bournville), Lever Brothers (Port Sunlight), and the Rowntrees (New Earswick) in England.

Copartnership. Two methods which have won approval abroad have not yet been tried

in America. The copartnership companies, in which the tenants by regular payments in addition to rent gradually acquire stock in the company, so retiring outside capital, have apparently demonstrated their value in England, but up to 1916 only one attempt along similar lines has been made in America. This was at Billerica, Mass., and at that date was not yet in full operation.

Government Aid. This method is that of government loans of cash or credit, usually to municipalities or to approved limited-dividend companies. The details vary in different countries, but a brief description of English procedure must suffice. The money must be used in the erection of workmen's houses (a workman is one whose annual income does not exceed £160). After assuring itself that the building conforms to its standards the government will advance 85 per cent of the cost secured by a first mortgage and repayable in annual installments over a period of from 20 to 80 years, usually 30 years. The interest rate varies from 2¾ to 4¼ per cent, but is usually from 3½ to 3¾ per cent.

Canada has made a beginning in government aid through a provincial law which authorizes cities and towns of Ontario to guarantee securities of approved housing companies up to 85 per cent of the total value of the development. Under this act Toronto guaranteed the securities of the Toronto Housing Company, which erected several groups of dwellings. In the United States there have been two definite attempts to secure government aid. The Massachusetts Homestead Commission introduced a bill providing for the loan of State money to be used in building workmen's dwellings. The Supreme Court of the Commonwealth declared that this bill would be unconstitutional, since it would involve taxation for private rather than public benefit. The Commission therefore prepared an amendment to the constitution permitting the Legislature to authorize the Commonwealth to buy and improve land, build upon it, and sell the same for the purpose of relieving congestion of population and providing homes for citizens, provided the sale was not made at less than cost. This amendment was adopted by a large majority at the general election in November, 1915.

In 1915 bills were introduced in Congress authorizing the loan of government money for the erection of workmen's dwellings in the District of Columbia. The amount of the loan was not to exceed three-fourths of the value of the property, was to be repaid within 40 years, and was to bear interest not exceeding 4 per cent.

Municipal Housing. Another form of governmental activity in Europe has not received such general approval, and there is no attempt in America to imitate it. This is the building of dwellings by the government itself. Here Germany's experience differs from that of England, especially in the success which has attended municipal operations in Ulm.

Liverpool is the great English example of government house building and management, though many other English cities have undertaken large developments. Necessary as they may have been to improve sanitary and social conditions, they have all been failures financially. Liverpool, however, presents a strong argument even on the financial side by its showing of more than compensating savings in

charges for health, police, etc., as a result of its housing schemes. See CITY PLANNING; HOUSING PROBLEM.

TOWNS, CHARLES B. (?-). An American expert on drug habits. He established a hospital in New York, where he successfully treated persons addicted to the use of alcohol, morphine, opium, tobacco, etc. Towns, who visited China in 1908, opened hospitals at Peking, Tientsin, and Shanghai and cured 4000 opium users. Having at this time fully demonstrated the efficiency of his method, he published it for the benefit of the medical profession. He was author of the restrictive drug legislative act of New York, known as the Boylan Law, which was enacted in 1914. He published *Habits that Handicap: The Menace of Opium, Alcohol, and Tobacco and the Remedy* (1915).

TOWNSEND, CHARLES ELROY (1856-). An American legislator, born at Concord, Jackson Co., Mich. He attended the University of Michigan in 1877-78, was register of deeds of Jackson County in 1886-97, was admitted to the bar in 1895, and thereafter practiced at Jackson, Mich. He served as a delegate to the Republican National Convention in 1888 and from 1898 to 1902 was a member of the Republican State Central Committee. A member of the Fifty-eighth to the Sixty-first Congresses

(1903-11), he was reelected to his seat in the House, but in 1911 became United States Senator.

TOWNSEND, CHARLES HASKINS (1859-). An American zoölogist, born at Parnassus, Pa. From 1883 to 1902 he was connected with the United States Fish Commission, and thereafter was director of the New York Aquarium. He also served as a member of the Bering Sea Fur Seal Commission in 1896 and as an expert before the Russo-American fisheries arbitration at The Hague (1902). In 1912-13 he was president of the American Fisheries Society. He published a number of scientific papers and popular articles.

TOWNSEND, EDWARD WATERMAN (1855-). An American journalist and novelist, notable for his studies of lower New York life and dialect. He was born in Cleveland, Ohio. After a common-school education he became engaged in journalism in New York and attracted attention by sketches of Bowery life done in the picturesque slang of the streets, and contributed to the *Sun* and the *Journal*. These are collected in part as *Chimmie Fadden, Major Mac, and Other Stories* (1895); *Chimmie Fadden Explains, Major Mac Expounds* (1895), and *Near a Whole City-Full* (1897). *A Daughter of the Tenements* (1895) and *Days Like These* (1901) are novels, also of New York life. Later books are *Chimmie Fadden and Mr. Paul* (1902); *Lees and Leaven* (1903); *Sure* (1904); *Reuben Larkmead* (1905); *Our Constitution* (1906); *Beaver Creek Farm* (1907); *The Climbing Courvatels* (1909). He was elected to the National Institute of Arts and Letters in 1914.

TOWNSEND, GEORGE ALFRED (1841-1914). An American journalist, born in Georgetown, Del. He was educated in Philadelphia and was successively connected with the *Inquirer and Press* of that city, the *New York Herald and World*, and the *Chicago Tribune*. He first gained distinction as a war correspondent in the Austro-Prussian War (1866). Among his books are: *Campaigns of a Non-Combatant* (1865); *Poems* (1870); *Washington Outside and Inside* (1871); *Tales of the Chesapeake* (1880); *The Entailed Hat* (1884); *President Cromwell* (1885), a drama; *Poems of Men and Events* (1899); *Poems of the Delaware Peninsula*. Much of his newspaper correspondence was over the signature Gath.

TOWNSEND, LUTHER TRACY (1838-). An American Methodist Episcopal theologian, educator, and author. He was born at Orono, Me., and graduated at Dartmouth College in 1859, and at Andover Theological Seminary in 1862. In 1863-64 he served as adjutant in the army. He was professor of Hebrew and Greek in Boston University School of Theology (1868-72), and then professor of practical theology and sacred rhetoric until his retirement in 1893. Among his publication are: *Credo* (1869); *Sword and Garment* (1871); *The Supernatural Factor in Revivals* (1877); *The Intermediate World* (1878); *Story of Jonah in the Light of Higher Criticism* (1897); *Evolution or Creation* (1899); *Anastasis* (1900); *Adam and Eve, History or Myth?* (1904); *God and the Nation* (1905); *The Deluge* (1907); *Bible Inspiration* (1909); *Bible Studies* (1913); *The Stars are not Inhabited* (1914).

TOWNSEND, THOMAS SEAMAN (1829-1908). An American compiler, born in New York City.

From 1860 to 1901 he collected and arranged all important items concerning the Civil War that appeared in the newspapers of the country, thus forming a chronological history of great value to future historians. This enormous collection of 125 volumes is now in the Columbia University Library. It is entitled the *Townsend Library of National, State, and Individual Civil War Records*. He published *Honors of the Empire State in the War of the Rebellion* (1899).

TOWNSEND, WILLIAM JOHN (1835-). An English Methodist clergyman, born at Newcastle-on-Tyne. Educated at Ranmoor College, Sheffield, he entered the ministry of the Methodist New Connexion in 1860, and was president of the conference in 1886, general missionary secretary (1886-91), and Connexional editor (1893-97). He was president of the National Free Church Council in 1902 and of the first annual session of the United Methodist Conference (1908). Besides helping to edit *A New History of Methodism* (2 vols., 1909), he published: *The Great Schoolmen of the Middle Ages* (1881); *Madagascar: Its Missionaries and Martyrs* (1892); *The Great Symbols* (1901; new ed., 1912); *History of Popular Education in England and Wales* (1903); *Robert Morrison* (new ed., 1904); *The Story of Methodist Union* (1906).

TOWNSEND'S WARBLER. A wood warbler (*Dendroica townsendi*) of the Pacific coast of the United States, black and yellow in color (see Colored Plate of AMERICAN WOOD WARBLER with the article WARBLER) and having the general habits of its congeners. (See WARBLER.) It is not numerous and lives in the mountain forests. This and several other birds of the West owe their names to the naturalist J. K. Townsend, who in 1834, in company with Thomas Nuttall (q.v.), traveled overland to the Pacific coast and brought to the notice of science many novel species of animals.

TOWNSHEND, town'zend, CHARLES, second Viscount (1674-1738). An English statesman. A descendant of a very ancient English family of Norfolk, he succeeded to the peerage in 1687, was educated at Eton and King's College, Cambridge, and took his seat as a Tory in the House of Lords in 1697. He was named by the Godolphin administration one of the commissioners for arranging the union with Scotland (1706), was joint plenipotentiary with Marlborough at Gertruydenburg, and negotiated with the States-General in 1710 the Barrier Treaty, which pledged the States-General to the Hanoverian succession, and England to procure the Spanish Low Countries for the United Provinces, as a barrier against France. In 1712, upon the formation of the Harley ministry, Townshend was dismissed from his places, and the Barrier Treaty was censured by the House of Commons, which voted that Townshend and all who had been concerned in the treaty were enemies to the Queen and Kingdom. This persecution raised him from the rank of a follower to the station of a leader. He maintained a close correspondence with the court of Hanover and obtained the entire confidence of George I, who on his accession to the throne of England made Townshend Secretary of State with power to name his colleagues. He selected General, afterward Earl, Stanhope and formed a ministry entirely Whig in its party character. He strengthened it by the addition of his

brother-in-law, Sir Robert Walpole, who, from being at first paymaster of the forces, was soon made Chancellor of the Exchequer and First Lord of the Treasury. Through misrepresentations on the part of his colleagues, Townshend lost favor with the King and was, in 1716, dismissed from office. After the breaking up of the South Sea Bubble and the death of Sunderland (q.v.) and of Stanhope, Townshend again (1721) became Secretary of State. But he was no longer the acknowledged leader of the Whigs. The superior talent of Walpole, his financial abilities, and his influence in the House of Commons caused a change in the relative position of the two ministers and converted the two men into rivals and enemies. Townshend, resigning the contest, retired to Rainham, to cultivate his paternal acres. "Never minister had cleaner hands," said Chesterfield; and his reputation for both private and public integrity remains unsullied.

TOWNSHEND, CHARLES (1725-67). An English politician. He was the second son of the third Viscount Townshend and was educated at Leyden and Oxford. He entered Parliament in 1747, attached himself to Lord Halifax, and was given a position in the Board of Trade in 1748. In 1754 Townshend was made Lord of the Admiralty, but resigned the following year. Becoming a member of the Privy Council under Pitt in 1757, upon the dissolution of the Whig government in 1761 he was won over by Bute with an offer of the post of Secretary for War. On Bute's resignation in 1763 he was appointed President of the Board of Trade. After opposing the Grenville administration he accepted the position of Chancellor of the Exchequer under Pitt in 1766. But Pitt soon lost control over his colleagues by his acceptance of the peerage and his long periods of illness, so that Townshend began to advocate measures to which Pitt was opposed. In 1767 his first budget was rejected, and he thereupon proposed those taxes on certain goods imported into America which was one of the chief causes of the Revolution. Townshend himself did not live to see this result, but died suddenly on Sept. 4, 1767. He was ranked as an orator with Pitt and was far more popular than the Great Commoner with the House of Commons. Consult P. H. Fitzgerald, *Charles Townshend: Wit and Statesman* (London, 1866), and Harry Graham, *Splendid Failures* (ib., 1913).

TOWNSHEND, SIR CHARLES JAMES (1844-). A Canadian jurist. He was born at Amherst, Nova Scotia, and was educated at King's College, Windsor. Called to the bar in 1866, he practiced his profession at Amherst. He was a Conservative member of the Provincial Legislature in 1878-84, a member of the Provincial cabinet in 1878-82, and of the House of Commons in 1884-87. In 1887 he was appointed a puisne judge of the Supreme Court of Nova Scotia and in 1907-15 was Chief Justice of the Province. In 1911 he was knighted.

TOWNSHEND, CHARLES VERE FERRERS (1861-1924). A British soldier, commander in chief of the Mesopotamia campaign in the Great War. He entered the Royal Marines in 1881, but joined the army in 1886 and was promoted through the grades to major general in 1911. He served in the Sudan and Nile expeditions (1884-85) and in the Hunza Nagar expedition

(1891-92); commanded Chitral Fort during a siege; and participated in the Dongola expedition (1898) and in the South African War (1899-1900). Townshend was assistant adjutant general of the Ninth Division Army in India in 1907-09, and in 1912-13 commanded a division of the Territorial Force. During the European War (see WAR IN EUROPE) he commanded the British army that withstood for nearly five months a Turkish siege at Kut el Amara in Mesopotamia, and was compelled to surrender in April, 1916, for lack of food.

TOWNSHEND, GEORGE, first MARQUIS (1724-1807). A British soldier. He served early in the Netherlands and at Culloden and Laufeld. While temporarily retired from the army he drafted the Militia Bill of 1757. In 1759, as brigadier general, he joined Wolfe's expedition against Quebec, commanded the left wing on the Heights of Abraham, and at Wolfe's death succeeded to the chief command. In 1764 he took the family title, Viscount Townshend. As Lord Lieutenant of Ireland in 1767-72 he was in continual dispute with the Irish House of Commons. He was made Marquis in 1786 and field marshal in 1796.

TOWNSHIP (AS. *tūnscepe*, from *tūn*, inclosure, town + *-sceipe*, Eng. *-ship*). A minor political or territorial division in England and the United States. In England, in Anglo-Saxon times, as a political unit it was known as the tūnscepe; as an ecclesiastical area it was the parish. As a political unit it had a popular assembly (*tun moot*); as an ecclesiastical unit it had a vestry meeting. The chief executive officer was the *tun reeve*. He with the priest and four other persons represented the township in the popular assembly of the hundred and county. Upon the settlement of the American Colonies the township was transplanted to America and still survives, like many other political institutions of English origin. Here it is a subdivision of the county, and its political importance varies with the locality of the State. In New England, under the name of the town, it plays a far more important part in the work of the local administration than the county—in fact, it performs most of the business of local government which in the Southern States is attended to by the county. (See *Town*.) In the Middle and Western States the township plays a somewhat less important part in the work of the local government than it does in New England, the county there sharing with the township many of the important functions of local government.

In the Southern States the township is not an administrative unit of much importance. On account of early social and political conditions there, the county has been from the first the chief unit of local government, although there are signs of development in the Southern township which may increase its administrative importance in the future. In some of the Middle and Western States the town meeting exists, having been transplanted from New England. Elsewhere the chief governing authority is a township board. The township has a quasi-corporate capacity, being able to own real estate and to sue and be sued, but in performing public governmental duties it acts for the State and cannot be held liable for the negligence or tortious acts of its agents. The word "township" is also applied to the units of the congressional survey in some of the Southern and Western States.

these being rectangular areas 6 miles square, each of which is subdivided into 36 sections containing 640 acres. (See diagram under SURVEYING.) This is probably the most simple system of land division yet established. The congressional township, as it is sometimes called, is not a public corporation or juristic personality, but a geographical convenience. Consult Ashley, "The Anglo-Saxon Township," in *Quarterly Journal of Economics*, and Bryce, *American Commonwealth* (new ed., 2 vols., New York, 1910).

TOWNSLEY, CLARENCE PAGE (1855-1926). An American soldier, born at Dekalb, St. Lawrence Co., N. Y. He graduated from the State Normal School at Potsdam, N. Y., in 1872, from Union College in 1876, and from the United States Military Academy in 1881. Entering the artillery service, he was promoted captain in 1899 and colonel in 1911. During the Spanish-American War he served on the staff of General Ludlow, who was chief of artillery and chief ordnance officer of the Department of Havana, Cuba. In 1909-11 he was commandant of the Coast Artillery School at Fort Monroe and in 1912-16 was superintendent of the United States Military Academy (West Point).

TOWNSVILLE. A fortified seaport on the east coast of Queensland, Australia, situated on Cleveland Bay at the mouth of Ross Creek, 870 miles northwest of Brisbane (Map: Queensland, E 5). It has a cathedral, courthouse, technical school, barracks, etc. Its industrial establishments include foundries, distilleries, and meat-exporting establishments. It is the terminus of the railway from Winton, 365 miles inland, and has an extensive shipping trade; the harbor is tidal and has been much improved by two long breakwaters, large vessels being enabled to enter. Pop., 1901, 12,717; 1911, 13,835.

TOWSE, J(OHN) RANKEN (1845-). An American dramatic critic. He was born at Streatham, Surrey, England, and was educated at Cambridge. Coming to the United States in 1869, he joined the staff of the *New York Evening Post* the next year and after 1874 was its dramatic critic. To this paper he contributed notable articles on all the most important theatrical productions. Some of his criticisms appeared also in the *Nation*. In the Saturday supplement of the *Post* were published his *Sixty Years of the Theatre: An Old Critic's Memories* (1913-14; part ii, 1915-16).

TOWTON. A parish in Yorkshire, England, about 11 miles southwest of York, noted as the scene of a decisive victory gained by the Yorkist forces under Edward IV and the Earl of Warwick over the Lancastrians, commanded by the Duke of Somerset and the Earl of Northumberland, March 29, 1461. The battle is said to have been the most sanguinary ever fought on English soil, and according to a contemporary statement 28,000 men were left dead upon the field. The victory secured Edward IV (q.v.) in possession of the throne. See *ROSES*, *WARS OF THE*.

TOXÆMIA. A poisoned condition of the blood due to the circulating in it of toxic materials, either chemical or bacterial in their nature. These toxins may be derived from putrefactive or other fermentative changes in the intestinal tract or from the products of bacterial activity in the tissues circulating the blood. When bacteria themselves find entrance

into the blood stream, the condition is known as bacteræmia. See AUTOINTOXICATION; IMMUNITY; TOXIN; VACCINE THERAPY.

TOXICOLOGY (from Gk. *τοξικόν, toxikon*, poison, neut. sing. of *τοξικός, toxikos*, relating to the bow, from *τόξον, toxon*, bow, so called because first used to poison arrow points + *-λογία, -logia*, account). The branch of medical science which treats of the nature of poisons, their morbid effects on the animal system, their detection in the organs or tissues of the body, their antidotes, of the treatment of poisoning, and of the legal questions connected with poisoning. A poison may be defined as any substance which when applied to the body or introduced into the system, in whatever manner, produces death or serious bodily harm. Poisons may enter by the mouth or may be absorbed by the skin in amounts sufficient to cause death or severe toxic symptoms, as from lotions or salves containing opium, corrosive sublimate, arsenic, carbolic acid, etc. Gaseous or volatile poisons may enter the lungs through inspired air, e.g., illuminating gas, carbon monoxide, or chlorine. Poisons may gain access to the circulation through ulcerated surfaces or wounds; by direct injection into the tissues, as by hypodermic injection, poisoned weapons, or snakebites; or they may be introduced by way of the mucous membrane of the rectum, vagina, urethra, etc.

Most medicinal agents are poisonous if taken in sufficient quantity, this quantity varying with the individual, the state of health, fullness or emptiness of the stomach, habit, and other circumstances. The influence of habit is shown by opium habitués who take enormous doses of the drug without immediate evil effects. A special susceptibility to certain substances is noted in some individuals. This is called idiosyncrasy. Idiosyncrasy towards certain articles of food or towards foreign proteins such as egg albumen, serums, etc., when injected, is now looked upon as a phase of anaphylaxis (q.v.). Races and individuals may possess or attain a high degree of immunity to particular poisons—the Oriental is much less susceptible to opium than the European, and the latter bears alcohol better than savage races. In certain diseases there is a diminished susceptibility to the action of particular poisons, while in others there is increased sensibility. Thus, in tetanus, hydrophobia, mania, or delirium tremens doses of various sedatives may be given with benefit which would in health prove fatal; on the other hand, when there is a predisposition to apoplexy, an ordinary dose of opium may cause death. Some poisons are harmless to the stomach, but violently toxic when injected beneath the skin.

Poisons may be classified according to their chemical properties or their physiological action. The latter is the usual and most satisfactory basis and depends upon the effects of poisons upon the system when in healthy condition. According to the physiological classification poisons are divided into two great groups: (1) the irritants and (2) the neurotics. An irritant poison is one which when swallowed produces irritating effects upon the mucous membrane of the alimentary canal, resulting in nausea, vomiting, purging, pain in the abdomen, cramps in the stomach and other parts of the body. This group is subdivided into (a) corrosives, whose action is chiefly local, and (b)

the true irritants, whose local effects may be slight, but which produce their characteristic effect after absorption. Many drugs act in both ways, e.g., oxalic acid and carbolic acid. A neurotic poison is one which acts chiefly on the nervous system, producing drowsiness, giddiness, headache, delirium, stupor, coma, convulsions, or paralysis.

A few principles of the general treatment of poisoning may be given. The indications are (1) to neutralize and render harmless the poison by the administration of the proper antidote (q.v.); (2) to remove the poison from the body by inducing vomiting or washing out the stomach; (3) to combat the effects of poison already absorbed by giving drugs which are antagonistic to the one absorbed and supporting life until the body rids itself of the poison through natural excretory channels. Mechanical antidotes include the use of the stomach tube or pump, the employment of emetics, cathartics, stimulants, injections, ligations, etc. The true or chemical antidotes include albumin, milk, charcoal, soap, starch, oils, tannin, turpentine, acids, alkalies, potassium permanganate, sodium chloride, iodine, iron, etc.

When a poison has been taken by the mouth the stomach should be emptied immediately by means of the stomach tube or emetics, except where there is severe corrosion and perforation of the stomach is feared. A prompt and certain emetic is apomorphine, which will act when given hypodermically. Domestic resources are usually limited to large drafts of mustard and warm water, warm milk in large quantities, oils, butter, and lard, common salt solution, soapsuds; these often act with great promptness. Ipecac in the form of the sirup is found in most households and may be given in doses of one or two tablespoonfuls to adults or half that to children. It is safe and unirritating, but is too slow for emergencies. Other useful emetics are copper sulphate, zinc sulphate, turpeth mineral, and alum. In poisoning it is better to use almost any emetic at once than to lose valuable time getting the right one. When poisoning is due to irritants after evacuation of the stomach, bland and viscid fluids should be given to protect the wall of the alimentary tract and allay inflammation. These agents are called demulcents—flaxseed tea, white of egg, milk, etc. Where the poison has gained entrance by inoculation, as in the case of dogbites or the stings of reptiles, the part should be washed, sucked, or incised freely, and a ligature applied about the extremity above the wound, i.e., between it and the heart. The wound should then be thoroughly cauterized.

The stomach having been emptied, the next step is to administer the proper antidote or physiological antagonist. In general it is to be remembered that alkalies counteract acids and vice versa, since they tend to form harmless salts. Poisoning by the irritant metallic salts is best treated with albumin, in the form of white of egg, an inert, insoluble albuminate being formed. The antidote for the vegetable alkaloids is tannin, most conveniently given in the form of strong green tea. Chemical antidotes act only on such portions of the poison as have not been absorbed and must be given promptly.

Physiological antidotes or antagonists follow the poison into the circulation and combat its effects as long as it remains in the body.

Corrosive Poisons include acetic, carbolic, chromic, lactic, oxalic, and salicylic acids; concentrated mineral acids (sulphuric, nitric, etc.); creosote; corrosive sublimate, the caustic alkalis (potassium and sodium dioxide, usually in the form of lye, ammonia, etc.); quicklime; potassium chlorate; and potassium nitrate. These poisons act either on the surface of the body, causing deep and painful destruction of tissue, or internally, by producing intense gastroenteritis and collapse. The symptoms common to the group are nausea, vomiting, pain, and purging, the vomited and dejected matters being mucous, serous, or bloody. The mouth and lips, hands and face, are frequently burned and corroded. Treatment consists in neutralizing the poison and giving demulcents. In the case of weak acids, magnesia, chalk, soap, and dilute ammonia may be given as antidotes: for alkaline poisoning weak acids, such as dilute vinegar or lemon juice, may be given. When the poison is concentrated the stomach tube should not be used. Carbolic acid is best antidoted with dilute alcohol. The sulphate of magnesia is also a perfect antidote.

True Irritants include, besides certain of the corrosive poisons already mentioned, bromine, blister beetle, croton oil, chlorine, antimony, arsenic, copper, chromium, lead, tin, zinc, phosphorus, and iodine (qq.v.). In concentrated form most of them cause irritation to the gastrointestinal tract, and also show specific action on various organs after their absorption by the blood. Arsenic is commonly employed, or taken accidentally, with homicidal or suicidal intent. It is widely used in the arts and is a constituent of vermin exterminators. Poisoning may be acute or chronic. In acute cases the symptoms are those common to irritant poisons. The chemical antidote is known as arsenic antidote, or dialyzed iron. A small dose of arsenic (1 to 3 grains) is sufficient to kill. Chronic poisoning by arsenic is also common as a result of inhalation or contact with the various arsenical greens used in coloring wall papers, carpets, etc., grinding arsenic in mills, and from vapors in smelting copper. Symptoms are gastric irritation, cough, throat troubles, gradually failing health, and paralysis. See ARSENIC.

Lead poisoning may also be acute or chronic, the latter being the most usual form. Acute cases are due to the ingestion of the acetate (sugar of lead), carbonate, oxide, or chromate of lead, and painters are the chief sufferers. The prominent symptoms are gastrointestinal irritation, cramps in the legs and abdomen, followed by paralysis of the extremities, convulsions, and coma. The sulphate of magnesia (Epsom salt) is the antidote, forming an insoluble sulphate of lead and acting also as a purge. Chronic poisoning arises from handling paints, drinking water conducted in lead pipes, the use of cosmetics containing lead, and eating canned foods contaminated by solder. It is an incident of many different trades. (See OCCUPATIONAL DISEASES.) The symptoms come on insidiously and consist of a peculiar gripping colic (lead colic), obstinate constipation, muscular cramps, paralysis of the extensor muscles of the forearms (wrist-drop), and a blue line at the junction of the gums and teeth. Chronic poisoning is treated by removing its source and by the administration of Epsom salt and potassium iodide to eliminate the lead already absorbed. See LEAD.

Phosphorus poisoning is due to yellow phosphorus, commonly derived from matches or rat poisons. Workers in match factories are most usually attacked, although rat poison is sometimes taken with suicidal intent. The poison is very active and recovery is rare. The prominent symptoms in acute poisoning are vomiting of matters luminous in the dark, a smell of phosphorus in the breath, inflammation of the stomach and intestines, jaundice, convulsions, and coma. Treatment consists in washing out the stomach and the administration of old oil of turpentine or potassium permanganate.

Poisonous Foods. Many foods which, owing either to their inherent properties (mushrooms and other fungi) or to the development of putrefactive bodies within them (ptomaines), produce symptoms of poisoning when eaten. The symptoms are very diverse, but intense gastrointestinal irritation is common to all of them, and they may therefore be appropriately classed as irritants. Mushroom poisoning arises through mistaking various fungi, such as mushrooms, toadstools, and truffles, for edible varieties. The toxic substance in many of these is muscarine, a deadly alkaloidal poison, producing violent vomiting, colic, thirst, dyspnea, paralysis, and death. Ptomaine poisoning is due to the products of putrefactive decomposition in animal or vegetable matter. The ptomaines are alkaloids and resemble chemically many of the vegetable alkaloids. Not all ptomaines are poisonous and not all food poisons are ptomaines. The foods which sometimes produce symptoms of poisoning, whether ptomaine or other, are corned beef, sausage, pickled or decaying fish, putrid game, cheese, milk, shellfish, particularly mussels and crayfish, land crab, etc. The treatment of food poisoning, from whatever cause, is prompt evacuation of the stomach, preferably by stomach tube, using plenty of water, and administration of tannic or gallic acid or strong tea. See MUSHROOM; PTOMAINES.

Neurotic Poisons. These act principally through the nervous system and as a rule produce little or no tissue change.

Alcohol may act as an acute or chronic poison. Its effects are fully considered under INTOXICATION.

Opium and its chief alkaloid (morphine) laudanum, Majendie's solution (of morphine), and paregoric are often used for suicidal or homicidal purposes. Paregoric was formerly responsible for many cases of opium poisoning in children, being a common ingredient of soothing sirups. Acute opium poisoning is characterized by a short preliminary stage of pleasurable excitement followed by drowsiness, sleep, and complete unconsciousness. In a moderately advanced case the pupils are contracted to a pin point, the respirations are slow, the pulse full, the skin moist. The breathing grows slower until death supervenes from respiratory paralysis. The stomach must be promptly emptied and tannic acid or potassium permanganate given as antidote. Stupor is combated by administration of strong coffee, atropine, or strychnine, and by cold douches, flicking with wet towels, electrical stimulation, and later by forced artificial respiration. Chronic opium poisoning is seen in those habituated to the drug, both in eastern and western countries. See MORPHINE; OPIUM.

Cocaine is extensively used as a local anæst-

thetic, and alarming symptoms have followed its absorption by the mucous membrane or its hypodermic injection. Death occurs very rapidly (from 40 seconds to four minutes), with great depression and respiratory or cardiac failure. If the patient can be kept alive for half an hour, recovery is almost certain. If the poison has been taken by the mouth, evacuate the stomach, and in any case fresh air, artificial respiration, and stimulants are called for. See COCAINE.

Chloral is quite often injudiciously used by the public to induce sleep and quiet the nerves; it is also taken with suicidal intent and given by criminals (knock-out drops) to induce prolonged stupor, often with fatal results. The patient simply passes into a deep sleep without previous excitement, and death occurs from heart failure. Treatment is like that of opium and cocaine. See CHLORAL.

Belladonna and its alkaloid atropine produce, when taken in poisonous amounts, dilatation of the pupil, flushing of the skin, dryness of the mouth, delirium, and sometimes convulsions. Recovery is the rule, but when death occurs it is from paralysis of the heart. Treatment consists in washing out the stomach, and opium is the physiological antidote. Similar in effects and treatment to belladonna are homatropine, hyoscyamus (henbane), hyoscyamine, hyoscine, stramonium, and dulcamara. See ATROPINE; BELLADONNA.

Strychnine and nux vomica are contained in certain vermin killers and used both for suicide and murder. In poisonous doses they act principally on the spinal cord, producing cramps and convulsions like those of tetanus. Death or recovery is usually speedy. The patient is to be put in a quiet dark room, and tannic acid or charcoal is given, followed by stomach washing. This must be done before spasms set in. Chloroform and ether control the convulsions, and the bromides and opium act in the same way, but more slowly. See STRYCHNINE; TETANUS.

Prussic acid and the various cyanogen compounds contained in cyanide of potash, bitter almonds, peach and plum pits, are exceedingly rapid and fatal poisons. When smaller doses have been taken sulphate of iron may be given as an antidote, and affusions and douches of cold water and a resort to artificial respiration are the most useful measures. See HYDROCYANIC ACID.

Among other substances in the class which are occasionally taken in poisonous doses are aconite, cannabis indica, curare (arrow poison), digitalis, hemlock, and the various coal-tar products, such as acetanilid, phenacetine, and sulphonal (qq.v.).

Anæsthetics (ether, chloroform, and nitrous oxide) act as narcotic poisons when taken in overdose. The symptoms may be divided into two stages—one of excitement with rapid pulse and respiration, struggling and flushed face; and one of depression, in which the muscles are relaxed, the patient is insensible, passes into coma, and dies from cardiac or respiratory failure. When dangerous symptoms come on during the administration of an anæsthetic, this is to be stopped, the tongue drawn forward, the patient exposed to a current of fresh air, and if breathing stops subjected to artificial respiration. Hypodermic injections of atropine or strychnine are also given. The inhalation or

drinking of ether and chloroform is indulged in as a habit by a few individuals. See ANÆSTHETIC.

Gaseous Poisons. The more common of these are carbonic-acid gas, carbon monoxide, hydrogen sulphide, sulphurous oxide, illuminating gas, sewer gas, and cesspool emanations, and carbonic-acid gas (choke damp) as found in the air of mines, cellars, and wells. Miners are frequently killed by the latter. Carbon monoxide occurs in charcoal fumes, fuel gas, and illuminating gas and passes into the air of a room from defective flues or pipes. Air containing 1 per cent of this gas is rapidly fatal. When exposure to this poison has been long and unconsciousness exists, recovery is not probable. The effects of illuminating gas are similar to those of carbonic oxide. Sewer gas is a mixture of sulphureted hydrogen, ammonium sulphide, nitrogen, and carbonic-acid gas. The symptoms of the gaseous poisons depend on the amount absorbed and vary from slight headache and dizziness to suffocation and collapse. The treatment is to get the patient into the fresh air, give oxygen, or perform artificial respiration, use the pulmotor, and stimulate. See PULMOTOR.

Animal Poisons. The stings of insects, the bites of scorpions, tarantulas, snakes, and rabid dogs are comprised in this group. Their action is complicated. The local effects are irritation, redness, swelling, and œdema, or even gangrene. The poison after entering the circulation may disorganize the blood, causing jaundice, hæmoglobinuria, hemorrhage into the tissues, and cyanosis. There are in addition general symptoms, such as vertigo, dyspnoea, prostration, cardiac paralysis, and finally collapse. Local treatment of such bites consists in the application of a tight band or ligature above the wound to prevent absorption; the destruction by the knife or cautery of the area containing the poison after removing as much as possible by suction; and the administration of stimulants such as ammonia, alcohol, or strychnine, to keep up the strength until the poison is eliminated. A serum known as antivenene has been employed as treatment in bites of poisonous snakes with doubtful results. See GLANDERS; HYDROPHOBIA; SERUM THERAPY.

The medicolegal duties of the medical examiner in cases of fatal poisoning, whether suicidal or homicidal, are: (1) to establish the presence or absence of conditions characteristic of any poison; (2) to preserve all necessary material for subsequent analytical examination and to avoid introducing possible causes of error; (3) to recognize or exclude natural causes of death; (4) to perform experiments on animals, if necessary, in order to demonstrate the toxic effect of the substance separated by the chemical; and (5) to record carefully all observations and state clearly the conclusions as to the cause of death. Difficult cases constantly arise in which the post-mortem appearances are not decisive or are consistent with either disease or poison. In performing an autopsy for medicolegal purposes the identity of the body must first be established and the autopsy should be done in the presence of witnesses. The organs and tissues to be removed and preserved for future analysis are deposited separately in clear glass jars, which are sealed. The tissues and organs to be removed are the stomach, and intestines ligated and unopened,

the entire liver, the blood from the heart and vessels, both kidneys, the urine, the entire brain, a large piece of muscle from the thigh, and portions of the bone and spleen. Important information as to the time of absorption is evidenced by the distribution of poison in the various tissues. The unabsorbed residue is found in the stomach and intestines. Poisons in both stomach and liver indicate a short interval between the taking and death, while poison in the liver and other organs, with none in the stomach, indicates a greater interval. Most poisons remain in the liver after disappearing from the stomach and remain longer in the muscles and bones than in any other tissue. Poisons are found in their greatest purity in the kidneys and urine. Proof of poisoning has been established by chemists by analysis of muscles or one kidney, when all the other tissues have been destroyed by the suspected parties. Besides the examination for poisons and their lesions, every organ must be examined for all natural causes of death, and in particular the causes of sudden death should be rigidly excluded. Consult: Witthaus and Becker, *Medical Jurisprudence, Forensic Medicine, and Toxicology* (New York, 1894); J. J. Reese, *Medical Jurisprudence and Toxicology* (8th ed., Philadelphia, 1911); W. R. Smith, *Medical Jurisprudence* (London, 1913); W. Autenrieth, *Laboratory Manual for the Detection of Poisons and Powerful Drugs* (Philadelphia, 1915); A. H. Brundage, *Manual of Toxicology* (8th ed., New York, 1915). See ALKALOIDS; AUTOPSY; DEATH; MEDICAL JURISPRUDENCE; OCCUPATIONAL DISEASES.

TOXIN. Toxins are specific poisonous substances elaborated by the metabolic activities of certain microorganisms. A few varieties of bacteria secrete their toxins directly into the tissues or culture media in which they grow and are known as soluble, exogenous, extracellular, or true toxins. Other bacteria retain most of the poisonous material within themselves and hence are known as intracellular or endotoxins, these being liberated only when the bacteria become disintegrated by chemical, physical, or mechanical means. Besides bacterial toxins there are characteristic poisons produced by various plants and animals and termed respectively phytotoxins and zoötoxins. The more important true toxins causing infection in man are those of diphtheria, tetanus, botulism, dysentery, staphylococcal, and other bacterial toxins. Owing to their extreme susceptibility to various chemical and physical influences, such as light, heat, age, etc., toxins are difficult to isolate in their pure state. Oxidizing agents destroy them, and our knowledge of them has been gained chiefly through the lesions and symptoms which they produce when injected into susceptible animals. They are all poisonous, but in order to become effective must enter into chemical combination with the animal cells. They are, with the exception of botulin, destroyed by the gastrointestinal juices. While their exact chemical nature is unknown, it is the general belief that they are toxalbumins and closely allied to proteins. It has also been abundantly demonstrated that they are colloid in nature and bear a close resemblance to enzymes. They differ from ptomaines in that they are absolutely specific synthetic products, whereas ptomaines are cleavage products from the medium upon which the bacteria grow.

Toxins, moreover, can give rise to antibodies, whereas ptomaines cannot produce them. See ANTITOXIN; BACTERIA; DIPHTHERIA; IMMUNITY; SERUM THERAPY.

TOXODONTIA, tók'sō-dōn'shī-ā (Neo-Lat. nom. pl., from Gk. *τόξον*, *toxōn*, bow + *δόντις*, *odontis*, tooth). An extinct suborder of ungulate mammals found fossil in the Tertiary deposits of Argentina and Patagonia, South America. *Toxodon* was a heavily built animal as large as a rhinoceros, with a large heavy head placed on a short neck which sloped down from the shoulders, so that the head was much lower than the back. The teeth are large, compressed laterally, and either triangular or prismatic in section, and they grew from persistent pulps. The bones of the skeleton are all massive, the legs short and thick, and the feet are three-toed. *Nesodon*, an earlier genus than *Toxodon*, was of smaller size and less robust build.

TOXOPHYLUS. A work in two books on archery by Roger Ascham (q.v.), in the form of conversations between Philologus and Toxophilus on the attractions of books and archery (q.v.).

TOXOPHYLAX'INS. See IMMUNITY.

TOX'OSO'ZINS. See IMMUNITY.

TOY, CRAWFORD HOWELL (1836-). An American Orientalist. He was born in Norfolk, Va., and graduated at the University of Virginia in 1856. He studied at Berlin in 1866-68, became professor of Hebrew at the Southern Baptist Theological Seminary in 1869, and in 1880 was called to Harvard, where he served as Hancock professor of Hebrew and other Oriental languages till his retirement in 1909, and also as Dexter lecturer on biblical literature till 1903. In 1879 he served as president of the American Philological Association. His publications include a translation and revision of Erdmann's commentary on Samuel in Lange's series (1877); an edition of Murray's *Origin of the Psalms* (1880); *The Religion of Israel* (1882; 3d ed., 1884); *Quotations from the Old Testament in the New Testament* (1884); *Judaism and Christianity* (1890); the Book of Ezekiel in the *Polychrome Bible* (Hebrew text, 1896; English, 1898); Proverbs, in the *International Critical Commentary* (1899); *Introduction to the History of Religions* (1913).

TOYAMA, tō'yā'mā. The capital of the Prefecture of Toyama in Japan, situated in the central part of Hondo, near the west coast (Map: Japan, E 5). The old castle is used as a school. There are manufactures of leather. Pop., 1908, 57,437.

TOYN'BEE, ARNOLD (1852-83). A pioneer of the Social Settlement movement. He was educated at Balliol College, Oxford, and afterward became a tutor and lecturer there. He was the author of a number of well-known addresses on political economy, but is best known by his efforts to understand the economic and social problems of the working classes of Whitechapel, among whom he made his home, associating himself with the religious work carried on there by his friend S. A. Barnett. Early in life Toynbee had come under the influence of Ruskin, but his sympathy with the artisan class found a means of expression entirely his own. His favorite maxim, "The welfare of the producer is as much a matter of interest to the consumer as the price of the product," voiced the religion of the student of social conditions. His name is associated with the modern Social Settlement

(q.v.). Two years after his death in the crowded Whitechapel district, which had been the scene of his efforts, Toynbee Hall was erected by the men of Oxford and Cambridge who had shared his labors there. Consult F. C. Montague, *Arnold Toynbee* (Baltimore, 1889), and A. Milner, *Arnold Toynbee* (3d ed., New York, 1901).

TOYNBEE, PAGET (1855–). An English scholar, especially known for his studies in Dante. A brother of Arnold Toynbee, he was born at Wimbledon, near London, attended Haileybury College, Hertfordshire, and Balliol College, Oxford, and was a private tutor (1878–92). He published: *Specimens of Old French* (ninth to fifteenth century) (1892); *Historical French Grammar*, which is a skillful revision and amplification of Brachet (1896); *Ricerche e Note Dantesche* (1899; 2d series, 1904); *Critical Text of the "Divina Commedia"* (1899); *Life of Dante* (1900; 4th ed., enlarged, 1910; Ital. trans., 1908); *Dante Studies and Researches* (1902); *Dante in English Literature, from Chaucer to Cary* (2 vols., 1909); *A Concise Dictionary of Proper Names and Notable Matters in the Works of Dante* (1914); *The Correspondence of Gray, Walpole, West, and Ashton* (1915).

TOYNBEE HALL. The first social settlement in the world, founded in 1884 by Canon Samuel A. Barnett, vicar of St. Jude's, Whitechapel, East London. It was named in honor of Arnold Toynbee (q.v.), who while a student at Oxford became interested in bettering the condition of the poor in the Whitechapel district. In 1877 Canon Barnett formed at Oxford a committee to consider university extension, as a result of which various lectures were given in Whitechapel. In 1884 the University Settlement Association was formed and Toynbee Hall was opened.

A basic principle in the minds of its founders was that constructive action for the alleviation of the condition of the poor required that practical experience of their problems to be gained only by intimate association. The plan provided that young university men, unencumbered with family affairs, should live as residents at the hall and devote some of their free time to the problems of the community. About the residents was grouped a body of "associates," about 100 in number, who lived near and coöperated. Moreover "guest rooms" at the hall afforded temporary quarters for graduates and undergraduates who desired to spend short periods there assisting and learning. Toynbee Hall gradually became the centre of educational and social endeavor for the district. Its activities have broadened and its influence deepened. It has libraries, lecture courses, reading clubs, technical classes, musical societies, numerous educational activities, workingmen's clubs, and is an active factor in local government. Consult: Philip L. Gell, *Account of the Work of Toynbee Hall in East London*, in Johns Hopkins University Studies (Baltimore, 1889); Canon S. A. Barnett and Mrs. S. A. Barnett, *Practicable Socialism* (London, 1915).

TOYOHASHI, tō'yō-hā'shē. A town in the Prefecture of Aichi, central Hondo, Japan, 45 miles by rail southeast of Nagoya (Map: Japan, E 6). Pop., 1898, 21,785; 1908, 43,980.

TOZER, HENRY FANSHAW (1829–1916). An English writer, teacher, and traveler. After graduating from Exeter College, Oxford, in 1850, he was tutor there from 1855 to 1893

and was also curator of the Taylor Institution (Oxford) from 1869 to 1893. He traveled much in Greece and in European and Asiatic Turkey, and, besides editing various works, published: *The Highlands of Turkey* (2 vols., 1869); *Lectures on the Geography of Greece* (1873); *Primer of Classical Geography* (1877); *Turkish Armenia and Eastern Asia Minor* (1881); *The Church and the Eastern Empire* (1888); *The Islands of the Aegean* (1890); *History of Ancient Geography* (1897); *An English Commentary on Dante's Divina Commedia* (1901), and a translation of the *Divina Commedia* (1904).

TRABERT, trā'bērt, WILHELM (1863–1921). An Austrian meteorologist, born in Frankenberg, Hesse. He took his Ph.D. in 1888 at Vienna University, where he became associate professor in 1901. The next year he was appointed to the chair of cosmical physics at Innsbruck and later to the directorship of the Central Bureau of Meteorology at Vienna. He became a member of the International Polar Commission. Trabert published: *Meteorologie* (1896; 2d ed., 1901); *Meteorologie und Klimatologie* (1905); *Lehrbuch der Kosmischen Physik* (1911).

TRAC'ERY (from *trace*, OF. *tracer*, *trasser*, Fr. *tracer*, to trace, track, delineate, from ML. **tractiare*, frequentative of Lat. *trahere*, to draw, drag). The decorative subdivision of a window, arch, or other opening into smaller parts by means of mullions, cusps, and foils, perforated stonework, etc.; but the term is not applied to such perforated slabs as fill many Oriental and some Romanesque windows. Tracery was developed during the Gothic period chiefly in France and England from its germ in two openings grouped under an arch with a decorative opening pierced in the spandrel above them. This early phase, called plate tracery, is seen in the early rose windows of Chartres (1170) and in English churches of the twelfth century. The openings were multiplied and in later examples replaced by slender mullions, arches, circles, cusps, and foils of stone (bar tracery). The general frame of each window inclosed several separate lights, and above and between their arched summits were minor foiled openings. These became more elaborate in the succeeding centuries, seeking ever more complex geometric combinations of lines. The rose or wheel windows, such as those of Notre Dame in Paris, and the clerestory and chapel windows of the cathedrals of Rheims and Amiens, illustrate the various stages of this development. This tracery spread gradually from the windows until it overran almost every part of the church with its delicate lace patterns, sometimes on a solid ground (wall tracery), sometimes pierced. The period of a Gothic structure can generally be judged with tolerable accuracy by the style of its tracery. This is particularly the case in England, where two of the three main divisions of the Gothic movement, the Decorated and the Perpendicular, are so called on account of their distinctive styles of tracery. During the Decorated (q.v.) period the tracery, at first composed of simple arches, circles, and cusps (geometric), later assumed freer curved lines (curvilinear or flowing). About 1375 there is an almost abrupt transition to the Perpendicular (q.v.) tracery, in which vertical mullions dominate the design. The English tracery, especially in the vast east and west windows, is on the whole

richer and more varied than the French. The finest French examples are the great rose windows of the west fronts and especially the transepts of the great cathedrals (whence the term *Rayonnant*). The Flamboyant (q.v.) style in France, contemporary with the English Perpendicular, had tracery of a very different description, composed of swaying and flowing lines, an elaboration of the English curvilinear type. German tracery followed in the main, but with variations, the French types (e.g., Strassburg, Freiburg). With a few exceptions Italian tracery is negligible, as large windows were not in favor. See *GOTHIC ART*; *WINDOW*.

TRACHEA, trā'kē-ā (Neo-Lat., from Lat. *trachia*, from Gk. *τραχεία*, *tracheia*, trachea, windpipe, rough artery, so called because of the rings of gristle, from *τραχύς*, *trachys*, rough), or *WINDPIPE*. The tube through which air-breathing vertebrates receive air into the lungs. It extends from the throat to the bifurcation of the bronchi. It is sufficiently described under *RESPIRATION*. Tracheotomy (q.v.), or the more modern practice of bronchoscopy, is necessary for the removal of foreign bodies lodged in the trachea and bronchi. The trachea shares certain inflammations and morbid processes in common with the larynx and the bronchi. For figure of trachea, see *BRONCHUS*.

TRACHEÆ. The characteristic elements of woody tissue. See *TRACHEID*.

TRACHEID, trā'kē-īd. A cell of the woody tissue in which the wall is thickened (lignified), but with thin areas of various forms left, resulting in different patterns of wall sculpture. Tracheids are single cells as distinguished from tracheæ (q.v.), which are cell fusions. Tracheids are characteristic of the secondary wood of gymnosperms, while tracheæ make up the wood of angiosperms. See *HISTOLOGY*.

TRACHEOTOMY (from Gk. *τραχεία*, *tracheia*, trachea, windpipe, rough artery + *τομή*, *tomē*, a cutting, from *τέμνειν*, *temnein*, to cut) and **LARYNGOTOMY** (from Gk. *λάρυγξ*, *larynx*, larynx + *τομή*, *tomē*, a cutting). Opening the trachea by incision in order to admit the entrance of air when suffocation is threatened.

Among the conditions which demand tracheotomy are foreign bodies in the air passages, cut throat, diphtheria, edema of the glottis, and tumors either within the larynx or pressing upon the air passages from without (as a goitre). The air passages may be opened in three different situations, viz., through the cricothyroid membrane (see *LARYNX*), when the operation is termed laryngotomy; through the cricoid cartilage and the up-

per rings of the neck, longitudinally, the blood vessels being pushed aside as much as possible with the handle of the knife. When the trachea is exposed and is cut through, the wound is held apart with tenacula that the tube may be inserted. When the operation is completed a large curved tube to breathe through is inserted in the aperture and secured round the neck with tapes.

A double tube or cannula possesses many advantages, as by withdrawing the inner one, which should slightly project at its lower extremity, it may be cleared of any mucus or blood that may have accumulated in it, without disturbing the wound. The calibre of the inner tube should always be sufficiently large to admit as much air as usually passes through the chink of the healthy glottis. Up to the time of O'Dwyer (q.v.) the operation of tracheotomy was frequently and successfully performed. In 1885 Dr. Joseph O'Dwyer, of New York, devised instruments wherewith intubation of the larynx was performed as a substitute for tracheotomy, especially in laryngeal diphtheria. Intubation consists in placing a short tube in position in the larynx, between the vocal cords, its lower end reaching a point as low as an incision would be made if the air passages were opened and thus admitting air from the throat. The recoveries from diphtheria in cases in which intubation is practical average over 50 per cent. The necessity for tracheotomy has further been reduced by the introduction of electrically lighted tubes (laryngoscopes, bronchoscopes), through which polypoid or fungous growths in the larynx and foreign bodies in even the smaller bronchial tubes can be seen and removed with special forceps.

TRACHINLÆ, trā'kīn'lē (Lat. nom. pl., from Gk. *Τραχίναί*, women of Trachis). A tragedy by Sophocles describing the death of Hercules, caused by the poisoned coat of Nessus, sent to him by Deianira in jealousy of the captured Iole. The play takes its name from the chorus composed of women of Trachis, where Deianira is awaiting the return of her husband.

TRACHOMA, trā-kō'mā. A disease of the conjunctiva. See *CONJUNCTIVITIS*, *Granular Conjunctivitis*.

TRACHYTE, trā'kit or trāk'īt (from Gk. *τραχύτης*, *trachytēs*, roughness, from *τραχύς*, *trachys*, rough). The name given to certain volcanic rocks which are composed essentially of alkali feldspar, having no quartz, but a small proportion of either biotite, hornblende, or augite. It agrees thus with syenite in mineral constitution, although it differs from the latter in its finer texture, indicative of rapid cooling at or near the surface. The presence of small cavities often gives the rock a rough feel; hence the name.

TRACK, RAILWAY. See *RAILWAYS*.

TRACK ATHLETICS. See *FIELD SPORTS*.

TRACKER ACTION. See *ORGAN*.

TRACT. See *GRADUAL*.

TRACTARIANS. A popular name given, in the early days of the Oxford movement (q.v.), to the party led by Newman, Pusey, and Keble, from the *Tracts for the Times*, written by these and other members of the party.

TRACTION ENGINE. See *AUTOMOBILE*.

TRACT SOCIETIES (Lat. *tractus*, treatment, discussion, handling, drawing, from *trahere*, to draw, drag). The word "tract" signifies a brief treatise. In the modern use of the term it is applied almost exclusively to treatises upon

INSTRUMENTS FOR INTUBATION.

the trachea, the operation being known as laryngotracheotomy; and through the trachea, below the isthmus of the thyroid gland, constituting tracheotomy proper.

The incision is made in the middle line of the

religious subjects, and a tract is distinguished from a book mainly by its external (pamphlet) form and its brevity. The earliest illustration of a tract is found in the separate books of the Bible, each one of which, as originally circulated in manuscript form from hand to hand, may be considered a tract. Apart from this, however, we may consider Wiclif, the great English reformer, as the first to begin the work of writing and distributing tracts, which, though laboriously produced by hand, yet obtained a large circulation. With the invention of printing the possibilities for the development of tract literature were wonderfully enlarged, and the religious movement which culminated in the Reformation may be said to mark the commencement of the general dissemination of Christian literature in tract form.

The availability of tracts as a means for propagating Christian knowledge led to the formation of societies for that express purpose. An early pioneer among tract societies for English-speaking peoples was the Society for Promoting Christian Knowledge, which was organized in England in 1698 and incorporated in 1701 to circulate Bibles and religious tracts both at home and abroad. The publication of tracts, begun by John Wesley in 1742, was soon carried forward upon a large scale, and in 1728 he organized the Society for the Distribution of Tracts among the Poor. The first interdenominational union of Christian effort for the circulation of tract literature was effected in 1750, in the city of London, by the formation of the Society for Promoting Religious Knowledge among the Poor. This was followed by the organization of similar societies in other cities, and, though none of these maintained a permanent existence, they must be regarded as forerunners of the great tract societies of modern times. In the closing decade of the eighteenth century, at Bath, England, Hannah More (q.v.) initiated a movement for the better circulation of Christian literature by putting forth a series of short religious tales in tract form, named the *Cheap Repository*. In 1795 the Religious Tract Society of Scotland (now known as the Religious Tract and Book Society) was founded in Edinburgh, by Rev. John Campbell. This was followed, in 1799, by the organization of the Religious Tract Society of London, which stands foremost in age and influence among tract societies of the present day.

In America the work of religious publication was begun by the Methodist Book Concern, which issued its first publication in 1789. The Massachusetts Society for Promoting Christian Knowledge, founded in 1803, may be properly regarded as the first interdenominational organization for tract work in America. This was followed by the formation of various local societies, among which were the New York Religious Tract Society, organized in 1812, and the New England Tract Society, organized at Andover in 1814. The latter society in 1823 changed its headquarters to Boston and its name to the American Tract Society, and two years later became merged in the American Tract Society, which was organized in New York City, on May 11, 1825, by friends of tract work, who desired to see a society of national scope and influence. Since that time tract societies have multiplied, but the American Tract Society still remains the principal agency for tract distribution in America.

A board of managers, consisting of a presi-

dent, vice president, and 36 members, are elected annually by this society. This board elects the publishing, distributing, and finance committees. The members of these three committees constitute an executive committee to conduct the business of the society. To promote in the highest degree the objects of the society, the constitution specifies that the officers and managers shall be elected from different denominations of Christians, that the publishing committee shall contain no two members from the same ecclesiastical connection, and that no tract shall be published to which any member of that committee shall object.

Some idea of the magnitude of the work of this society may be gained from the following statistics. The whole number of titles of distinct publications (not including periodicals) issued by the society from the home office from 1825 to 1916 was 9117. These have been published in more than a score of different languages. The total number of volumes issued during the previous 90 years is 35,018,140; of tracts, 460,663,742; and of periodicals, 295,460,168, making a grand total of 791,142,050 copies of publications printed. Four periodicals are published: *American Messenger*, *Apples of Gold*, *Amerikanischer Botschafter* und *Deutscher Volksfreund*, and *Manzanar de Oro*. The society has made foreign cash appropriations amounting to \$796,137, by the aid of which 5667 publications have been issued in 178 languages and dialects. It has also furnished electrotypes to foreign-mission stations to the value of \$61,177.96.

Missionary colportage is an important feature of the society's work. Since its organization the missionary colporteurs of the society have circulated by sale and grant 17,326,937 volumes; they have made 18,406,676 family visits, and they have addressed 585,948 religious meetings. The total value of the Christian literature circulated gratuitously by the society since its formation amounts to \$2,617,820.90.

During the 116 years of its existence the Religious Tract Society of London, England, has printed or assisted the printing of books and tracts in 282 languages, dialects, and characters; its annual circulation is over 65,000,000, and its total distribution to March, 1916, is estimated at over 540,000,000 copies of its publications.

In New York and many other cities there are city-mission and tract societies which find the printed page a valuable auxiliary in reaching the "submerged tenth." Many of the evangelical denominations have their own boards of publication or publishing societies, which employ tract literature, especially in aid of their Sunday-school work. In Great Britain, in addition to the Religious Tract Society, there are several other tract societies, such as the Monthly Tract Society and the Stirling Tract Enterprise. On the continent of Europe there are perhaps a score of societies which are engaged more or less in the publication and circulation of tract literature. Among the most important of these are the Paris Tract Society (*Société des Traités Religieux*), the Toulouse Religious Book and Tract Society, the Geneva Evangelical Society, the Italian Evangelical Publication Society of Florence, and the German Evangelical Book and Tract Society. In India, China, Japan, and other heathen lands there are a large number of tract societies which aim to provide Christian literature in the native languages.

Bibliography. The literature on the subject of tract societies consists chiefly of the annual reports, pamphlets, etc., published by the various societies themselves. *The Story of the Religious Tract Society for One Hundred Years*, by Rev. S. G. Green, D.D. (London, 1899), was prepared by an editorial secretary of the Religious Tract Society of London and is an authoritative history of that society. *The American Tract Society: An Historical Sketch* (New York, 1915), though but a brief pamphlet, presents the salient points concerning the history of the American Tract Society.

TRACY, trā'sē', ALEXANDRE DE PROUVILLE, MARQUIS DE (1603-70). A French soldier and administrator. After serving in several wars he was appointed lieutenant general of the French possessions in North America on Nov. 19, 1663, and reached Quebec, June 30, 1665, accompanied by many young nobles and 200 soldiers. In 1666 with 1300 men he led an expedition against the Mohawks, burned several of their towns, and forced them to sue for peace. This expedition greatly alarmed Gov. Richard Nicolls (q.v.), of New York, who attempted in vain to secure the aid of the New England Colonies for an expedition against the French. Soon after this expedition Tracy returned to France.

TRACY, ANTOINE LOUIS CLAUDE DESTUTT, COUNT DE. A French philosopher. See DESTUTT DE TRACY.

TRACY, BENJAMIN FRANKLIN (1830-1915). An American lawyer, soldier, and cabinet officer, born at Owego, N. Y. He was educated at Owego Academy and was admitted to the bar in 1851. In 1853 he was elected on the Whig ticket as district attorney of Tioga County and in 1856 was reelected. Prior to this he took an active part in the formation of the Republican party in his State. In 1861 he was elected to the State Assembly. In 1862 he recruited the 109th and 137th New York Volunteers and became colonel of the former. For his gallantry in the battle of the Wilderness he received the congressional medal of honor in 1895. Wounded in this battle, he was compelled to relinquish his command, but within a year he again entered the army as colonel of the 127th United States Regiment of negro troops. Subsequently he commanded the prison camp at Elmira and at the close of hostilities was brevetted brigadier general of volunteers. From 1866 to 1873 he was United States District Attorney for the Eastern District of New York and from 1881 to 1883 was associate judge of the State Court of Appeals. As Secretary of the Navy in President Harrison's cabinet (1889-93) he did such important work in increasing the number of battleships and raising the standards of the service to a high level that he has been called the "father of the navy." In 1893 he resumed his law practice in New York and in 1897 was the unsuccessful Republican candidate for mayor of New York City. In 1899 he was counsel for Venezuela before the Anglo-Venezuelan Boundary Arbitration Commission. For many years he was head of the law firm of Tracy, Boardman, and Platt; this he left in 1900 to associate himself with Coudert Brothers. At the age of 83 he argued a case before the United States Supreme Court.

TRADE, BALANCE OF. See BALANCE OF TRADE.

TRADE, BOARD OF. A department of govern-

ment in England designated "the lords of the committee of his Majesty's Privy Council appointed for the consideration of all matters relating to trade and foreign plantations." Cromwell in 1655 was the first to establish a permanent committee for matters of trade. Charles II continued the policy and in 1660 created two separate councils for trade and for foreign plantations, which in 1672 were consolidated into one. In 1786 the present department was established as a permanent committee of the Privy Council. The board as now constituted consists of the President, who is a member of the cabinet, together with the First Lord of the Treasury, the Chancellor of the Exchequer, and numerous other ex-officio members; but, like the Treasury Board, the Board of Trade does not meet and consists in practice of the President and his staff. It comprises the following departments: (1) The commercial, labor, and statistical department, whose principal function is the collection and dissemination of information concerning matters of trade. Since 1886 it has published the *Board of Trade Journal*. (2) The railway department, established in 1840, with numerous duties of supervision and inspection. (3) The marine department, established in 1850, which has general supervision over merchant shipping and the care of seamen. (4) The harbor department, whose province includes, besides lighthouses, harbors, etc., weights and measures, coinage, and other miscellaneous matters. (5) The finance department, which keeps the accounts for the board and audits for Parliament the reports of the life-insurance companies. (6) The fisheries department.

TRADE, RESTRAINT OF. See RESTRAINT OF TRADE.

TRADE ASSOCIATIONS. Associations of men engaged in manufacture or trade, for the furtherance or protection of their mutual interests. In England these associations antedate the nineteenth century. In the United States some were founded before 1850; by 1890 they had been formed in most well-established industries; while by 1900 they had spread to almost every subdivision of the industrial world. Trade association may include one or more of three classes of functions—the commercial, the industrial, and the protective. Associations to do the work of business agencies display most clearly the commercial function. The London Association of Guardians for the Protection of Trade was established as far back as 1776. The operation of the earlier societies was confined chiefly to compilations of registers of bankruptcies, insolvencies, and private settlements with creditors. Societies may undertake investigations into the circumstances connected with a bankruptcy and perform the general agency business of their members. Later features are in connection with credit. Large commercial concerns furnish general information, but there is still room for information bureaus within some trades. Many establishments have special credit men, who have formed a national association, with branches in many chief cities of the United States.

The general industrial functions of trade associations include, first, the surveillance of important influences, such as legislation or railway rates, which affect the entire trade. With many associations the tariff question is a weighty and permanent issue, while laws affecting labor, the quality, the method of sale, or the inspection of

goods (as in brewing or boiler making), are constantly watched, advocated, or contested. In the second place, associations may seek to establish agreement in business methods to keep their members informed of new inventions or processes, of market conditions, etc. A result of this activity is the publication of a trade journal, of which the *Bulletin of the National Association of Wool Manufacturers* (formed in 1864) is a well-known example. Various special functions are often assumed. Provision may be made for exhibits at fairs, trade schools may be encouraged, selling agencies established, bureaus of employment maintained, local improvements furthered, or, as in the lumber business, a system of mutual insurance may be attempted. An important function is the promotion of sociability and good will. It is not always easy to draw a line between the acts of a trade association and those of a trade combination in which the financial management has been centralized. At present the typical forms of protection are: (1) against introduction of so-called unfair methods within the trade, (2) against railroad discrimination in rates, and (3) against labor organizations. Jobbers' and retailers' associations protest against sales direct from manufacturer to consumer and sometimes establish a boycott against recalcitrant manufacturers. The decreasing importance of the jobber in the distributive system makes the efforts of their associations of interest. "Exclusive agreements" may be made by a middlemen's association with certain manufacturers, in which case no other but the latter's goods will be used. The object of certain associations is "to help the manufacturer decide who are legitimate dealers."

In trades where freight forms an important item of cost, a prime object of the association is likely to be adjustment of railroad rates. The National Association of Stove Manufacturers and the National Transportation Association, an organization of shippers, are examples. In 1903 the Georgia Sawmill Association took the radical move of disregarding the possibility of an appeal to the Interstate Commerce Commission and themselves asked for an injunction restraining certain Southern railroads from advancing rates on yellow pine. They asked that the Southern Freight Association be declared an illegal combination in restraint of trade. Increased demands of labor organizations in recent years have greatly stimulated defensive action by trade associations.

In the period 1906-16 there was a rapid growth of trade associations formed to deal with powerful and well-organized labor unions. Some are openly hostile to and oppose collective bargaining, some are willing to cooperate with the unions. The latter associations conclude agreements on wage scales and on conditions of labor with representatives of unions or federated unions in a particular industry. The control of the association over the individual member is relatively weak. Employers' associations have sometimes been started to cooperate with the union, but, failing to reach an agreement, have become bitterly opposed to the aims and methods of unionism. The National Erectors' Association is a case in point: organized in 1903, it treated with the unions, and, being unable to reach an agreement satisfactory to both sides, finally refused to treat further. A bitter struggle ensued, characterized by strikes and dynamite outrages.

Many of the associations insist on the right of the employer to determine whom he shall employ and what the conditions of labor shall be. Frequently special employment agencies are maintained by the association to enable members to secure an adequate supply of nonunion labor. Some have been active in improving the conditions of labor, introducing safety systems, and promoting welfare work.

In the United Kingdom in 1912 there were 1079 local employers' associations and 83 federations and national associations of employers. These figures do not include those formed merely for purposes of trade protection, insurance, the diffusion of knowledge, or the advancement of technical knowledge. In recent years many associations of employers have been organized in Germany. The Federation of German Employers' Associations, one of several such organizations, had in 1907 a membership of 300 associations, with a total of over 1,200,000 men in the employ of their members. In Germany in 1913 there were 111 federations or national associations and 3320 local or district organizations, comprising as far as reported a membership of 145,207 employers, who employed 4,641,000 workmen. Most of these associations were principally concerned with the relations between their members and workmen. There are no satisfactory statistics of employers' associations in the United States. Consult: Hollander and Barnett, *Studies in American Trade Unionism* (New York, 1906); G. Kessler, "Die deutschen Arbeitgeberverbände," in *Schriften des Vereins für Sozialpolitik*, vol. cxxiv (Leipzig, 1907); Commission on Industrial Relations, *Final Report* (Washington, 1915).

TRADE-MARK. A mark, name, emblem, or device adopted by a tradesman or manufacturer and attached to or stamped upon his goods in some manner for the purposes of identification by the public and protection against the sale of fraudulent imitations. The law of trade-marks is of modern development. In 1742 Lord Hardwick declared that he could not protect a trade-mark adopted by a trader from being used by another. It was not until 1803 that the English courts attempted to prevent the fraudulent use of an adopted trade-mark. Since that time the law on the subject has developed rapidly. The statute now in force in England is known as the Trade Marks Act, 1905. It provides for registration and makes the registry conclusive after seven years, unless the registration was fraudulent or contrary to morality.

The first trade-mark statute in the United States was passed in 1870. The salient features of the present law were enacted in 1905, although slight amendments were passed in 1906, 1907, and 1909. Under the decisions of the United States courts the office of a trade-mark is to indicate the origin or ownership of an article on which it is found. Therefore it follows that a valid trade-mark must fulfill one of the above essentials, either from its own nature or by reason of association with the article itself and the maker's name. A name which is merely descriptive of the qualities or nature of an article cannot constitute a valid trade-mark, as its use as such might tend to create a perpetual monopoly in the sale of the article. For example, the United States courts held that the words "acid phosphate" could not be protected as a trade-mark, as they were considered to be descriptive of the essential characteristics of the

preparation sold under that name, and, as it was a known form of chemical combination, it would prevent others from describing accurately a similar combination.

In general, a geographical name cannot be used as an exclusive trade-mark; although the use of a geographical name as a trade name, where the article bears no relation to the name and is manufactured elsewhere, will sometimes be protected. Fantastic and newly coined words may be regarded as trade-marks. A person's own name will not be protected as a trade-mark as against a person of the same name who, acting in good faith, desires to use his name on his own goods. A trade name is therefore to be distinguished from a trade-mark and can be protected by a court of equity only where some one attempts to deceive the public and take another person's trade by adopting his trade name. A close imitation of a trade-mark may amount to an infringement, especially if there are other circumstances tending to show that there is an intention to deceive the public and take advantage of the business reputation of another. The use of the national emblem cannot in any sense constitute it a trade-mark. On the other hand an Illinois statute prohibiting the use of the American flag for advertising purposes has been held unconstitutional.

Any one who handles goods may impress his trade-mark upon them and be protected in its use if he has exercised any peculiar skill or judgment in their selection, care, or alteration. The right to an exclusive trade-mark may be lost by abandonment, but the evidence of the intention to discontinue using it must be very clear. A trade-mark is not generally considered to be property in the sense that it can be taken under an execution, but it may be transferred from one person to another, unless it is of such a nature that to allow it to be used on the goods of a person other than the one who originally adopted and used it would tend to deceive the public. The sale of a business, good will, etc., usually includes the trade-marks under which goods were sold by the owners. See COPYRIGHT; PATENT; TRADE NAME.

Hopkins, *Law of Trademarks, Tradenames, and Unfair Competition* (2d ed., Chicago, 1905); L. B. Sebastian, *Law of Trade Marks and their Registration* (5th ed., London, 1911); Berthold Singer, *Trade Mark Laws of the World and Unfair Trade* (New York, 1913); H. C. Underwood, *How to Select Trade-Marks* (Fort Wayne, Ind., 1913); G. S. Rogers, *Good Will, Trade-Marks, and Unfair Trading* (Chicago, 1914).

TRADE NAME. A name under which a person or corporation does business and which by user becomes so associated with the good will of the business as to be valuable. A trade name is to be distinguished from a trade-mark which is affixed to or impressed on merchandise, and when registered is protected by statute. The wrongful user of an established trade name will be restrained by a court of equity on the ground that it constitutes fraud and deceit against the public and an unlawful appropriation of something which is so closely allied to the business of another as to be a species of property right. A trade name may sometimes be registered as a trade-mark, and this fact is the source of the con-

fusion resulting from the use of these terms as being interchangeable. The statutes of most States prohibit one corporation from adopting the same name as another, and the Secretary of State should be consulted before a name is adopted for a new corporation. Furthermore, equity will protect a corporation in the use of its name. See TRADE-MARKS, and references there given.

TRADESCANT, JOHN (c.1570-c.1637). A traveler, naturalist, and gardener, said to have been born in Holland. In 1620 he fought against the Algerine pirates. Afterward he was in the service of the Duke of Buckingham and seems to have become royal gardener. He established a physic garden and museum at South Lambeth and was the first Englishman to make a considerable collection of objects in natural history. His son JOHN (1608-62), born at Meapham, Kent, added largely to his father's collection and in 1637 visited Virginia, where he gathered "all varieties of flowers, plants, shells, etc." In 1656 he published his *Museum Tradescantianum: or a Collection of Rarities, Preserved at South Lambeth, Near London*. Upon his death the museum went by will to Elias Ashmole and in 1682 became the nucleus of the Ashmolean Museum at Oxford.

TRADESCANTIA, träd'es-kän'shi-a. A genus of monocotyledonous plants, including about 35 species, natives of tropical and temperate America, and commonly known as spider-worts. About 15 species are natives of the United States.

TRADE SCHOOLS. See TECHNICAL EDUCATION.

TRADE-UNION CONGRESS. A British federation of trade-unions, organized in 1868, which has met annually since that date except in 1871. At the time of its formation the British unions were engaged in an earnest struggle for favorable legislation, and the congress played an important part in securing the legislative victories of 1871-75. (See TRADE-UNIONS.) Since that time it has confined itself largely to the tasks of creating a favorable public opinion, voicing the demands of organized labor, providing a place for common meeting, and securing favorable labor legislation. The last function is exercised largely through a permanent parliamentary committee, the expenses of which are paid by a per capita tax upon the affiliated unions of £1 10s. per 1000 members. The parliamentary secretary devotes all his time to the work and receives a salary of £250 per annum. The congress itself is thus a deliberative body merely, but it has started two auxiliary federations—the Labor Representation Committee (see LABOR PARTY, BRITISH) and the General Federation of Trade-Unions. (See TRADE-UNIONS, THE GENERAL FEDERATION OF.) The membership of the trade-unions represented in the trade-union congresses in the United Kingdom increased from 110,000 in 1866 to 1,500,000 in 1890. At the Forty-fourth Congress, held in Newcastle in 1911, there were 127 trade-unions with a membership of 1,650,000 members represented. The total income for the year was £6928.

TRADE-UNIONS. "The term 'national trade-union,'" says the Federal statute providing for the incorporation of trade-unions, "in the meaning of this act shall signify any association of working people having two or more branches in the States or Territories of the

United States for the purpose of aiding its members to become more skillful and efficient workers, the promotion of their general intelligence, the elevation of their character, the regulation of their wages and their hours and conditions of labor, the protection of their individual rights in the prosecution of their trade or trades, the raising of funds for the benefit of the sick, disabled, or unemployed members, or the families of deceased members, or for such other object or objects for which working people may lawfully combine, having in view their mutual protection or benefit." No definition less complete is sufficient fully to indicate the complex character of the trade-union, since the trade-union has always been an insurance association and a social and educational club, as well as "a continuous association of wage earners for the purpose of maintaining or improving the conditions of their employment," as Beatrice and Sidney Webb define it.

History. The connection between the modern trade-union and the journeymen clubs of the Middle Ages is in dispute. Throughout the later Middle Ages and frequently after the fourteenth century traces are encountered of journeymen clubs—the German *Schenken*, the French *confréries de compagnons*—which maintained a more or less continuous existence, regulated apprenticeship, paid benefits, and engaged in conflicts with employers, characterized by the elements of the modern strike. Admitting, as Professor Ashley suggests, that the journeymen of these fraternities "were almost all unmarried, that when employed they lived in the master's house, that the masters themselves had usually been journeymen, that the number of masters and journeymen was very much the same," there nevertheless seems no tenable reason for denying to these associations the essential attributes of the modern trade-union. It is evident that effective and solid trade-unionism is intimately dependent upon the existence of a body of workers who will naturally remain wage earners throughout their lives. In other words, the trade-union follows in general the permanent separation of the employing and wage-earning classes. This separation, speaking generally, was a product of the industrial revolution and the factory system. Trade-unions consequently did not become numerous until late in the eighteenth century.

In England trade-unionism in the eighteenth century is marked by increasing hostility on the part of Parliament towards combinations of laborers. Laws regulating wages, apprenticeship, movement of laborers from parish to parish, etc., existed, and the activity of the trade-unions during that century seems to have been largely directed towards enforcement of those laws, which the employers did not always observe. Laws against combinations of workmen in specific trades began to multiply as the doctrine of *laissez-faire* secured wider acceptance. These culminated in the Combination Acts of 1799 and 1800, by which every form of combination, whether of employer or employees, was rigidly prohibited. In effect, the acts were enforced against the laborers only. For 25 years the unions were driven into hiding, but were by no means extirpated. In 1824 the whole group of combination laws was repealed, but in 1825 a reaction set in, and in another statute the law against combination was revived, but it left laborers free to combine; to

fix wages or hours of labor of parties to the combination.

The Act of 1825 was followed by the rise of labor organizations or general trade-unions of a Socialistic nature described under **LABOR ORGANIZATIONS**. But the trade-union proper was making steady progress within the separate trades, in which identity of interests made unity of organization and policy a comparatively easy task. About 1850 a reaction against the strike set in, and reforms in the management of the friendly-benefit system were inaugurated. The union which applied the new ideas most successfully was the Journeymen Steam Engine and Machine Makers' and Millwrights' Friendly Society, which in 1850 absorbed other large unions of mechanics and became the Amalgamated Society of Engineers, whose careful set of rules for the financial and general administration of the union served, according to Mr. and Mrs. Webb, as the "model for all national societies" founded between 1852 and 1889. The reaction from the Socialistic trade-unionism of the thirties brought to the front a remarkable group of labor leaders, acute, tactful, industrious, and conservative, who (1860-75) united in a persistent and energetic campaign for legislative reform. The first victory came in the Master and Servant Act of 1867, which corrected the most glaring defects of the old law on this subject. The union leaders, however, aimed at more sweeping concessions. By the celebrated Trade-Union Act of 1871 it was provided that no trade-union should be deemed illegal simply because it was in restraint of trade, and unions were given a legal standing carrying with it protection of their funds, without exposing them to the ordinary obligations of an incorporated company. Finally in 1875 the unions secured the passage of a very liberal Employers' and Workmen's Act (replacing the Master and Servant Act of 1867), and a revolutionary Conspiracy and Protection of Property Act, which expressly permitted peaceable picketing, and provided that no combination to do any act in furtherance of a trade dispute between employers and workmen should be indictable as a conspiracy unless such act if committed by one person would be punishable as a crime.

In 1860 a giant stride towards collective bargaining was taken by the formation in the hosiery trade of the first joint conference between employers and employees for peaceful settlement of trade disputes. Federation of trade-unions began; trade councils became common in the cities, and in 1868 the first national Trade-Union Congress was held at Manchester. Finally the successful legislation of 1871, like that of 1824, was followed by an expansion of trade-unionism and the reappearance of many of the phenomena which had marked the epoch of labor organizations in the thirties, with their ideal of an aggressive, militant organization, free from the incumbence of friendly benefits, embracing workingwomen and unskilled labor, participating actively in politics, and with tendencies towards Socialism.

The most noteworthy event of late years is the formation in 1899 and 1900 respectively of the General Federation of Trade-Unions (see **TRADE-UNIONS**, **THE GENERAL FEDERATION OF**) and the Labor Representation Committee, later the Independent Labor party. Between 1892 and 1911 inclusive the membership of British trade-unions grew from 1,500,451 to 3,010,346.

In the United States there is no positive record of a trade-union before 1803, the year in which the New York Society of Journeymen Shipwrights was incorporated. In 1806 a union of the House Carpenters of the City of New York was organized, and the first union of the Journeymen Tailors is said to have been organized in the same year. As early as 1817 the New York Typographical Society had been in active existence for some time, and in 1822 the Charitable Society of Shipwrights and Calkers of Boston and Charlestown was formed.

The most important events of the period 1825-50 are briefly described under LABOR ORGANIZATIONS. For a time trade-unionism seems to have become involved in general reform; wide-reaching and ambitious federations were formed which worked at the same time for the abolition of slavery, for woman's rights, land nationalization, and coöperation, as well as improvement of conditions of employment. During this period trade-unionism proper was undoubtedly making progress in the separate trades, and by 1840 in the principal industrial centres local unions had been organized among masons, marble cutters, shoemakers, saddlers, hatters, tailors, printers, bricklayers, roofers, painters, carpenters, and shipworkers.

The 15 years between 1850 and 1865 may well be described as the period of nationalization. Labor leaders had learned that for a time the labor movement must go forward cautiously, that participation in politics and broad attempts to reform things were dangerous, that labor organizations must be extended within trade lines and not by all-embracing amalgamations. In 1850 the union now known as the International Typographical Union was organized. (See TYPOGRAPHICAL UNION OF NORTH AMERICA, THE INTERNATIONAL.) This was probably the first American national union, though there is some reason to believe that the Silk and Fur Hat Finishers' National Association was organized as early as 1843. The National Association of Hat Finishers of the United States of America was

has been perfected, their administration improved. A number of vigorous labor journals have appeared; labor parties have been formed and in places have elected labor candidates; permanent boards of collective bargaining or arbitration and conciliation have been formed in many trades; boycotting through the union label and labor press has been systematized and developed; favorable legislation has been secured in every State; and, more important than any other result, public opinion has been brought to concede the utility and even the necessity of the trade-union. The most striking phenomenon of the epoch has been the formation of large federations of unions. Among these larger organizations may be named the National Labor Union (1866), the Knights of Labor (1869), the International Association of Workingmen (1864), the Industrial Brotherhood (1873), the American Federation of Labor (1881), the National Building Trades Council (1897), and the American Labor Union (1898). By far the most important of these is the American Federation of Labor. (See LABOR, AMERICAN FEDERATION OF.) Until 1906 this organization avoided direct participation in politics, confining itself to the organization of new unions, the passage of legislation favorable to labor, the extension of the union label, etc. In 1906, on account of alleged violations of the Federal labor laws, the American Federation decided to enter politics. It concentrated its efforts upon defeating a number of congressional candidates who were said to be especially hostile to organized labor, but its efforts were without success.

Statistics of Trade-Unions in the United States. These are collected by the labor bureaus of a few States, but no complete enumeration for the whole country has ever been made. The report of the Industrial Commission gave the estimated membership of labor organizations in the United States on July 1, 1901, at 1,400,000. The average membership of the American Federation of Labor alone during the year ending Sept. 30, 1911, was 1,761,835.

founded in 1854, the National Protective Association (the Locomotive Engineers) in 1855, the Sons of Vulcan and the National Spinners' Association in 1858.

Since the Civil War many local and national unions have been organized, their government

A more satisfactory idea of the growth of trade-unions may be gained from the preceding table, in which the total membership of unions in Great Britain and New York is given, and the average membership reported or paid upon to the American Federation of Labor.

Trade-Unions and the Law. The development of the law in the United States has been different from that in England. A few early cases are recorded in which trade-unions were declared illegal, but as early as 1821 in Pennsylvania and 1842 in Massachusetts a view diametrically opposite to the English law was taken, and since has been consistently maintained by American courts, except in so far as it has been modified in recent years by antitrust acts. Workmen may combine to improve conditions of employment and agree not to work for less than a certain amount or to refuse to work for employers paying less than this amount without active interference from legal authorities; and in several important cases the courts have gone to the point of recognizing the legality of the by-laws of unions and even of enforcing them (*Master Stevedores' Association v. Walsh*, 2 Daly, 1; *People v. Musical Mutual Protective Union*, 118 N. Y. 101). Legislatures have gone even further than the courts in recognizing the legality of the purposes of trade-unions. The Federal government and many of the largest States have enacted statutes providing for the incorporation of trade-unions under exceptionally favorable conditions. But only a few unions have taken advantage of the incorporation laws, and labor leaders generally oppose this, on the ground that it would subject the unions to many vexatious and costly suits at law. The State legislatures have also conferred several special privileges upon labor organizations. Massachusetts and Kansas, e.g., have exempted labor organizations from the operation of the statutes regulating fraternal beneficiary associations; and some of the States have passed statutes prohibiting employers from discharging workmen for joining labor organizations and even from

probably be given to the State statutes save where they are specifically labor organizations. Little attempt has been made to dissolve unions or punish their officers under antitrust statutes, but where these laws apply the legality of the most reputable unions is threatened.

Trade-Unions in Other Countries. While probably the germs of labor organizations in almost every country of continental Europe may be found in earlier and even in mediæval organizations and movements, they owe their present strength, spirit, and methods chiefly to the Socialistic propaganda; most of them have remained in close connection with the Social Democratic parties, and many of them—particularly in France, Belgium, Italy, and the Scandinavian countries—are as much political clubs as trade-unions. (See SOCIALISM.) There are, however, a number of strict trade-unions on the Continent—particularly among printers—and this number is increasing. As the continental labor-union grows more powerful, it manifests a stronger disinclination to be treated as a mere appendage of a political party. The continental union was late in developing. The year 1864, which marks the formation of the International Workingmen's Association (see INTERNATIONAL WORKINGMEN'S ASSOCIATION), furnishes a substantially accurate date for the beginning of the trade-union movement on the Continent.

The political character of continental unionism has decreased its efficiency by dividing the forces of labor into several semihostile groups. In Germany, e.g., we find the labor organizations divided into three distinct classes: a group of "peace" unions, known as the Hirsch-Dunckersche Gewerkvereine, assert the essential harmony of interests between employers and employees and depend upon arbitration and friendly bene-

making it a condition of employment that they should not belong to such organizations. A few States and many local legislative bodies have enacted laws providing, directly or indirectly, that certain public work—usually printing—shall be performed only by union labor. Within recent years the legal status of trade-unions has been seriously affected, at least in theory, by the so-called antitrust acts passed by Congress and many State legislatures, making contracts or combinations in restraint of trade or commerce illegal. The Federal statute—concerned, of course, only with interstate trade and commerce—has been held to apply to a labor organization of draymen and longshoremen (*United States v. Workingmen's Amalgamated Council*, 54 F. R. 994); and the same interpretation will

fits rather than strikes for the improvement of the conditions of employment. Clearly distinguished from the former by their aggressive methods in general are the socialistic Gewerkschaften, which in turn are divided into two groups over the question of direct participation in politics: the unions federated under the Central Commission advocating a separation of the labor and the Socialistic movements, and the local organizations opposed to this separation. The Christian Unions constitute a third class distinct from and opposed to the preceding groups by their anti-Socialistic principles. In Belgium the labor organizations have been practically dominated by the political parties. In France the factional quarrels of the Socialists have been carried into the labor organizations,

given "one-half the jobs which a New York contractor may have to dispose of on a building in Newark, the Newarkers to have the New York rate of wages." (b) Demarcation disputes, arising from conflicting claims to certain work lying midway between two distinct trades. The shipbuilding industries on the Tyne, e.g., were tied up for 18 months or more at one time by demarcation disputes which hinged largely about the "limit of the size of the iron pipes to be fitted by the engineers and the plumbers respectively, and whether the joiners should or should not be confined to woodwork of one and one-half inches' thickness." (c) The third class consists of those arising between a more extensive and a less extensive union, concerning the autonomy of the latter. Thus, the increased division of labor in the printing trade made of the pressmen a separate class, and new inventions produced the stereotyper and electrotyper. It was inevitable that these classes should desire trade independence, and that the original union should oppose all secessions. There has been a long series of conflicts between the old Typographical Union and bodies of discontented pressmen, bookbinders, stereotypers, and electrotypers. (d) Industrial organization versus trade autonomy. A similar but far more important source of jurisdiction disputes is the rapidly growing practice of adapting labor organization to industrial organization and uniting in one union all the trades represented in a single industry. Industrial organization inevitably brings the union adopting it into conflict with the unions of the separate trades represented in the industry. Thus, the United Mine Workers have had serious conflicts with the stationary firemen and the blacksmiths, and the brewery workers have been in constant strife with the painters and coopers, the team drivers, etc. In the strike and in all phases of collective bargaining industrial organization is superior, both for employers and employees. On the other hand, the subordination of a minority of skilled workers to a larger number of less skilled craftsmen is frequently a source of weakness and always a source of dissatisfaction.

Ultimate Form of Organization. One of the most persistently advocated remedies for jurisdiction disputes has been that of amalgamation, the form of organization in which all the trades are coalesced in a strong central union. Amalgamation has never proved practicable. United action is plainly necessary, but it must be secured by federation and not by consolidation. Another remedy for the jurisdiction dispute, tried with only partial success, is the "jurisdiction statement." The constitution of the National Building Trades Council, e.g., provides that "all organizations affiliated with any local Building Trades Council shall plainly and satisfactorily define the class of work they claim, and no trade will be permitted to do the work pertaining to another." Up to the present, the jurisdiction statement has been of but little use in preventing conflicts between unions. The indications are strong that the ultimate structure of union organization will be complex; that the unit of government will be the simple trade-union of the old type, but that these unions will be combined in a very large number of cross-cutting federations, each distinct and independent, but all of them formed, as it were, of the same material. The simple trade-union will probably retain jurisdiction over

such questions as industrial education, apprenticeship, and friendly benefits. On the other hand, the regulation of the strike and the settlement of demarcation disputes will in all probability come within the province of industrial federations, which are even now multiplying rapidly. The industrial federations have come to stay. Yet there will undoubtedly be additional federations. The broad general federation represented at present by the American Federation of Labor will surely persist, devoting itself particularly, as the federation does, to education of the working classes, the rapid extension of labor organization, the promotion of favorable legislation, the defeat of unfavorable legislation, the wider use of the boycott, and the maintenance of a labor press. It is probable that the time is almost ripe for political action by labor organizations. But past experience teaches unequivocally that almost without exception the entrance of trade-unions as such into politics has proved disastrous. Such being the case, it is probable that the trade-union will enter politics by means of distinct political federation. A striking example of this is the Labor Representation Committee (see **LABOR PARTY, BRITISH**) of Great Britain.

METHODS AND POLICIES OF TRADE-UNIONISM

Trade-Unionism and Monopoly. Probably no social institution in existence represents the change from the old economic policy of laissez faire more concretely than the trade-union. Almost every method adopted by trade-unions is in essence a regulation of competition. The essential function of the trade-union is collective bargaining; and the first condition of successful collective bargaining on its part is that it shall secure substantial control of the efficient supply of labor. In securing and maintaining such control two policies are adopted, a policy of inclusion and one of exclusion. To obtain control of a particular trade in a particular jurisdiction, the utmost effort will be made to bring into the union every effective competitor for work to be done in that jurisdiction. Once having control, there is the strongest temptation, if not a real necessity, for limiting the supply of craftsmen by regulation of apprenticeship, etc. Many trade-unions prosecute the work of organization vigorously and incessantly. In the beginning trade-unionism was sporadic and instinctive, and the national union was the product of the amalgamation of two or more self-organized locals. At present organization is deliberate, systematic, and proceeds from the top down; the local is the child rather than the parent of the national. Even exclusive unions like the Window Glass Workers enter heartily into the work of organizing the unskilled workers, because with the increasing use of machinery this body constitutes a constant menace to all trades. The organization of wage earners is the special work of the Federation of Labor. In 1911, e.g., an aggregate amount of \$46,962.05 was expended by the federation to defray organization expenses. Of this amount \$2,020.15 was paid to district or volunteer organizers, while the remaining amount was paid to 49 salaried organizers of the federation. New charters were issued to three international unions, 61 city central bodies, 207 local trade-unions, and 55 Federal labor unions.

Restriction of Membership. In almost every American union the applicant for admis-

sion must be accepted by the local which he desires to enter, and in voting upon applicants a minority of the members—in some important unions as few as three blackballs—are usually sufficient to exclude the candidate. But in most American unions the terms of admission are purely nominal.

Entrance to a Trade. Trade-union regulations concerning the entrance to a trade fall under four heads: apprenticeship, limitation of boy labor, progression within the trade, and the exclusion of women. Boy labor will be treated with the limitation of apprenticeship, while the regulation of promotion within a trade is not a question of great practical importance in American unions, except perhaps in the union of Post Office Clerks, where for obvious reasons the regulation of promotion becomes the main object. The exclusion of women is no longer attempted by American or English unions, the only case to the contrary in the United States known to the writer being that of the Upholsterers' International Union of North America. Nevertheless, only a small proportion of the female breadwinners are organized. In Great Britain, e.g., in 1911 the women and girls constituted only 9 per cent of the members of trade-unions and were found in only 187 out of the 1168 unions, though the census of occupations showed that the female breadwinners were nearly one-third as numerous as the males. In 1912 in New York State the women constituted 7 per cent of all members of trade-unions.

Regulation of Apprenticeship and Boy Labor. The regulation of apprenticeship was not in origin a trade-union policy; it was introduced, adopted, and sanctioned by statute law at a time when the trade-union did not exist. Consequently, although the trade-unions indorse the regulation of apprenticeship with striking unanimity and still regard it as an ideal, such regulation is at present enforced only in an insignificant number of trades and seems to be disappearing. The apprentice system is much less prevalent in the United States than in Great Britain; and in the latter country in 1897 Mr. and Mrs. Webb estimated that out of 1,490,000 members of the trade-unions only 90,000 belonged to unions actually able to enforce apprentice regulations. The desirability and expediency of the regulation of apprenticeship by trade-unions are questionable. An examination of the apprenticeship regulations of the few American labor-unions which are able to enforce them shows that the educational motive is decidedly a minor one, while these regulations exercise no perceptible effect in checking child labor under any given set of conditions. On the other hand, unions which have acquired sufficient power to regulate apprenticeship have evinced a strong disposition to restrict unduly the number of apprentices. A wide examination of the apprenticeship regulations of American unions shows that the average period of apprenticeship is more than three years and the average number of apprentices to journeymen somewhat less than 1 to 10. Finally—and this seems conclusive—the restriction of membership to workmen who have been apprenticed is not necessary to the successful operation of the union. The United Mine Workers, the Locomotive Engineers, the Carpenters and Joiners, and in fact most of the large unions, in practice if not in theory, are completely open.

Monopolistic Alliances between Trade-

Unions and Employers' Associations. The evil possibilities of the policy of exclusion are well illustrated in occasional compacts between trade-unions and combinations of manufacturers in which the two organizations combine to monopolize a certain industry for the benefit of both. In the Birmingham (England) Metal Trades these alliances, as they are called, were common about 1897-98. The essential feature of the Birmingham alliance was an agreement by which the employers bound themselves to employ none but union men, in return for which the latter agreed to work for no manufacturer who sold his product at prices less than those formally adopted by a wages board composed of an equal number of employers and employees. For every advance in price there was to be a proportionate, though not an equal, advance in wages. Monopolistic alliances of this kind are rare and as a rule not lasting.

Regulation of Wages. The most essential function, as well as the explanation and justification of trade-unionism, is the determination of the conditions of employment by collective instead of individual bargaining. The most important condition of employment is the rate of wages, as is well illustrated by the fact that in both England and the United States more than 50 per cent of the strikes which occur are from wage disputes. The conditions and characteristics of the regulation of wages by trade-unions may be briefly summed up: (1) The standard rate as maintained by American unions is a local rate fixed by the local union. In a few trades working largely by piece, such as the Potters, Glass Blowers, etc., the scale of prices is fixed for the whole country by the national union; and in a few other unions, such as the Brewery Workmen and the United Hatters of North America, a national minimum time rate is prescribed. But in the vast majority of unions the regulation of wages is left wholly to the local union, and no strong demand for uniformity seems to exist. (2) Contrary to general opinion, the majority of trade-unions, in trades in which it is possible, favor work by the piece-rate system. In England Mr. and Mrs. Webb have made a careful study of the wage system of every trade-union having more than 1000 members, unskilled laborers and transport workers excepted. Of these, 111 unions, having 1,003,000 members, were examined; 49, with 573,000 members, insisted on piecework; 24, with 140,000 members, willingly recognized piecework; and 38, with 290,000 members, insisted on time-work. A similar investigation in the United States was made by the Industrial Commission. Information was secured concerning 50 important unions in which piecework was possible. Of these unions 28 accepted the piecework system in some department without active opposition, while 22 unions either forbade or actively discouraged piecework. The reasons for this are clear. In some occupations, such as spinning and weaving, the intensity of the labor is determined by the speed of the machine, or, speaking generally, the employer finds it possible to set the pace for the employee. In such occupations it is evident that the workers will insist upon piece payment to prevent forcing and overexertion. In other occupations, such as ordinary carpentering or repair work in general, it is impossible to estimate how much skill or time will be required to perform a given job or piece, and here the time rate is the workman's

only defense against exploitation. The testimony collected by the Industrial Commission amply proves that the majority of the labor leaders of the United States would abolish the piece-rate system instantly if it were possible. The leaders hold that under the piecework system the most proficient workmen set the pace and fix the standard rate, thereby depressing the earnings of the less talented but no less industrious or deserving shopmate. In addition the argument is made that the piece-rate system either encourages excessive production and thus depresses prices, or throws the work into the hands of a few workmen, thus increasing the amount of nonemployment, both of which results tend strongly to reduce wages. The feeling is also prevalent that the piece system stimulates employees to overexert themselves and to work themselves out at an early age.

The piece system in practice may be, and often is, manipulated to the injury of the general body of wage earners. It is true that employers are disposed to reduce piece rates as soon as the more efficient workmen in their employ demonstrate an ability to earn an unusually high rate by the system; and furthermore, the testimony seems convincing that in many instances the piece-rate system leads overambitious employees to injure their health in the attempt to earn high wages; but the objection to piecework on the ground that it leads to overproduction, and the defense of a uniform wage irrespective of productive power, are untenable, if not from the standpoint of the trade-union, at least from the standpoint of the general public.

Hours of Labor. The regulation of the hours of labor is an important function of the trade-union, as the question of the working day is primarily one of health, morals, and the necessary leisure for education and social and religious duties. In this respect the trade-unions have from the beginning placed unusual reliance upon the law. But they have also worked incessantly to reduce the hours of labor by direct negotiations with employers, by strikes, and by boycotts.

The normal day, like the standard wage in most American unions, is generally left to the separate locals, and even in the few nationals which have a maximum working day for the whole country the locals are left free to secure a shorter working day if possible. But although the locals have wide discretion in fixing the normal day, the national organizations and leaders constantly urge them to reduce the number of hours, and among the national organizations strong enough to lead in this matter, laws requiring increased rates for overtime, or wholly forbidding overtime except in cases of extreme emergency, are common.

Restriction of Output. The preceding section makes it plain that trade-unions do restrict the industrial output openly and systematically. The restriction of the output of individual workers is accomplished in several ways: by adopting a normal day and discouraging or prohibiting overtime; by limiting the daily task or the earnings of pieceworkers; by discouraging or prohibiting the grading of time-workers and thus leveling wages; by forbidding piecework, time-work, contract jobs, or the butty system; and in some cases by encouraging the go-easy system of secret loafing, or the "adulteration of labor."

A variety of arguments are brought forward in defense of the general policy of the limitation

of output. Trade-unions claim that this is the only way of preventing overexertion on the part of workmen, particularly under the piece system; that it tends to prevent unemployment and moderates the destructive competition of the army of the unemployed; and finally, that it tends to prevent overproduction. There is a large degree of truth in all these contentions. The history of the factory system is one long proof of the truth that, under a régime of freedom of contract in the sale and purchase of labor, wage earners are driven by the employers and led by the pace of the harder workmen to impair the health both of themselves and their offspring. It is true also that increased leisure, wisely spent, tends to elevate the standard of life, and that wages are in a measure determined by the standard of life; that collective bargaining presupposes given rules based upon the average efficiency and endurance, thus restraining in its operation the strongest workmen from doing their utmost; that in periods of temporary depression distributive justice sanctions a limitation of the work and income of each, in order that all may have some work and some income.

No judgment upon this subject may, however, be rendered except in concrete cases. When the United Mine Workers demand an eight-hour day in underground mines, the justice of the demand seems unanswerable; when the Window Glass Workers insist on a four months' stop each year, the demand is questionable; but when the Chicago plumbers limit, as they did in 1889, the amount of work in some branches to about half as much as could be performed by an able-bodied workman without undue strain, the demand is *prima facie* inequitable.

The point is even clearer in the limitation of wages as distinct from the limitation of hours. That the Detroit Stove Founders should limit piece earnings per day to \$4.50 may seem reasonable as a preventive of overexertion; but that time-workers, like stonecutters, carpenters, and coopers, should oppose the payment of more than the standard rate to exceptionally efficient workers, or that the machinists should oppose a classification of their workmen by the War and Navy departments, thus forcing all to the level of the idlest or most incompetent, seems indefensible.

Attitude towards Machinery. Historically trade-unions have opposed the introduction of labor-saving machinery, but, speaking generally, the unions have realized at last that it is impossible effectively to oppose the introduction of labor-saving devices; and among trade-union leaders the number of those who fully realize that the machine in the long run is the friend and ally of the wage-earning classes is rapidly increasing. Trade-union leaders may be said in general to have learned how to meet successfully the industrial problems caused by the introduction of machinery. Thus, when the printers were confronted with a great decrease in the demand for labor as a result of the invention of the typesetting machine, the Typographical Union met the problem in a rational manner. It insisted that the operators of the machines should be selected from ordinary printers, and that they should be paid as much at least as the wages of the hand printers. For a short time large numbers of printers were thrown out of employment, but in three years, according to the estimate of the president of the Typographical Union, the increased demand for printers, conse-

quent upon the decrease in the cost of printing, afforded work for more than the old supply of printers. The justice of trade-union regulation respecting the use of machinery must in each case be decided in accordance with its intent. Trade-unions are justified in the attempt, if not clothed with the duty, of lessening hardships occasioned by the introduction of labor-saving inventions. It is permanent antagonism to machinery which is hopeless and economically fallacious.

Trade-Union Insurance. Mutual insurance—aid to the traveling journeyman in search of work, assistance in case of sickness, and a collection to defray burial expenses—was perhaps the principal function of the trade-union of the eighteenth century and still constitutes a principal function of trade-unionism in foreign countries, particularly in England. In the 13 years (1898-1910), e.g., the 100 principal trade-unions in England expended \$2,948,314 in dispute or strike pay, \$6,656,632 in unemployment benefits, \$10,997,694 in other benefits, and \$5,567,926 for administration expenses.

Among American unions, however, conditions are entirely different. Of 115 international unions reporting to the Federation of Labor in 1911, 71 paid death benefits to the amount of \$1,471,381.37, 29 paid \$818,556.88 in sick benefits, 8 paid traveling benefits of \$58,784.71, 3 paid tool insurance to the amount of \$5,648.70, and 16 paid total unemployment benefits of \$218,742.71.

While it is evident that the friendly benefit is not essential to the successful conduct of a trade-union, it is also true that the leading American labor leaders strongly advise the institution of the benefit system, and in unions maintaining this system it has been of immense service in accumulating large reserve funds, in forcing obedience from members, in preventing them from dropping out when their interest wanes, and in stimulating a more conservative policy in general. The powerful Cigar Makers' International Union, e.g., and the railroad brotherhoods furnish illustrations of the advantages of the insurance system as an auxiliary to trade-unionism. (See RAILWAY BROTHERHOODS.) The insurance function, however, is strictly subordinate, except in one or two organizations. The insurance funds are unprotected and may be expended in strikes, trade wars, or for any purposes meeting the approval of constituted authorities. After having paid insurance assessments for years the individual member may be expelled for a trifling infraction of rules, or may see the insurance system abolished and all funds dissipated in supporting a sympathetic strike. Nevertheless the individual members acquiesce in this condition of affairs and oppose any attempt at regulative legislation. The widespread opposition of trade-unions to incorporation rests largely upon the belief that it would destroy this unlimited freedom in the use of insurance funds.

Collective Bargaining, Arbitration, and Conciliation. Modern political economy recognizes in collective bargaining a legitimate and the most important function of trade-unionism. This concerted action, by which employers are prevented from fixing wages at the rate acceptable to the neediest competitor, is the goal and aim of trade-unionism. The walking delegate, or business agent, who represents a body of union workmen, advises them what rate of wages to

demand, and conducts their negotiations for them, is thus not an ugly incident, but an essential necessity of trade-unionism—the very heart of the institution.

In England systematic collective bargaining by recurrent joint conferences was first introduced in the hosiery trade about 1860. At the present time Mr. and Mrs. Webb estimate "that in all skilled trades where men work in concert on the employer's premises 90 per cent of the workmen find either their rate of wages or their hours of work and often many other details predetermined by a collective bargain in which they personally have taken no part, but in which their interests have been dealt with by representatives of their class." And in the United States the system has been introduced to an extent scarcely realized by the general public. Thousands of local agreements exist in the cities, particularly in building industries; in about a dozen trades national agreements exist. The history of trade arbitration and collective bargaining shows that the value of these agreements lies in the conciliatory spirit engendered by conferences in which employees and employers meet on a footing of friendly equality. This arbitrator or umpire, with decisive vote, is relatively unimportant. The reason for this statement lies in the important difference between the adoption of new contracts and the interpretation of existing contracts. The latter function is judicial and may safely be left to authoritative arbiters. On the other hand, the adoption of new principles, or the determination of future conditions, is a matter of competitive struggle, which, except on extraordinary occasions, should not be left to outside parties, however disinterested. Recognizing this truth, trade-union leaders generally oppose compulsory arbitration; and even in collective bargaining arbitration seems to be going out of favor both in England and the United States. In the printing (newspaper) and general foundry trades agreements for arbitration exist, but none of the national systems of collective bargaining in the United States contain a provision for arbitration in case representatives of employers and employees fail to agree.

Collective bargaining is somewhat dependent upon the organization of employers, and it increases in extent and efficiency as employers' organizations increase. Associations of employers are not new, but in the last few years they have become not only more numerous than in the past, but more systematic and more thoroughly managed. (See TRADE ASSOCIATIONS.) Most of the existing manufacturers' associations, like the Stove Founders' National Defense Association and the National Association of Builders, encourage collective bargaining and thus make for industrial peace. A large majority of American unions officially indorse arbitration and conciliation. In Great Britain Mr. and Mrs. Webb think that the opposition to arbitration in the strict sense is steadily growing. In the United States opinion is divided, and it is impossible to say whether opposition is increasing or decreasing. It is, however, indisputable that the employees far more frequently invoke the aid of State boards of arbitration than the employers, and that they are practically undivided in support of collective bargaining on the one hand and in opposition to compulsory arbitration on the other hand.

Strikes. Trade-union regulations respecting strikes (see STRIKES AND LOCKOUTS) are so di-

verse that it is impossible to describe them in a few sentences. Generally speaking, the local union is the active agent in the strike; the national organizations in which a local may be forced to strike against its will number probably less than a dozen, and in only three or four may a local be expelled for striking against the decision of the national officers. The control of the locals is through the purse. Many unions maintain protective funds, or war chests, which in well-managed organizations assume very respectable proportions. If the local desires strike pay and other financial support, it must refrain from striking except in accordance with established regulations of the union. In the better organized unions a procedure like the following is imposed upon locals: Before the strike may be considered a local grievance committee, or the local president or business agent, must attempt to settle the grievance amicably with the employer in question. If this fails, the local may then vote upon the question of striking, and this ballot is usually secret, while in most unions a two-thirds vote is required to authorize the strike. If the local indorses the strike, the decision must be ratified by the national president or executive board, and at this point, again, most unions require the national president to proceed to the scene immediately and make every effort to adjust the grievance by peaceable negotiation with the employer. Only after the failure of this attempt may the national sanction be conferred upon the strike.

The effect of such regulations can be easily appreciated. The strike of the past was sporadic, passionate, and directed against some abuse which the workers believed intolerable. The strike of the present day is deliberately and systematically conducted; it marks the rising market and periods of prosperity; with many trade-unions it has become a settled policy. It is not intended to suggest that trade-unions encourage strikes; the general opinion of economic writers is to the contrary. What is meant is that the strike as conducted by the trade-union is governed by interest and not by passion; and that "while the most intelligent and conservative labor leaders freely recognize the expensiveness of strikes and desire to supplant them as far as possible with peaceable methods of negotiation, they almost uniformly maintain that workingmen gain in the long run far more than they lose by the general policy of striking." For the statistics of strikes, see STRIKES AND LOCKOUTS.

Boycotts. The American union has done with the boycott what it has done with the strike—made it less violent, but more deliberate and systematic. The old form of boycott—the fiery crusade for the social and commercial ostracism of the offending employer—is still met with occasionally, but the favorite method at present is to place the recalcitrant employer on an unfair list and spread the ban through the medium of the labor press. The initiative is largely taken by complaint of the local union to the national executive board that some employer is violating union rules. The national officers usually offer the employer a hearing at which to disprove the charges, or offer proof of intention to discontinue the objectionable practice, and if such proof is not supplied the offender is placed on the list of merchants or manufacturers with whom loyal trade-unions are encouraged to have no business dealings either as purchasers of commodities or sellers of labor. A

majority of American unions use this system to a greater or less extent. The Federation of Labor gives national scope to the more important boycotts by indorsing them and including the offenders' names in the column of the *American Federationist*. It is clear that if the 1,465,800 or more members of the Federation strictly observed every official boycott the latter would become a formidable weapon against manufacturers and sellers of commodities in general use among the laboring classes. The observance, however, is so lax that the boycott is not effective except in a few industries, such as the brewing industry, and in some union strongholds, such as Chicago, Milwaukee, and the larger cities generally.

The question of the legality of boycotts has long been a matter of controversy in the American courts. In the Danbury Hatters' case in 1915 the Supreme Court of the United States held that a boycott conducted by a trade-union against a firm whose products are sold in any State other than that in which they are manufactured, constitutes a combination in restraint of trade and is in violation of the Sherman Antitrust Act. While this case was in the courts, in 1914, the Clayton Act was passed, including a clause which expressly declares that boycotts are not in violation of any law of the United States.

Finally, trade-unions exert what is often called "a legal boycott" through the familiar union label, which has played such an important part in the building up of the Cigarmakers', Garment Workers', and Hatters' unions in America, and the use of which is now spreading, not only among American unions, but among those of England, Germany, Austria, and Australia. See UNION LABEL.

Ely, *The Labor Movement in America* (new ed., ib., 1905); Hollander and Barnett, *Studies in American Trade Unionism* (ib., 1906); Samuel Gompers, *Labor in Europe and America* (ib., 1910); F. T. Carlton, *History and Problems of Organized Labor* (Boston, 1911); E. D. Bullock (comp.), *Selected Articles on Trade-Unionism* (White Plains, N. Y., 1913); Helen Marot, *American Labor Unions* (New York, 1914); Louis Levine, *Syndicalism in France* (2d ed., ib., 1914); also *Annual Reports of the Industrial Commission* (Washington, 1885 et seq.); *Bulletins of the United States Bureau of Labor* (ib., bimonthly); *Report of the Royal Commission on Labor* (London, annually); *Reports of the Massachusetts Bureau of Statistics of Labor* (Boston); *Annual Reports of the New York Bureau of Labor Statistics*, and monthly journals published by various trade-unions.

TRADE-UNIONS, THE GENERAL FEDERATION OF. The central labor organization of Great Britain. It was organized July 1, 1899, under the auspices of the British Trade-Union Congress for the purposes of upholding "the rights of combination of labor," promoting industrial peace, and establishing a fund for mutual assistance and support. The Federation is "open to every bona-fide trade-union in Great Britain," but the unit of membership is the trade-union and "no branches or individuals are allowed to join." It is governed by a general

council of delegates which meets annually, and between these sessions by a management committee of 15. Appeals may be taken from the decisions of both the council and the committee to the general membership. The Federation is "nonpolitical and nonlegislative," leaving to the Labor Representation Committee (see LABOR PARTY, BRITISH) the campaign for the election of labor representatives to Parliament, and to the Parliament committee of the Trade-Union Congress the agitation for favorable labor laws. The Federation pays, in strikes authorized by the general council or the management committee, two grades of strike benefits—five shillings a week per member "on the higher scale" and half this amount "on the lower scale." Unions on the higher scale contribute sixpence a member per quarter, and unions on the lower scale threepence a member per quarter, on 90 per cent of the total membership, exclusive of superannuated members. In cases of emergency the management committee is authorized to increase the regular dues 100 per cent. The entrance fee is one penny per member upon 90 per cent of the total membership, but in addition it is provided that "Any society desirous of joining the Federation shall pay ten per cent of the average worth per member of the class or scale the union or society is joining, in addition to their entrance fee, but any society not in existence at the time of adoption of this scheme shall be allowed to join on payment of five per cent of the average worth per member of the Federation at the time of joining." No union is entitled to benefits until it has belonged to the Federation for 12 months. The Federation started with 343,000 members. In 1910 the membership was 709,564.

TRADE WINDS. See WIND.

TRADING STAMPS. Slips of engraved or printed paper, usually in the form of gummed stamps, which are given by merchants to purchasers of goods and which may be presented to some person or corporation in exchange for articles of value. The purchasers of goods are generally given books in which the stamps are pasted until a sufficient number have accumulated for redemption. The advertising advantages of this scheme have made it very profitable, and one method of obtaining the desired publicity is the printing of books containing the names of all subscribers and distributing these books among the residents of the surrounding country or district.

Although frequently attacked as constituting a contract void against public policy, because of the element of chance involved, the courts have uniformly upheld such contracts. In certain specific instances, however, as when stamps containing certain numbers, the obtaining of which depends upon mere chance, are more valuable than others, the scheme constitutes a violation of the statutes against the maintenance of lotteries. Because of the claim that the trading-stamp business is demoralizing in that it fosters a desire in the public to get something for nothing and that it tends to maintain the gambling spirit, statutes were passed in many States prohibiting the distribution of such stamps. It was contended also that the scheme was objectionable because many people who received stamps failed to present them for the premium offered, and that in any event the dealer distributing the stamps was bound to reduce the quality of his wares or increase the price.

These statutes, however, have, with a few slight exceptions depending upon the peculiar wording of the particular statute, been held to be unconstitutional as an improper exercise of the police power and a taking of property without due process of law. Such was the fate of such legislation in New York and New Hampshire. See LOTTERY.

TRADUCIANISM (from Lat. *traducianus*, from *tradux*, vine branch for propagation, from *traducer*, to lead along, train, propagate, from *trans*, across, through + *ducere*, to lead). One of the theories adopted for the purpose of explaining the production of the soul in the procreation of human species. It is ascribed to Tertullian (q.v.) as its first author and is elaborately explained and defended by him in his book *On the Soul*, written after he had lapsed into the Montanist heresy. In opposition to others who had held the theory of preëxistence of souls, Tertullian taught that souls, like bodies, are propagated from one generation to the next. In another place he describes this origin of soul from soul as generation, and even of a class analogous to corporeal generation; and this more gross and material exposition of the theory of traducianism is sometimes called generationism, which, however, is commonly looked upon as a totally distinct theory. A third hypothesis to explain the origin of the soul is that of creationism (q.v.).

TRÆTTA, træ-ët'tä, TOMMASO (1727-79). An Italian composer, born at Bitonto. He studied at the Conservatorio di Loreto, Naples (1738-48), and in 1751 produced his first opera, *Farnace*, in Naples. From 1765 to 1768 he was a director of a conservatory in Venice and resigned to become court composer to Catharine II at St. Petersburg. Of his 40 operas perhaps the most important is *Ippolito ed Aricia* (1759), which gained for its composer a life pension from the King of Spain. His works were characterized by theatrical effectiveness and harmonic vigor. Consult V. Capuzzi, *Traetta e la musica* (Naples, 1878).

TRAFALGAR, or, more commonly in England, trå-fål'gër, CAPE. A low promontory on the south coast of Spain, about 29 miles southwest of Tarifa (q.v.), at the western entrance to the Strait of Gibraltar. It is memorable for the great naval victory obtained off its shores by the British fleet under Nelson over the combined fleets of France and Spain on Oct. 21, 1805. The allies had 33 ships, commanded by the French vice admiral, Villeneuve, while Nelson had 27. The British fleet was arranged in two columns. The first under Collingwood fell upon the rear of the allied fleet, commanded by the Spanish vice admiral, Gravina. After a terrible contest, in which Nelson himself lost his life, the two British columns completely disorganized the hostile line. Eighteen ships were captured, and Napoleon's naval power was gone forever. For the influence this victory had on the course of the Napoleonic wars, see NELSON, HORATIO; NAPOLEON I. Consult Edward Fraser, *The Enemy at Trafalgar* (London, 1906).

TRAFALGAR SQUARE. A London square named from the battle of Trafalgar and containing the imposing granite column in memory of Nelson and statues of Havelock, Napier, Gordon, and George IV. About it are many public buildings.

TRAFFIC AND TRAFFIC PROBLEMS. See RAILWAYS.

TRAFTON, MARK (1810-1901). An American Methodist Episcopal minister, born in Bangor, Me. He joined the Maine conference in 1831, but held most of his charges in the New England and Providence conferences. In 1855, while serving as pastor at Westfield, Mass., he was elected to represent his district in the Thirty-fourth Congress. He was known as a poet also. He published: *A Plea for Infant Baptism and against Exclusive Immersion* (1846); *Rambles in Europe* (1852); *The Safe Investment* (1856); *Baptism, Subjects and Modes* (1870); *Scenes in my Life* (1877).

TRAGACANTH. See GUMS.

TRAGEDY. See DRAMA.

TRAGIC POET, HOUSE OF THE. One of the most attractive houses of Pompeii, made famous as the home of Glaucus in Bulwer's *Last Days of Pompeii*. The name was assigned through misconception of a painting discovered at the time of the excavation. It had two stories and was richly decorated with paintings, among them, "The Nuptials of Zeus and Hera" and "The Sending Away of Briseis," both preserved in the Naples Museum, together with the noted mosaic of a dog with the motto "Cave Canem," originally in the floor of the vestibule. Consult August Mau, *Pompeii: Its Life and Art* (Eng. trans. by F. W. Kelsey, 2d ed., New York, 1902).

TRAGOPAN (Neo-Lat., from Gk. *τραγός*, *tragos*, goat + *πάν*, *Pan*, Pan), or **HORNED PHEASANT**. One of the pheasant-like birds of the genus *Tragopan*, which have naked cheeks, a hornlike caruncle projecting backward from behind each eye, and a loose wattle, capable of being inflated, hanging beneath the bill. Five species are known, all found in India and China. They are brilliantly colored, live high up among the mountains, and are probably the only members of their family which nest in trees. See **HORNED PHEASANT**.

TRAILING ARBUTUS. See **ARBUTUS, TRAILING**.

TRAILL, träl, CATHERINE PARR. A sister of Agnes Strickland (q.v.).

TRAILL, HENRY DUFF (1842-1900). An English journalist and author, born at Blackheath, near London. He was educated at the Merchant Taylors' School, London, and at St. John's College, Oxford. In 1869 he was called to the bar at the Inner Temple, but he soon gave up law for journalism. He edited the *Observer* from 1889 to 1891 and was the projector and first editor of *Literature* (established 1897). Traill did much miscellaneous work of good quality. For the "English Men of Letters Series" he wrote *Sterne* (1882) and *Coleridge* (1884); for "English Worthies," *Shaftesbury* (1886); for "English Statesmen," *William III* (1888); and for "English Men of Action" *Stratford* (1889). Other biographies by him are *Lord Salisbury* (1891), *Sir John Franklin* (1896), and *Lord Cromer* (1897). In politics and history notable works of his are: *Central Government* (1881); the exhaustive *Social England* (1892-1904), of which he was editor; *From Cairo to the Soudan Frontier* (1896); *England, Egypt, and the Soudan* (posthumous, 1900). *The New Lucian* (1884), *Number Twenty* (1892), and *The New Fiction and Other Essays* (1897) represent him at his best as a satirist and as a commentator on life whose humor is strongly tinged with melancholy. Political verse contributed to various periodicals was collected under the titles *Recaptured Rhymes* (1882) and

Saturday Songs (from the *Saturday Review*, 1890).

TRAIN, GEORGE FRANCIS (1829-1904). An American author, born in Boston, Mass. After engaging in the mercantile business in Boston and Australia he went to England in 1860 and undertook to form street-railway companies in Birkenhead and London, but his plans were obstructed by legal opposition. His publications include: *An American Merchant in Europe, Asia, and Australia* (1851); *Young America Abroad* (1857); *Irish Independence* (1865); *Championship of Women* (1868). He also published an autobiography entitled *My Life in Many States and in Foreign Lands* (1902).

TRAIN BANDS. Early English militia raised by commissions of musters and organized and drilled as military bodies. On the abolition of the fyrd in 1604, James I organized in its place the train bands to the number of nearly 200,000 men. As an organization the train bands were neither militia nor volunteers, but partook of the nature of both and in point of efficiency lacked both discipline and drill. During the Civil War they sided almost to a unit with the Parliamentarians and rendered very effective service. After the Restoration the command and control of the army were definitely assigned to the King; before this time the question had been in doubt. The term is also found in connection with forces of militia in the early American Colonies.

TRAIN DISPATCHING. See **RAILWAYS**.

TRAINED NURSES. See **NURSES, TRAINING OF**.

TRAINING. See **PHYSICAL EDUCATION**.

TRAIN STOP, AUTOMATIC. See **BLOCK-SIGNAL SYSTEM**.

TRAJAN (MARCUS ULPIUS TRAIANUS) (51-117 A.D.). A Roman Emperor (98-117), born at Italica, near Seville, in Spain. He was descended from a family which was probably of Roman origin and was early trained to arms, becoming a leader in the Parthian and German campaigns during the reigns of Titus and Domitian. He was prætor (85) and consul (91) and was adopted (97) by Nerva (q.v.) as his colleague and successor. Trajan celebrated his accession, in January, 98, by largesses to the soldiers and to Roman citizens and their children. He also made provision out of the Imperial treasury for the maintenance of the children of poor freemen in Rome and other Italian towns. In 101 Trajan set out on his first campaign against the Dacians, who had exacted tribute from Rome since Domitian's time. The struggle was long and destructive, but the Romans at last gained a decisive superiority and in a subsequent campaign (104-105) completely subdued their opponents, whose country thenceforth became the Roman province of Dacia and was secured by partial colonization. This conquest, the first since the death of Augustus, was celebrated, on Trajan's return to Rome, by a triumph and by games on a most extensive scale, which continued for four months. The Column of Trajan was erected to commemorate this victory. In 106 Trajan again went to the East. Landing in Syria, he marched northward, receiving on his way the submission of numerous princes, and conquered Armenia, which he made a province. The record of the events of the next seven years of Trajan's reign is extremely defective, the few notices in Dio Cassius and others being insufficient for the construction of a con-

secutive narrative. In 115 he again set out from Syria, directing his march this time against the Parthian Empire. He took Ctesiphon almost without a struggle and, descending the Tigris, subdued the tribes on both banks, being the first and only Roman general who navigated the Persian Gulf. On his return he found that Mesopotamia, north Syria, and Arabia required to be subdued again. This being done, and Parthia again conquered, Trajan attempted to reach Italy, but died at Selinus in Cilicia.

Though most of Trajan's reign was spent in the gratification of his warlike ambition, internal affairs were not neglected; the administration of justice was vigorous and impartial; that of finance was equally acceptable; informers (*delatores*) were severely punished, and peculating governors of provinces rigorously prosecuted. The improvement and beautifying of Rome were carried on; the Empire was traversed in all directions by new military routes, canals and bridges were constructed, new towns built, the Via Appia was restored, the magnificent Forum Traiani erected, and the harbor of Centum Cellæ (*Civitavecchia*) constructed. During Trajan's reign a mild persecution of the Christians took place. Consult: Johannes Dierauer, *Beiträge zu eine kritischen Geschichte Trajans* (Leipzig, 1868); Schiller, *Geschichte der römischen Kaiserzeit* (Gotha, 1883); and the article "Ulpian, 8," in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

TRAJAN, ARCH OF. 1. An arch at Benevento, Italy, somewhat resembling the Arch of Titus at Rome, erected in 114 A.D. to commemorate the completion by Trajan of a new road to Brundisium. It is of white marble with one archway 27 feet high, the whole structure being 50 feet in height. The reliefs represent the triumphs of Trajan over the Dacians. The arch is one of the finest and best-preserved specimens of the Roman arch. 2. A triumphal arch, in good preservation, at Ancona, Italy, built by the Roman Senate in 112 A.D. It commemorates the building of new quays by Trajan. The single archway is 29 by 46 feet. 3. An arch at Timgad (q.v.).

TRAJAN, BATHS OF. Baths built by Trajan on portions of the remains of the Golden House of Nero in Rome (*Therma Trajanæ*). The scanty ruins are situated on the Appian Way, where some remains may be seen in the Villa Field. They adjoin the Baths of Titus (q.v.), with which they were confused until 1895, on the northeast. The materials of the magnificent edifice were used in limekilns and in constructing other buildings. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

TRAJAN, FORUM OF. An immense group of public buildings in ancient Rome, filling the space between the Capitoline and Quirinal hills. It was named after its principal builder, the Emperor Trajan, and included the Forum proper, entered by the famous Arch of Trajan and containing his equestrian statue in bronze; the Basilica Ulpia; the celebrated Column of Trajan, in the midst of a cloistered court, where were also located the two Ulpian libraries, one Greek, the other Latin; and the Temple of Trajan, built by Hadrian. See FORUM.

TRAJAN'S COLUMN. A celebrated column at Rome, erected 114 A.D., near the centre of the Forum of Trajan, ostensibly by the Roman Sen-

ate and people, in honor of the Emperor Trajan. The pedestal is covered with sculptured trophies of Dacian arms, and a very remarkable series of bas-reliefs, forming a spiral round the shaft, 3-4 feet wide and 660 feet long, exhibits a continuous history of the military achievements of Trajan in his Dacian wars. These are in excellent preservation and, independently of their beauty as works of art, are invaluable as records of ancient costume, military operations, and history. A spiral staircase in the interior of the column leads to its summit. The column proper is of the Roman Doric or, rather, Tuscan order; its height, including base, shaft, and capital, but excluding the lofty pedestal (18 feet), is just 100 Roman feet (29.57 meters). The tradition that its total height of 147 feet above the pavement marked the height of the hill removed to level the site of the Forum is now generally discredited. The summit was crowned by a colossal statue of the Emperor, which was incongruously replaced (by Pope Sixtus V in 1588) by one of St. Peter. The ashes of Trajan, who died in the East, were said to have been deposited under this column in a golden vase, but no traces of such a burial have been found, though a few years ago a chamber was found in the base in which the ashes may once have been deposited. Consult: C. E. Fröhner, *La colonne Trajane* (4 vols., Paris, 1872-74); Salomon Reinach, *La colonne Trajane au musée de Saint-Germain* (ib., 1886); Conrad Cichorius, *Die Reliefs der Trajanssäule* (2 vols., Berlin, 1896-1900); E. Petersen, *Trajan's dakische Kriege* (Leipzig, 1899); S. B. Platner, *The Monuments and Topography of Ancient Rome* (2d ed., Boston, 1911).

TRAJAN'S WALL. A line of fortifications stretching across the Dobrudja from Czernavoda, where the Danube bends northward, to a point of the Black Sea coast near Kustendje. It consists of a double and in some places a triple line of ramparts of earth (8¾-11 feet in height on the average, though occasionally it attains an altitude of 19½ feet), bounded along its north side by a valley which, being generally marshy, serves admirably the purpose of a ditch. The construction of this rampart is attributed to Trajan, the general of the Emperor Valens, who in 377 A.D. endeavored by this means to check the advance of the Visigoths. In 1854 Trajan's wall became an important line of defense on the invasion of the Dobrudja by the Russians, and the invaders were twice defeated in their attempts to pass it—at Kostelli (April 10) and Czernavoda (April 20-22).

TRAJECTORY (from Lat. *trajicere*, *trans-jicere*, to throw across, from *trans*, across, through + *jacere*, to throw). In mathematics, any plane curve which cuts at a constant angle a series of plane curves of the same species having a common origin. If the constant angle is a right angle, the curve is called an orthogonal trajectory of the system. The question of such a curve was proposed by Johann Bernoulli (1691) in his *Acta Eruditorum*, and Newton (1716) laid the foundation for the theory of trajectories. Consult, for the history of the trajectory, Terquem, in the *Nouvelles annales de mathématiques* (Paris, 1845); for the various classes, Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897, and supplement, 1899). See GUNNERY.

TRAJECTORY, IN GUNNERY. See BALLISTICS.

TRALEE. A seaport of Ireland, the chief town of County Kerry, on the Lee, 1 mile from its mouth and 207 miles west-southwest of Dublin (Map: Ireland, B 7). The town is well built and dates from the twelfth century. Pop., 1901, 9867; 1911, 10,300.

TRALLES, träl'lez. An ancient city of Lydia in Asia Minor, on the Eudon River, a northern branch of the Mæander. Its origin was ascribed to Argive and Thracian settlers. It was a thriving commercial centre. Under the Seleucidæ it was known as Seleucia and Antiochia.

TRAM. See SILK.

TRAMP. The American equivalent of the English "sturdy beggar" and "vagrant." His first statutory appearance was in 1876 in New Jersey, and he was soon recognized legally in 21 States. He is commonly defined as an able-bodied man without visible means of support, wandering aimlessly, begging, and refusing work, camping and kindling fires on highways and private property, and terrorizing women and children. What really distinguishes him from the prosaic vagrant of other countries is his extensive use of the railways—stealing rides, or, in his argot, "jumping trains." From 1901 to 1905 inclusive 23,964 "trespassers" were killed and 25,236 injured by railroads in the United States, or more than the combined numbers for passengers and trainmen. From one-half to three-fourths of these trespassers are tramps.

The great difficulty with the train-jumping tramp is that local authorities do not like to bear the expense of prosecutions and maintenance in jail. The common custom is for the authorities to put the tramp back on the next train or give him 24 hours to leave town. By this method each town naturally receives as many as it gets rid of. Action by a unit at least as broad as the State is absolutely necessary. In 1895 Massachusetts showed a mean daily tramp population of 791, as against 451.4 in 1890, implying a total for the State of 2832, as against 1616 before, and of 79,427 for the United States. The mean was lower, with but two slight intermissions, afterward, and in 1902-03 was 369.6, suggesting 1323 for Massachusetts and 38,636 for the United States. In 1905 Massachusetts passed an effective vagrancy law, and conditions in that State ceased to be indicative for the country as a whole. The effects are shown by the numbers of tramps sheltered in almshouses in the State in the successive years. In 1905 there were 23,341; 1906, 7200; 1907, 3127; 1908, 423; 1909, 272; 1914, 131. Unfortunately no general decrease in vagrancy is indicated, as they were merely driven to other States. In 1915 the problem was most acute in New York City, which has the reputation of being "the best town for bums in the United States." The average cost of the tramp to the community is about \$4.40 a week, independent of his possible depredations; and although 83.5 per cent of tramps say their health is good, 10 per cent of them admit having had a dangerous contagious disease.

There are no national repressive laws. Those of the various States have been characterized by a severity born of panic, a penalty sometimes being 12 months' imprisonment, and in two States sale at public auction for a designated period. Contrary to the common impression, the tramp generally has learned and frequently practiced a trade or profession, about one-half

having this ability. The proportion of professionals, or those who never work, is small, their real weakness being chronic tendency to intermittency in work. This is fostered by their habits and marital condition, 63 per cent being admitted drunkards and 93 per cent unmarried; and again by the conditions of industrial activity, the drunkard being employed only when he is indispensable, and discharged, along with the unmarried man, when business slackens—witness the great rise in tramp population after 1873 and the fall after 1901. Statistics seem to show that the surest way of correction lies in prevention.

In England the ancient penalties against what we call tramping were very severe. Under Edward VI the punishment was branding on the breast with a V and two years' slavery. In 1572 it was whipping for the first offense, boring the ear with a hot iron for the second, and death for the third. A fine of 10 times the dole was imposed on the person helping the vagrant. The vagrant may now be lodged in the casual ward of the Union (almshouse), where he must break stone or pick tow in payment. The alarming increase in the evil in England led the President of the Local Government Board in 1904 to appoint a departmental committee on vagrancy. In its report in 1906 this committee recommended much more stringent treatment and the introduction of the Swiss and German travel-card system to distinguish vagrants from honest work seekers.

In Germany the most drastic modern measure against the prime vice of tramping, open mendicancy, was that taken in Bavaria in 1790-95, under Count Rumford, where in four years 10,000 vagabonds were arrested. It proved effective. The number of tramps in Germany is unknown, but has been set at 100,000. The tramp there is the lineal descendant of the old artisan wandering abroad to complete his knowledge of his craft. Beginning in 1854, when Professor Perthes, of Bonn, founded a cheap tavern for them, where no drink stronger than beer could be had, the number of these home refuges (*Herbergen zur Heimat*) increased in 1901-02 to 462, a gain of 72 from 1892 to 1902, with an aggregate of paying guests for the year of 1,931,575 and of nonpaying guests or those rendering an equivalent in work of 759,057. For 108,505 of these situations were found. In 1910 the number was 449, according to the statistics of the association (*Deutschen Herbergs Verein*) into which they had been organized in 1886. Three new ones were opened and nine closed during the year. Of these 217 were connected with *Verpflegungstationen* or *Wanderarbeitsstätten*. The number sheltered during the year was 2,726,850, aggregating 4,727,297 nights' lodgings (as against 2,622,000 and 4,547,028 the previous year). Employment was found for 133,899, a decrease of 5189 compared with the previous year. In more or less direct communication with the *Herbergen*, in 240 instances under the same roof, is, on the one hand, a great network of local establishments (*Verpflegungstationen*) where lodging and a meal is furnished in exchange for work, generally wood-chopping; or, if there is no separate building, an order is given for cheap entertainment at a local tavern.

On the other hand is a chain of labor colonies (*Arbeiterkolonien*), the first of which was established in 1882 at Wilhelmsdorf in Westphalia by

Pastor von Bodelschwingh. The number in 1910 was 34 in Germany, with an additional one for Germans in England at Libury Hall, near London. Twenty-six were established between 1882 and 1892, a decade of especial industrial depression. During the year 1910, 12,303 persons were admitted (against 12,878 for 1909) and 12,445 dismissed. The total number admitted from the beginning was 226,935, and the capacity of the existing colonies 4888. It is interesting to note that, of the 12,303 admitted, 4742 came for the first time and 2548 for the second, while 1342 had been over seven times in a colony; 9467 had never been married, and only 513 were married at the time of admission. Of those dismissed, about exactly half (6324) left "at their own request" situations were found by the colonies for 911 and by the occupant himself in 1295 cases. The rest were mainly discharged for misdemeanors of various sorts or ran away or were turned over to the poor-relief authorities or hospitals; 37 died. Of recent years public action dealing with vagrancy has been growing in Germany. A Prussian Law of June 29, 1907, empowers the Diet (Landtag) of any province to compel communal and municipal authorities to establish wayfarers' lodges (*Wanderarbeitsstätten*), and Westphalia has since put in operation a complete system. The best example of what may be done is afforded by the Kingdom of Württemberg, where a quasi-public Society for the Promotion of Wanderarbeitsstätten in Württemberg, assisted by fiscal appropriations, maintains a chain of 27 institutions (close of 1909). During the year October, 1909, to September, 1910, 82,212 migratory workers were admitted to the lodges. The cost to the state of a day's entertainment is about one mark (25 cents) against an estimated average intake of from two to three times as much when they are permitted to beg. The system reduced court sentences for begging and vagrancy by 78.5 per cent the first year. Three labor colonies with a capacity of 150 are an adjunct of the system. Every applicant received must have a travel card (*Wanderschein*), to be obtained on establishment of identity and proof of a clear police record and of having been employed or prevented from work by sickness during the preceding three months. A day's entertainment is given for four hours' work. After the midday meal the wanderer must, if no suitable work can be furnished him, proceed to the next *Arbeitsstatt*, the time of arrival and departure being punched on the *Wanderschein*.

The Swiss labor colonies have attracted particular notice in the United States. They are compulsory and under the supervision of the cantonal authorities; there is one in each canton, that at Wytzwyl being the largest and most successful. They have nearly eliminated vagrancy from Switzerland. Partly as a result of Mr. Edmond Kelly's book on "The Elimination of the Tramp" (1908), the New York Legislatures of 1911 and 1912 passed bills establishing a tramp farm along the Swiss lines in the State. Land was purchased, but owing to insufficient appropriations the work has not been carried to completion (1913). Massachusetts has a tramp farm.

Labor colonies are also more or less successful in Holland and Belgium, and the French have experimented, under Paris municipal patronage, along the same lines, at La Chalmelle in the Department of Marne.

TRANCE (OF., Fr. *transe*, extreme fear, Sp., Portug. *trance*, crisis, hour of death, from Lat. *transitus*, passage over, from *transire*, to pass over, cross, from *trans*, across, through + *ire*, to go). A general term in psychology denoting various forms of modified consciousness. The psychological symptoms vary from seeming inanimation to a waking condition, though a manifestly abnormal one, of exaggerated suggestibility in respect to some dominating idea. In general there is more or less marked anaesthesia. What may be termed the waking trance is also characterized by extraordinary concentration or automatic mental action, while the ordinary functions of the body are little interrupted. The thoughts of the subject are ordinarily fixed on one kind of idea, frequently religion. In trance sleep, except in its protractedness and the lessened sensibility to external stimuli, there appears to be little that is abnormal. In trance coma these symptoms are more intense, and respiration and circulation are feebler. In death trance, except sometimes the inner dream life, all animation ceases, including the action of heart and lungs. The thought, or dream, of trance is likely to be more sequential and coherent in character than that of normal sleep. Various pathological and psychopathic conditions are often called trance, such as deep and unusually protracted sleep, lethargy, suspended animation, the hypnotic state, and altered personality. Preston, *Hysteria and Certain Allied Conditions* (Philadelphia, 1897); Frank Podmore, *Modern Spiritualism* (2 vols., London, 1902); Morton Prince, *Dissociation of a Personality* (2d ed., New York, 1908); J. H. Hyslop, *Psychical Research and Survival* (London, 1913). See SOMNAMBULISM.

TRANI, trà'né. A seaport in the Province of Bari delle Puglie, Italy, 27 miles by rail northwest of Bari (Map: Italy, F 4). Its ancient walls have given place to spacious boulevards. The twelfth-century cathedral has a very high tower and magnificent bronze doors. The Santa Maria Immacolata is a beautiful church. The Gothic palace (the seat of a priests' seminary) and the old castle (now a prison) are both interesting. Excellent building stone is quarried. Trani first came into notice when it submitted to the Normans in 1073. During the Crusades it carried on a heavy trade with the Levant. Pop. (commune), 1901, 31,800; 1911, 32,059.

TRANSBAIKALIA, tràns'bî-kâ'îl-â. A province of eastern Siberia (Map: Asia, N 3).

Area, 238,308 square miles. The province is divided by the Yablonoi Mountains, a part of the Stanovoi (q.v.) chain, into two parts, of which the western has the character of an elevated plateau intersected by a deep valley that extends from Lake Baikal to the Uda River and is used by the chief highways as well as by the Trans-Siberian Railway. The portion east of the Yablonoi chain is lower than the western part and is traversed in the southeast by the Nerchinsk Mountains. The region is watered by the Argun and Shilka, which unite to form the Amur, by the Vitim, a tributary of the Lena, and by the Selenga (q.v.), a tributary of Lake Baikal. Of the numerous lakes the principal is Baikal (q.v.). The climate is continental, dry, and very severe, the temperature being occasionally as low as -58° . The snow-fall is slight. Transbaikalia is one of the most highly mineralized regions of Siberia. Gold is found especially in the Nerchinsk Mountains, where there are also rich deposits of silver and lead. Coal is found near the southeastern shore of Lake Baikal, and iron in many parts. The mining industry, however, is not highly developed, and only the gold output is important. The mines are owned to a large extent by the state and worked by convict labor, the centre of the mining industries being the Nerchinsk region. Agriculture is confined chiefly to the south, where the natural conditions are more favorable. Stock raising is extensively carried on, and hunting is still of considerable importance. The chief manufactures are leather, spirits, and flour. The transit trade with Mongolia through Kiakhta (q.v.) is large. Estimated population at the beginning of 1914, 945,700, of which the town population was 144,300. The Russian population is largely in the Nerchinsk mining region. Prosperous settlements of Raskolniks are in the Chikoi, Khilok, Uda, and other valleys. There are many Cosacks, largely Mongolian in character. The aboriginals, mostly Buryats (about 180,000) and Tunguses (about 30,000), have still in the main preserved their clan organization, although many of them have been assimilated with the Russians. Capital, Tchita (q.v.).

TRANSCASPIA. A Russian province in west Asia (Map: Asia, G 4). Its area is 235,120 square miles. In its general features the region resembles Turkestan, of which it may be considered a western continuation. The larger part of the north consists of elevated table-lands with some mountains in the peninsula of Manghishlak in the northwest and a deep depression near the Khivan frontier in the east. The central part is lower and is practically a desert with shifting sands and dried-up river courses. The southern part is traversed by a mountain chain which separates the sandy deserts of Turcomania from the highlands of north Persia and from its structure and direction appears to be a continuation of the Caucasus system. This region is watered by the Atrek, which flows along the southern boundary to the Caspian and by the Tejend and the Murghab. As a whole, Transcaspiia is scantily watered. Irrigation is practiced. The coast is indented by a number of deep inlets, of which that of Kara Bugas is noted for its extreme salinity. The climate is hot and dry, and the precipitation extremely meagre. The region contains rich mineral deposits, of which salt, naphtha, ozocerite, and gypsum are mined to some extent.

Agriculture is developing in the southern part, which is more favorably situated with regard to irrigation. The principal products are wheat, sorghum, rice, and barley. Cotton is also successfully cultivated. The natives have extensive herds of sheep and other stock and export skins and wool. A number of household industries, such as rug weaving and the production of various articles of felt, are more or less developed. The chief medium of transportation is the Transcaspiian Railway, which traverses the southern part of the territory. Pop., 1912, 486,200, of whom the Turcomans constituted about two-thirds. Capital, Askhabad (q.v.).

TRANS-CAUCASIA. The southern part of the Caucasus (q.v.), comprising six governments, three provinces, and two districts of Russia (Map: Asia, F 4). Area, about 95,405 square miles. It was the scene of severe fighting between the Russians and the Turks during the Great War. (See WAR IN EUROPE.) Pop., 1912, 6,931,900.

TRANSCENDENTAL, TRANSCENDENT (from *transcendent*, from Lat. *transcendens*, pres. p. of Lat. *transcendere*, to surpass, from *trans*, across, through + *scandere*, to climb, Skt. *skand*, to spring, ascend). Words employed by various schoolmen, in particular Duns Scotus, to describe the conceptions that by their universality rise above or transcend the 10 Aristotelian categories. (See CATEGORY.) Thus, according to Scotus, *ens*, or being, because it is predicable of substance and accident alike, of God as well as of the world, is raised above these by including or comprehending them.

Between the hitherto convertible terms "transcendental" and "transcendent" Kant drew a distinction, of considerable importance in understanding his own system. By the word "transcendental" he designates the various forms, categories, or ideas assumed to be constitutive or regulative elements of human experience; although they are manifested only in experience, they are not products of experience. Among such transcendental elements are space and time, causality, and substantiality. The knowledge that these elements are not of empirical origin is called transcendental knowledge. The word "transcendent" Kant reserves, but not with uniform consistency, for those objects that lie in the world of things in themselves, entirely inaccessible to experience, and for any pretended knowledge of such objects. See KANT.

TRANSCENDENTAL DEDUCTION. See DEDUCTION.

TRANSCENDENTALISM. A term applied in philosophy to Kant's system and to those like it in maintaining that there can be knowledge of transcendental elements. (See TRANSCENDENTAL.) The terms Transcendentalism and Transcendental school are now frequently used by English-speaking peoples to designate the views of thinkers like Emerson (see EMERSON, RALPH WALDO) and his colleagues in the Transcendental Club (1836) and at Brook Farm (q.v.). The so-called Transcendental movement was mainly confined to New England, especially to Massachusetts, and in point of time to about 1830-50. In its origin it dates much further back, and in its effects it can scarcely be said to be entirely extinct to-day. In character it was partly philosophical, thus connecting with German and French thought; partly economic, thus connecting with French and English schemes of social reform; partly

literary, thus connecting with the poetry of such dissimilar characters as Wordsworth and Shelley and with the gospel of Carlyle; partly theological in a loose sense, thus connecting with Unitarianism; but on the whole, as Emerson averred, primarily spiritual, thus connecting with and finally coalescing in contemporary movements for regeneration of every kind. It may be said that New England Transcendentalism was in the main a result of a revolt from the formalism both of Unitarianism and of Calvinism, and coalesced with a loose system of intuitional philosophy borrowed from Germany and with the Romantic revolt from classicism in literature, as well as with a contemporaneous American movement for securing the benefits of foreign culture, and which finally more or less merged in the great antislavery agitation. It will be necessary to dwell briefly on each element.

Transcendentalism in New England was involved in the great awakening of a century before, for both were spiritual manifestations, the earlier of which did much to shake the hold of rigid Calvinism and to introduce the religious emotionality and liberalism that were later to culminate in men like William Ellery Channing and Theodore Parker (qq.v.). Within 20 years after the awakening Arminianism and Arianism, through the agency of the Deists and other British writers, had made many converts, especially in eastern Massachusetts. Jonathan Mayhew (q.v.) is typical of these early liberals or Unitarians. The followers of Jonathan Edwards struggled valiantly against the innovators and held most of New England for orthodoxy, but by 1785 there was a distinctively Unitarian church (King's Chapel) in Boston, even if 30 years were to elapse before this name could be definitely fastened on the seceders from Calvinism. This change of faith was not effected without heartburning and a development of religious unrest among New Englanders, which made the acceptance of new philosophical ideas, new literary standards, and new social theories all the easier when the time was ripe. The appointment of Unitarian professors at Harvard, resulting in the founding of Andover Theological Seminary (q.v.), and the preaching of such men as the younger Buckminster and Channing, undoubtedly prepared the way for Emerson, Alcott, Ripley, and Parker.

But although by 1825 Unitarianism had won a victory in Boston and its environs, it was not destined to maintain its ascendancy for so long a period as its foe, Calvinism, had done. It, too, showed a tendency to formalism, both in thought and in taste, and impressionable souls soon broke away into new paths of philosophy, theology, and literature. Some little knowledge of Kant and his successors, of Schleiermacher, and of Goethe had been obtained by a few persons prior to 1830. Before 1840 the labors of George Ripley, F. H. Hedge (qq.v.), and other translators had considerably increased this knowledge; in consequence the influence of German thought upon New England Transcendentalism cannot be ignored, although it is easily exaggerated. French thought, as illustrated by Cousin and more by Fourier, was less influential, but that there was a decided taste for foreign literature which gave an impetus to the contemporaneous movement for a greater and freer spiritual life seems to be clearly established. This meant dissatisfaction with eighteenth-century standards and with the colo-

nial character of American literature and thus involved the founding of the *Dial* (q.v., 1840-44). Nor in this connection should we forget the interest displayed by some Transcendentalists in the Oriental Scriptures, in Neoplatonism, and in more or less occult literature. But behind the revolt from formal Unitarianism and the craving for new forms of philosophy and literature that characterized many young persons in New England between 1830 and 1840, there was the uplift of the world's spirit that showed itself in many ways, and there was also on the part of aspiring souls a contempt for the vulgarity and selfishness of American political and business life of this epoch. It is no wonder that New England was unable to develop orderly schools of thought and literature and seemed given over to extremists and fad-dists of all sorts.

In 1836 (September 19) Emerson, Hedge, Alcott, and others formed the so-called Hedge or Transcendental Club. Little came of this organization until the *Dial* was started in 1840 and Brook Farm (q.v.) was founded in 1841. Neither enterprise was fully successful, but both were influential upon literature and thought, though not greatly upon action. Under Margaret Fuller (q.v.) and Emerson the *Dial* was a hospitable receptacle for the verses of the Transcendentalist poets—C. P. Cranch (q.v.), the younger W. E. Channing (q.v.), and others, whose merits are slowly being recognized—and for many of the best papers of the two editors and of Thoreau. (See THOREAU, HENRY D.) It did not create or recreate American literature, but it undoubtedly stimulated important writers. Brook Farm community life was laughed at by the hard-headed and not effectively supported by many of the leading Transcendentalists themselves, but it set up a beneficial ideal of "plain living and high thinking;" it furnished Hawthorne material for his *Blithedale Romance*, and it doubtless leavened the utilitarian spirit of the country and the age.

No writer upon New England Transcendentalism has failed to remark upon the exceedingly elusive character of the movement. It is difficult to disengage its elements, to delimit it in point of time, to say what it really accomplished, to determine what it became. If it had been fully organized, the case would have been different for the student, yet the results would probably have been less fortunate, both to the Transcendentalists themselves and to the American people at large. Not being hampered by organization, by formulas, by the apparatus of propagandism, the Transcendentalists were better able to serve a more specific cause of greater moment—that of Abolition. They were also enabled to follow the bent of individual genius after having experienced the stimulating effects of having lived in a period of uplift. Emerson became the favorite moralist of his countrymen and an important poet; Alcott gave full vent to his eccentricity and ended as the patron saint of the Concord Philosophers; Margaret Fuller had a brilliant and only too short career as a critic and woman of letters; Ripley, by his reviews in the *Tribune* and his services with C. A. Dana (q.v.) as an encyclopædist, showed that a Brook Farmer was capable of valuable if homely work in the cause of letters and science; Thoreau revealed nature to his countrymen and became a high priest of individualism as well as a writer of truly classic prose; Theo-

dore Parker died just before the beginning of the crusade of which he was perhaps the greatest preacher. Thousands of men and women throughout New England were inspired by Transcendentalism to devote themselves to every form of philanthropy. The era of the Transcendentalists was in many respects an American Renaissance, the effects of which were not confined to this country, but were spread, chiefly through the writings of Emerson, Thoreau, and Channing, to England and to some extent to the continent of Europe. That their ideas were vague and often transcended reason, not to say common sense, that their literary work was largely amateurish, that their extravagances gave much occasion to legitimate ridicule, that their so-called movement was the forerunner of religious and social manias of all sorts, can scarcely be gainsaid; but it is equally idle to deny the loftiness of their aims and the importance of their works.

Higginson, *Old Cambridge* (ib., 1900); G. W. Cooke, *Unitarianism in America* (Boston, 1902); id., *The Poets of Transcendentalism: An Anthology* (ib., 1903); Leighton, *French Philosophers and New England Transcendentalism* (Charlottesville, Va., 1908); H. C. Goddard, *Studies in New England Transcendentalism* (New York, 1908). The last two works contain bibliographies.

TRANSCENDENTAL NUMBERS. See NUMBER.

TRANSCONTINENTAL RAILWAYS. See CANADA; SIBERIA; UNITED STATES, *Transportation*.

TRANSCRIPTION (Lat. *transcriptio*, from *transcribere*, to transcribe, from *trans*, across, through + *scribere*, to write). In music, an arrangement of a composition for instruments or voices other than those employed by the composer. See PARAPHRASE.

TRANSEPT (from Lat. *trans*, across, through + *septum*, *septum*, inclosure, partition; connected with *sapes*, hedge). A projecting wing at right angles with the nave and aisles of a church, forming one of the smaller arms of the cross. The term is improperly used in the singular to designate the two transepts together. In some early basilicas and a few Italian churches of later date (e.g., Santa Croce and San Lorenzo, Florence) the transepts are at the extreme east end, forming a T-plan. The square space at the meeting of the nave and transepts is called the crossing. In the early Middle Ages the transept became quite common and in the Gothic age almost universal. The transepts sometimes project beyond the side aisles; when this is not the case, they show externally by their height above the side-aisle roofs and internally by their width and height, which are equal to those of the nave. The crossing is often surmounted by a spire, tower, or dome requiring much heavier piers than those of the nave and choir generally.

While single transepts were the rule, double transepts were sometimes used in England and Germany. The double English transept was on the scheme of the archbishop's or Passion cross, with both arms east of the nave; the double German transept was connected with the double choir, one at each end of the church. The ends of the transepts in Gothic churches were

often treated as façades only second in importance to the main front, with their large rose or wheel windows and their elaborate portals. Those of Notre Dame in Paris, of Chartres, Rouen, and Amiens are particularly beautiful. Many of the English transepts have only one side aisle; the French examples have usually two. See CHURCH.

TRANSFER PROCESS. See LITHOGRAPHY.

TRANSFIGURATION (Lat. *transfiguratio*, from *transfigurare*, to transfigure, from *trans*, across, through + *figurare*, to form, from *figura*, shape, form) of CHRIST. The temporary revelation of the glory of Jesus during his earthly ministry, recorded in Mark ix. 2-8 and parallel passages. The festival commemorating it can be traced back to the fifth century, but was established on August 6 as a solemn feast for the whole Roman Catholic church in 1457, as a thanksgiving for the victory over the Turks near Belgrade. It was retained as a black-letter festival by the Church of England and restored as a greater feast by the American Episcopal church at the revision of the Prayer Book in 1892.

TRANSFORMATION. See MARBLE FAUN.

TRANSFORMER. In electrical engineering, an apparatus for transforming or converting an electric current. The term commonly is applied to a device for transforming an alternating current to a higher or lower voltage. Machines for converting alternating currents to continuous currents and vice versa are known as converters or rectifiers (q.v.) and are described under dynamo-electric machinery (q.v.). Devices for obtaining pulsating currents of high potential from pulsating currents of low potential are described under induction coil (q.v.). Devices for transforming a continuous current at one voltage to a continuous current at another

FIG. 1. DIAGRAM OF ESSENTIAL PARTS OF A TRANSFORMER.

voltage are known as dynamotors and are described under dynamo-electric machinery (q.v.). The present article treats only of devices used to transform alternating currents into other alternating currents differing in magnitude and potential and known as static transformers.

A transformer consists of two electric circuits, each made up of turns of insulated conductor, interlinked with a magnetic circuit, usually consisting of iron, in such a manner that any magnetic flux set up by a current in one electric circuit will thread the other. (See MAGNETISM.) Any change in the current in one of the coils causes a change in the magnetic flux, and a change in the magnetic flux threading the second coil generates a voltage in that coil. If the current in one coil is continually changing, as is the case with an alternating current, an alternating flux is set up

and the alternation of that part of this flux threading the second coil produces an alternating voltage in the second coil. At the same time the alternation of the flux produces an alternating voltage in the first coil which opposes the current and is known as the counter electromotive force (C. E. M. F.).

Since with an iron magnetic circuit practically all the magnetic flux set up by the coil into which a current is sent (the primary) threads the other coil (the secondary), there is very little leakage of flux and the voltage induced in any one turn of either coil is practically the same. Thus, if there are 10 turns in the primary coil and one turn in the secondary coil, the counter electromotive force of the primary will be 10 times the induced electromotive force of the secondary coil, whereas, in accordance with the law of conservation of energy, if power is given out by the secondary it must be taken from the primary, and both members have very nearly the same power, i.e., the product of volts and amperes in the primary is equal to the product of volts and amperes in the secondary. Hence the currents are inversely proportional to the voltages or to the respective numbers of turns in the two windings.

The winding having the greater number of turns and the higher voltage is known as the high-tension winding; the one with the lower voltage and turns is the low-tension winding. The winding connected to the source of energy is called the primary and that connected to the load the secondary. If the low-tension winding is the primary we have a step-up transformer, and if the high-tension winding is the primary we have a step-down transformer. The former type is used in power stations to raise the voltage of the alternating-current generators (usually about 2200 volts) to a suitable voltage for the transmission line (30,000 to 60,000 volts), while the step-down transformer is used at the other end of the line to lower the voltage of the transmission line to a voltage suitable to the consumer.

When the secondary winding is closed through an external circuit, a current will flow and set up a magnetic reaction. The turns of the secondary carrying a current form a magnetomotive force opposing the primary flux and tending to reduce it. A reduction in primary flux causes a decrease in the counter electromotive force, which permits more current to flow in the primary, so that the primary winding may always be resolved into two magnetomotive forces—one overcoming the counter magnetomotive force of the secondary and one unopposed producing the primary flux. The latter unopposed magnetomotive force results from the magnetizing current or no-load current.

Since in practice both windings have electrical resistance, there will be a loss of voltage in each whenever current flows, and thus the observable voltage at the terminals of the secondary or load will be less than that generated by the primary flux, and the voltage impressed on the primary must be greater than the counter-electric force by the amount of the resistance drop in that circuit.

Since it is impossible to place the two windings so that all the flux set up by either winding will interlink the other winding, there is a leakage of flux between the two windings, and besides the mutual or useful flux common to both windings each winding has an additional flux

caused by its own particular current and linked only with itself. The windings are thus inductive and have induced in them a voltage which serves no useful purpose, but reacts against the main voltage. This is the same in effect as if choke coils (i.e., coils so wound as to have considerable reactance) or inductances were connected into the external part of each winding. The reactive voltage in such an inductance is out of phase with the current which produces it, and its effect must be shown by vector relations. If the current is in phase with the useful voltage, the reactive voltage is at one-quarter period out of phase or at right angles to the useful voltage. On the other hand, if the load is inductive and the current lags behind the useful voltage, the reactive voltage will be directly subtractive. Thus, when supplying a load the secondary external voltage for a given impressed voltage on the primary is less than when the transformer is not loaded, and the ratio of transformation is different, being less than the ideal in a step-up transformer and more than the ideal in a step-down transformer. The transformer is said to have a regulation expressed by the percentage decrease in secondary terminal voltage from no load to full load.

Under all operating conditions there must be a certain mutual magnetic flux in order to produce voltage, the voltage depending upon the magnitude of this flux and its rate of change, i.e., the frequency of the impressed voltage. To produce this flux a magnetizing current must flow. This magnetizing current is in phase with its flux and therefore out of phase with the voltage, as an alternating voltage is always one-quarter period out of phase with the flux which produces it. The magnetizing current is therefore said to be reactive or wattless, as it represents very little active power or heat power. On the other hand, the alternation of the magnetic flux in the iron produces various losses in the iron known as hysteresis (q.v.) and eddy-current losses. (See FOUCAULT CURRENTS.) Hence a small component of the no-load current must be in phase with the voltage to supply this heat-power loss and is known as the energy component of the no-load current.

These losses are reduced as far as possible in practice by using specially selected steel having a low hysteresis loss and a high electrical resistance to reduce the eddy-current loss. Recent forms of steel containing silicon are very good in this respect. In addition the steel is divided into thin sheets or laminations to reduce the value of the loss from eddy currents.

The loss in voltage due to the electrical resistance of the two windings also represents a loss of energy, and the energy output of the secondary is less than the amount of energy input to the primary due to these so-called copper losses as well as the losses in the iron called the core loss. Thus, the energy equation of the transformer is $\text{Input} = \text{Output} + \text{Core loss} + \text{Copper loss}$ in both windings. The core loss varies only a fraction of a per cent between no load and full load and is called a constant loss, while the copper loss, being proportional to the square of the current, is very nearly proportional to the square of the load. It is called the variable loss. At that load of any transformer at which the copper loss is equal to the iron loss the efficiency is a maximum.

These losses of energy manifest themselves

in the body of the transformer as heat, and a considerable skill is displayed in the design of a transformer to dispose of this heat without causing a rise in temperature of the transformer which will injure the insulating materials used. This is accomplished by allowing spaces in the iron core between the windings and the core and between various parts of the windings themselves. These are known as ducts, and through these ducts either oil or air is circulated to carry off the heat. The former method gives what are known as air-cooled, and the latter, oil-cooled transformers. The air-cooled type is usually supplied with a ventilating fan to force the air through the transformer, while the oil-cooled type is placed in a large tank of oil, and as the oil next to the heated parts of the body becomes heated, it rises to the top, is replaced by cooler oil, and the hot oil gives up its heat to the sides of the tank, which in turn transmit it to the surrounding outside air.

FIG. 2. CORE-TYPE TRANSFORMER.

Transformers are divided into two types in accordance with the arrangement of their magnetic and electric circuits. The core type (Figs. 1, 2) consists of one magnetic circuit with the two electric circuits wound on the two legs of a rectangular core, the windings being divided into many sections and interspersed to reduce the magnetic leakage. The shell type (Fig. 3) consists of two magnetic circuits with a common leg around which the various sections of the two windings are placed. The relative advantages of the two types are a

FIG. 3. SHELL-TYPE TRANSFORMER.

matter of detail of design and mechanical construction, but in 1916 the core type was growing in favor and the shell type was declining.

The first transformers were constructed by Michael Faraday in England in 1831 and nearly at the same time by Joseph Henry in the United States. Faraday discovered that when the current in a coil was varied a voltage was induced in a near-by coil, although both were stationary and did not touch. This is called mutual induction. For a long time the only application of this discovery was in the making of induction coils (q.v.), Ruhmkorff coils, and other similar small apparatus. With the introduction of alternating currents into electrical engineering, however, the transformer found a wide field of application. When a current flows through a conductor there is a loss of energy proportional to the resistance of the conductor multiplied by the square of the current. The energy transmitted, however, is proportional to the product of the current and the voltage. If we double the voltage we can use one-half the current for the same energy trans-

mitted, and one-half the current gives one-quarter the amount of energy lost as heat in the conductor. From this relation comes the law that the amount of copper required in a conductor to transmit a given amount of energy over a given distance with a certain loss is inversely proportional to the square of the voltage used. It is desirable to use a high voltage in the transmission system, but it is dangerous and inconvenient to use a high voltage in the generating machinery and particularly in the small devices in which the energy is utilized. It is thus economically advantageous to use step-up transformers between the generators and the transmission line and to use step-down transformers between the transmission line and the load.

The transformer is therefore the keystone of the present-day transmission systems, making it possible to operate the transmitting lines at from 60,000 to 150,000 volts and still use safe and convenient voltages in the machinery at each end of the system. By this means it is possible to transmit electrical energy economically over distances of from 100 to 200 miles. Transformers for 100,000 volts are quite common, those for 150,000 volts are found in commercial operation, while transformers for 750,000 and 1,000,000 volts are in use for testing purposes. In regard to size the largest units are of 15,000 kilo volt ampere capacity. Transformers for a given power are much smaller in bulk than any other class of electrical apparatus of the same capacity on account of their high efficiency, and on this account as well as because they have no moving parts they are much cheaper.

There are three general classes of transformers: (a) constant potential; (b) current or series; (c) constant current. The first class is intended to receive power from a circuit of approximately constant potential and deliver an approximately constant potential. The great majority of power transformers are of this class. The current or series transformer is intended to be connected in series with the load, is independent of the potential, and is designed to deliver from its secondary a current bearing

FIG. 4. THREE-PHASE TRANSFORMER.

a definite proportion to the primary current. It is used for supplying instruments and controlling devices. Its success depends upon the accuracy and constancy of the relation of the currents in the two windings. The constant-current transformer is intended to receive energy from a source of constant potential and to supply a constant current in the secondary irrespective of the amount of the load. It is used for supplying arc lamps operating upon a series circuit. The method of operating is

to vary the relative position of the two windings and thus the amount of flux from the primary which interlinks the secondary.

Power transformers may be single phase, containing one primary circuit and one secondary circuit, or polyphase, containing two or three primary circuits and a like number of secondary circuits, one primary and one secondary each wound on one of several legs of the magnetic circuit having a common connection (Fig. 4).

An autotransformer, sometimes called a compensator, but more properly named a single-circuit transformer, consists of a single electrical circuit wound on a magnetic core. When a voltage is impressed upon this circuit and a current flows, a flux is set up which generates the same counter electromotive force in each turn of the winding. If a connection is made to the middle point of this winding, the voltage between this point and either extremity is one-half of the total, and if the intermediate connection is made at any other point the main voltage is divided into parts directly proportional to the number of turns between the special connection and the main terminals. It is thus possible to get any fractional voltage desired by tapping at the proper turn of the single winding. This device is used when it is desired to obtain a transformation of voltages varying only slightly from unity, i.e., from 100 volts to 80 volts. The current will be inversely transformed. The advantage of the arrangement is that, when the ratio of transformation is not very great, much less copper and somewhat less iron are required for the same output. If the difference between the primary and secondary voltage is 10 per cent of that of the primary, the device need have only 10 per cent of the size of the usual two-circuit transformer.

A potential regulator is a special form of transformer in which the secondary coil is connected in series with the primary so that its voltage is either added to or subtracted from the primary, giving a convenient regulation of voltage. The magnitude of the secondary voltage is varied by changing the position of the magnetic circuit so that the amount and direction of the flux set up by the primary may be varied with respect to the secondary. It is used for regulating the voltage at the ends of alternating-current transmission circuits.

An induction regulator is a device constructed like a polyphase induction motor, but both members are normally stationary and each phase of the secondary is designed for a low voltage and connected in series with one primary phase. The flux set up by the primary rotates according to the law of the polyphase magnetic field and induces voltages in the secondaries proportional to the number of turns. By varying the position of the secondary with respect to the primary by hand, the secondary voltage may be added to or subtracted from the primary or may be connected in some intermediate phase so that it is possible to vary the voltage per phase by gradual increments from primary minus secondary voltage to primary plus secondary voltage. Its use is the same as the potential regulator, except that it is adapted to polyphase circuits.

TRANSFUSION OF BLOOD (Lat. *transfusio*, from *transfundere*, to pour from one to the other, from *trans*, across, through + *fundere*, to pour). The injection into one person of blood taken from another, either directly, from vein to vein, or after it has been defibrinated. The operation has been regarded as legitimate in obstetric surgery since the year 1824, when Dr. Blundell published his well-known work entitled *Physiological and Pathological Researches*. The operation had, however, been vaguely known to the medical profession for the last four centuries; and there are obscure allusions in the Roman poets, which would seem to indicate that it was practiced as early as the Augustan age. References to transfusion are also found in the papyri of the Egyptians and in the works of Pliny and Celsus. Pope Innocent VIII was transfused in 1492, three boys who acted as donors losing their lives, probably from air embolism, in this unsuccessful experiment. The older and rather formidable operation of transfusion gave way for a long time to the operation of infusion into the veins or subcutaneous tissues of a hot saline solution of a temperature of 100° F. to 120° F. This solution contains sodium chloride in the proportion in which it is found in solution in normal physiological tissues (about 0.6 per cent). But during the past few years the technique of blood transfusion has been much simplified, and the procedure is undertaken with success in simple hemorrhage, as in the case of bleeding from gastric or intestinal ulcer, after surgical operations entailing shock and loss of blood; and in altered blood conditions such as those occurring in pernicious anemia, acute gas poisoning, cancer, etc. Transfusion may be direct or indirect. In the latter method the desired amount of blood is withdrawn from the donor into a glass jar containing a small amount of sodium citrate solution to prevent clotting. The resulting mixture is injected into a vein of the recipient. The direct method is the most satisfactory, and its use was largely stimulated in America by the work of Crile in 1898 and Carrel in 1902. Their method involves dissecting out the veins. A still simpler procedure was invented by Linderman, which with modifications is now the favored method. Two small needles connected with cannulas are inserted—one into a vein of the donor, the other into a vein of the recipient. A series of Record syringes are now filled rapidly with blood from the donor and emptied into the vein of the recipient, warm saline so-

lution being injected in the intervals to keep the blood from clotting in the needles. The process may be further simplified by interposing a three-way stopcock, which renders the flow nearly continuous. Consult J. S. Horsley, *Surgery of the Blood Vessels* (St. Louis, 1915).

TRANSISTHMIAN CANAL. The projects for a transisthmian canal have included two principal routes, the Nicaragua and the Panama, though there also has been a discussion of a number of secondary routes, some of which have been investigated by engineers and received study for many years. The most thorough and comprehensive study of recent years was that made by the Isthmian Canal Commission in 1899-1901, and not only were the two main routes discussed, but also other possible projects. The political questions involved have largely been confined to the Nicaragua and Panama schemes, and as these propositions have attracted such widespread attention in the past and as each possesses certain unique features, both engineering and otherwise, they will be found fully treated under their respective heads. (See NICARAGUA CANAL; PANAMA CANAL.) It might be said, however, that the United States Senate, on Feb. 18, 1916, ratified a treaty with Nicaragua whereby, in exchange for a payment of \$3,000,000, the exclusive rights for an interoceanic canal across Nicaraguan territory were granted and a naval base in the Gulf of Fonseca ceded for 99 years.

The result of many examinations showed that there was no probability of the existence of any practicable canal location between Panama and the mouth of the Atrato River except by the adoption of a tunnel line, and there seemed to be no reason for further field work except in the interest of geography. Consult *Report of Isthmian Canal Commission, 1899-1901* (Washington, 1901), and the bibliography under NICARAGUA CANAL and PANAMA CANAL.

TRANSIT INSTRUMENT (Lat. *transitus*, passage over). An astronomical instrument consisting principally of a telescope fixed to a horizontal east-and-west axis and revolving in the plane of the meridian. It is employed, as its name denotes, in the observation of the meridian transits of the heavenly bodies, i.e., in noting the exact instants when they reach the meridian of the observatory. The axis, which is the most important part of the instrument and thus demands the utmost care in its construction, consists of a hollow sphere or cube, to opposite sides of which are tightly fastened the bases of two cones in whose apices the pivots are screwed; the sphere or cube is pierced for the admission of the telescope, which is firmly fastened at right angles to the axis. One of the pivots is hollowed so that a stream of light can be directed from a lantern halfway along the interior of the axis, and through an aperture in the side, into the telescope tube, where, being received by a small reflector, set at 45° to the axis and telescope tube, it is directed to the eyepiece, rendering visible a series of fine spider threads stretched across the field of view. The pivots must be carefully turned to a perfectly cylindrical form and fitted into the instrument so that they are accurately in line. One extremity of the axis carries one and sometimes two small graduated circles, each supplied with index, clamping screws, and vernier; these circles are capable of indicating angular measures to within 1' or 2'. There are

three adjustments necessary before a transit instrument can be used: the axis must be horizontal; the sight line of the telescope, as marked by the spider threads, must be at right angles to the axis of motion; and the latter must be placed so as to point accurately east and west. On the perfection of the first two of these adjustments depends whether the telescope sweeps over a great circle of the sphere, and the third is necessary to insure that this great circle shall be the meridian of the place of observation. These adjustments can never be made quite perfect, and the usual mode is to investigate the amount of error in each and allow for it by a calculated correction applied to the observed time of the star's crossing the meridian. To note accurately this observed time by the astronomical clock is, as we have said, the essential part of a transit observation. It is best done by means of a chronograph (q.v.), an instrument with which an automatic record of the observed time can be made by means of an electric signal sent out directly from the observer's hand. The transit used by engineers will be found described and illustrated under SURVEYING INSTRUMENTS.

TRANSIT OF VENUS. The passing of Venus across the sun's disk, seen when the planet is exactly in line with the sun and the earth at inferior conjunction. The two planets, Mercury and Venus, whose orbits lie between the sun and the earth's orbit, can at times pass between us and the sun. They can then be seen in the telescope, appearing as black dots projected on the luminous solar surface. These transits can occur only when the earth is near one of the nodes of the planet's orbit, i.e., in the case of Venus in June and December and in the case of Mercury in May and November, and at the same time the angular distance between the centres of the sun and the planet is less than the sun's angular semidiameter, or about 18'. On account of the inclination of the planet's orbit to the ecliptic, this means, in the case of Venus, that the planet must be less than about 1° 42' from the node, and the smallness of this limit alone shows that transits of Venus are of rare occurrence. At present the intervals in years between successive transits occur in the following order: 8; 121½; 8; 105½; 8; 121½. The last two transits occurred on Dec. 8, 1874, and Dec. 6, 1882; the next two will not take place until June 8, 2004, and June 6, 2012. Two transits of Mercury have already occurred during the present century, viz., on Nov. 12, 1907, and Nov. 6, 1914. The remaining dates for the century are given below; it will be noticed transits of Mercury are more frequent than those of Venus.

May 7, 1924	November 6, 1960
November 8, 1927	May 9, 1970
May 10, 1937	November 9, 1973
November 12, 1940	November 12, 1986
November 13, 1953	November 14, 1997

If the exact instant of time be observed when the planet first touches the solar disk and again when it finally leaves it, the observations can be used to calculate the solar parallax and the distance from the earth to the sun. Transits of Venus are especially well suited for this purpose, and they have been very elaborately observed in the past, especially in the years 1874 and 1882. Unfortunately experience has proved that it is impossible to observe the required instants of time with sufficient preci-

sion, and other methods of measuring the sun's distance are now preferred by astronomers.

Transits of Mercury are not well adapted for solar parallax observations and are indeed of quite minor importance astronomically. See **BLACK DROP**; **PARALLAX**.

TRANSKEI (tráns-ki') **TERRITORY**. A dependency of the Cape Province, South Africa, between the Great Kei River and Tembuland. Area, 2552 square miles. Pop., 1911, 188,895 (2189 whites), this being the most densely populated part of Cape Province. The territory is administered by a chief magistrate and is subject to the Native Territories Penal Code.

TRANSLATION, SENSE OF. See **STATIC SENSE**.

TRANSLEITHANIA. A name applied to the eastern division of the Austro-Hungarian monarchy on account of its position east of the Leitha River, which forms a part of the boundary line between the two divisions of the monarchy. See **CISLEITHANIA**.

TRANSMIGRATION. See **METEMPSYCHOSIS**.

TRANSMISSION GEAR, IN MOTOR VEHICLE. See **MOTOR VEHICLE**.

TRANSMISSION OF POWER BY ELECTRICITY. The electrical transmission of energy in considerable quantities from the point of generation to one or more distant points of delivery. This excludes telegraphy and telephony where energy is transmitted over a wire but in small quantities. Energy is transmitted in order to utilize a cheap, convenient, or otherwise advantageous source of energy supply, and the total cost of generation and transmission to the point of use must be less than would be the cost of generation at the point of use, otherwise such transmission would not be profitable. Therefore transmission plants are usually supplied by water power or by cheap coal, and the electricity is derived from generators. In general the term "transmission" would include any arrangement for the transmission of electrical energy from a generator to the utilizing devices, but by convention among engineers the term is confined to the transmission of energy at comparatively high voltages over considerable distances without any division or distribution of the energy, while the term "distribution" applies to the transmission of energy from a local centre to various utilizing devices over distances of 1 or 2 miles and at voltages from 100 to 2000. Each transmission line is therefore only a part of the whole system and is augmented by distribution lines in order to make the system complete. The weight of copper required to transmit any amount of energy for any distance with any specified loss in power is directly proportional to the square of the distance and inversely proportional to the square of the voltage, and is given in exact terms for direct-current work and to a close approximation for alternating-current work by the formula $W = 125 PD^2 \div KE^2$, where W is the weight of copper in pounds, P is the power delivered in watts, D is the distance one way in thousands of feet, K is the ratio of power lost in the line to the power delivered, and E is the voltage delivered.

The fundamental fact in the transmission of energy by electricity is that great distances can be economically overcome only by the use of high voltages. This explains why direct current is seldom considered as a means of

transmission. Direct-current generators cannot be built for more than 1500 volts on account of the trouble at the commutator. To connect a large number of such generators in series involves great difficulties in the use of the energy at the receiving end. The motors must also be connected in series and be insulated to stand the maximum voltage. This limits their use to places where skilled supervision can be exercised. There are a few instances of the use of direct-current transmission in Europe, but in the United States there is none.

Voltages. The alternating-current system lends itself admirably to high-voltage transmission because the alternating-current transformer (q.v.) permits the use of any convenient voltage in the generators, such as 2200, and this may be easily and economically transformed to a high voltage suitable for transmission, such as 30,000 to 150,000. At the load end of the line other transformers receive the high voltage and transform it to some low alternating voltage suitable to the consuming devices. Thus, the alternating-current transformer makes possible the economical operation of high-voltage transmission lines. The usual voltages employed in transmission lines vary from 30,000 to 150,000 volts, depending upon the amount of power and the distance over which energy is to be transmitted, and practice shows that the voltage chosen is about 1000 for each mile of transmission. With the higher voltages the expense for copper for a given power decreases very rapidly, but the expense of the insulators and poles increases, and the cost for insulation at voltages over 100,000 is very considerable. At this voltage the phenomenon of the loss of energy between the two wires suspended in air, known as corona and due to the breaking down and ionization of the air, becomes of importance, and to reduce this loss it is necessary to space the wires at a considerable distance from each other and to increase the size of the wire used.

The electrical energy may be transmitted in the form of single-phase, two-phase, or three-phase alternating currents as well as by direct current. Single-phase and direct-current systems require two wires, the three-phase requires three wires, while the two-phase system requires four wires. For a given voltage between wires the relative weights of copper required are: single-phase and two-phase, 100; three-phase, 75; direct-current, 50. For reasons mentioned above the direct-current system is not much used and the three-phase system, being next in economy of copper, is most generally used. The single-phase system is objectionable because single-phase motors are not easily made to be self-starting and have a poorer efficiency than the three-phase, while the three-phase induction motor is a very satisfactory device.

Frequencies. The frequency of the alternating current is either 25, 50, or 60 cycles per second. From the point of view of the transmission line alone 25 cycles is preferable on account of the lesser effect of the inductance and capacity of the line and the advantages of a low frequency for generators and motors of very large size. But for lighting purposes the higher frequency is necessary and the cost of transformers is less with the higher frequency. The inductance of a line depends upon the length of line and the distance between the wires and produces a reactive drop in voltage proportional to the frequency. This loss in voltage does

not represent a loss of energy, but interferes with the voltage regulation. The capacity of a line depends upon the length of the line and the proximity of the conductors to each other and is very great in underground cables. The capacity causes a charging current proportional to the voltage and frequency, which may be called an idle current, as it represents no energy but flows even at no load.

As a result of the inductance and capacity of a transmission line which represent energy stored either in electromagnetic or electrostatic form, the line is subject to dangerous potentials whenever anything causes a sudden variation in the distribution of this stored energy.

Line Construction. The construction of a transmission line may consist either of wooden poles and wooden cross arms carrying the wires on glass or porcelain insulators, or steel latticework poles, or sometimes towers carrying the wires suspended from the arms by suspension insulators. The wooden pole is satisfactory and cheaper for voltages up to about 60,000, while the steel type is better for the higher voltages. In the wooden-pole construction the insulators are fastened rigidly on upright pins on the cross arms, and the conductors, consisting usually of copper but sometimes of stranded aluminium, are laid on these insulators and fastened to them. The poles are usually from 40 to 50 feet in height, spaced 100 to 150 feet apart, and carry two cross arms with duplicate transmission lines on each side of the pole, giving increased capacity and reliability. The steel construction may consist either of lattice poles for moderate voltages or large towers for high voltages with duplicate lines. The latter are 40 to 60 feet high, spaced from 400 to 600 feet apart and arranged to place the wires from 5 to 10 feet apart, the wires being hung from arms on the tower by suspension insulators connected like links in a chain.

The wires used are generally between No. 2 and No. 0000 Brown and Sharp gauge, and solid if of copper, but of larger cross section and stranded around a steel core if of aluminium. A transmission line usually costs from \$2000 to \$4000 per mile, not including the cost of the right of way.

Cables. Another type of transmission developed as a result of conditions in the large cities is by means of underground cables, in which the three conductors, shaped roughly like sectors of a circle, are insulated from each other and from the outside by rubber or preferably paper and the whole incased in a lead sheathing and sometimes by a steel armor. This type of transmission is in general use at voltages of 13,000, and there are certain examples in operation with voltages as high as 30,000. It is much more expensive to install and used only where local conditions require it.

Regulation. The line regulation is the difference between the voltage delivered and the voltage impressed at the generator end of the line and in practice has values from 5 to 20 per cent, as the loss in voltage due to the self-inductance of the line may be quite great and varies considerably with the load. This variation in voltage is no longer objectionable, as regulating devices are available which will maintain the voltage delivered to the customer fairly constant irrespective of the voltage of the transmission line. The loss of energy and power in

the transmission line varies from 5 to 15 per cent and depends largely upon economic conditions. If the cost of energy at the source is low, it is advisable to be economical in the amount of copper installed in the line and thus save in the cost of the line. This relation is expressed in a very general form by what is known as Kelvin's law, which states: "The most economical transmission system is that in which the annual interest on the cost of the copper of the line is equal to the value of the energy lost in the line in one year." However, this does not take account of the cost of the poles, insulators, right of way, maintenance, etc., and must be qualified in practice.

Notable Installations. As interesting examples of the latest practice in electrical transmission of energy in 1916, the following installations may be mentioned: the Pacific Light & Power Co., at Los Angeles, Cal., transmits 60,000 kilowatts over 241 miles at a voltage of 150,000 and a frequency of 60 cycles; the line consists of aluminium conductors. The Ausable Electric Co., near Battle Creek, Mich., transmits 19,000 kilowatts, a distance of 245 miles by means of copper conductors operating at 140,000 volts and 60 cycles; this in 1916 was about the longest line in commercial operation. The Hydro Electric Power Commission of Ontario transmits 107,000 kilowatts from Niagara Falls to Toronto and other cities, a distance of 135 miles, using both copper and aluminium conductors and operating at 110,000 volts and 25 cycles. The Mississippi River Power Co. has a plant of 112,000 kilowatts' capacity, with provision for 225,000 kilowatts ultimately, at Keokuk, Iowa, using the power of the Mississippi River; this is transmitted over a distance of 144 miles by means of copper conductors at 110,000 volts and 25 cycles and is the largest capacity in a single plant.

Distribution Systems. The local distribution of electric energy may be by direct currents, by single-phase alternating currents, or by polyphase alternating currents. The choice between the alternating-current system and the direct-current system depends upon the character of the apparatus used for the load and upon the available current. Direct-current motors are usually preferable to alternating-current motors on account of their convenience and ease of control, but are limited in the voltage at which they may be operated. The alternating-current system allows a greater freedom in the choice of voltage on account of the simplicity and cheapness of transformers. The single-phase system is preferable for lighting alone on account of the simplicity of its connections, but if many motors are to be supplied either the two-phase or three-phase system should be used on account of the superior starting ability and efficiency of the motors. The three-phase system is generally used at present on account of the economy of copper in distribution. If the power is to be used for a combined load of lighting as well as motors, a frequency of 50 or 60 cycles is preferable, as the flickering of the lamps at 25 cycles is unpleasant, although such lamps are in use in some cities.

The most convenient voltage for local distribution is the 220-volt 3-wire system, in which 220-volt motors are operated between two of the wires and 110-volt lamps and small motors may be operated between the third wire and

either of the others. This is a very common arrangement both for direct-current and single-phase distribution. If many large motors are to be used, 500 to 600 volts is chosen on account of the lesser copper required, and this is the usual voltage in the distribution of energy for street and interurban railways. In the three-phase system a voltage of 220 between lines is the more common, although voltages of 110, 440, and 550 are in use. It is also quite customary to distribute at 2200 volts and use step-down transformers for a group of motors.

The use of the electric motor in factories and shops is becoming more general, and on account of the convenience and the economy of energy the electric motor is rapidly taking the place of shafting and belting for the transmission of energy, even for the short distances between the power station and the machinery of a factory. Large and medium size machines are driven by individual motors, and groups of small-size machines are driven by one motor and a short shafting. Recent types of electric motors are designed to have a range of speed of 1:3 or 1:4 by very gradual steps, resulting from a control of the field. This gives a very nice control of the machine. Another advantage of the use of electric motors is that, when one machine or group of machines is not in use, the motors driving them may be shut down and a waste of energy may be avoided.

Dwight, *Constant-Voltage Transmission* (ib., 1915); and for recent development, papers in the *Transactions of the American Institute of Electric Engineers* (New York, annually), *Proceedings of the National Electric Light Association* (ib., annually), and the *Electrical Engineering Press*.

TRANS-MISSISSIPPI EXPOSITION. An exposition held in Omaha, Neb., June-October, 1898. The site covered about 200 acres, a mile north of the city. The main buildings, with exhibits devoted to agriculture, fine arts, machinery and electricity, manufactures, mines and mining, and the United States government, were grouped around a grand court and surrounded the lagoon or canal which terminated at its west end in a lake 400 feet across, at the end of which was an electric fountain. The grounds were skillfully improved by gardening, until the prairie gained the name of Magic City. Of special interest among the features was the ethnological gathering of 500 Indians, representing 25 tribes. The total attendance was 2,613,508, and the total receipts \$1,924,077.

TRANSPADANE REPUBLIC. A republic formed by Napoleon in 1796 on the south side of the Po and in 1797 united with the Cispadane Republic, on the north side, to form the Cisalpine Republic (q.v.).

TRANSPIRATION (from Lat. *trans*, across, through + *spirare*, to breathe). The evaporation of water from the aerial surfaces of plants. The term is used instead of evaporation, first because the evaporation is modi-

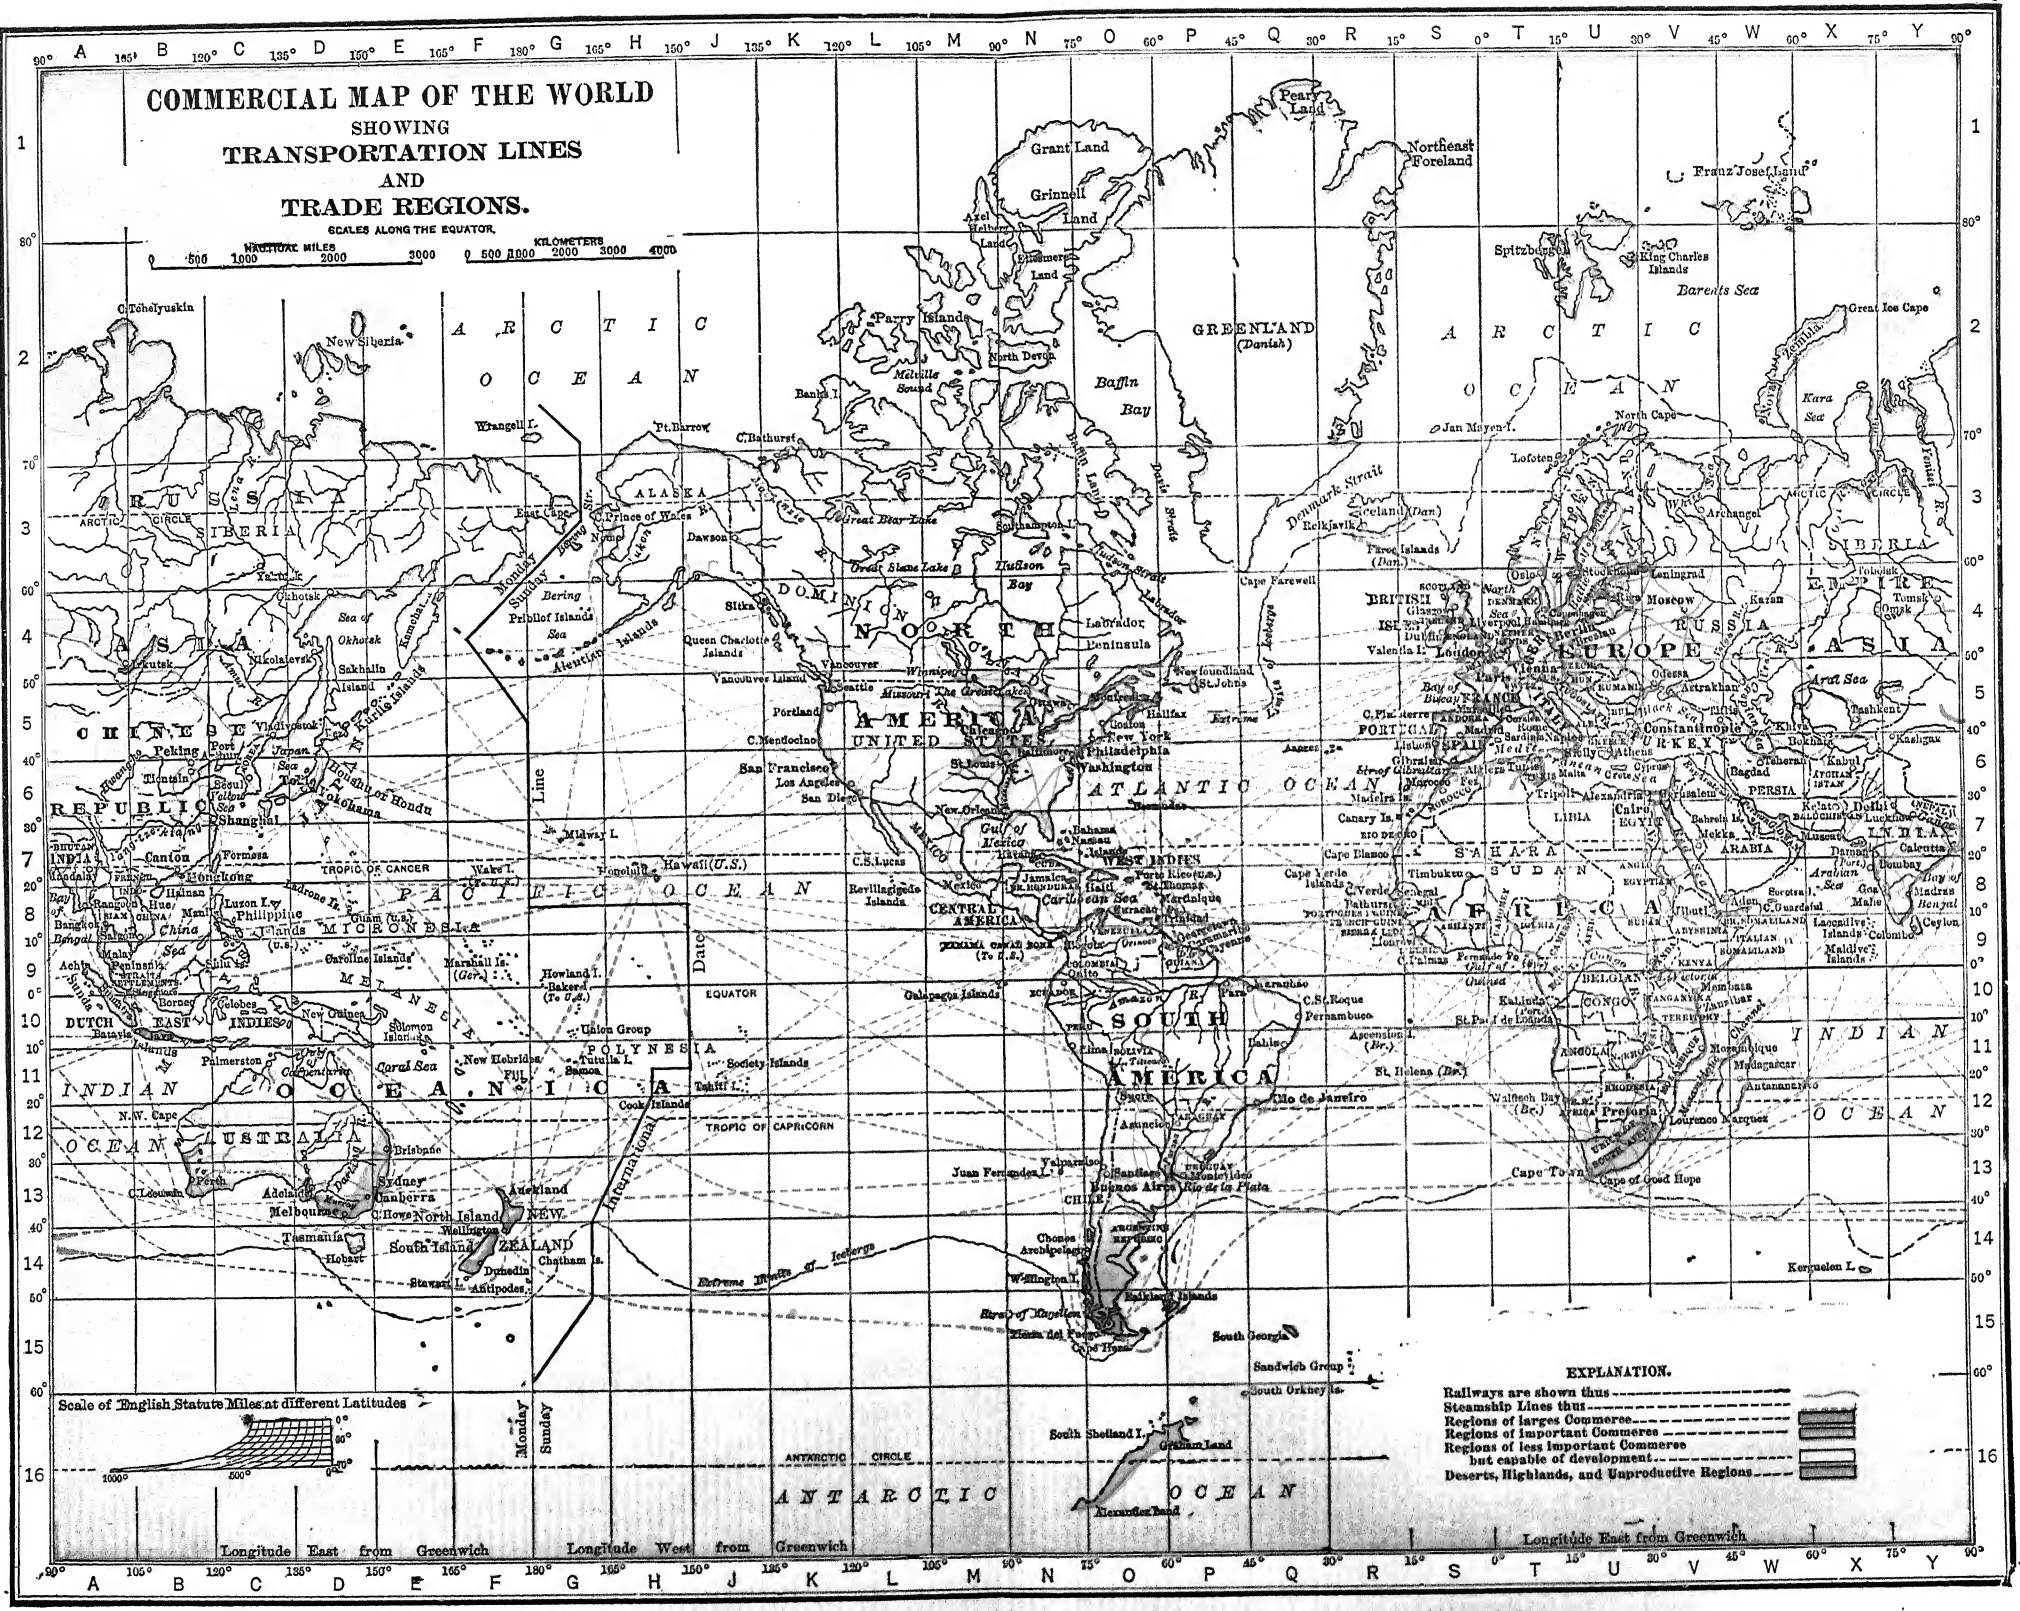

fied by the action of the living organisms, and, second, because the absorption of radiant energy by the organism prevents the complete stoppage of evaporation when the plant is surrounded with a saturated atmosphere. In most land plants transpiration from the epidermal cells is inconsiderable, because such become nearly waterproof by cutinization of the outer walls. The cells bordering the interior air chambers (see AERATION) are nearly or completely saturated with water, and from them it evaporates readily into the air occupying these spaces, whence it finds its way by diffusion through the stomata (q.v.). The rate of transpiration will be determined by the relative humidity of the outer air, temperature, wind, light, etc. Transpiration is unavoidable, because gases must be absorbed from the air (see ABSORPTION); it is necessary, at least to some plants, for cooling; and it is advantageous for the movement of dissolved salts. See CONDUCTION.

Since excessive loss of water is one of the greatest dangers to which plants are subject, plants growing in dry regions show a great variety of adaptations to reduce the rate of transpiration and to conserve the moisture which reaches them. (See XEROPHYTES.) The amount of water transpired varies greatly on account of variation in external conditions and internal structure. A few examples of transpiration under normal conditions will illustrate. In 12 hours on a hot, dry day a sunflower 3.5 feet high, having a leaf area of 5316 square inches, lost 30 ounces of water. The loss of water from 100 square centimeters of leaf surface in 24 hours for the pea was 2.51 grams, for the hop 4.3 grams, for the hemp 9.3 grams. Estimates as to the loss of water during the growing season by the plants of wheat grown on one hectare (about 2.5 acres) equal 1,179,920 liters, and by oats 2,277,760 liters. If all this water could be caught and condensed on the same area, it would reach in the first case a depth of 118 millimeters (4½ inches) and in the second 228 millimeters (9 inches). A beech tree having 200,000 leaves was estimated to lose between 300 and 400 liters (about 2 barrels) on a hot day. See ENERGY OF PLANTS.

TRANSPIRATION OF GASES. See DIFFUSION; EFFUSION.

TRANSPORTATION. The carrying of persons and goods from place to place. The part which transportation plays in the practical life of a community depends most directly upon the complexity of its economic system. Wherever the division of labor and the localization of industry have reached a high degree of development transportation necessarily attains a correspondingly high development. The rise of industry on a great scale and the creation of efficient means of transportation mutually condition each other.

More than 1000 years before our era Phœnician ships were trading in the Mediterranean, and later along the shores of the same sea the Greek cities built up their colonial and trade system. Rome was relatively late in developing maritime traffic, but by the time of the Empire an extensive commercial system had arisen, bringing to Rome the raw produce of Sicily and north Africa and extending westward even beyond Gibraltar. Ancient land transport was comparatively insignificant. The Greek roads were chiefly to sacred places, such as Delphi, and their economic importance was small. The Ro-

man roads were established for military rather than economic reasons, but they were vastly more extensive. Centring at Rome, they not only stretched through Italy, but (under the Empire) to Constantinople and Asia Minor, along parts of the north coast of Africa, westward to Spain, over the Alps to Gaul, and through Britain. Excellent as these roads often were, their method of construction was wastefully expensive from the modern standpoint.

The return to a more primitive economy in the early Middle Ages meant that for a time transportation should cease to play any important part in the economic life of Europe. The salient points in the story of its gradual revival are the stimulus given by the Crusades to trade with the East, the consequent growth of the Italian cities, and, in the twelfth century, the formation of the great trade league (Hansa) of the north European towns. Although the rise of towns and the establishment of fairs made a certain amount of land or river transport necessary, it was slow, insecure, and costly and, at least on the Continent, was subject to burdensome and arbitrary tolls. The destruction of the Eastern caravan routes through the Turkish and Mongol invasions gave especial importance to the discovery of an ocean route to the Indies made by Portuguese navigators at the end of the fifteenth century. The introduction of the compass made transoceanic voyages readily possible. The discovery of America made them profitable, and helped to shift the centre of trade from the Mediterranean to the Atlantic, from the Italian cities to the Portuguese, the Spanish, and the Dutch. The growth of colonial empires, based essentially on transportation, marks a most important era in the world's economic history.

many of the local tolls were put aside. In England little effective action was taken by the central government, and, despite many Turnpike Acts (granting rights to levy tolls in return for maintaining roads) the English highways remained poor throughout the eighteenth century, till the efficient road-making methods of McAdam (1756-1836) and Telford made possible the great improvements of the nineteenth. In the United States, as in England, private or local activity has been chiefly relied on for road making. Private turnpikes were constructed in Colonial times, and during the "internal improvement" era, after 1800, Federal roads were built. Roadbuilding has been recently carried on systematically in many parts of the United States.

The slowness and costliness of land transportation, even in the eighteenth century, made it impossible to convey ordinary goods any long distance. An era of canal building, which began in England soon after 1750, met in part the increasing need of the growing industrial centres for communication with one another and with the sea. The same movement appears in the United States in the first quarter of the next century. With the rise of the factory system following 1760, with the application of steam power to mining and manufactures, and the possibilities of machine production on a large scale, came an imperative need for more rapid and more adequate means of transport, which only the railroad and the steamship could supply. Through them, in the nineteenth century, international industry has been made possible.

The following table, from the *Report of the United States Commissioner of Navigation* (1915), shows the merchant marines of the world, according to *Lloyds Register* (1915-16). Only vessels of over 100 tons are included.

COUNTRY	SAIL		STEAM		TOTAL

Land transport lagged far behind that on the sea. With the growth of centralized nations a political motive arose for the improvement of roads and of internal trade. Under Louis XIV (1643-1715), during the ministry of Colbert, the French roads were greatly bettered, and

It appears from these figures that steamships comprise 68 per cent of the world's vessels (not reckoning China, Turkey, etc.) and nearly 89 per cent of their tonnage, although for some nations the percentages are much higher. The preponderance of British ships is most notable

in steamships. In 1801 there was in the United Kingdom a total net tonnage of 1,786,000: in 1850 the figure was 3,565,000; in 1880, 6,575,000; in 1915, 12,065,940. The percentage of net steam tonnage was 4.7 in 1850, 41.4 in 1880, and 97.4 in 1905. German shipping grew still more rapidly. The sailing tonnage decreased from 1,223,000 in 1885 to 286,860 in 1915, but the (net) steam tonnage rose from 520,186 in 1885 to 1,057,525 in 1895 and from 1,910,660 in 1905 to 2,661,945 in 1915.

Before the introduction of iron ships American builders were greatly favored by the cheapness of native timber, and for this and other reasons American shipping was dominant in the world's carrying trade. The tonnage engaged in foreign traffic was 667,000 in 1800, and, though somewhat set back by the War of 1812, it rose to 1,439,000 in 1850 and 2,497,000 in 1861. This was its maximum. The coasting trade continued to rise from 1,117,000 in 1840 to 2,645,000 in 1860 and from 4,236,000 in 1900 to 6,486,000 in 1915, including vessels of all sizes. But foreign shipping had fallen to 1,314,000 in 1880 and in 1910 was but 782,000. However, on account of the Great War, this increased to 1,863,000 in 1915. While in 1860 66.5 per cent of the imports and exports of the United States were carried in American vessels, in 1870 the percentage was only 35.6; in 1880, 17.4; in 1890, 12.9; and in 1900, 9.3. Yet in 1915 the percentage rose to 14.3.

The growth of railway mileage since 1830 is shown in the following table, compiled from the *Journal de la Société de Statistique de Paris*, 1909-10:

GROWTH OF RAILWAY MILEAGE SINCE 1830

YEAR	United States	Great Britain and Ireland	France	Germany	Russia	The World
1830	23	57	24	121
1840	2,818	838	303	360	17	4,792
1850	9,021	6,624	1,870	3,761	311	23,980
1860	30,626	10,437	5,865	7,285	989	67,055
1870	52,922	15,151	11,019	12,253	6,982	128,407
1880	93,262	17,929	16,109	21,057	14,617	230,515
1890	166,654	20,334	24,030	26,638	19,225	377,746
1900	194,334	21,932	26,611	31,933	29,892	491,236
1910	240,438	23,285	30,185	37,337	36,880	625,659

For further statistics and general discussion of this subject, see RAILWAYS; STEAM NAVIGATION.

TRANSPORTATION, CONDUCT OF. See RAILWAYS.

TRANSPORTATION, IN LAW. See ADMIRALTY LAW; CARRIER, COMMON; COMMERCE; HIGHWAY; MARITIME LAW; PUBLIC CALLING; ETC.

TRANSPORTATION, PENAL. Banishment from society in the form of exile, ostracism, or outlawry. The practice is well known among uncivilized peoples and existed among the ancient nations and in mediæval Europe. In England, under a Statute of Elizabeth (1597), "dangerous rogues" might be banished by justices in quarter sessions, but no system of transportation can be said to have arisen till the time of Charles II, when justices were empowered to send certain offenders to America instead of inflicting the death penalty. In 1717 transportation was authorized as a substitute for other punishments than hanging, and the contract system, by which individuals agreed to transport convicts in return for their labor during the period of sentence, was established. The business was profitable at first, but became less so, until a payment had to be made for each criminal transported. Protests from America were frequent but unavailing. After 1776 a twofold system was developed. To meet immediate needs, hulks stationed in the Thames (later at Portsmouth and other places) were arranged to receive convicts; and though this was begun merely as a temporary expedient, it endured as a legalized system for over three-quarters of a century. Involving overcrowding and bad sanitary and moral conditions, the hulk system was severely criticized by several parliamentary committees, but was abolished only gradually, as penitentiaries were constructed.

Within a decade after 1776 a settlement for criminals had been founded in Australia (q.v.). In 1787 the first lot of convicts left for New South Wales. In 1804 transportation to Tasmania began. The number sent was at first small. The annual average up to 1816 was less than 600, but it reached 2000 in 1820-30. The spirit and practice of the system were essentially penal, not reformatory, and conditions of life in a colony where most persons were convicts were almost inevitably bad. The report of the parliamentary committee of 1838 condemned the system at almost all points, and (1842) a "probation system" was planned by which prisoners were classified and might pass through various stages towards pardon or freedom. The difficulty of the scheme was to find work in the colonies for ticket-of-leave men or "probationers," while the matter was further complicated by an increasing objection of the colonists to the importation of convicts. Norfolk Island was for years a criminal depot, first of criminals from New South Wales, and, afterward for about 20 years, after 1826, from Van Diemen's Land. Transportation to New South Wales ceased after 1849 and to Tasmania after 1852. Thenceforth Western Australia was from 1850 the only outlet, and though the probation system worked there suc-

cessfully, the colony was unable to provide for all English convicts. With the development of the system of penal servitude (1853-63) transportation declined, and the last shipment to Western Australia was in 1868.

In France penal transportation was established by a Law of 1854. Guiana was at first utilized as a place to send criminals, but its climate proved quite unsuitable, and after 1864 most prisoners condemned to transportation were sent to New Caledonia. Here the penal settlement numbered over 1200 in 1894, when transportation to that colony was discontinued. According to the present law persons condemned to hard labor, if military offenders or recidivists, may be sent to Guiana. In a representative year the number of convicts sent to Guiana runs between 700 and 800. Russia is the only other modern nation which has practiced transportation on a large scale. Siberia (q.v.) was made a place of settlement in the seventeenth century, and after the discovery of the mines the system grew apace. Between 1807 and 1899 it was estimated that 865,000 persons had been transported to Siberia. Since 1869 the island of Sakhalin (q.v.) has been used largely as a penal colony. In 1896 it contained 15,000 convicts and exiles and less than 3000 free settlers. The horrors of Siberian exile have been mitigated in recent years. Convict labor does not prove of permanent economic advantage, and in Siberia, as elsewhere, it has been found impossible to colonize a country with convicts. In 1900, following the investigation of a commission of 1899, the Russian penal system was radically reformed. Imprisonment is to take the place of exile for all except political and religious offenders. No further attempt is to be made to settle convicts as colonists, but all those exiled will remain imprisoned during their sentences. Consult: Franz Holtzendorff, *Die Deportation als Strafmittel in alter und neuer Zeit* (Leipzig, 1859); Sir E. F. Du Cane, *Punishment and Prevention of Crime* (London, 1885); Kropotkin, *In Russian and French Prisons* (ib., 1887); George Kennan, *Siberia and the Exile System* (2 vols., New York, 1891); F. H. Wines, *Punishment and Reformation* (new ed., ib., 1910); H. De Windt, *The New Siberia: Visit to Penal Islands of Sakhalin* (London, 1896).

TRANSPORTATION AND WATER WORKS. See PUBLIC UTILITIES, REGULATION OF.

TRANSPOSING INSTRUMENTS (from *transpose*, OF., Fr. *transposer*, from Lat. *transponere*, to transpose, from *trans*, across, through + *ponere*, to place). Those musical instruments whose natural scale is always expressed in C major irrespective of the actual pitch. Some composers have begun to disregard the keys in which parts for such instruments were always written and to employ the key of the piece for all instruments. See MUSICAL INSTRUMENTS.

TRANSPOSITION (Lat. *transpositio*, from *transponere*, to transpose). In music, the performance of a composition in a key other than the one in which it was written by the composer. Vocal works are most frequently transposed, as when a tenor wishes to sing a work originally written for low voice. Transposition occurs also often in transcription. Singers have no difficulty in transposing a song into any key, but the transposition at sight upon any instrument, especially the organ or pianoforte, is difficult. See SCORE.

TRAN'SUBSTANT'IA'TION (ML. *transubstantiatio*, change of substance). A word used by Roman Catholic theologians to designate the change which they believe to take place in the eucharistic elements of bread and wine in virtue of the consecration. The term was first officially adopted by the Church at the Lateran Council of 1215, and the doctrine involved by it explicitly defined as an article of faith by the Council of Trent: "The whole substance of the bread is changed into the body of Christ, and the whole substance of the wine into his Blood, the species alone remaining."

The definition of the manner of Christ's presence is theological, and the terms thereof rest on Scholastic philosophy, which to-day is the system, taught in all Catholic seminaries. It is based upon the belief in the existence in everything of an essential distinctive principle not cognizable by the senses, called substance; the species or accidents of the thing are qualities which are perceived by the senses—color, taste, smell, solidity, etc. In transubstantiation, accordingly, the accidents remain unchanged, while the underlying substances of bread and wine cease to exist, their places being taken by the substance of the body and blood of Christ. The objections to the doctrine have been chiefly drawn from the philosophical difficulties which are involved in it; and the defenders of it have therefore added to the proofs which they profess to draw from the Scripture and tradition a general demonstration that the doctrine, although mysterious, does not involve any philosophical repugnance or impossibility. Leibnitz (q.v.), although a Protestant, has not only entered at great length and in several portions of his works into this philosophical discussion, but professes to prove, by strict philosophical principles—by the consideration of the properties of matter, of substance, of space, extension, and the like—that the essential principle of the body "may exist in many places at the same time, nay, under far-distant and distinct species." See LORD'S SUPPER, and bibliography there given; also SUBSTANCE.

TRANSVAAL, trāns-vāl', or PROVINCE OF THE TRANSVAAL; formerly SOUTH AFRICAN REPUBLIC. A British possession in South Africa (Map: Cape of Good Hope, H-K 5). There were transferred to Natal, in January, 1903, 7000 square miles of area, including the districts of Vrijheid, Utrecht, and a section of the Wakkerstroom District, with a total population of nearly 60,000, 8000 being whites. Its area is 110,426 square miles.

The interior of the Transvaal is a bush country (Bosch veld) lying 4000 feet above sea level, studded with small hills. In the east this plateau is terminated by the northern Drakensberg, culminating in the Mauchberg (8730 feet). On the eastern border are the Lebombo Mountains. Across the interior plateau stretches from east to west the far-famed Witwatersrand, with Johannesburg and the rich gold fields, which separates the Limpopo and the Vaal basins. Just north of the Witwatersrand and in general parallel with it extend the Magalies Mountains. Pretoria lies at the eastern outlet of the narrow valley thus formed. In the centre of the extensive Drakensberg system, which occupies the whole eastern third of the colony, is Barberton with its gold fields. The Transvaal is drained mainly by the Limpopo River, which

forms the boundary on the northwest and north, and the Vaal River, which forms most of the southern boundary. The Olifant River, the principal affluent of the Limpopo, has nearly its entire course within the Transvaal. The Barberton region is drained by the Komati, which flows into the Indian Ocean. None of the rivers of the Transvaal, however, are navigable.

The climate west of the Drakensberg and south of the Magalies Range is subtropical, with a European character. The mean annual temperature is 67° F. January is the warmest month, July the coldest. There are winter frosts. The northern and eastern sections of the Transvaal are more tropical, especially the valley of the Limpopo. Rain, on the whole very uncertain, is most prevalent from October to April, and it ranges from 40 inches in the east to 12 in the west. The climate of the interior uplands is noted for its healthfulness. Among the distinctive trees are the thorny acacias and the eucalyptus. The range of plants is very large, including the European grains and many of the valuable tropical species. The northeastern section is the least fruitful. The flocks and herds of the Boers were very large before the War of 1899-1902, and horses were also bred, though to a much less extent.

Granite and slate are in general the basic formations, upon which rests the so-called Cape Formation, above which are found quartzite and coal-bearing layers. The Transvaal is exceptionally rich in minerals, including copper, iron, coal (in different sections), lead, diamonds (in the Pretoria District and in the southwest corner in the direction of Kimberley), and notably gold. Gold was first discovered in 1867 and is now found abundantly in numerous districts. The rich gold fields of the Witwatersrand—the Rand, of which Johannesburg is the mining centre—and those of Barberton have made the Transvaal particularly famous. Around them developed the history of the colony. From 1905 to the end of 1914 the value of the gold produced was £312,546,987, chiefly in the Rand. The largest output was in 1912, 9,107,512 ounces, £38,686,250; in 1914, 8,394,322 ounces, £35,656,814. Other important mineral products in 1914 were: diamonds, 1,142,683 carats, £1,162,031; coal, 5,157,268 tons, £1,150,746; tin ores, 3386 tons, £307,282; copper, 14,957 tons of concentrates, £320,327; silver (contained in gold bullion and base metal ores), 890,782 ounces, £102,471. The total mineral production in 1905 was valued at £22,698,275; in 1913, £42,500,410. The number of persons working at the gold mines in January, 1915, was 21,966 whites and 178,229 colored. The diamond mines are situated chiefly in the Pretoria District; in January, 1915, 367 whites and 222 colored were engaged in diamond mining. The coal mines are in the Barberton, Middelburg, and Pietersburg districts; in January, 1915, 566 whites and 10,332 colored were engaged in coal mining. Copper mining has increased rapidly in recent years.

The country is well adapted to agriculture and stock raising, though its possibilities are as yet meagrely developed. The area under cultivation is increasing and amounts to upward of 2,000,000 acres, but much agricultural produce has to be imported. Maize and tobacco are regarded as the most important crops. At the end of 1913 sheep numbered 5,024,898; goats, 2,104,527. Horses in 1913 numbered about 89,-

000; mules, 25,000; asses, 106,000; cattle, 1,339,000; swine, 303,000; ostriches, 5400. Manufacturing is not greatly developed, but there are iron and brass factories, breweries, brick, tile, and pottery works, grain and saw mills, machine shops, and factories for tobacco, soap, ice, explosives, etc. Since the establishment of the Union of South Africa foreign-trade statistics are not published for the separate provinces.

The principal imports are ironwork and machinery, chemicals, wood, sugar, preserved meats, flour, articles of apparel, and live animals. The exports are principally mining products, wool, tobacco, horses, and mules. The largest amount comes through the Cape Province, though almost as much enters through Natal. The Transvaal has railway communication with the sister provinces and with Portuguese East Africa. At the end of 1913 there were 2638 miles of railway open to traffic, of which all but 6 miles was government line.

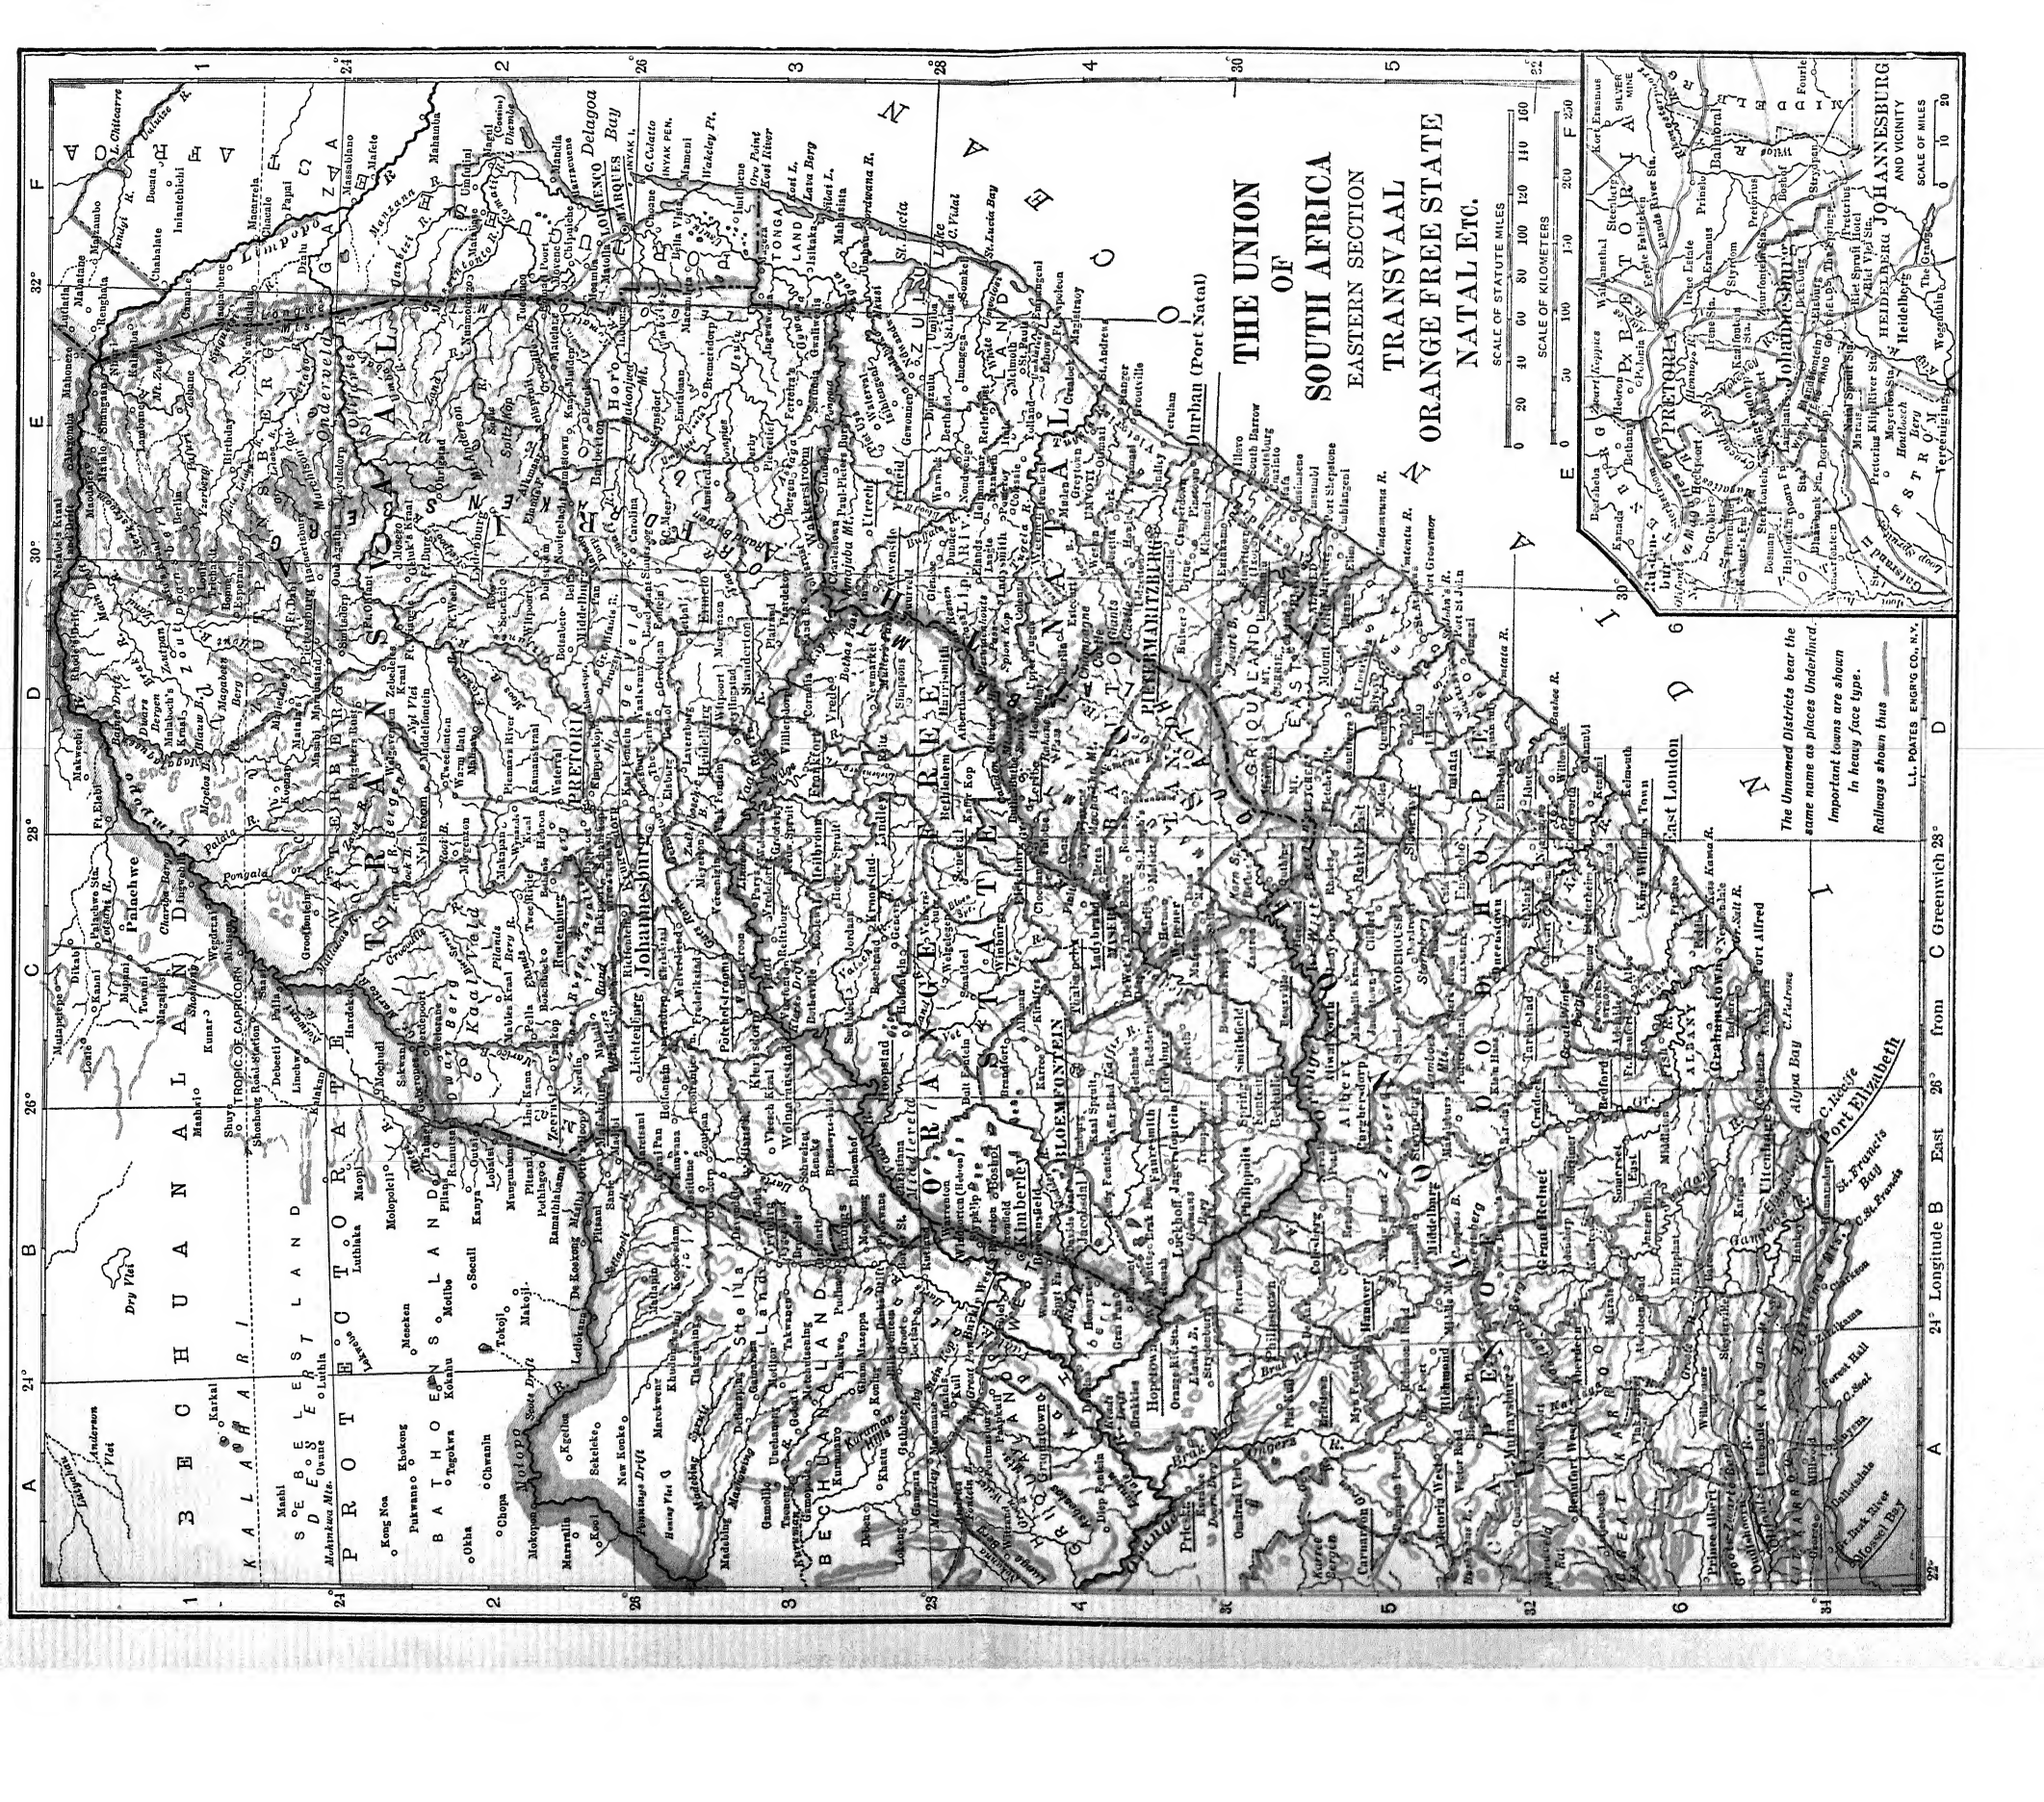

The Transvaal was annexed to Great Britain, Sept. 1, 1900. After an intermediate period of military rule and crown colony government it received in 1906 a constitution, which provided for a bicameral legislature consisting of an elective lower house of 69 members and a nominated upper house of 15 members. The Transvaal is one of the original provinces of the Union of South Africa, established May 31, 1910. It has an administrator appointed by the Governor-General for five years and a provincial council of 36 members elected for three years. The province elects eight members to the Upper House and 45 members to the Lower House of the Union Parliament. The suffrage is conferred on every white male British subject. The capital is Pretoria (q.v.), which is also the seat of the Union administration. For the fiscal year 1915 the estimated revenue was £1,308,000; expenditure chargeable against revenue, £1,349,580; capital expenditure, £435,801.

The population was returned by the censuses of 1904 and 1911 as follows:

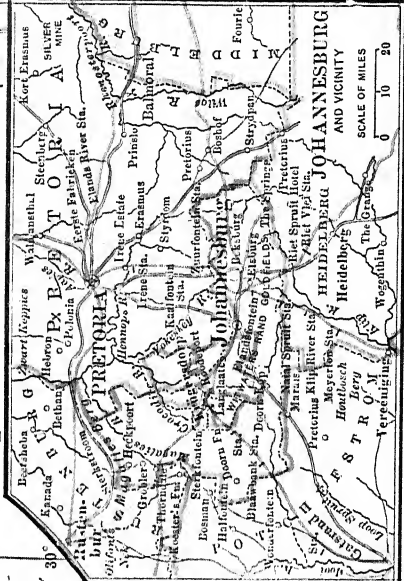

RACES	1904	1911		
		Males	Females	Total
Whites.....	297,277	236,913	183,649	420,562
Bantu.....	937,127	705,862	513,983	1,219,845
Mixed and other colored.....	35,547	28,780	17,025	45,805
Total.....	1,269,951	971,555	714,657	1,686,212

The most numerous Bantu race is the Basuto, with 455,801 in 1911; next are the Tonga, 171,848, and the Bechuana, 106,500. East Indians numbered 10,048, and persons returned as "mixed," 22,655. The white and other adherents of the leading churches were as follows in 1911: Dutch churches, 204,058 and 24,634; Anglican, 89,805 and 51,355; Methodist, 27,938 and 92,969; Presbyterian, 24,739 and 6670; Lutheran, 6618 and 101,271; Roman Catholic, 22,312 and 6439. Persons returned as of no religion numbered 943,616.

History. The Transvaal was one of the two states founded by the Boers after the "great trek," or emigration, from Cape Colony. These Boers were descendants of the colonists who had come into South Africa under the Dutch control. They were a hardy, vigorous, bigoted race, holding the natives in slavery and hence

not getting along well with their savage neighbors. The dislike of the English which naturally arose after the latter took possession of Cape Colony in 1806 culminated in 1833, when the Emancipation Law was passed. Some years later a considerable number of the Boers went north with their families, flocks, and household goods and at first founded a colony at Natal. This was broken up by the British government in 1843, and the Boers, going westward, founded the Orange Free State. In 1848 this also was taken under British control (remaining thus, however, only for a few years), and the more irreconcilable of the Boers "trekked" once more, across the Vaal, and founded the South African Republic, commonly known as the Transvaal. By the Sand River Convention, concluded in 1852, Great Britain recognized the independence of "the emigrant Boers living north of the Vaal River" and boundaries were duly established. The new state was for some years allowed to take its own course, and the only interference with its increasing prosperity came from the struggles with the natives, between whom and the Boers there was bitter enmity. In 1877 some discontented burghers suggested to the British government that the Transvaal should be taken under its protection. Mistaking the appeal of a faction for national sentiment, the British Commissioner, Sir Theophilus Shepstone, declared the Republic British crown territory, and annexation was persisted in by the British government in spite of repeated appeals. In 1880 the people revolted against the British régime. On December 13 a mass meeting was held at Heidelberg and the restoration of the independent Republic was declared. A brief campaign, in which the Boers developed remarkable fighting powers, according to methods especially adapted to the country, followed this act. The Boer victories of Laing's Nek and Ingogo were followed by the battle of Majuba Hill (Feb. 27, 1881), which resulted in the worst defeat sustained by British arms in many years. On Aug. 8, 1881, peace was concluded by the Convention of Pretoria, in which self-government was restored to the Transvaal burghers, subject to the suzerainty of the British crown. This latter reservation gave Great Britain the right to maintain a British Resident in the country and to march her armies across the territory in time of war and also the control of external relations. The Convention of London, signed Feb. 27, 1884, omitted the suzerainty clause, and the Boers claimed that thereby Great Britain gave up all control over their affairs. The British government, on the contrary, maintained that the Convention of London was supplementary to that of Pretoria, and that the latter was in force except where directly contravened by the former. In the years 1881-93 several events occurred which reacted upon the relations of Great Britain and the South African Republic. The first of these was the formation in Cape Colony of the Afrikaner Bond, with a platform calling for a union of European races in South Africa on a basis of South African nationality and independence. This movement increased the dislike of the British government to the development of any strong, independent power in the neighborhood of the British South African possessions. The advance of the English into Mashonaland and Matabeleland, which the Boers had coveted and which hemmed them in, was to

them an added irritation; and the climax was reached in the aggressive attitude of the British South Africa Company, which held rights of exploitation and administration in the new British territories.

The discovery of gold in the Transvaal in 1884 opened a new and troubled era. Hitherto the country had been agricultural and rural, with a homogeneous population. Now there was a sudden influx of mining men, promoters, and adventurers of all nations. In the Witwatersrand was founded the populous mining city of Johannesburg, inhabited very largely by these Uitlanders, or outlanders. The Boers felt that the primitive life they had wished to preserve was invaded, circumscribed, and likely to be overwhelmed. They therefore sought to restrict the privileges of citizenship in order to retain the political control in their own hands. This led to constant friction and to attempts to secure British intervention. In the autumn of 1895 a plan was arranged between the leaders of the British South Africa Company—Cecil Rhodes (q.v.), his colleague, Mr. Beit, and Dr. Jameson, administrator of Rhodesia—on the one hand, and several leaders of the Uitlanders—Lionel Phillips, Charles Leonard, and John Hays Hammond representing them—on the other, for an armed raid into the Transvaal from Rhodesia for the purpose of bringing about by a display of force the reforms desired. Dr. Jameson made it understood finally that he should act in behalf of the British supremacy. The Johannesburg committee did not apparently intend to overthrow the government, and when this was known sought to stay action while they issued a manifesto calling for the desired reforms. Jameson, disregarding their warning, entered the Transvaal December 29 with 600 men. He was defeated, surrounded, and obliged to surrender (Jan. 2, 1896). The Transvaal government turned the prisoners over to the British government for trial. They were convicted in England and received light sentences. Four of the Johannesburg leaders were condemned to death by the Transvaal courts, but this was commuted to a heavy fine. The raid caused a great excitement and assumed international importance. It brought the agitation and the bitter feeling between the two countries to an acute stage. The controversy, concealing under diplomatic phraseology much irritation on both sides, continued for some time longer. Mr. Chamberlain, the English Colonial Secretary, seemed determined to force the position of the Republic, and President Kruger was obstinate in his refusal to yield any important point. In the autumn of 1899, when war seemed imminent, the Orange Free State decided to make common cause with the South African Republic. On October 9 an ultimatum which made peace and continued negotiation impossible was presented to the British agent at Pretoria and Mr. Chamberlain summarily closed the correspondence. War broke out in November, 1899 (see SOUTH AFRICAN WAR), and ended in May, 1902. As a result the Boer republics were incorporated in the British Empire. The protracted struggle left the Transvaal burghers in a ruined condition, and the first necessity was to restore the rural population to their homes. For this purpose the British government, in the treaty of peace signed at Vereeniging, promised to provide the sum of £3,000,000, and the process of repatriation was immediately begun.

Many Boers, however, preferred exile to living under the British crown, and there was a considerable emigration in the following years to German Southwest Africa, Argentina, Mexico, and the United States. The most prominent question of the years immediately following the war was connected with the supposed difficulty of obtaining an adequate supply of native labor for the Rand mines. An ordinance providing for the importation of Chinese laborers was nevertheless issued by the Legislative Council in February, 1904, and the first consignment of coolies arrived in June. By the end of 1905 about 50,000 Chinese had been brought to the Rand. The hardships of the compound system to which the laborers were subjected resulted in constant, successful attempts at escape, and wandering bands of Chinese soon became a serious menace to life and property in the Rand section. The prospect of the grant of representative government led, in 1905, to the rise of political parties, including the Progressive Association which stood for the maintenance of complete British ascendancy, the Responsible Government Association, and Het Volk representing the Boer element. The tremendous victory gained in Great Britain by the Liberals in the general election of January, 1906, was due in very large degree to the general abhorrence for the system of Chinese "servitude" established in the Transvaal. On July 31, 1906, the Liberal government announced a new constitution for the colony (see above, section on *Government*). The first election took place in February, 1907. The conciliatory spirit in which the new government entered upon its duties was shown in a speech of General Botha, who became the first Premier, outlining his programme at a banquet given in its honor at Pretoria in March. He declared that the British government and people had, by the grant of a free constitution, trusted the people of the Transvaal in a manner unequaled in history and that it was impossible for the Boers ever to forget such generosity. His cabinet would do its best to create a united nation, in which one section would not regard the other with contempt or distrust. As soon as responsible government was established in the Orange River Colony, the cabinet would begin to work towards a union of all South Africa. He denied that the government was hostile to the mining interests, but declared its opposition to any combination of corporations aiming at monopolizing portions of the country. No extreme measures would be taken against the employment of Chinese labor, and the natives would also be treated fairly. As regards education, Dutch-speaking and English-speaking children would be taught, up to a certain point, each in his own language.

A great question which agitated the Transvaal was the immigration of Hindus, who came in large numbers to work in the mines. In order to maintain "white supremacy," severe immigration and domicile laws were enacted and many Hindus were compelled to leave the country. On May 31, 1910, the Transvaal was united with Cape of Good Hope, Natal, and the Orange Free State to form the new Union of South Africa, and Pretoria was made the capital and the seat of government of the new federal union. For the further history of the Transvaal, see UNION OF SOUTH AFRICA.

TRANSVERSAL (ML. *transversalis*, from Lat. *transversus*, *traversus*, *transverse*, p.p. of *transvertere*, to cross, transverse, from *trans*, across, through + *vertere*, to turn). In geometry, a term commonly applied to a line cutting a pencil of parallels. In modern plane geometry the term is extended to mean any straight line cutting the other lines of a figure. Thus, any

line intersecting the three lines forming a triangle ABC in P , Q , R , is a transversal of the triangle. The theory of transversals is one of the most important in modern geometry. It has its origin in a theorem attributed to Ptolemy (q.v.), but which is found in the *Spherics* of Menelaus (q.v.) and which has been thought to go back to Hipparchus (q.v.). This states that a straight line drawn arbitrarily in the plane of a triangle determines on the lines of its sides six segments such that the product of three not having a common extremity equals the product of the other three. More generally, of course, a transversal may be

a curve cutting other curves, and in particular a geodetic line cutting the sides of a spherical triangle. Pappus (q.v.) in his *Collections* approaches the theory from another standpoint and shows that if a pencil of four lines is cut by a transversal in the points *A, B, C, D*, the ratio $\frac{AC}{AD} = \frac{BC}{BD}$ is constant for any position of the transversal. Pappus also showed that if a transversal cuts the sides and diagonals of a complete quadrilateral, the six segments determined on this transversal are such that the

product of three not having a common extremity will equal the product of the other three; that each diagonal is cut harmonically by the other two; and that when a hexagon has three of its vertices collinear and the other three also collinear, the intersections of the opposite sides are collinear also—a special case of Pascal's theorem on a hexagon inscribed in a conic. Desargues (q.v.) in his *Essai pour les coniques* generalized the theorem of Pappus with respect to the quadrilateral. He showed that, if a transversal cuts a conic and a quadrilateral inscribed therein, the product of the segments between either point of the conic and two opposite sides of the quadrilateral will have to the product of the segments between this point and the other two opposite sides the same ratio as between the corresponding products when the other point of the conic is taken. The theory was extended by Pascal, who was a friend of Desargues, and later by Newton, Cotes, and Maclaurin. In more recent times Carnot and Poncelet have been among the foremost to elaborate the theory. To Carnot is due the introduction of negative lines in the theory of transversals, and the treatment of the subject as related to modern geometry. See CONCURRENCE AND COLLINEARITY, Ceva's and Menelaus' theorems being important examples of the theory of transversals.

TRAN'SYLVANIA (Hung. *erdély*, from *erdő*, forest, the name corresponding to Lat. *Transilvania*, beyond the forest; Ger. *Siebenbürgen*). A former grand duchy and crownland of Austria, since 1867 an integral part of the lands of the Hungarian crown. Area, 57,804 square kilometers. It occupies the southeastern corner of the Hungarian Kingdom, with an area of 21,518 square miles (Map: Hungary, J 3). It is separated from Rumania on the east and south by the great range of the Carpathian Mountains, which bends round at a right angle, the part extending east and west being known as the Transylvanian Alps. The interior is crossed by numerous spurs of the border chains and has an elevated surface cut by many mature valleys of great fertility. The chief river, the Maros, an affluent of the Theiss, crosses the country from northeast to

southwest. The southern part is traversed by the Aluta, an affluent of the Danube, which breaks through the Transylvanian Alps in the Red Tower Pass, while the northern part is drained by the Szamos, an affluent of the Theiss. Transylvania has a number of small mountain lakes and is rich in mineral springs. The region is famous for its scenery, and the mixture of nationalities, with the various costumes, adds greatly to its picturesqueness. The climate has a continental character of considerable range in temperature, and in the mountain regions the winters are long and severe. In spite of its mountainous surface Transylvania has a very productive soil. The chief crops are wheat, barley, rye, oats, flax, tobacco, and some industrial plants. Fruits and especially grapes are cultivated extensively. Stock breeding is favored by the abundance of meadow land and is carried on on a large scale. The local breed of horses is superior and many are exported. Wool is an important product. The mineral products include salt, gold, silver, and coal. Wild game still abounds in the mountains and large forests, including bears, wolves, foxes, and boars. Transylvania is well provided with transportation facilities. Pop., 1900, 2,456,998; 1910, 2,678,367. The vernacular of 55 per cent of the population in 1910 was Rumanian, 34.3 per cent Magyar, 8.7 per cent German. The Germans represent mainly descendants of colonists brought into the country from the region of the lower Rhine by King Gejza II of Hungary about the middle of the twelfth century. They dwell mainly in the southern part of the country, the district inhabited by them being known as Saxon Land. Their chief town is Hermannstadt (Nagy-zeben). The great bulk of the inhabitants of Transylvania belong to the peasant class. The nobility and gentry are Magyars. Of the population 29.6 per cent are Greek Orthodox, 28 per cent Greek Catholic, 26 per cent Protestant (including 2.5 per cent Unitarian), 14 per cent Roman Catholic, and 2.4 per cent Jewish.

History. Transylvania formed part of the Roman Province of Dacia. When the great migration of nations took place it was for a time occupied by the Germanic peoples. They were followed by the Avars, after whom came the Petchenegs. In the eleventh century the country was brought under the sway of the Magyars. The advent of German colonists in the twelfth century improved the condition of the country. It was probably not long after this that the immigration of Wallachs set in from the region now called Rumania. Under the Hungarian kings Transylvania was ruled by voivodes. In 1526, after the battle of Mohács, in which Louis II of Hungary was overwhelmed by Solyman the Magnificent, the national party among the Hungarians chose John Zápolya, Voivode of Transylvania, King. He had a rival in Ferdinand I of Hapsburg. Part of Hungary remained in possession of John Zápolya, who was upheld by the Turks. Transylvania was severed from the Kingdom of Hungary, the royal crown remaining in the possession of the Hapsburgs. From 1571 to 1576 the country had an able prince in Stephen Báthory, who in 1575 was elected King of Poland. Other princes of the Báthory (q.v.) family followed. At the beginning of the seventeenth century Transylvania was for a short time in the power of Austria, but in 1604 a great rising of the Protestants

in the country and in Hungary took place under the head of Stephen Bocskay (q.v.), who was elected Prince of Transylvania in 1605 and in 1606 forced the Hapsburgs to recognize the liberties of the Hungarian Protestants. In the Thirty Years' War two princes of Transylvania, Bethlen Gábor (q.v.) and George Rákóczy (q.v.), figured among the champions of the Protestant cause. When Leopold I of Austria, after the overthrow of the Turks at Vienna (1683), had made himself master of the heart of Hungary, he proceeded to secure possession of Transylvania. Prince Michael I Apafi (q.v.) had to acknowledge the Austrian ruler as overlord of Transylvania, which was united with Hungary, and his son, Michael II, was forced to renounce his title for a money consideration. In the Peace of Karlovitz, in 1699, the Turkish Sultan recognized the sovereignty of Austria over the country. The Diploma of Leopold I in 1691 had guaranteed to Transylvania its ancient privileges and customs. It was erected into a grand principality in 1765. In the Hungarian revolution of 1848-49 Transylvania was the scene of terrible massacres of the Magyars by the Wallachs and of the victories and final defeat of General Bem (q.v.). In 1849 Transylvania was separated from Hungary and made an Austrian crownland. In 1867 it was again united with Hungary. Transylvania was invaded by the Russians in the Great War. See WAR IN EUROPE. TRANSYLVANIA, PRINCE OF. See BETHLEN GÁBOR.

TRANSYLVANIA COLLEGE. An institution for higher education founded in Lexington, Ky., in 1798. It succeeded Transylvania Seminary, which was chartered in 1783. The seminary was located near Danville, Ky., but was removed to Lexington in 1789. It was consolidated with Kentucky Academy and the name changed to Transylvania University in 1798. Gifts to its endowment fund were given by George Washington, John Adams, Aaron Burr, John Jacob Astor, and General Lafayette. In 1865 Transylvania was consolidated with Kentucky University, the successor of Bacon College, and the institution took the name of Kentucky University. In 1908, however, the name Transylvania was resumed, and in 1915 the title was changed from that of Transylvania University to Transylvania College. The alumni of the college number more than 4000. In the autumn of 1915 there were 270 students, of whom 142 were preparing for religious vocations. The faculty numbered 24. The endowment at the end of the collegiate year was \$499,249. The library contains 21,000 volumes. The buildings, grounds, and equipment were valued at \$525,000, and the annual income amounted to \$70,648. The president in 1916 was Richard F. Crossfield, LL. D.

TRANSYLVANIA, UNIVERSITY. See TRANSYLVANIA COLLEGE.

TRAP (Ger. *Trapp*, from Swed. *trapp*, trap rock, from *trappa*, Ger. *Treppe*, stair; so called because often developed in steplike masses).

A very general term, little employed in scientific language, but commonly used to designate dense and generally fine-grained igneous rocks of black or dark-green color. The term is almost synonymous with basalt (q.v.) or diabase (q.v.), but might include as well gabbro, norite, peridotite, pyroxenite, etc. When altered such rocks assume a green color from the hornblende, chlorite, epidote, or other secondary minerals developed in them, and they are then known as greenstone. Both greenstone and trap include a wide range of rock families, which by reason of their fine texture and often altered condition are difficult to determine without careful and generally microscopic study.

TRAP. See PLUMBING.

TRA'PA (Neo-Lat., abbrev. of ML. *calci-trapa*, caltrop, from Lat. *calx*, heel + ML. *trappa*, snare, from OHG. *trappa*, *trapa*, AS. *træppe*, *treppe*, Eng. *trap*; so called from the

CHINESE BUFFALO NUT (*Trapa bicornis*).

four spines of some species, which thus resemble caltrops). A small genus of aquatic plants, the only representative of the family Hydrocharitaceae, now generally placed in the family Haloragidaceae. *Trapa natans*, the water caltrops, is found in ditches and ponds in southern Europe, is grown in ponds in Holland, and is found in a few places in Massachusetts and New York. The floating leaves are rhomboidal, toothed, and smooth; those under water are cut into capillary segments. The fruit has four spines; the large, almond-like kernels are edible, either raw or roasted or in soups, and taste somewhat like chestnuts; hence the French name *marron d'eau* (water chestnut). Nuts of *Trapa bispinosa*, the Singhara nut, being starchy, are widely used as food in Cashmere, where they are made into cakes, etc. *Trapa bicornis*, by some botanists considered to be a form of *Trapa natans*, is much cultivated in China for its edible fruit. Some botanists reduce all the species to one, with possibly several varieties.

TRAPANI, trā'pà-nè. The capital of the province of Trapani, Sicily, situated on a peninsula of the northwest coast, 45 miles west by south of Palermo (Map: Italy, D 5). There are several fine churches with noteworthy sculptures and paintings, and palaces architecturally interesting. The lyceum has a picture gallery and a natural-history collection. The spe-

cial industries are connected with the working of coral, shell cameos, marble, and alabaster. There are also shipbuilding yards, saltworks, fisheries, and an export trade in wine, fruits, olive oil, etc. The fine harbor, which is defended by a fort, is the scene of much commercial activity. Near the city is the ancient Anunziata pilgrimage church, with the famous statue of the Madonna of Trapani. Trapani, the ancient Drepanum and seaport of Eryx (q.v.), was fortified by the Carthaginians in the third century B.C. Here in 249 B.C. they defeated the Romans in a great naval battle. Eight years later, however, Trapani became a Roman colony. It was a royal residence in the Middle Ages. Pop., 1901, 59,452; 1911, 62,572.

TRAPDOOR SPIDER. Any one of the large hairy tropical spiders of the family Theraphosidae, which make long tubes in the earth, lining them with silk and fashioning at the entrance a bevel-edged, hinged, accurately fitting trapdoor made of alternate layers of earth and silk. The upper surface is covered with earth or gravel so as to disguise the entrance. The spider hides in the nest when not seeking prey, and with some species a branch to the tunnel is built with a separate door.

The digging of the burrow (always on high sloping ground) is a laborious task. The earth is loosened with the mandibles and is carried away piece by piece supported by the mandibles and maxillae. One observed took an hour to dig a hollow as large as half a walnut. A species common in the southwestern United States (*Ctenitza californica*) digs holes nearly an inch in diameter and sometimes a foot in length. When the spider is on guard, holding the door down from inside by means of its mandibles and feet, it is impossible to raise the trapdoor without tearing it. Experimenters at San Diego, Cal., removed the trapdoors of 60 nests, unhinging them at night. Without exception the spider had by morning completed a new door. Continued removal resulted in a falling off in the quality of the doors, owing to the failure of the spider's supply of silk. The fifth door made, by a single spider, was almost entirely of mud with hardly enough web to coat and hinge it. When the trapdoors were fastened down, a side branch with a new door was always made overnight with an opening near the original mouth.

The nests are generally in pairs, but it is not known whether they are occupied by different sexes. The young hatch in the mother's burrow and live there for a few weeks; then they leave the nest and begin small tubes of their own. The food of these spiders consists largely of ants and other crawling wingless insects. They have been known to eat earthworms and large caterpillars. The trapdoor spiders of southern Europe make thin covers which rest loosely on the top of the hole, but they are covered with leaves or something of the sort in order to disguise them.

McCook, *American Spiders and their Spinning Work*, vol. iii (Philadelphia, 1893); J. H. Emerton, *Common Spiders of the United States* (Boston, 1902); J. H. Fabre, *The Life of the Spider* (Eng. trans. by Alexander Teixeira de Mattos, New York, 1913); J. H. Comstock, *Spider Book* (new ed., ib., 1914).

TRAPEZIUM. As commonly defined in the United States, a quadrilateral of which no two sides are parallel. The distinction between trapezium and trapezoid was not always clearly made by Greek writers, but in general the word "trapezium" meant a quadrilateral having two parallel sides, and "trapezoid" meant a quadrilateral in general, ordinarily having no parallel sides. In England this is the present usage, a trapezium having two parallel sides and a trapezoid having no parallel sides. See QUADRILATERAL.

TRAPEZOID (Gk. *τραπεζοειδής*, *trapezoeidēs*, shaped like a trapezium, from *τράπεζα*, *trapeza*, table, from *τέτρα*- *tetra*, four + *πούς*, *pous*, foot + *εἶδος*, *eidos*, form). As commonly defined in the United States, a quadrilateral two of whose sides are parallel; but see the discussion under **TRAPEZIUM**. The parallel sides are called the bases. The area of a trapezoid is given by the formula $A = \frac{1}{2}(b + b')a$, where b and b' are the bases and a the altitude. See QUADRILATERAL.

TRAPP, JOHN (1601-69). A Puritan clergyman. He was born at Croome d'Abitot; graduated B.A. at Oxford (1622); was usher (1622-24), then headmaster of the free school at Stratford-on-Avon (1624-26); vicar of Weston-on-Avon, 2 miles from Stratford (1636-46); rector of Welford (1646-60); then went back to Weston, where he died. His fame rests upon his biblical commentaries, which furnish a specimen of Puritan Bible study at its best and are often both witty and wise. They were issued in a collected edition in 1662 et seq. and reissued, with a *Memoir* by A. B. Grosart, as *Commentary on the Old and New Testaments* (1865-68). Consult Spurgeon, *Commenting and Commentaries* (London, 1876).

TRAPPING (from *trap*, AS. *træppe*, *træppe*, OHG. *trappa*, *trapa*, trap, snare; connected with Ger. *Trappe*, flight of stairs, ladder). The taking of animals and birds by means other than the arrow, spear, or gun. The methods used may be divided into four classes: (1) the pit, the inclosure, and the heavy deadfall, for the largest animals, such as the bear and the lion, and the lighter deadfall and snap trap for smaller beasts, as wolves, foxes, and beavers; (2) the box trap; the switch-up, and various snap traps and snares for the lesser kinds of quadrupeds; (3) nets of various kinds with or without decoys and birdlime for birds; (4) nets and baskets for fish.

The pit is a hole in the earth, lightly covered and carefully concealed. It is placed where the game is likely to go voluntarily or where it may be drawn, either by judicious beating or by an enticing bait. The covering breaks and the quarry is caught in the pit. The kind of animal so caught varies with the country; e.g., the Arabs trap lions in pits. The inclosure is a space round which in Africa the heavy creeping vines from tree to tree have been woven together into rough hurdles, and in Asia the bamboo is similarly employed.

The heavy deadfall inclosure is a pen about 3 feet wide, 4 feet deep, and 5 feet high, made of logs driven into the soil. Four heavy corner posts hold transverse logs and the fall log. The principle of the trap is that when the bait is disturbed, say by a bear, a heavy log will fall upon the animal's back and crush its body against the lower log fixed across the front of the pen. To reach the bait the bear must

enter the trap at least halfway. A slight forward pull releases the lower end of the bait stick and causes the fall log to drop. Sometimes the fall log is a heavy slab set up on bait sticks. The box trap is practically the deadfall, but, instead of the log falling on the captive, the box lid falls down on the box's sides and end and incloses the catch unhurt. This can be placed anywhere, even in a tree. For the switch-up a runway of the animal sought is selected, and on either side, a notched stick is driven projecting about 8 inches aboveground, with a crosspiece resting on the notches. A spring sapling about 5 feet long is then driven into the ground near by and its springy head bent over the crosspiece and fastened to it, after which a noose of brass wire is hung on it (or an overhanging branch of a tree may be used in the same way). The rabbit or other small animal hopping along the runway runs his head in the sliding noose; this grips his neck, and in his struggles he releases the crosspiece, which lets the sapling spring up to vertical, and the captive is lifted off its feet and strangled. The steel-spring trap is used for every kind of quadruped, from the bear to the rat. It is made of two jaws of steel, which when open lie flat on the ground harmless, but when the pan between them is depressed the spring forces the jaws together, generally catching the animal's leg.

Fish are trapped in many ways: by gill nets spread from stake to stake across the swims of the fish when they come from the sea, like shad, into the estuaries in the spring to spawn; or by other nets, set to catch fish migrating from the fresh waters to the sea, like salmon and trout. Similar ones are sometimes set under ice, near holes cut through it, towards which the fish will invariably come to the light. There is the cast net, a circular net with lead weights around its bottom edge, which when thrown and spread, by a twirl of the arm, into shallow water where a shoal of fish are, sinks rapidly at the full extent of the circle, and when drawn in by the caster pulls up all the fish within its area. Baskets are set for eels, into which they can crawl, but out of which they cannot return. Snares—or snigs, as they are sometimes called—will capture fish in shallow water, notably pike. They are wire nooses at the end of a rod which the snarer deftly slips over the head of the fish and tightens with a snatch. Snaring game fish is generally prohibited in the United States, and in most of the States seines or nets of any kind may be lawfully used only under rigid restrictions. Consult: Harding, *Wolf and Coyote Trapping* (Columbus, Ohio, 1909); E. Kreps, *Science of Trapping* (ib., 1909); F. H. Buzzacott, *Encyclopedia of the Hunter's and Trapper's Art* (2d ed., Chicago, 1913).

TRAPPISTS. A branch of the Cistercian Order, following the reforms introduced in 1664 by Jean le Bouthillier de Rancé (q.v.). They take their name from the monastery of La Trappe in Normandy, of which Rancé was abbot when he began his reforms. They are among the most austere of Roman Catholic orders. The day in a Trappist monastery begins with matins in the church at 2 A.M., followed by a half-hour's meditation, and mass or study occupies the time until ten minutes to six. Then follows prime, and from 7.30 to 9 manual labor

or instruction. At 9.45 terce, high mass, sext, and examination of conscience. Dinner is at 11, except on fast days, when it is an hour later. The hour after it is occupied by study in winter, but a siesta is conceded in summer. Work or teaching comes again from 2 to 4; vespers and meditation at 5, at 6 compline, at 7 supper, and bed at 8. The dinner consists of a small quantity of soup and vegetables with a pound of bread, a little fruit, and one glass of beer. The supper is of a similar nature, and those who need it are allowed a little milk, coffee, or broth on rising. The fasting season lasts from Holy Cross Day (September 14) until Easter. The Trappist sleeps in his habit, removing only his shoes. Only the superiors have separate rooms; each of the others has simply a curtained alcove in a dormitory. Perpetual silence is the most characteristic restriction imposed. It is absolute, unless he has the care of guests or needs to speak to his superiors; other communications are by signs. When sick, he is nursed in the infirmary; dying, he is carried into the church to receive the last rites in the presence of his brethren. The dead are buried in their habits, without coffins. Novices are received after two years' probation, and three years later may be professed. Besides the choir brothers, who are or mean to be priests, and the lay brothers, oblates are also received—persons who for some reason do not wish to take the vows, but conform to the rule during their residence.

The earlier houses of the order were nearly all in France; their expulsion from that country at the time of the Revolution and under the Third Republic has caused them to plant numerous monasteries in other countries. According to official statistics, in 1908 they had 4000 members in 71 monasteries. They have three houses in England, two in Ireland, nine in Belgium, five in Italy, five in Holland, three in Germany, four in Asia, two in Africa, and 10 in America, including four in the United States, five in Canada, and one in Brazil. The monasteries in the United States are located at Gethsemane, Ky.; New Malleray (near Dubuque), Iowa; Lonsdale, R. I.; Jordan, Oreg. They do not as a rule undertake the cure of souls, but conduct a few mission stations in South Africa, the Congo State, Japan, China, etc. Consult: C. Gaillardin, *Les Trappistes ou l'ordre de Cîteaux au XIX^e siècle* (2 vols., Paris, 1844); *La Trappe*, par un Trappiste de Sept-Fons (ib., 1870); F. Pfannenschmidt, *Geschichte der Trappisten* (Paderborn, 1874); Suchier, *Der Orden der Trappisten und die vegetarische Lebensweise* (2d ed., Munich, 1906). For the ordinary reader, the most vivid and accurate account of life in a Trappist monastery is in J. K. Huysmans, *En Route* (Eng. trans. by C. Kegan Paul, London, 1896).

TRAQUAIR, trāk'wâr, RAMSEY HEATLEY (1840–1912). A British naturalist, born at Rhynd, Perthshire. He graduated at Edinburgh University and from 1873 to 1906 was keeper of natural history collections at the Royal Scottish Museum, Edinburgh. From 1883 till 1887 and again from 1896 till 1900 he was Swiney lecturer on geology in the British Museum. Traquair became a leading authority on fossil ichthyology. His publications include: *Structure and Affinities of the Palæoniscidæ* (1879); *Structure and Affinities of the Platysomidæ* (1879); *Report on Fossil Fishes Collected by the*

Geological Survey of Scotland in the Silurian Rocks of the South of Scotland (1900); *Les poissons Wealdiens de Bernissart* (1911).

TRARIEUX, GABRIEL (1870-). A French dramatist and poet, born at Bordeaux and educated at the Lycée Condorcet. He was codirector of the review *L'Art et la Vie* (1896-98) and of the *Revue d'Art Dramatique* (1898-1901) and in 1903 was appointed dramatic critic of *La Revue*. Trarieux became a member of the central committee of the League for the Defense of the Rights of Man. He wrote: verse, *La chanson du prodigue* (1892) and *La coupe de Thulé* (1896); dramatic criticism, *La lanterne de Diogène* (1902); essays, *Les petites provinciales* (1904); and the following dramas: *Joseph d'Arimathe* (1898); *Sur la foi des traités* (1900); *Les vaincus*; *Hypatie*; *Savonarole* (1900); *La guerre au village* (1903); *L'Otage* (1907); *L'Alibi* (1908); *La dette* (1909); *Un soir* and *La brebis perdue* (both 1911); *L'Escapade* (1912).

TRARIEUX, JACQUES LUDOVIC (1840-1904). A French advocate and Senator, father of Gabriel Trarieux (q.v.). He was born at Aubeter, Charente, and became an advocate at Bordeaux, where he was elected a deputy in 1879. In the Chamber of Deputies he joined the Republican Left. He failed in the elections of 1881 and 1884, but was returned to the Chamber for Charente in 1885. In 1888 he was elected for Gironde to the Senate, where he sat with the Left Centre, and in 1897 was reelected. Trarieux served in the Ribot cabinet in 1895. He was one of the four Senators who were charged with the prosecution of General Boulanger (see BOULANGER, GEORGES ERNEST) before the High Court, and he was also active in the revision of the Dreyfus case (see DREYFUS, ALFRED), being the founder and first president of the League for the Defense of the Rights of Man (Ligue pour la Défense de l'Homme et du Citoyen).

TRASIMENO, trā'sē-mā'nō, LAGO (Lat. *Trasimenus Lacus*), or LAGO DI PERUGIA. A lake in Italy, lying between Cortona and Perugia (Map: Italy, D 3). It is about 10 miles in length by 8 in breadth; the greatest depth is not above 30 feet. The lake has no apparent outlet, and the margins are flat and overgrown with reeds. It is surrounded on all sides by hills, those on the north side, extending from Cortona to the lake, being known as Gualandro Hills—the *montes Cortonenses* of Livy. They are covered at the present day with oaks, vineyards, and olive plantations. The lake is memorable chiefly for the great victory obtained by Hannibal in 217 B.C., during the Second Punic War, over the Romans under Flaminius. Consult Livy, xxii, 3-6.

TRASK, SPENCER (1844-1909). An American banker and philanthropist, born in Brooklyn. He graduated from Princeton in 1866 and entered the Wall Street banking house of H. G. Marquand. In 1881 he established the firm of Spencer Trask & Co., which became well known in finance, having branch houses in Philadelphia, Albany, and Providence. He early saw the value of Edison's experiments and became one of the inventor's supporters, as president of the Edison Electric Light Company and director in numerous companies manufacturing the Edison products. He was also identified with many other corporations and with railroads, reorganized the *New York Times*, was a patron of art,

and built St. Christina's Home for children at Saratoga. He was deeply interested in municipal reform and in local Democratic politics. He was killed in a railroad collision. Spencer Trask did much to restore to popularity the mineral waters at Saratoga, and in 1915 an elaborate memorial was erected there in recognition of this service. His wife, Kate Nichols ("Katrina") Trask, became well known as an author.

TRASTAMARE, HENRY II OF. See HENRY II OF TRASTAMARE.

TRASTEVERE, trās-tā've-re. A district of Rome about the Janiculum, which was annexed to the city by Augustus as the *Regio Transtiberina*. In Imperial times it was the abode of street peddlers and during the Middle Ages was frequented by foreigners. It is now almost entirely inhabited by the working classes. Many valuable antiquities have been recovered in the district, among them the Apoxyomenos (q.v.) of Lysippus. Consult K. Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909).

TRAU, trou. A town of Dalmatia, Austria, on the Adriatic, 12 miles west of Spalato (Map: Austria, E 5). It is interesting for its remains of Venetian domination, including a thirteenth-century cathedral. Pop. 1910, 3507.

TRAUBE, trou'be, LUDWIG (1818-76). A German clinician, born at Ratibor, Silesia. He studied at the universities of Breslau, Berlin (M.D., 1840), and Vienna. He became lecturer at the University of Berlin in 1849 and for many years was connected with the Charité Hospital. In 1862 he was made professor at the Friedrich-Wilhelm Institute and in 1872 professor at the university. Traube was especially noted for his experiments on animals for the purpose of demonstrating pathological conditions. The practice of auscultation and percussion was greatly promoted by him, and he also made important studies regarding diseases of the heart, kidneys, and lungs. He published, among other works, *Gesammelte Beiträge zur Pathologie und Physiologie* (1871).

TRAUMATROPISM (from Gk. τραῦμα, *trauma*, wound + τροπή, *tropē*, a turning, from τρέπειν, *trepein*, to turn). The sensitiveness of plant parts to wounding, by reason of which they change their growth so as to curve away from the side wounded. This sensitiveness is especially manifested by roots; in which, however, severe wounding may produce a purely mechanical effect, overpowering the true irritable reaction, which is only manifest in response to slighter wounds. See GROWTH.

TRAUN, trou'n. A river of Austria. It rises on the Gross-Hochkasten in northwest Styria and, entering Upper Austria, traverses the Hallstättersee and the Traunsee (q.v.) and flows into the Danube a few miles below Linz. It is celebrated for its trout. Near the village of Roitham it forms a notable waterfall. Length, about 110 miles.

TRAUNSEE, trou'nzā, or **GMUNDENER-SEE**, gmyn'den-ēr-zā. The largest lake of Austria after the Attersee (Map: Austria-Hungary, C 3). It lies in Upper Austria, at an altitude of 1376 feet, between Ebensee and Gmunden in the Traun valley, and is 8 miles long and 626 feet deep. Like the Attersee, it is situated amid impressive surroundings and is noted for its picturesqueness.

TRAUTENAU, trou'te-nou. A frontier town of Bohemia, situated 74 miles northeast of Prague, on the right bank of the Aupa, a tribu-

tary of the Elbe. It is the centre of the linen industry of the Riesengebirge and has in addition paper mills. Here occurred two engagements between the Prussians and Austrians, June 27 and 28, 1866. Pop., 1900, 14,791; 1910, 16,143.

TRAUTWINE, trout'win, JOHN CRESSON (1810-83). An American civil engineer, born in Philadelphia, Pa. In 1828 he began study in the office of William Strickland, whom he assisted in building the United States Mint at Philadelphia. Between 1831 and 1836 he was an engineer on several railways and in 1836-42 was chief engineer of the Hiawassee Railway, connecting Georgia and Tennessee. Trautwine helped to build the Canal del Dique, between the Bay of Cartagena and the Magdalena River, and he executed (1850) surveys for the Panama Railway, for the Lackawanna and Lanesborough Railway (1856), and for a railway route across Honduras (1857). He also planned a system of docks for Montreal. He wrote: *Method of Calculating the Cubic Contents of Excavations and Embankments* (1851); *Field Practice of Laying out Circular Curves for Railroads* (1851); *Civil Engineer's Pocketbook* (1872). The *Pocketbook* was long known as the "engineer's bible" and under the editorship of John C. Trautwine 2d and 3d passed through many editions and is still current.

TRAVAILLEURS DE LA MER, trá'vã'yër' de lá mâr' (Fr., Toilers of the Sea). A novel by Victor Hugo (1866), containing wonderful descriptions of the sea.

TRAV'ANCORE'. A native state of British India, lying territorially within the Province of Madras (Map: India, C 8). It occupies the western part of the extreme south end of the Indian peninsula and stretches from Cape Comorin northward along the coast to Cochin. Area, 7129 square miles. The coast, which is low and sandy, is lined with lagoons receiving numerous small streams. The land rises gradually to the crest of the Anamalai Mountains, which extend along the eastern boundary with an average altitude of 4000 to 5000 feet, rising in their highest peaks to over 8500 feet. The climate is hot on the coast; the rainfall is heavy, and the mountain slopes are covered with forests of valuable woods, such as teak and ivory.

Rice, the sago palm, and vegetables are among the principal products. Pepper, coffee, tea, coconut products, and timber are the chief articles exported. Travancore is one of the most progressive of the native states of India. Its chiefs for a long period have been highly qualified by character and education for their positions, government has been well administered, and a higher degree of prosperity has prevailed than has been common in India. The chieftaincy descends in the female line. The ruling family belongs to the Hindu race. A tribute of \$400,000 is paid annually to the British in consideration of the protection which they afford. Pop., 1901, 951,038; 1911, 3,428,975, the great majority being Hindus. About one-fifth of the population are Syrian Christians. Trivandrum (q.v.) is the capital.

TRAV'ELER, THE. A poem by Oliver Goldsmith (1764).

TRAVELERS, LAW AS TO. See CARRIER, COMMON; HIGHWAY; RULES OF THE ROAD; TICKET.

TRAVELER'S JOY. See CLEMATIS.

TRAVELER'S TREE, or RAVENALA (*Ravenala madagascariensis*). A remarkable plant of the family Musacæ, a native of Madagascar. The stem resembles that of the plantain or banana, but sends out leaves only on two opposite sides. The lower leaves drop as the stem grows, and in old trees they are sometimes 30 feet in air. A tree often has 24 leaves, each leafstalk 6 or 8 feet long, and the blade 4 or 6 feet more. The blade of the leaf is oblong, bright green, and shining. The fruit is not succulent, but is filled with a brilliant blue or purple fine silky fibre, among which are 30 to 40 seeds. Forty or 50 fruits grow in a bunch, and three or four bunches may be seen at once on the tree. The leaves are used for thatch and for other purposes, and the leafstalks for partitions and often for walls of houses. The bases of the leafstalks usually hold water, even in the driest weather, more than a quart being readily obtained by piercing the thick part of the base. This water, used for drinking in case of need, has suggested the name. A second species, *Ravenala guyanensis*, occurs in South America.

TRAVELING GRATES. See SHAKING GRATES; STOKER, AUTOMATIC.

TRAVELING SIDEWALK. An arrangement for the transportation of passengers, consisting essentially of a series of parallel, closely abutting platforms traveling on wheels or rollers at different speeds. A sidewalk of this character was installed at the Columbian Exposition at Chicago in 1893 to convey passengers from one part of the grounds to another, and similar structures have been employed at other exhibitions and elsewhere. The principle of operation of the traveling sidewalk may be readily

SECTION OF TRAVELING SIDEWALK.

understood by an explanation of the accompanying diagram. In this diagram *a*, *b*, *c*, *d*, *e*, and *f* are the parallel platforms. The platform *a* is stationary, but the others all travel by means of flexible rails riding on the rims of the wheels *g*, *h*, *i*, *j*, and *k*. These wheels rotate on a common shaft at the same number of rotations per minute, but, being of different diameters, they carry the superimposed platforms at different speeds; thus, platform *b* has, say, a speed of 3 miles per hour, *c* a speed of 6 miles, *d* a speed of 9 miles, *e* a speed of 12 miles, and *f* a speed of 15 miles. The platforms travel continuously, and a foot passenger desiring to use them steps from the stationary platform *a* onto the moving platform *b* and then onto *c*, *d*, *e*, and *f* in succession; the return to the stationary platform is made in a similar manner, but, of course, in the reverse direction. By having the difference between the speeds of any two adjacent platforms no greater than the speed of a brisk walk the transition from one speed of travel to the next higher or lower is accomplished without difficulty, and the pedestrian can board and leave the moving platforms at any point he may choose. It has been proposed, where the distances to be traveled are considerable, to have seats on the highest-speed section.

TREE FERN AND TRAVELER'S TREE

TREE FERN

TRAVELER'S TREE

A traveling stairway is a similar arrangement placed on an incline, but supplied with but one moving platform. It is used for ascending to elevated-railway platforms and in large shops, and is called an escalator (q.v.). See ELEVATOR, *Escalator*.

TRAVELING STAIRWAY. See ELEVATOR, *Escalator*.

TRAVEMÜNDE, trā've-mūn'de. A town of Germany, the outport of Lübeck, lying 9 miles northeast of that city, at the mouth of the Trave (Map: Germany, D 2). It is a well-known watering place. The old walls of the town were torn down in 1882. Pop., 1900, 1849; 1910, 2174.

TRAVERS, JEROME D (UNSTAN) (1887-). An American golf champion. He was metropolitan champion of New York for five years, and for three years held the New Jersey honors. The national amateur title, which he first won in 1907, he held in 1907, 1908, 1912, and 1913, losing to Francis Ouimet in 1914. In 1915 he won the national open title, playing 72 holes in 297 strokes. He published *Travers' Golf Book* (1913), and *The Winning Shot* (1915), with Grantland Rice.

TRAVERS, MORRIS WILLIAM (1872-). An English chemist. He was born in London and studied there at University College and in France at Nancy. At the former institution he taught until 1903, was next professor of chemistry at University College, Bristol, and in 1906-14 was director of the Indian Institute of Science at Bangalore. His researches on gases at low temperatures are well known and include *Argon and its Companions*, with Sir William Ramsay; *The Liquefaction of Hydrogen* (1900); *The Experimental Study of Gases* (1901; Ger. trans., 1905); *Researches on the Attainment of very Low Temperatures* (1904); *Further Notes on the Self-Intensive Process for Liquefying Gases* (1906).

TRAVESARI, trā'vēr-sā'rē, AMBROGIO. See AMBROGIO IL CAMALDOLESE.

TRAVERSE. In common-law pleading, a denial of facts alleged in a pleading. A traverse includes all pleadings by way of denial, whether made by the defendant or the plaintiff. See PLEADING.

TRAVERSE (OF., Fr. *travers*, from Lat. *transversus*, *transversus*, lying across, transverse, p.p. of *transvertere*, to turn across, from *trans*, across, through + *vertere*, to turn). In fortification, a mass of earth projecting inward from, or flanking, the parapet, and designed to afford protection against oblique or enfilade fire or both. Traverses must not rise above the crest of the work, otherwise they would reveal the gun positions. In modern fortification they are employed only to a limited extent. In gunnery (q.v.) traverse describes the moving or pointing of a gun on its pivot, when taking aim, the gear by which the operation is accomplished being known as traversing gear. The platforms by which heavy naval or fortress guns and carriages are moved into position, or by which their direction is changed, are called traversing platforms. See FORTIFICATION.

TRAVERSE CITY. A city and the county seat of Grand Traverse Co., Mich., 60 miles northeast of Manistee, at the mouth of the Boardman River, on Grand Traverse Bay, an inlet of Lake Michigan, and on the Pere Marquette, the Grand Rapids and Indiana, the Traverse City, Leelanau, and Manistique, and

the Manistee and Northeastern railroads (Map: Michigan, D 4). It possesses an attractive situation and good fishing facilities and enjoys considerable reputation as a summer resort. The Northern Michigan Insane Asylum is here, and there are two public libraries. Traverse City is situated in a noted cherry-growing region and is also extensively engaged in manufacturing. It is known for its production of oval wood dishes. Some of the other important manufactures are baskets, lumber, interior finishings, farm implements, shoes, cider, candy, flour, leather, fur coats and robes, furniture, foundry and machine-shop products, etc. The city has adopted the commission form of government. Traverse City was settled about 1850 and was chartered as a city in 1895. Pop., 1900, 9407; 1910, 12,145; 1915 (U. S. est.), 13,542; 1920, 10,925.

TRAVERTINE (from It. *travertino*, *tiburtino*, from Lat. *tiburinus*, travertine, relating to Tibur, from *Tibur*, an ancient town of Latium, now called Tivoli). A massive or cryptocrystalline variety of limestone that is deposited from springs or rivers and usually has an irregularly banded structure owing to its mode of formation. A variety known as *calc tufa* consists of cellular depositions from the waters of small springs and often contains fossil leaves, twigs, etc. See CALCAREOUS TUFFA.

TRAVESTY (OF. *travesti*, p.p. of *travester*, to disguise, from Lat. *trans*, across, through + *vestire*, to clothe, from *vestis*, garment). A term applied in literature to denote a burlesque representation of something previously executed in a serious and lofty manner. It differs from parody (q.v.) in this respect: that while the latter changes the subject matter and the *dramatis personæ*, but mockingly imitates the style of the original, the former leaves the subject matter partially, and the *dramatis personæ* wholly, unaltered; producing a purely comic effect by the substitution of the mean, the frivolous, and the grotesque in action or speech, for the serious, the noble, or the heroic. See PARODY.

TRAVIATA, trā'vī-ā'tā, LA. An opera by Verdi (q.v.), first produced in Venice, March 6, 1853; in the United States, Dec. 3, 1856 (New York).

TRAVIS, WILLIAM BARRETT (1811-36). An American soldier, born in Edgefield Co., S. C. After studying law he began practice at Claborn, Ala., about 1830. He removed to Texas, then beginning the struggle for independence, in 1832 and at once took part in the insurrection. He was made a colonel in the revolutionary army and was captured by the Mexican forces, but was finally released. With about 150 men he defended the Alamo (q.v.) from Feb. 23 to March 6, 1836, against Gen. Santa Anna (q.v.) and about 5000 Mexicans. Desperate fighting continued until only Travis and five others were left. They surrendered on being assured that their lives would be spared, but by Santa Anna's orders they were all killed.

TRAWLING (from *trawl*, from OF. *trawler*, *troller*, *troler*, Fr. *trôler*, to ramble, stroll, drag about). One of two modes of deep-sea fishing or of exploration of the depths. In Europe a trawl or beam trawl is a triangular purse-shaped net, about 70 feet long, usually having a breadth of about 40 feet at the mouth. The upper part of the mouth is secured to a wooden beam which keeps the net open; this beam is

supported on two upright iron frames, known as trawl heads or irons. The underside of the net is made with a deeply curved margin attached to the ground rope, the whole length of it in contact with the ground. A trawl has also generally two pockets, one on each side, made by lacing together the upper and under parts, so that fish turning back from the cod may be caught in them. The meshes vary in size from 4 inches square at the mouth to 1¼ inches square in the cod, or narrow hinder end of the net. Two stout ropes about 15 fathoms long are fastened to the trawl heads and form a bridle, to which is shackled a towing line 150 fathoms long. Trawling is generally in the direction of the tide and can be followed with advantage only on a sandy or other smooth bottom. The vessels employed on the Dogger bank and near the English coast vary in size from 35 to 60 tons. Many of these trawlers stay at sea for six weeks at a time in all seasons of the year, their fish being packed in ice, collected by fast-sailing cutters, and conveyed to market. Cod, haddock, etc., are caught in great numbers by trawling; some kinds of flat fish, as soles, are scarcely to be obtained by other means. Smaller trawl nets are used in bays and estuaries.

In the United States a trawl is a long line anchored on the fishing ground, from which depends a row of short lines carrying baited hooks. The device is principally used on the fishing banks. See DEEP-SEA EXPLORATION; FISHERIES.

TREACLE (tré'k'l) **BIBLE.** See **BIBLE**, CURIOUS EDITIONS OF.

TREACLE MUSTARD. See **ERYSIMUM**.

TREADMILL. A machine where the weight of men or animals acting on a series of treads or steps arranged on a cylinder or endless band is employed to furnish power. The most general application of this machine has been to farming machinery, where horses and dogs are used to supply the motive power. The endless band formed by the treads is inclined and is connected with a flywheel, to which the machinery to be operated is connected by belting. The term "treadmill" is most generally applied, however, to a device formerly in general use in prisons in Great Britain for convicts sentenced to hard labor. It consisted of a wheel in the form of a long hollow cylinder, with steps around its circumference and a hand rail above the wheel, so that a prisoner might support himself while treading the steps and thus working the wheel. The desired resistance could be created by means of weights, or the motive power thus created utilized to grind grain, etc. The physical exercise was severe, and the use of the treadmill in British prisons, which had been gradually abandoned, was entirely abolished early in the twentieth century. The crank, a small wheel with paddles, which revolves in a box partially filled with sand or gravel, was substituted in some prisons where unproductive hard labor was necessary, but this also was abolished in a more enlightened penology. As the amount of work could be measured with accuracy, the treadmill was occasionally employed in physiological investigations.

TREADWELL, AARON LOUIS (1866-). An American zoölogist, born at Redding, Conn., and educated at Wesleyan University (B.S., 1888; M.S., 1890) and at the University of Chicago (Ph.D., 1898). He was professor of

zoölogy and geology at Miami University (1891-1900) and at Vassar College was professor of biology (1900-14) and thereafter professor of zoölogy. In addition, he was an instructor at the Marine Biological Laboratory at Woods Hole (1898-1906, 1913) and honorary curator of annulates at the American Museum of Natural History from 1909. His writings include a number of papers dealing chiefly with annelid systematics and embryology, the most important of the latter being *The Cytogeny of Podarke obscura* (1901). He contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

TREADWELL, DANIEL (1791-1872). An American inventor, born at Ipswich, Mass. Among his more important inventions are a power printing press; a system of turnouts for single-track railroads (1826); the gypsy, a hemp-spinning machine for the manufacture of cordage (1829); and a method of constructing cannon from wrought iron and steel according to a process said to resemble that invented later by Sir William Armstrong. (See **ARMSTRONG**, **WILLIAM GEORGE, BARON**.) Of these, the spinning machine was probably the most successful. In 1822, in conjunction with Dr. John Ware, he founded the *Boston Journal of Philosophy and the Arts*, and from 1834 to 1845 he occupied the chair of Rumford professor at Harvard. Treadwell had a taste for theology and was one of Longfellow's circle of friends, and is the theologian of the *Tales of a Wayside Inn*. He published: *The Relations of Science to the Useful Arts* (1855); *On the Practicability of Constructing a Cannon of Great Calibre* (1856); *On the Construction of Hasped Cannon* (1864). Consult biographical sketch by M. Wyman in *Memoirs of the American Academy of Arts and Sciences*, vol. xi (Cambridge, 1888); also Samuel Longfellow, *Life of Henry Wadsworth Longfellow* (Boston, 1886).

TREADWELL, FREDERICK PEARSON (1857-1918). A chemist, long resident in Switzerland. He was born in New Hampshire, but early went abroad and studied chemistry at Heidelberg, where he received the degree of Ph.D. in 1878 and served as assistant to the great Bunsen (q.v.). In 1883 he went to Switzerland and became assistant to Victor Meyer (q.v.) at the Technical School in Zurich. There he had become professor by 1894. With Meyer he published *Tabellen zur qualitativen Analyse*, but he is best known for his *Lehrbuch der analytischen Chemie* (2 vols.) which passed through many editions and was translated into several languages, the English version being widely used as a textbook in American universities.

TREASON (OF. *traison, traisson*, Fr. *trahison*, treason; from Lat. *traditio*, surrender, delivery, from *tradere*, to deliver over, betray). At common law there were two distinct classes of crime known as treason, termed respectively high treason and petit treason. The first was disloyalty to the sovereign or a violation of allegiance due him. The second was a violation of the allegiance due from an inferior to a superior, by taking the life of the superior, as of a wife to her husband, a servant to his master, or an ecclesiastic to his superior. Petit treason is now everywhere punished only as a homicide. High treason, being in effect treachery against the sovereign, was the highest crime a subject could commit. By the ancient common law, however, the crime was not clearly defined;

hence there was great latitude as to what was held by the judges to be treason. Thus, the accroaching, or attempting to exercise, royal power (a very uncertain charge) has been treated as treason; and killing the King's father or brother, or even his messenger, has also been so treated. The inconvenience of these constructive treasons led to the passing of the Statute of 25 Edw. III, c. 2, which attempted to define treason; and it was defined in five forms: (1) When a man compasses or imagines the death of the King, Queen, or their eldest son and heir. Under this clause it was held that the husband of a queen regnant was not included; but it includes a king *de facto* without regard to his title. The phrase "compassing and imagining the death of a king" has been held to mean the mere purpose or design, as distinguished from the carrying such design into effect; nevertheless, the purpose can be proved only by some overt act, such as providing weapons or ammunition for the purpose of killing the King, or assembling and consulting on the means to kill the King, although such acts might fall short of the legal definition of an attempt. The law has often, however, been strained; a paper found in a closet was held to convict Algernon Sidney (1683), though merely speculative in its character. (2) Another form of treason was the violating of the King's companion (*i.e.*, wife), or his eldest daughter unmarried, or the wife of the King's eldest son and heir. (3) Another form was that of levying war against the King in his realm either by taking arms to dethrone the King or under pretense to reform religion or the laws; by resisting the King's forces; or by joining an insurrection. (4) It was also treason to adhere to the King's enemies in the realm by giving them aid and comfort, as by sending intelligence or provisions or selling arms to them. (5) Lastly, it was treason to slay the Chancellor, Treasurer, or the King's justices of the bench or in assize while in their places administering justice. Besides these specific forms of treason, the Statute of Edw. III enacted that, if there should be other cases not above specified, the judge should tarry without going to judgment, till the King and Parliament should judge it treason or other felony—which was a safeguard against the judges indulging too much in refinements about constructive treason. At a later period, between the reigns of Henry IV and Mary, the courts, nevertheless, returned to the practice of inventing constructive treasons and included as such the clipping of money, burning houses to extort money, refusing to abjure the Pope, etc. These and other newly invented treasons were totally abolished by a Statute of 1 Edw. VI, c. 12, but many of like nature were established under Elizabeth. A subsequent Statute of 1 Anne, c. 17, provided that whoever endeavors to hinder the next in succession under the Act of Settlement from succeeding to the crown is to be held guilty of treason; and whoever maliciously affirms another to have right to the crown otherwise than according to the Act of Settlement commits treason. Moreover, by 36 Geo. III, c. 7, whoever compasses or intends death or bodily harm to the person of the King is to be adjudged a traitor. The Act of 25 Edw. III, c. 2, was confirmed and made perpetual by 57 Geo. III, c. 6, which with the other statutes referred to embody the English

statutory law upon the subject. There have been numerous statutes making certain specific acts treason, but most of these were repealed shortly after their enactment. The crime is neither a felony nor a misdemeanor, but a grade of crime by itself. All acting and abetting in the commission of treason are principals, there being no accessories in the crime of treason. See ACCESSORY; PRINCIPAL.

A copy of an indictment for treason and a list of the witnesses and jurors, together with the addresses of the latter, must be delivered to the prisoner 10 days before the trial, and he is entitled to have counsel assigned to defend him. This right, which prisoners accused of other crimes have not in English law, was conferred by a Statute of William III.

The punishment for treason was the most severe and revolting of the harsh punishments imposed by the common law. The traitor was to be drawn on a hurdle to the place of execution, hanged by the neck, his head then severed from the body, the body divided into four quarters, and the head and quarters to be at the disposal of the crown. But in 1870 these barbarities were abolished, and the penalty is now changed to execution by hanging. The consequence of a conviction of treason was also forfeiture (*q.v.*) and corruption of blood, the corruption of blood having the effect that the attainted person could neither inherit lands from his ancestors nor transmit them to any heir. But this was altered as regards England and Ireland in 1870 by the Statute of 33 and 34 Vict., c. 23. The convict suffers forfeiture and is disqualified for any public office; the court may order him to pay the costs of his conviction, and his whole property is transferred to administrators named by the crown, who administer it and retransfer the surplus to his heirs and representatives.

There are certain minor offenses which are called misprision of treason, being those closely bordering on treason. (See MISPRISION.) Such are offenses which consist in the bare knowledge and concealment of treason, without any degree of assent thereto, for any assent makes the party a principal traitor. The punishment of misprision of treason was loss of goods and lands during life.

In the United States treason may be either against an individual State or against the United States. In the former case it may be an offense at common law, although the constitution or statutes of most of the States define the crime and provide a punishment. Most of these provisions, however, are modeled after the provisions of the United States Constitution defining treason. The Constitution of the United States (Art. III, Sec. 3) provides that treason against the United States shall "consist only in levying war against them, or in adhering to or giving aid and comfort to their enemies." It is further provided that no person shall be convicted of treason unless on the testimony of two witnesses to the overt act or upon confession in open court. The penalty is death or imprisonment and fine at the discretion of the court. Levying war within the meaning of this provision must be a defiance of public government by armed force and must amount to more than a mere riot or an interference with the execution of the laws for some private purpose. The acts of the defendant must also proceed beyond mere preparation, as by enlist-

ment of men for military service. They must meet or be assembled for a treasonable purpose and some act done towards executing with force their purposes. Thus, an assembly of men arrayed in a military manner for the purpose of overawing the public and finally assailing the government is levying war upon the government, although no actual blow is struck. Adhering to or giving aid and comfort to the enemies of the United States means more than mere sympathy with enemies of the government; it must be the voluntary giving of actual assistance to those who are waging war against the United States.

Most of the State constitutions contain provisions similar to the clause of the United States Constitution, defining treason against the State and providing a punishment. Generally they provide that treason against a State may be committed by armed opposition to its laws or by forcibly attempting to overthrow or usurp the government. In practice, the common law of crime and the statute law of crime in the several States have been found adequate to punish crime of a treasonable nature without resorting to prosecution for treason, and there have been few prosecutions for the specific offense of treason against a State. Consult authorities referred to under **CRIMINAL LAW**. Cf. **PRÆMUNIRE**. See **ATTAINDER**.

TREASURE ISLAND. A stirring tale of adventure by Robert Louis Stevenson (1883).

TREASURER, LORD HIGH. Formerly the third great officer of the crown in England, who was sole head of the King's exchequer. The office was originally held by one person, but in 1612 James I put it in commission; and from the accession of George I (1714) down to the present time it has been the practice to vest the office in a board of Lords Commissioners of the Treasury.

TREASURE-TROVE (*treasure*, from OF. *tresor*, Fr. *trésor*, It., Sp. *tesoro*, from Lat. *thesaurus*, from Gk. *θησαυρός*, *treasure* + *trove*, from OF. *trover*, *trouver*, Fr. *trouver*, to find). In the common law of England, hidden treasure of gold, silver, and bullion accidentally found in the earth, the owner of which cannot be ascertained. Treasure-trove belongs to the crown, and in certain districts the right to claim it has been granted to the nobility. In order to come within this rule, the treasure must be concealed, as distinguished from that which is casually lost and remains on the surface, as to which a different rule applies. A finder of treasure-trove is bound by law to give notice of his discovery to the proper officials of the crown, and failure to do so may subject him to fine and imprisonment. The present policy of the English government is to allow a finder to keep treasure thus discovered, less a small percentage of its value to be paid to the crown, unless it is valuable as an object of historical or antiquarian interest, in which cases it is claimed by the crown in order to be preserved in the national museums. By the Treasure-Trove Act of India, if no owner is found, the finder is entitled to three-quarters and the owner of the ground to one-quarter of its value. Though there are dicta to the effect that the common law as to treasure-trove applies in the United States, such a right is seldom, if ever, enforced. See **FINDING**.

TREASURY, DEPARTMENT OF THE. The executive department of the government of the

United States controlling the national finances. It was established by Act of Congress in September, 1789, and was the successor of the Treasury Department created by the Congress of the Confederation in 1781, of which Robert Morris was for a time superintendent. It is the most extensive and complex of the departments and in rank stands next to the Department of State. At its head is the Secretary of the Treasury appointed by the President, who is a member of the cabinet and receives a salary of \$12,000. He is second among the cabinet officers in the line of succession to the presidency. The department as originally established consisted of a Secretary, a Comptroller, an Auditor, a Treasurer, a Register, and an Assistant Secretary, together with a few clerks. From this the department has grown to be a vast establishment employing some 5000 persons at Washington, with numerous bureaus, branches, and offices throughout the country. The only qualification for the office of Secretary of the Treasury is the negative one that he shall not be interested in foreign commerce. He is required to digest and prepare plans for the revenue and public credit, to prescribe forms for keeping the public accounts, to superintend collection of the revenues, to grant all warrants under certain limitations for moneys issued from the Treasury in pursuance of appropriations made by law, and, in general, to perform such duties relative to the finances of the United States as shall be required by law. Simultaneously with the development of the country the duties of the department have been extended to the management of the national debt, the supervision of the national banks, the internal-revenue system, the legal-tender currency, the merchant marine, the lighthouse system, the life-saving and public-health services, the Coast Survey, etc. The Secretary is ex officio a member of the Federal Reserve Board. He is aided by three Assistant Secretaries. The business of the department is distributed among the following offices and bureaus: the Comptroller of the Treasury, six Auditors, the Treasurer, the Register, the Comptroller of the Currency, the Commissioner of Internal Revenue, the Mint, the Bureau of Engraving and Printing, and the Public-Health Service.

The Comptroller of the Treasury, since 1894, has been aided by an Assistant Comptroller. He exercises a kind of supervisory power over the Auditors, countersigns warrants drawn by the Secretary of the Treasury, etc. He is ex officio a member of the Federal Reserve Board. The original act creating the Treasury Department provided for a single Auditor; four additional Auditors were provided in 1817, and a sixth was added in 1836. The six Auditors are assigned to the Treasury, War, Interior, Navy, Post-Office, and State and other departments respectively, with the duty of examining accounts. The Treasurer is charged with the duty of signing the paper currency and of receiving and keeping the moneys of the United States and with disbursing the same on warrants properly drawn and countersigned. There are Assistant Treasurers at New York, Boston, St. Louis, Philadelphia, New Orleans, Baltimore, Cincinnati, Chicago, and San Francisco. The Register signs all stocks and bonds and all Treasury notes and coin certificates issued under the authority of the United States. The Comptroller of the Currency enforces the provisions of the

national banking laws and superintends the issue of bank-note currency. At the head of the Bureau of Internal Revenue is a commissioner who is charged with the enforcement of the internal-revenue laws and the collection of the internal revenues. He is aided by a collector in each revenue district. For the collection of the customs there is a collector in each district, a surveyor in the larger ports, and a general board of appraisers to hear appeals against decisions of the collectors with regard to the dutiability of imported goods. The Director of the Mint has the supervision of all mints and assay offices throughout the country and makes annual reports to Congress on the coinage of the country, the yield of precious metals, etc. The Bureau of Engraving, established in 1874, has charge of the preparation of designs, stamps, bank notes, bonds, Treasury drafts, and other securities of the United States. The Solicitor of the Treasury has charge of all legal measures to prevent the evasion of the revenue laws and the counterfeiting of the coin and other securities of the United States.

TREASURY NOTE. A certificate of credit issued by the Treasury Department on the authority of the government and made receivable for government dues. In the United States treasury notes bearing interest were issued at different times before the Civil War, but it was during that struggle that the financial necessities of the government first led to the issue of very great quantities of noninterest-bearing Treasury notes, which, however, were made legal tender for all public and private debts except duties upon imports and interest on the public debt. See **MONEY**.

TREAT, ROBERT (1622-1710). A Colonial Governor of Connecticut, born in England. He emigrated to America with his father and settled in Wethersfield, Conn. In 1639 he settled in Milford, from 1653 to 1659 was a deputy, and from 1659 to 1664 was an assistant. He opposed the union of the Connecticut River and New Haven settlements and went with the dissatisfied faction which founded Newark, N. J. In 1672 he returned to Milford and later distinguished himself in King Philip's War. In 1676 he was chosen Deputy Governor of Connecticut and in 1683 was elected Governor and, with the exception of the two years in which the Colony was under Sir Edmund Andros (1687-89), served until 1698. From the latter year to 1708 he was again Deputy Governor. He was a zealous guardian of popular liberty in the Colony as against the interference and encroachments of Sir Edmund Andros (q.v.).

TREATIES, INDIAN. The first step of the United States government in determining its policy in regard to the Indians, whether expressed or implied, was to decide as to the nature of their territorial rights, this being the chief and altogether the most important factor in their relations with the whites. The decision reached on this point is distinctly stated by the United States Supreme Court in the case of *Johnson and Graham's Lessee v. McIntosh* (8 Wheaton, 453 et seq.), as follows: "It has never been contended that the Indian title amounted to nothing. Their right of possession has never been questioned. The claim of the government extends to the complete, ultimate title, charged with the right of possession, and to the exclusive power of acquiring this right." The next step was to determine the branch of the government

to carry out this policy. By the ninth of the Articles of Confederation it was declared that "the United States in Congress assembled have the sole and exclusive right and power of regulating the trade and managing all affairs with the Indians not members of any of the States."

It is evident, therefore, that, while acting under the Articles of Confederation, the right of managing and controlling the relations with the Indians resided in Congress alone. When the Constitution was framed this authority was conferred upon the legislative department in the following brief statement: "To regulate commerce with foreign nations and among the several States, and with the *Indian tribes*." It is apparent, from the use of the term "tribes," that the framers of the Constitution had in contemplation the method of dealing with the Indians as tribes through treaties. This is clearly shown by the Act of March 1, 1793, in which it is stated that no purchase or grant of lands from the Indians shall be of any validity "unless the same be made by a treaty or convention entered into pursuant to the Constitution." This action of Congress necessarily placed the initiatory steps in dealing with the Indians under the jurisdiction of the President as the treaty-making power, subject to confirmation by the Senate.

The Colonies and also the mother country had treated with the Indians as "nations," their chiefs or sachems often being designated as "kings"—and this idea was ingrafted into United States policy. It must also be remembered that the Colonies were weak, the Indian tribes comparatively strong and capable of requiring recognition of equality. Notwithstanding the evident anomaly of such a course, the growth in numbers and strength of the whites, and the diminishing power of the natives, this implied equality was recognized in dealings between the two until the Act of March 3, 1871. During all this time Indian titles to lands were extinguished only under the treaty-making clause of the Constitution; and these treaties, though the tribe may have been reduced to a small band, were usually clothed in the same stately verbiage as the most important treaty with a great European power. From the formation of the government up to March 3, 1871, 653 treaties were made with 97 different tribes or recognized tribal organizations.

It was ordered by this Act of March 3, 1871, that "No Indian nation or tribe within the territory of the United States shall be acknowledged or recognized as an independent nation, tribe, or power with whom the United States may contract by treaty," thus terminating a legal fiction that lasted nearly 100 years. It appears, from the Annual report of the Commissioner of Indian Affairs for 1890, that the Indian title to all the public domain had been extinguished, except in Alaska, in the portions included in 162 reservations, and those acquired by the Indians through purchase. As the title to reservations is derived in most cases from the United States, and title by purchase is derived directly or indirectly from the same source, it may be stated that the Indian title to all the public domain, except in Alaska, had practically been extinguished by the year 1890. It would seem, in fact, that the United States government proceeded on the theory that all the lands within its bounds were held by the natives, and hence that their possessory right must be ex-

tinguished. The only known variation from this rule was in the case of the Uintah Utes, where an omitted portion of their claimed territory was taken possession of without agreement.

A natural corollary of land cessions by the Indians to the United States government was the establishment of reservations for these natives either within the limits of the original territory or elsewhere. These were the restricted areas to which the Indians were confined in order to bring them more directly under the control and care of the government and to lessen the liability of conflict with the whites and warring between the tribes. It was hoped also that by thus curbing the wandering habit these reservations might become the first step towards civilization. This policy (also followed in Canada under both French and English control) was inaugurated by the government as early as 1786 and continued as an established policy to the present day. The earliest reservations were chiefly formed as the result of the cession of lands by the tribes, thus restricting their limits, but expressly stating in the treaty defining the bounds that the portion so limited was "allotted to" or "reserved for" the given Indians. (For a list of these, see INDIAN RESERVATIONS.) The method of establishing reservations has not been uniform—some being by treaty, some by executive order, and others by act of Congress. Those established by executive order, independent of the act of Congress, were not held to be permanent before the General Allotment Act of 1887, under which the tenure has been materially changed, and all reservations, whether by executive order, act of Congress, or treaty, are held permanent. Reservations by executive order under authority of an act of Congress are those which have been authorized or established by acts of Congress and their limits defined by executive order, or have been first established by executive order and subsequently confirmed by Congress.

Other respects in which the power of Congress intervenes in reference to Indian lands, or is necessary to enable the Indians to carry out their desires in regard thereto, are the following: 1. Allotments of land in severalty previous to the Act of Feb. 8, 1887, could be made only by treaty or by virtue of an act of Congress, but by this act general authority is given to the President for this purpose. 2. Leases of land, sale of standing timber, granting of mining privileges, and right of way to railroads are all prohibited to the Indians without some enabling act of Congress. On the other hand, it is obligatory on the government to prevent any intrusion, trespass, or settlement on the lands of any tribe of Indians except where their consent has been given by agreement. Consult C. C. Royce, "Indian Land Cessions in the United States," in *Bureau of American Ethnology, Eighteenth Annual Report*, part ii (Washington, 1902).

TREATY (OF. *traite, traicte*, Fr. *traité*, It. *trattato*, treaty, from ML. *tractatus*, treaty, agreement, from Lat. *tractare*, to treat, manage, frequentative of *trahere*, to draw, drag). A compact or agreement entered into between the governments or sovereigns of two or more states. A treaty is somewhat analogous to a contract in private law, the main differences being in the origin, purpose, and manner of enforcement. Thus, a treaty is concluded with more formality than a private contract, its purposes are usually

of a public character, while its enforcement rests chiefly upon the good faith of the contracting parties. The right of entering into treaty relations is one of the essential attributes of sovereignty and is therefore not usually permitted to so-called dependent states except under certain restrictions, nor to the component members of states having the federal system of government. So-called dependent states frequently retain the right of making commercial and extradition treaties, postal and customs conventions, and sometimes treaties of alliance and of naturalization. Component members of confederate states usually retain a considerable degree of treaty-making power, as, e.g., the members of the German Bund of 1815-66 or the States of Argentina (q.v.). Under the present German Empire the individual states enjoy the power to make treaties only with their immediate foreign neighbors, and only concerning postal and telegraph communication across the boundary between them. The Commonwealths of the United States are expressly forbidden to enter into treaty relations with foreign states or to make agreements among themselves except with the consent of Congress. The treaty-making power of a country is determined by its constitution. In the United States it is vested in the President, acting by and with the advice and consent of the Senate, two-thirds of the members concurring. The President exercises this power through the Department of State or through special plenipotentiaries appointed for the purpose. In monarchical countries the treaty-making power is usually a prerogative of the crown, but an indirect influence is frequently exercised by the Legislature, especially when an appropriation of money is necessary to carry into effect the stipulations of the treaty. In the German Empire treaties which relate to any subject already regulated by Imperial law require the approval of the Legislature. In the French Republic the President is empowered to negotiate treaties; but if the treaty is one of peace or commerce, or involves the finances or the territory of the state, or relates to the personal or property rights of Frenchmen in foreign states, the approval of the two Chambers is necessary. With the few exceptions of this kind, the negotiation and ratification of treaties in the European states are in the same hands, but they are distinct and separate steps, and ratification may be withheld after the treaty has been negotiated. Everywhere formal ratification is essential to the validity of a treaty.

In the United States, where the negotiating and ratifying authorities are in different hands, the question of ratification assumes a double importance, for it by no means follows that ratification is a matter of course. In several notable instances treaties negotiated by the President have been rejected by the Senate. Foreign governments, therefore, negotiating with the President of the United States are presumed to know that negotiation is only the initial stage in the procedure. The Senate has, moreover, claimed the right, and has exercised it in several instances, of ratifying only a part of a treaty instead of sending it back as a whole for revision. An important question has arisen in the United States as to whether Congress is bound to enact the necessary legislation to carry into effect the stipulations of a treaty negotiated by the President and duly ratified by the Senate. This question first arose

in 1794 in connection with the unpopular Jay Treaty (q.v.), which called for an appropriation of money to carry it into effect. The House of Representatives was at first inclined to refuse its concurrence and gave in only after a sharp struggle, and then by a very close vote. It is impossible to say even now that the question has been decided one way or another. The rule now is to lay reciprocity treaties before Congress for its approval and for the enactment of the necessary legislation to carry them into effect. This practice has been followed in the case of reciprocity treaties with Mexico, Canada, and Cuba.

The question has also been raised as to how far the government is bound by the action of its negotiator provided he has not exceeded his instructions. Formerly the rule prevailed that if the plenipotentiary acted in accordance with his full power his principal was bound by his action, since the knowledge of the full power by the other party was a motive which induced him to negotiate. Some writers, following the doctrines of the Roman law, still hold that the principals are in good faith bound by the acts of their duly authorized plenipotentiaries. Others make a distinction in this respect between treaties proper and contracts, holding that, in view of the magnitude of the interests involved in agreements between states and the possibility of errors of judgment or of policy on the part of negotiators, a right of examination and of rejection is indispensable. It is now universally conceded that the principal may withhold his ratification from treaties negotiated strictly in pursuance of instructions where it is found to be impossible from physical or other reasons to fulfill their stipulations, or on account of mutual error by which both parties were misled, or where a change of circumstances upon which the validity of the treaty was made to depend has occurred, or where ratification of the treaty would involve injury to a third party.

The extent of the treaty-making power unless restricted by the constitution is almost unlimited. It includes the acquisition of foreign territory, the disposal of domestic territory, the recognition of new states, the creation of servitudes, the formation of alliances, the granting of special privileges with respect to trade, commerce, and residence, the delimitation and rectification of boundaries, the guarantee of territorial integrity, the neutralization of ship canals, etc. It is a common provision in European constitutions to restrict the treaty-making power with regard to the cession of domestic territory by requiring the approval of the legislature in such cases. A constitutional question has been raised in the United States as to whether the treaty-making power extends to the alienation of land belonging to a State, and on this point constitutional lawyers differ in opinion, but the better view seems to be that where doubt exists as to the right of a State to land which it claims the disputed territory may be ceded by treaty. On the other hand, it is contended that land to which the right of the State is undisputed cannot be disposed of without the consent of the State except in case of conquest, where transfer is inevitable as a means of terminating the war.

The usual conditions essential to the validity of a treaty are, first, that the contracting parties shall possess the requisite capacity for

entering into treaty engagements. Thus, neutralized states are lacking in the capacity to enter into treaties which contemplate the waging of offensive war. In the second place, the plenipotentiaries who negotiate the treaty must be properly authorized. In the United States the President rarely if ever participates directly in the negotiations. This duty generally devolves upon the Secretary of State, although not infrequently the work is intrusted to a minister resident or to a special plenipotentiary or commissioner. Agreements entered into in excess of their authority are invalid and ratification may be withheld. An unauthorized agreement is called a sponson and is of no effect unless approved by the sponsor's government. The third essential to the validity of a treaty is freedom of consent on the part of the signatory powers. If either party acts under constraint the resulting agreement is void except in the case of treaties or other agreements arising in the course of war, where from the nature of the case the element is present. But an error as to the value of a consideration such as may result from imperfect geographical knowledge with regard to a boundary will not affect the validity of the treaty. Finally, treaties which stipulate for the execution of objects which are physically impossible of execution, which are repugnant to the usages of international law, or which conflict with previous engagements with other powers are held to be invalid. Thus treaties stipulating the establishment of slavery, assuming joint control over a portion of the high seas, or impairing the sovereignty of a third power would be invalid.

Treaties are susceptible of classification along different lines. Vattel classifies them as equal and unequal, or those in which the reciprocal considerations are equal and those in which they are unequal; personal treaties, which expire with the death of the sovereign who contracts them; and real treaties, which bind the state permanently. De Martens follows the same arrangement, but adds transitory conventions and mixed treaties. Calvo distinguishes treaties, with reference to their form, into transitory and permanent; with reference to their nature, into personal and real; with reference to their effects, into equal and unequal and simple and conditional; and, finally, with reference to their objects, into treaties of guarantee, commerce, neutrality, alliance, etc. Hall arranges them as follows: (1) those which are declaratory of the law as understood by the contracting parties; (2) those which stipulate for practices which the contracting parties wish to incorporate into the usages of law, but which they know to be outside the actual law; (3) those which are, in fact, mere bargains, in which, without any reference to legal considerations, something is bought by one party at the price of an equivalent given by the other.

Cartels, capitulations, and suspensions of arms, or truces, are sometimes involved in the classifications of treaties, although strictly speaking they are not treaties. Transitory agreements or conventions are treaties which contemplate the immediate execution of the stipulations and which are complete when this act has been performed. Examples are treaties of delimitation, of cession, etc. Permanent treaties are those which are continuous in effect, either perpetually or for a specified period. Such are treaties of amity and commerce, of

neutrality, of extradition, postal and customs conventions, etc. Cartels are agreements entered into in time of war between the commanders of opposing armies for the purpose of effecting an exchange of prisoners, and they may be transitory or for the period of the war. Capitulations are similar agreements for the surrender of a place, fleet, or army. Every general commanding is presumed to have authority to enter into agreements of this kind subject to any restrictions that may be imposed by the authority of his own state.

A treaty of alliance is an agreement between two or more states with a view to concerted action for a certain purpose. It may be temporary or permanent, equal or unequal, and offensive or defensive or both. Defensive alliances are usually formed with a view to preventing armed aggression against either party while offensive alliances are formed for the purpose of waging war against another state or states. A good example of the first class was the Treaty of 1778 between the United States and France, while the alliances formed among various European states to curb the ambitions and aggressions of Louis XIV and Napoleon I were in form examples of offensive alliances, although defensive in character. Treaties of guarantee are entered into for the purpose of securing the observance and execution of already existing treaties or for the maintenance of certain existing conditions for a limited period or in perpetuity. Among the conditions which have been made the subject of guarantee may be mentioned the independence and territorial integrity of states, as, for example, Greece in 1832 and the Ottoman Empire in 1856; the neutralization of states, as in the case of Belgium and Switzerland; the neutralization of ship canals, as in the case of the Suez and Panama canals; the free navigation of rivers; and the payment of state debts.

What are known as reciprocity treaties have been the subject of frequent negotiations in recent years, on account of the increasing importance of international commercial relations. Such treaties provide for reciprocal commercial advantages, usually in the form of reduced customs tariffs on the products of each state when imported into the other. They are usually entered into for limited periods of time and are sometimes subject to revision at stated periods. According to the older usage, in 1916 still followed by the United States, the special privileges granted by reciprocity treaties cannot be claimed of right by other nations simply because they have treaties entitling them to the same privileges as are allowed to the most favored nation. The basis for refusal to grant such privileges is that the nation demanding them is not able to offer in return the same advantages as the nation to which the privileges have just been given. According to European usage, such special privileges are forthwith accorded to nations having most favored nation treatment. Treaties of peace resemble ordinary treaties in form and in substance, but differ from them as regards the position of the contracting parties, since the element of duress is usually present in the negotiations, and hence freedom of conduct is not one of the requisites to the validity of such treaties. See WAR.

As regards the preparation of treaties, it has already been said that the ordinary method of negotiation is by a regular agent or commis-

sioner. During the nineteenth century, however, the preparation of a number of the most important European treaties has been intrusted to general international congresses or conferences composed of ambassadors and in some cases of the sovereigns of the states concerned. Such were the Congress of Vienna of 1814-15 (see VIENNA, CONGRESS OF), called to settle the questions growing out of the Napoleonic wars; the Congress of Aix-la-Chapelle in 1818 (see AIX-LA-CHAPELLE), which terminated the military occupation of France; the Congress at Paris in 1856 (see PARIS, TREATIES OF), which effected a partial settlement of the Eastern Question at the close of the Crimean War and drew up a declaration relative to the usages of maritime warfare; the Congress of Berlin of 1878 (see BERLIN, CONGRESS OF), in respect to the questions growing out of the war between Turkey and Russia; and the Congress of Bucharest in 1913 called to settle the terms of peace after the second Balkan War.

The language employed in the preparation of treaties was formerly Latin. Towards the close of the seventeenth century it was replaced by French, which is now the general diplomatic language of Europe and America. Each signatory power may insist upon the use of its own language, in which case a copy is prepared for each state in its own language and is usually arranged in parallel columns. Two states having a common tongue naturally employ that language. With regard to the form it may be said that no fixed rule prevails except that the stipulations of the treaty are usually preceded by a recital of the names and titles of the negotiators, with a statement of the purposes which the treaty is intended to accomplish. The treaty is divided into articles and clauses, ending with the terms of ratification and the signatures of the negotiators. A copy is prepared for each contracting party, and the signatures follow, usually according to the principle of the *alternat*, i.e., the plenipotentiary from each state signs first the copy intended for the use of his own government. After the act of ratification by each of the parties there follows the formal exchange of ratifications, when the operation of the treaty begins. Treaties sometimes contain provisions for the accession of third parties. Such were the Declaration of Paris (q.v.) in 1856, the Geneva Convention (q.v.) of 1868, and the Treaty of Washington of 1871. See WASHINGTON, TREATY OF.

Treaties are terminated in various ways. They cease to be binding with the mutual consent of the parties thereto; or with the denunciation of either party if that right has been reserved when the object of the treaty has been attained, as in the case of a boundary treaty, an arbitration treaty, or convention for the settlement of claims; when the operation of the treaty is conditioned upon terms which no longer exist, as in the case of a treaty allowing free navigation on a river which has ceased to be navigable; and when either party refuses to perform mutual stipulations. In the latter case the other party may consider itself released from its obligations, or it may demand a fulfillment of the treaty and require an indemnity for injuries resulting from any infractions thereof. By the usages of international law the refusal of either party to abide by a treaty, however burdensome, is a sufficient cause of war, since, as in the case of an ordinary contract, it

is binding upon both parties until mutually abrogated. Thus, the German invasion of Belgium in 1914, in defiance of the treaty of neutralization to which Great Britain was a party, afforded cause of war to the latter state. Material change in the circumstances contemplated in a treaty is sometimes put forward as sufficient ground for disregarding it. Thus, in 1915 Greece refused to live up to the terms of her treaty with Servia, whereby she was bound to come to Servia's aid if attacked by Bulgaria, on the ground that the treaty contemplated independent aggression on Bulgaria's part, and not aggression incidental to the action of powers of the first rank. Finally, it is to be said that a treaty is terminated when the state of things contemplated by the parties, and hence its real basis, no longer exists. Thus, a treaty is entered into in contemplation of the continuance of a particular form of government which in the course of time is displaced by another. Or the basis of the treaty may be changed by the absorption of one state by another, as in the case of Algeria, a state with which the United States had a treaty previous to the French conquest begun in 1830. Similarly the establishment of the German Empire in 1871 put an end to the treaties between the United States and the several German states with which she had entered into treaty relations. When a state is destroyed or loses its national character by other means, its treaties fall to the ground, but ordinarily a mere change in the form of government will not affect its obligations to other states. In case of war between the contracting parties all treaties are suspended, while certain of them are terminated. Treaties stipulating for a permanent arrangement of territorial and other national rights are at most simply suspended during the war and revive at peace. Such are treaties which recognize within certain territorial limits the independence of one of the contracting parties; treaties which establish new rules or modify old rules of international law, such as the Declaration of Paris of 1856; and treaties which contemplate a state of war and which come into effect only at the outbreak of hostilities, such as treaties of alliance and treaties which regulate blockades and define contraband of war, regulate rules of capture, etc. Treaties of commerce and navigation and postal conventions are usually extinguished by war.

Sir Travers Twiss says that Great Britain in practice admits of no exception to the rule that all treaties as such are put an end to by subsequent war between the contending parties. In pursuance of this rule the treaties of Westphalia and Utrecht were several times reversed by the signatory powers after they had engaged in war with one another. (See WESTPHALIA, PEACE OF; UTRECHT, PEACE OF.) A notable diplomatic discussion between Great Britain and the United States arose after the War of 1812 over the question whether the Treaty of 1783 (see PARIS, TREATIES OF), in so far as it granted to the Colonists fishery rights off Newfoundland, was suspended by the subsequent war between the contracting parties. The United States claimed that the treaty provision in question was not extinguished, it being the recognition of a preëxisting right which the Colonies had always enjoyed in common with the mother country. Great Britain claimed, on the other hand, that the permission to fish on British

coasts was in the nature of a grant of a special privilege and therefore terminated by the war.

As in the case of private contracts, certain rules for the interpretation of treaties have grown up. Phillimore arranges the rules of interpretation under three heads: (1) authentic interpretation, i.e., the interpretation supplied by the lawgiver himself; (2) usual interpretation, based on usage and precedent; and (3) doctrinal interpretation, or the interpretation founded upon scientific exposition of the terms of the treaty itself. The following are the commonest rules of interpretation: Words are presumed to have been used in their ordinary sense, but technical terms are used in the sense and with the meaning applied to them in the particular art to which they belong; the provision of a treaty can have but one true meaning and the interpretation must be mutual; the interpretation should be made with regard to the context and spirit of the whole treaty; terms peculiar to the language of one of the contracting parties must be given the meaning which they have in that language; clauses defining grants, privileges, and favors should be strictly interpreted; an interpretation which renders a treaty inoperative is to be avoided; special clauses are to be preferred to general, prohibitory to permissive; earlier clauses are explained by later ones and obscure clauses by clearer ones in later treaties, as later treaties explain and modify earlier ones on the same subject. The rule has been laid down by the United States Supreme Court that a treaty is on the same plane of equality with a statute of Congress, so that a later statute may supersede a prior treaty, while a subsequent treaty may supersede a prior statute on a given subject. A notable instance was the supersession in 1892 of a treaty with China by the act of Congress for excluding Chinese laborers. This mode of terminating treaties, however, is not sanctioned by international law and does not affect the responsibility of either contracting party for the fulfillment of its obligations. In the United States treaties go into effect from the date of signature so far as the contracting parties are concerned, but only from the date of ratification so far as the rights of the individual are involved. Another rule of interpretation in the United States is that the Supreme Court will not undertake to enforce a treaty which requires congressional legislation for its execution. Until such legislation is forthcoming the individual concerned must address himself to the political departments of the government.

To secure the enforcement of treaties, it was formerly the custom to demand and receive hostages, the last instance of the kind being in 1748 to secure the execution of the Treaty of Aix-la-Chapelle. Solemn oaths accompanied by religious rites on the occasion of ratification were once common, but are no longer resorted to. Pledges are sometimes required, as in the case of the treaty of peace between Germany and France in 1871, when certain French fortresses were retained by the Germans as security for the payment of the large indemnity exacted from France. The organs for the enforcement of a treaty are the courts, the legislature, the executive, and the army and navy. Thus, treaties of peace, of cession, of commerce, etc., are enforced for the most part by the legislative branch assisted by the executive, while in the case of treaties of naturalization, extradition,

and treaties affecting the rights of foreigners the judicial branch plays an important part.

TREATY ELM. The tree in Shackamaxon, Philadelphia, under which William Penn made his famous treaty with the Indians in 1682. Its probable site is now occupied by the Penn Treaty Monument.

TREATY RIGHTS, ECCLESIASTICAL. Those rights relating to the exercise of religion which are secured by treaty to the subjects or citizens of one state while they are residing in the territory of another state. The international agreements from which such rights arise differ radically from those treaties, generally known as concordats, which are made from time to time between sovereign states and the see of Rome to regulate the condition of the adherents of the Roman Catholic church within the jurisdiction of the contracting state, since no ecclesiastical authority is made a party to the contract, which is directly between sovereign states in favor of the citizens of one or both. Such a body of rights belongs to the department of private international law. It had its origin in the Reformation period, when the organic unity of Western Christendom was broken and there was no single ecclesiastical authority with which a state could deal in relation to all its subjects. At the present time among the Great Powers of the world, and especially among those of Western civilization, the liberties and rights of foreign-born residents are amply secured by what is known as "the most favored nation clause" of the prevailing treaties. Those nations, however, which have been foremost in missionary enterprise among peoples of a different civilization have found their interests to require intervention by their governments, and the United States of America, in the protection of widespread missionary enterprise, has secured for its citizens ecclesiastical rights in many countries. These rights differ considerably both in extent and kind, although, speaking generally, they have been elaborated as time went on and intercourse became more frequent. The first of such rights specifically mentioned was secured by the United States in its Treaty of 1805 with the Sultan of Tripoli, in which it was provided that the Consul or Agent of

the United States should have liberty to exercise his religion in his own house, and that his servants should not be impeded in going to his house at the hours of prayer. The Treaty of Guadalupe Hidalgo concluded with the Republic of Mexico in 1848 stipulated for American residents freedom from prosecution on account of their religion and also liberty to propagate it. The Treaty concluded in 1856 with the King of Siam provides that all American citizens visiting or residing in Siam shall be allowed the free exercise of their religion, and liberty to build places of worship in such localities as shall be assented to by the Siamese authorities. Americans have ecclesiastical treaty rights in China which were not abrogated by the foreign intervention following the Boxer uprising. They are provided by two treaties—one of June 18, 1858, and the other of July 4, 1868. American citizens have a right by the terms of these treaties to teach and practice peaceably the principles of the Christian religion, to reside in those places where foreigners are permitted to reside, and in such places to establish and maintain schools and to maintain cemeteries free from profanation. They have also the right to attend the Chinese educational institutions under the control of the central government. By the Treaty of 1858 with Japan Americans are secured the free exercise of their religion and the right to erect suitable places of worship. American citizens are forbidden to injure any Japanese temple or *Mia*, and neither Americans nor Japanese are allowed to do anything calculated to excite religious animosity. The government of Japan has abolished the practice of trampling on religious emblems. By the Treaty of 1859 with the Republic of Paraguay citizens of the United States residing in Paraguay are at liberty to exercise in private and in their own dwellings or the dwellings of the consuls of the United States their religious services, but no right of propaganda is specified. The Treaty of 1830 with the Ottoman Empire merely confirmed as the treaty rights of Americans privileges already existing. American missionaries were first established in Turkey in 1818, and the privileges of extraterritoriality were then assigned to them by ancient usage. The liberty to exercise their religious functions, as a privileged class, had been *ab antiquo* granted by a voluntary extension of what is known as the Edict of Toleration granted by the Turks, upon their conquest of Constantinople, to the ecclesiastics of any friendly Christian nation. While the United States was not a party to the Treaty of Berlin (1878), yet the guaranty given by the Turkish delegates applies to American citizens: "Throughout the [Ottoman] Empire the most different religions are professed by millions of the Sultan's subjects, and not one has been molested in his belief or in the exercise of his mode of worship. The Imperial government is determined to maintain this principle in its full force and to give to it all the extension that it calls for." By a protocol of 1874 a qualified right to hold real estate is granted to American citizens. What is known as the Protestant Charter regulates mission schools.

TREBBIA (Lat. *Trebia*). A river of north Italy. It rises in the Apennines of Liguria and after a northeasterly course of 58 miles joins the Po above the city of Piacenza. Upon its banks Hannibal defeated the Romans under

Sempronius in 218 B.C. (See HANNIBAL.) In the vicinity the Austrians and Russians under Suvarov were victorious over the French under Macdonald, June 17-19, 1799.

TREBELLI, trā-bel'lē, ZELIA (1838-92). A French dramatic and coloratura soprano, born in Paris. Her real name was Gillebert. At the age of six she began to study the piano and soon was an excellent performer. In 1854-59 she studied singing under Wartel and made her debut as Rosina in Rossini's *Barbiere di Siviglia* at Madrid (1859). The following year she sang with success in Germany and in 1862 in London. From then until her retirement in 1889 her career was an uninterrupted series of triumphs in all the European capitals. Twice she visited the United States, in 1878 under Mapleson, and in 1884 during the first season of the Metropolitan Opera House under Abbey. In 1863 she married the tenor Bettini, but after a few years the union was dissolved. Her death occurred at Etretat. She was equally great as a singer and as a versatile actress.

TREBITSCH, trā'bīch. A town of Moravia, Austria, 40 miles by rail east of Brünn (Map: Austria, D 2). A fine abbey in the transition style of the thirteenth century and the palace of Count Waldstein are worthy of notice. Woolens, shoes, and malt are manufactured, and horses are dealt in. Pop., 1900, 10,597; 1910, 11,665.

TREBIZOND (Turk. *Tirabzon*; Lat. *Trapezus*; Gk. *Τραπεζοῦς*, *Trapezous*, probably so called because founded on a table-land, from *τράπεζα*, *trapeza*, table). A city of Asia Minor, capital of the Turkish Vilayet of Trebizond (Map: Turkey in Asia, D 2). It is on the Black Sea coast near its east end, 570 miles east of Constantinople. The city is built on a small table-land between two deep parallel valleys which run out to the coast. The highest portion is crowned by an ancient castle, and the city is still surrounded by Byzantine walls. The streets are narrow, but the city has a wide extent, nearly every house being surrounded by gardens. There are numerous churches and mosques, some of the latter being old Byzantine churches. The bazars are mostly situated outside of the walls in the Christian quarters, the intramural portion being reserved for the Mohammedan population. The industries include wool, silk, and linen weaving, tanning, dyeing, and filigree manufactures. The harbor is an exposed roadstead, but the geographical position of Trebizond has for many centuries made it the chief entrepôt for the transit trade between Persia and Europe. It is the terminus of the main caravan route to Persia via Erzerum. It is also the northern port of a road attaining the Persian Gulf. The transit trade has, however, greatly declined since the opening of the Russian railroad to Batum. Pop. (est.), about 55,000, of whom considerably more than half are Mohammedans, the rest being chiefly Greek and Armenian Christians. Many Lazi dwell also in Trebizond and obtain a living as bakers or gardeners.

Trapezus was founded by Greeks about 700 B.C. as a colony of Sinope. It was a flourishing city when Xenophon and his Ten Thousand reached it after the famous retreat. In 1204, after the occupation of Constantinople by the Crusaders, Prince Alexius of the Comnenian family established the Empire of Trebizond and made the city his capital. This Empire lasted

until 1461, when it was overthrown and the city captured by the Turks. Trebizond was bombarded several times by Russian fleets in the Great War and in the early part of 1916 was captured by combined operations of land and naval forces. See WAR IN EUROPE.

TREBIZOND, GEORGE OF. See GEORGE OF TREBIZOND.

TREBLE, trēb'l (OF. *treble*, triple, from Lat. *tripplus*, threefold, from *tres*, three + *-plus*, -fold). The highest part in harmonized music, which in general contains the melody and is sung by a soprano voice. The treble or G clef is placed on the second line of the staff, indicating that the note G occupies the line encircled by its lower curve. It is one of the two clefs in use in music for keyed instruments. For the history of the sign, see MUSICAL NOTATION, *Clefs*.

TREBLE, LILLIAN MASSEY (1854-1909). A Canadian philanthropist, the daughter of Hart Almeri Massey (q.v.). She was born at Newcastle, Ontario, and was educated there and at Toronto. In 1897 she married John Mill Treble. While engaged in deaconess and mission work in Toronto she organized classes in domestic science, and her increasing interest therein led to the adoption of a complete curriculum in household science in Toronto University, Manitoba University, and in several women's colleges. She gave to Toronto University a handsome and commodious structure called the Lillian Massey Household Science and Art Building, and this was opened in 1913. She died in California. In addition to numerous benefactions in her lifetime she bequeathed the greater part of a large fortune to charitable institutions.

TREDGAR. A market town on the north-west border of Monmouthshire, England, 18 miles northwest of Newport (Map: England, C 5). Coal mining is the chief industry. The formerly important iron and steel works have been abandoned. The town owns gas and water works and cemeteries. Pop., 1901, 18,574; 1911, 23,601.

TREE. A plant which attains a considerable height and has a relatively large development of woody tissue. Trees differ from herbs in size and development of woody tissue. They differ from shrubs in having a single stem, or trunk, which branches out at some distance from the ground, while shrubs often have several stems and are of lower growth and bushy habit. Trees are commonly classed as deciduous or evergreen, depending on the relative permanence of their foliage. (See DURATION; FOREST.) They also differ among themselves in the manner of their growth, method of branching, etc. See STEM. For descriptions, see ASH; MAPLE; OAK; PINE; ETC.

Elliott, *Important Timber Trees of the United States* (Boston, 1912); F. S. Mathews, *Field Book of American Trees and*

Shrubs (New York, 1914); R. V. Cole, *Artistic Anatomy of Trees* (Philadelphia, 1914); J. E. Rogers, *The Tree Book* (Garden City, N. Y., 1914); B. E. Fernow, *Trees and their Care* (New York, 1915); G. E. Masee, *Diseases of Cultivated Plants and Trees* (2d ed., ib., 1916).

TREE, SIR HERBERT BEERBOHM (1853-1917). An English actor manager, born in London. He made his debut in 1877 as Grimaldi at the Globe. In 1884 he won great success in *The Private Secretary* at the Prince's, and three years later he undertook the management of the Comedy Theatre and produced *The Red Lamp*. From 1887 to 1896 he was manager of the Haymarket, where one of his productions was *Trilby*. Tree opened the new Her Majesty's (later His Majesty's) Theatre with *The Seats of the Mighty* (1897), afterward producing, among other plays: Grundy's *The Musketeers*, Phillips's *Herod and Ulysses*, Fitch's *The Last of the Dandies*, Belasco's *The Darling of the Gods*, *Oliver Twist*, and *The Beloved Vagabond*.

But he became best known for his elaborate productions of Shakespearean plays. In most of these he himself took leading parts. In 1905 he inaugurated a Shakespeare Festival, which was repeatedly successful. With his company Beerbohm Tree visited Germany in 1907, at the invitation of Emperor William, and in 1916 played in the United States, presenting *Henry VIII* and *The Merchant of Venice*. He was knighted in 1909. His *Thoughts and Afterthoughts* appeared in 1913.

TREE BOA. Any of various long, slender, active South American snakes of the boa family, which spend their lives in trees and have acquired a remarkable power of clinging to the moving branches, even in a high wind, without coiling their bodies about any support. The name is also specifically given to the large ringed boa (*Epicrater cenchris*). See BOA.

TREE CAT. See PALM CRIVET.

TREE CREEPERS, or WOOD HEWERS. A group of birds, forming the family Dendrocolaptidae, related to the ant thrushes (Formicariidae) and true ovenbirds (Furnariidae), with the tail feathers stiff and sharp-pointed as in the woodpeckers and similarly useful in climbing tree trunks. The bill is usually curved and slender and often is elongated, enabling them to pull insects out of deep crevices. About 400 forms are known, all confined to tropical America; all have a similar style of coloration, some shade of brown, with white spots beneath and rufous on the wings. See CREEPER.

TREE CRICKET. Any one of a group of small, pale-colored crickets which usually inhabit trees and shrubs. They are nocturnal in their habits and lay their eggs in the twigs of various plants—a habit which, when the insects are numerous, results in damage to vineyards and to raspberry and blackberry plantations. The common snowy tree cricket (*Aecanthus niveus*) is a delicate whitish-green insect. The young hatch about the first of May and feed upon plant lice and the eggs of other insects. When full-grown they feed upon vegetation.

TREE DUCK. See GOOSE, *Wild Geese*.

TREE FISH. One of the Californian rock fishes (*Sebastes sistriceps*), about a foot long. It is dark olive, blackish above and yellowish below, with the front of the head coppery red, two black bands downward and backward from the eye, and several oblique black crossbands on the sides. Black prominent ridges cross the

cranium. See ROCKFISH, and Plate of ROCKFISH, ETC.

TREE FROG, or TREE TOAD. A frog of the family Hylidae, connecting the toads with the typical frogs and of prevaillingly arboreal habits. Tree frogs have teeth on the upper jaw and vomers and in some genera elsewhere in the mouth. The toes are invariably claw-shaped and swollen at the base, and each carries at the tip a flattened, adhesive cushion, whose sticky secretion greatly aids the animal in clinging to smooth surfaces. Most of them are of small size, more elegant in form than the true frogs, of brighter colors and more active habits. They feed on insects, which they pursue on the branches and among the leaves of trees or shrubs. All have loud, piping notes and are remarkable for their power of changing their colors to simulate the tint of the resting place. (See METACHROSIS.) They are also remarkable for the great variety in their methods of placing their spawn, and the character of their metamorphoses, which are severally described under CRICKET FROG, FERREIRO, MARUPIAL FROG, ETC. The principal genus is *Hyla*, which contains about 200 species scattered all over the warmer forested parts of the world, but especially numerous in tropical America. The type is *Hyla arborea*, common throughout all central and southern Europe and Asia. Of the North American species the most familiar is *Hyla versicolor*, which is a green, gray, or brown warty frog, whose clear, loudly trilled rattle is an almost daily evening sound. One of the first notes heard in the spring in the eastern United States is the piping of *Hyla pickeringii*, a smaller, more yellowish species, often called the peeper. The cricket frog (q.v.) is another numerous species. Various others inhabit the Southern States. Many species of the West Indies and South America carry their eggs about on the back of the females, glued to or sunken into the skin, as is notably the case with *Hyla goeldii*. Notable cases are described in the *Proceedings of the Zoological Society of London* for 1895. Australia possesses several species of great interest, especially the familiar *Hyla caerulea*, whose cry is a sharp crackling bark. The whole group is one of extraordinary variety and interest. Consult authorities cited under FROG. See Colored Plate accompanying TOAD.

TREE HOPPER. Any insect of the homopterous family Membracidae, a very strange group comprising a variety of grotesque forms. The antennae are inserted in front of and between the eyes, and the prothorax is so prolonged that it covers the rest of the body, and its curious modifications have been developed in order to bring about a protective resemblance of these insects to various plant structures. The tree hoppers, like other Homoptera, have an incomplete metamorphosis, and the young are active and suck the juices of plants by means of their beaks. The species are very numerous, and the group is one of wide distribution. The most bizarre forms occur in tropical regions, but many curious species are found in the temperate zone. A common form in the United States is the little humpbacked *Telemona monticola*, which sometimes swarms on the branches of the Virginia creeper in June. Another interesting form (*Entilia sinuata*) is found upon the leaves of the sunflower and other annual plants. It lays its eggs in the midrib of the upper leaves; the mother insect broods over her eggs, and the

young from the time of hatching until full-grown are constantly attended by ants, which are attracted by a sweet secretion. The buffalo tree hopper (*Ceresa bubalus*), so called from its horned prothorax, is a species of considerable economic importance, which damages the small twigs of fruit trees in the act of laying its eggs. Large holes are made in the bark, in which the eggs are inserted in clusters. Consult J. H. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, 1909), and L. O. Howard, *The Insect Book* (new ed., New York, 1914).

TREE KANGAROO. One of a genus of kangaroos which in the forests of northern Australia and New Guinea inhabit trees, although they creep awkwardly about the branches, as if not yet well adapted to an arboreal life. They constitute the genus *Dendrolagus* and embrace several species, of which the black one (*Dendrolagus ursinus*) of New Guinea, which is very dark in color except the whitish face, and about 20 inches long exclusive of the tail, is one of the best known. The relative length of the limbs is of normal proportions, unlike that of ordinary kangaroos. See Plate of KANGAROOS.

TREE LIZARD. See DRAGON.

TREE OF HEAVEN. See ATLANTHUS.

TREE PARTRIDGE. See HILL PARTRIDGE.

TREE PORCUPINE. One of the small, prehensile-tailed arboreal porcupines of South America of the genus *Sphingurus*. There are eight or nine species, the most common of which is the Brazilian tree porcupine (*Sphingurus prehensilis*). See PORCUPINE, and Plate of PORCUPINES AND HEDGEHOGS.

TREE SHREW, or SQUIRREL SHREW. One of the curious insectivorous animals of the family Tupaiidae, of the Oriental region and eastward to Borneo. They are related to the hedgehogs, but outwardly have almost exactly the appearance of ordinary squirrels, except for the long, flexible, shrewlike nose. Some 48 forms have been named, of which the Malayan banxring (*Tupaia glis*), with its several subspecies, is one of the best known and often becomes a pet or resides, half tame, in gardens and village shade trees. The Madras tree shrew (*Tupaia*, or *Anathana*, *elliotti*) is found throughout India. All are much alike, feeding on both insects and fruits. For the most complete summary, consult M. W. Lyon, "Treeshrews: An Account of the Mammalian family Tupaiidae," in *United States National Museum, Proceedings*, vol. xiv (Washington, 1913).

TREE SNAKE. Many snakes are more or less arboreal in habits, but some are so distinctively so as to merit the name especially. Many of the smaller boas (see TREE BOA) live almost wholly in tree tops, as is necessary in the flooded parts of the Amazonian region. Among the colubrine groups of that region is the genus *Leptophis*, whose species are very slender with long whiplike tails. The best known (*Leptophis bicercus*) is a beautiful creature 6 feet long, the upper surface golden green, the lower yellow or white; it subsists upon small reptiles and birds and their eggs. An Oriental genus (*Dendrophis*) has the ventral scales keeled and notched, enabling them to take hold of a surface so securely that they are able to glide up the branches of trees in almost straight lines. A group of tropical green tree snakes (*Dipsadomorphæ*) exists the species of which are highly poisonous, and in Africa are found tree vipers (q.v.). See OPISTHOGLYPHA.

TREE TOAD. See TREE FROG.

TREE TOMATO (*Cyphomandra betacea*). A semiwoody South American plant belonging to the family Solanaceæ, often cultivated for its fruit. The plants are evergreen, 6 to 10 feet in height, and they bear on long pedicels numerous egg-shaped fruits about 2 inches in diameter. In color the smooth-skinned fruits are greenish purple, changing as they ripen to reddish or yellowish brown. In flavor and uses the fruit is similar to the ordinary garden tomato. Plants begin to bear when about two years old from seed and remain continuously in fruit for several years. The tree tomato is not hardy and can be grown in the North only under glass.

TREE VIPER. A genus (*Atheris*) of rather small, arboreal vipers of Africa. They are of bright green and yellow colors, so as to be readily concealed in foliage. Their tails are especially prehensile, like those of boas. Four species are known.

TREE WORSHIP. See NATURE WORSHIP.

TREFFEL, tré'fêl', GEORGES (1873-1914). A Frenchman of letters and encyclopædist, born at Vayrac. He studied at the lycées of Auch, Toulouse, and Henry IV and became associated with the editorial department of the *Nouveau Larousse*. He contributed also to the *Petit Larousse*, the *Larousse pour tous*, and the *Larousse Mensuel*. In addition to writing numerous and excellent biographies for these works, he compiled the *Atlas départemental Larousse*.

TREFFENFELD, JOACHIM HENNIGES VON. See HENNIGES VON TREFFENFELD, JOACHIM.

TREFOIL. A frequent charge in heraldry (q.v.), representing the clover leaf, which is always depicted as slipped, i.e., furnished with a stalk.

TREFOIL (OF. *trifol*, *trefeul*, Fr. *trèfle*, from Lat. *trifolium*, trefoil, three-leaved, from *tres*, three + *folium*, leaf), **BIRD'S-FOOT TREFOIL** (*Lotus*). A genus of plants of the family Leguminosæ. The pods are cylindrical, somewhat spongy within and imperfectly divided into many

BIRD'S-FOOT TREFOIL (*Lotus corniculatus*).

cells. The name "bird's-foot trefoil" is derived from the resemblance of the clusters of pods to a bird's foot. The numerous species are natives of the temperate and colder regions of the Old World. The common bird's-foot trefoil (*Lotus corniculatus*) is common in European pastures. The spreading decumbent stems, 4 to 16 inches

long, arise from a short thick rhizome and bear umbel-like cymes of 5 to 10 yellow flowers, which have a rich honey-like odor. The leaves have three obovate leaflets, and at the base of each leafstalk there are two large leaflike ovate stipules. The plant is by some regarded as the shamrock (q.v.) of Ireland. It is nutritious and much liked while young by all kinds of stock. It is common in the United States, especially in the South. A larger species, similar, with stem nearly erect, more compact heads of smaller flowers, and smaller seeds, is the greater or narrow-leaved bird's-foot trefoil (*Lotus major*) of much the same range. Marsh bird's-foot trefoil (*Lotus uliginosus*) is common in damp meadows. The winged pea (*Lotus tetragonolobus*), remarkable for four membranous wings which run along its pods, is a native of southern Europe, where it is grown for salads and as an ornamental plant. It is cultivated in the United States mainly as a forage plant and a winter crop for plowing under in spring as green manure. The name "tick trefoil" is given to various species of *Desmodium*, and shrubby trefoil is *Ptelea trifoliata*. See CLOVER.

TRE FONTANE, trà fôn-tá'ná (It., Three Fountains). The traditional scene of St. Paul's martyrdom, a spot outside of Rome, 3 miles from the Porta San Paolo. According to the legend, when the Apostle's head was struck off, it made three bounds, and at each spot a spring gushed forth. Over the springs stands the church of St. Paul without the Walls, which contains the column to which St. Paul was bound.

TREGELLES, trê-gél'is, SAMUEL PRIDEAUX (1813-75). An English scholar and New Testament critic, born at Falmouth, of Quaker parentage. He attended the Falmouth Classical School for four years (1825-28), but was in the main self-educated. Tregelles' interest in biblical studies began early, and from 1838 to his death he devoted himself assiduously to the study of the New Testament text and related subjects. In 1844 he published *The Book of Revelation in Greek, Edited from Ancient Authorities with a New English Version*. In 1854 his valuable *An Account of the Printed Text of the Greek New Testament* appeared. This work was not only a history, but a discussion of principles of textual criticism, and as such is still of value. His next important work was his revision of the New Testament part of Horne's *Introduction* under the title, *An Introduction to the Textual Criticism of the New Testament* (1856). Meanwhile he was diligently collecting material for a new critical edition of the Greek Testament, collating manuscripts, examining patristic readings and important ancient versions. The first part of Tregelles's *Greek New Testament, Edited from Ancient Authorities*, appeared in 1857. The last installment was published in 1872, sent out while the author was suffering from illness which proved fatal not long after. Among other writings not directly connected with the New Testament text his facsimile edition of the *Canon Muratorianus* (1860) and his translation of Gesenius' Hebrew Lexicon (1847) deserve mention. Tregelles' piety was sincere, his scholarship exact and painstaking, and his industry remarkable. His edition of the Greek Testament ranks with those of Tischendorf and of Westcott and Hort, as one of the three great critical editions of the last century. His principles, clearly worked out and consistently applied, were similar to those of Lachmann, but his reconstructed text was

based on a wider and more thorough survey of the field of evidence than Lachmann's. An *Appendix* to Tregelles' Greek Testament, edited by Hort and Streane, from Tregelles' own papers was published in 1879. Consult Scrivener, *A Plain Introduction to the Textual Criticism of the New Testament*, vol. ii (4th ed., London, 1894), and Hauck-Herzog, *Realencyklopädie für protestantische Theologie*, vol. xx (Leipzig, 1908).

TREHALASE. See ENZYME.

TREITSCHKE, trítsh'ke, HEINRICH VON (1834-96). A German historian and political writer. He was born at Dresden, Sept. 15, 1834, the son of an officer in the Saxon army. His father's family was of Bohemian descent (the family name was originally Treschky) and had emigrated at the beginning of the Thirty Years' War from Bohemia to Saxony. An illness in early life impaired his hearing and resulted some years later in complete deafness, and young Treitschke had to give up his ambitions of a more active life for one of study. The failure of the German revolution in 1848 made a deep impression on him, and while still a boy he advocated, to the disgust of his highly conservative family, a unification of Germany under Prussian leadership. He studied history, economics, and politics at Bonn and Leipzig. After first considering a journalistic career Treitschke in 1858 became a lecturer in history at the University of Leipzig. Popular as a teacher from the beginning, he lectured before large audiences on the constitutional history of Germany. Political events he followed always with close interest. In 1864 he published an essay "Bundesstaat und Einheitsstaat," one of his most important writings and by many considered his best work, in which he attacked the German confederacy and advocated a German union. In 1866, when Baden joined with Austria in the Seven Weeks' War, he resigned the chair he then held at Freiburg and became editor of the *Preussische Jahrbücher* in Berlin. But in the same year he was called to the University of Kiel, in 1867-73 he was a professor at Heidelberg, and in 1873 he accepted a chair at Berlin. After the foundation of the German Empire he was elected to the Reichstag. At first a member of the National Liberal party, later he became a conservative. He attracted attention as a parliamentary orator and was noted for his speeches against the Ultramontanes (q.v.) and the Socialists. His strong stand against modern conceptions of social problems and their solution led him into various literary feuds with leading German economists like Brentano and Schmoller and caused his resignation as an editor of the *Preussische Jahrbücher*. As professor of history at the University of Berlin he attracted large and notable audiences because of his great powers as a speaker and especially because of his uncompromising Germanism. He bitterly denounced Catholics, Jews, and Socialists, in fact any one who in his opinion was not truly Prussian and German. He died at Berlin, April 28, 1896.

When a young man Treitschke had planned a history of modern Germany, but the first volume did not appear till 1876, and the work was left unfinished, covering only the period down to the events of 1848. With the possible exception of Mommsen's *Roman History*, the most brilliant work of the kind in the German language is Treitschke's *Deutsche Geschichte im neunzehn-*

ten Jahrhundert (5 vols., 1874-94; Eng. trans., *History of Germany in the Nineteenth Century*, 7 vols., New York, 1915 et seq.). Every side of national life and thought is treated with a knowledge, a vigor, and an eloquence that have made the book a national possession. But its faults are as conspicuous as its merits. It is written throughout from a Prussian standpoint, with a pronounced antipathy to the smaller states and without comprehension of the men and movements that opposed the military and bureaucratic régime of the Hohenzollerns. Treitschke was the last and greatest of the Prussian school which arose in the years of national depression and contributed powerfully to prepare the soil for the idea of a national union of Germany under Prussian leadership.

After the outbreak of the European War in 1914 the discussion of Treitschke's position and influence in the development of modern political thought in Germany was revived, and he was even attacked as one of the spiritual instigators of the great war. Especially in England, where he was almost unknown during his lifetime, many of his writings were now read with interest, and his anti-English utterances were held partially responsible for the growing antagonism between the countries in recent years. Originally, however, Treitschke was an admirer of England and English institutions, although his later judgment became more severe because of England's unfriendly attitude in the Franco-Prussian War. When Germany entered upon the project of a colonial empire, Treitschke prophesied an unavoidable clash of interests with England, and without predicting a war he considered the possibility of it.

Besides his greatest work, Treitschke's writings include: *Zehn Jahre deutscher Kämpfe, Schriften zur Tagespolitik* (1874; 3d ed., supplemented, 1897); *Der Sozialismus und seine Götter* (1875); *Der Sozialismus und der Meuchelmord* (1878); *Ein Wort über unser Judentum* (1880); *Historische und politische Aufsätze* (1865; N.S., 1870; vol. iv, 1897); *Zwei Kaiser* (1888); and the posthumous volumes *Reden im deutschen Reichstag* (1896) and *Politik, lectures* (2 vols., 1897-98). Selected writings, *Ausgewählte Schriften*, appeared in 1907 (2 vols.). In early life he published two volumes of verse, *Vaterländische Gedichte* (1856) and *Studien* (1857). His letters to R. von Mohl and to his wife and his correspondence with Gustav Freytag are to be had in German. Selections from Treitschke's *Lectures on Politics* were translated by A. L. Gowne (London, 1914), and in 1915 a collection in English was made of essays written between 1871 and 1895, under the title *Germany, France, Russia, and Islam*.

Bibliography. A. Mägge, *Heinrich von Treitschke* (New York, 1915), containing a bibliography; Edmund McClure, *Germany's War Inspirers: Nietzsche and Treitschke* (ib., 1915); H. W. C. Davis, *The Political Thought of Heinrich von Treitschke* (ib., 1915). For life and selected

writings: Adolf Hausrath, *Treitschke: His Doctrines and his Life* (ib., 1914).

TRELAWNY, tre-lawni, EDWARD JOHN (1792-1881). An English author, known as the friend of Shelley and Byron (qq.v.). He was born in London. Though he was of an ancient and famous family, his education was neglected. Entering the royal navy at the age of 13, he served in the fleet blockading Cadiz (1805). He subsequently deserted and passed through exciting adventures in the East Indies. In January, 1822, he met Shelley and Byron at Pisa. He was the last to see Shelley's boat disappear in the fog on the memorable 8th of July, 1822; he superintended the cremation of Shelley's body at Viareggio, snatching the heart from the flames. In 1823 he accompanied Byron to Greece, where he took part in the war of liberation and married, as his second wife, the sister of the Greek chieftain Odysseus. After living in Italy and traveling in the United States (1833-35), he settled in England, becoming a lion of London society. He died at Sotting in Sussex. His body was cremated and buried by the side of Shelley's in the Protestant cemetery at Rome. Trelawny charmed two generations by his rich fund of anecdote. He was sought out by young men who wished to meet the comrade of Byron and Shelly. He figures as the old seaman in Millais's "Northwest Passage." Trelawny wrote his early autobiography under the title *The Adventures of a Younger Son* (anonymous, 1831). How much is truth and how much fiction in this book will probably never be determined. Trelawny is best known for *The Recollections of the Last Days of Shelley and Byron* (1858), republished, with changes, as *Records of Shelley, Byron, and the Author* (1878). Both are brilliant books, the latter of great value. Consult the edition of *The Adventures of a Younger Son*, with memoir by E. Garnett (London, 1890), and *Letters* (ed. by H. B. Forman, Oxford, 1910).

TRELAWNY, SIR JONATHAN (1650-1721). An English bishop and third Baronet of Trelawny. He was born at Pelynt, Cornwall, graduated at Christ Church, Oxford, in 1672, and took priest's orders in 1676. He took an active part in suppressing Monmouth's Rebellion of 1685 and was rewarded with the bishopric of Bristol. The appearance of the First Declaration of Indulgence (see DECLARATION OF INDULGENCE) alienated him from King James; he refused to sign the declaration, and later successfully opposed the effort of the Earl of Bath to control the Cornish elections in the interests of the crown. On May 18, 1683, he united with five other bishops and the Archbishop of Canterbury in drawing up a petition against the Second Declaration of Indulgence. As a result all seven were in the following month committed to the Tower on a charge of seditious libel, but were acquitted, and soon afterward King James II was driven from the throne. Trelawny seems not to have united in the invitation of William, but after the coronation of the new sovereigns he was made Bishop of Exeter. Consult Elizabeth Strickland, *Lives of the Seven Bishops Committed to the Tower in 1688* (London, 1866).

TRELAWEY, tre-lēs', WILLIAM (1857-). An American botanist, born at Mount Vernon, N. Y. He graduated at Cornell in 1880, and, after serving as instructor in botany at Harvard and at the University of Wisconsin, was professor at Wisconsin in 1883-85. In 1885 he was

made Engelmann professor of botany in Washington University at St. Louis, and in 1889 became, in addition, director of the famous Missouri Botanical Garden there. In 1913 he was appointed professor of botany at the University of Illinois. He was the first president of the Botanical Society of America (1884-85), served also as president of the American Society of Naturalists in 1903, and was elected to the National Academy of Sciences in 1902. His chief interest was the classification of certain groups of flowering plants, especially the genus *Agave* (q.v.).

TREMAREC, YVES JOSEPH DE KERQUELEN. See KERQUELEN-TREMAREC, Y. J. DE.

TREM/ATO'DA (Neo-Lat. nom. pl., from Gk. *τρηματώδης*, *trēmātōdēs*, having many holes, porous, from *τρημα*, *trēma*, hole). A class of Platyhelminthes, the flukes, characterized by the possession of certain suckorial pores or openings. They have soft roundish or flat bodies, and their visceral organs are lodged in the parenchyma of the body. Most of them are hermaphrodites. They seldom reach a large size (at best about 5 inches), but are usually visible to the naked eye. The color is dull gray, green, or brown, sometimes mottled. The reproductive organs are complicated and developed to a remarkable degree, occupying a large part of the body. These worms are not all parasitic, nor are the parasitic forms confined to a single host during the whole of their existence. Many of them have a remarkable life history, showing an extraordinary succession of generations, in which the young resemble not parents or grandparents, but great-great-grandparents. The first three or four generations live in the body of some invertebrate, especially water snails; but the next generation is free-swimming, and its offspring are like the original form and parasitic within some vertebrate.

The Trematoda are divided into two orders: (1) *Ectoparasitica*, trematodes with three or more suckers, living on the outside of their hosts and with a direct development from the egg; (2) *Endoparasitica*, trematodes with not more than two suckers, living in the blood vessels, alimentary canal, or other spaces of higher animals and undergoing a complicated alternation of generations. This order includes a large number of species, many of which are dangerous to domestic animals and also to man. See FLUKE.

TREMBLAY, trăn'blá', FRANÇOIS LECLERC DU. See JOSEPH, FATHER.

TREMBLEY, trăn'blá', ABRAHAM (1700-84). A Swiss naturalist, principally known for his studies in Holland of the hydra, and the discovery of its power of regenerating lost parts. (See REGENERATION.) His *Mémoires pour servir à l'histoire d'un genre de polypes d'eau douce à bras en forme de cornes* (2 vols., 1744) brought him great fame and became a classic.

TREMOLITE (from *Tremolo*, an Alpine village, where the mineral was discovered). A variety of amphibole (q.v.), consisting of calcium and magnesium silicate. It is white to dark gray in color. It occurs usually in monoclinic prisms, although sometimes it is found in fibrous aggregates with a silky lustre.

TREM/OLO (It., trembling). In music, an expression indicating that a note or a chord is to be reiterated with great rapidity for an indefinite number of times, so as to produce a quivering sort of effect. In singing the tremolo is highly

effective in dramatic situations. But with many singers it is a mannerism arising from improper control of the breath. (See SINGING.) For the stringed instruments the tremolo is extensively employed by composers and is written It is produced by a very rapid alternation of the up-and-down stroke of the bow.

TRÉMOUILLE. See LA TRÉMOILLE.

TREMULANT. See ORGAN.

TREMULOUS POPLAR. See ASPEN.

TRENCH, HERBERT (1865-1923). A British poet, born at Avoncore, County Cork, Ireland, and educated at Oxford, where he took honors, and became a fellow of All Souls. For a time he was senior examiner at the Board of Education; he traveled in many lands and served also as director of the Haymarket Theatre. His books include: *Deirdre Wedded* (1901), containing 19 poems in addition to that which gives the volume its title; *The Questioners* (1907); *Lyrics and Narrative Poems* (1911); *Ode from Italy in Time of War* (1915).

TRENCH, MILITARY (from OF. *trencher*, *trancher*, Fr. *trancher*, to cut, from Lat. *truncare*, to lop, from *truncus*, trunk, from *truncus*, OLat. *truncus*, maimed). An excavation of varying dimensions, the earth from which is placed directly in front to form a parapet. Trenches are to be found in permanent and semi-permanent fortifications as well as hasty intrenchments (see FORTIFICATION), their nature, number, and methods of construction varying with the circumstances. Trenches are necessary for both the attack and the defense, modern conditions and future indications giving a constantly increasing importance to their use by an attacking force. Time is often a great factor in the determination of the style of trench to be adopted, or the number of men required for its construction. Usually an average of one pace per rifle is reckoned for shelter trenches, which for troops kneeling would require a depth of about 3 feet, while as a shelter for men standing it would be necessary to excavate to 4 feet, 7 inches, the removed earth in both cases being sufficient to provide an upper parapet of about 3 feet in thickness.

Trenches have been long advocated by military engineers and have been gaining greatly in favor in general military opinion in late years. The tendency for a long time to have all such work done by the engineers is being superseded by an attempt to establish simple standard types which shall be generally understood by all troops so that it shall only be necessary in campaign operations to indicate to troops that a lying-down, or a kneeling, or a standing trench is to be constructed in a given general position, and the troops which are to defend the trenches will themselves construct them, under only the general supervision of the engineers. In the case of occupation of the same lines and works for a long time the works are more closely supervised by the engineers to secure the best construction and to avoid needless changes as the commands occupying the lines are changed. Modern warfare is carried on by enormous armies which occupy long fronts whose ends rest in the sea or on forbidding mountains. The opposing lines therefore parallel each other for miles during long periods of time. Increasing attention is consequently focused on the trenches. The tendency has been to make the front line deep enough for standing and only wide enough for the passage of a single file behind the line

of soldiers defending the trench. A bench or berm is left at the top and front of the trench on which the soldier may rest his elbows in taking his aim.

If trenches are made deeper than as just indicated, a banquette or bench of suitable height is left against the front face for the soldiers to stand upon. To prevent them from caving in, the nearly vertical faces of the trench are ordinarily revetted with planks, woven brush, or bags filled with earth. The horizontal plan or line of trenches is given small changes of direction and provided with traverses to localize the effects of bursting shells and of enfilade or flanking fire. The front or parapet is provided with head cover of logs, sandbags, or earth supported on wooden roofs. Frequent loopholes for firing are left in this head cover.

In front of the trenches the ground is cleared to afford a better view of the enemy and to deny him cover. Obstructive barriers or obstacles largely of barbed wire are placed to impede his progress in the event of a charge. Running forward from the front line of trenches are galleries constructed as bases for mining operations against the enemy. Running back from the front line of trenches are communicating trenches. These may be dug lower and covered over for protection from fire and overhead view. These lead to lines of trenches in the rear and to the positions of the supports and reserves. Published statements from the European War indicated that an increasing use was being made of subterranean passages and rooms where many troops might rest during bombardment and emerge to resist the subsequent charge. Frequent variations of these details of construction occur. In crossing low and swampy ground it is impracticable to excavate and all protection must be afforded by higher parapets. These in turn have the objection of being visible; but a choice must often be made between two defects and the less objectionable accepted. Great care must always be exercised to provide proper drainage for all trenches, as their value will otherwise be decreased if not entirely sacrificed. See MINES AND MINING, MILITARY; SIEGE.

TRENCH, RICHARD CHENEVIX (1807-86). Archbishop of Dublin, poet, and scholar. He was born in Dublin and educated at Harrow and Trinity College, Cambridge, where he took his degree in 1829 and was intimate with the members of the Apostles' Club, including Tennyson, Hallam, and Sterling. He was ordained deacon in 1832 and became curate to Hugh James Rose (q.v.) at Hadleigh, identifying himself to a certain extent with the High Church party. He was curate of Curdridge in Hampshire from 1835 to 1841 and in 1845 was examining chaplain to Bishop Wilberforce. From 1846 to 1858 he held a theological professorship at King's College, London, having meantime been appointed in 1856 to the deanery of Westminster. In 1863 he became Archbishop of Dublin and took a foremost position in the opposition to the disestablishment of the Episcopal church in Ireland, as well as in the settlement of the delicate questions which arose after it had been accomplished. He resigned his see, owing to infirmity, in 1884 and died in London two years later. Noteworthy among his theological works are: *Notes on the Parables* (1841); *Notes on the Miracles* (1846); *Commentary on the Epistles to the Seven Churches* (1861); *Studies in the Gospels* (1867), all of which were widely popular and influential.

His poetical work is graceful, tender, and thoughtful as a whole. A collected edition appeared in two volumes (1885). His best-known books in philology are *The Study of Words* (1851); *English, Past and Present* (1855); *Proverbs and their Lessons* (1905). To these may be added his *Lectures on Medieval Church History* (1877). See Trench, *Letters and Memorials of Archbishop Trench* (London, 1888), and J. Sylvester, *Archbishop Trench* (ib., 1891).

TRENCH FOOT. See SURGERY, MILITARY.

TRENCHARD, STEPHEN DECATUR (1818-83). An American naval officer, born in Brooklyn, N. Y. He became a midshipman at the age of 16, was promoted to passed midshipman in July, 1840, was wrecked in the *Washington* off the coast of North Carolina in 1845, was attached to the *Saratoga* during the Mexican War, became a lieutenant in 1847, and was slightly wounded while serving under Tatnall when that officer assisted the English in their attack on the Pei-ho forts in China. During the Civil War he served on the *Rhode Island*, was made commander in July, 1862, and participated in the bombardments of Fort Fisher in 1864 and 1865. He was promoted to be captain in 1866, commodore in 1871, and rear admiral in 1875, commanded the North Atlantic squadron in 1876-78, and retired in 1880.

TRENCK, FRANZ VON DER, BARON (1711-49). An Austrian soldier of fortune, born at Reggio in Calabria, the son of a lieutenant colonel in the Austrian service. He became a cavalry officer at 17, distinguished himself by his mental accomplishments, his remarkable success in the fields of gallantry, and his love for dueling and miscellaneous murder, which in the end forced him to leave the army. He went to Russia, where he was made a captain of hussars, but was cashiered not long afterward for gross insubordination and imprisoned at Kiev, whence he returned to settle on his estates in Slavonia. Trenck armed and drilled 1000 of his tenants, whom he called Pandours, and by their means succeeded in restoring order on the frontier, which was overrun with Turkish banditti. In 1741 he offered the services of his regiment to Maria Theresa, and his aid was accepted. His deeds of violence at last led to his trial before a court-martial and condemnation to imprisonment for life. He was confined at the Spielberg, near Brünn, until his death, caused by poisoning himself when he found escape impossible. Consult Hübner, *Franz von der Trenck* (Stuttgart, 1788), and Trenck's own memoirs, *Merkwürdiges Leben und Thaten des Freiherrn Franz von der Trenck* (Vienna, 1770).

TRENCK, FRIEDRICH VON DER, BARON (1726-94). A German adventurer, born at Königsberg, the son of a Prussian general and cousin of the preceding. At 16 he became a cornet in the guards and in 1744 ordnance officer to Frederick the Great. In 1749 he became captain of cuirassiers in the Austrian service. While in Danzig in 1754 he was arrested by order of Frederick and kept in severe confinement at Magdeburg till 1763. After his release he settled at Aix-la-Chapelle, where he married the burgomaster's daughter, gave himself to literary pursuits, and went into business as a wine merchant. In 1774-77 he traveled in England and France, and, restored to the possession of his Prussian estates after the death of Frederick II, lived at Berlin and Königsberg. In 1791 he went to Paris and became a zealous adherent of the

Mountain party. He was, however, suspected of plotting with the foreign enemy and was guillotined July 25, 1794. Consult the autobiographical *Friedrich Trendels merkwürdige Lebensgeschichte* (Berlin, 1787), which he rendered into French in 1789. His collected writings were published at Leipzig in eight volumes (1786).

TRENDELENBURG, trăn'de-len-burk, FRIEDRICH (1844—). A German surgeon, born in Berlin, the son of Friedrich A. Trendelenburg. He received his medical education in Edinburgh, Glasgow, and Berlin and became professor of surgery at Rostock (1875), at Bonn (1882), and at Leipzig (1895), as successor to Karl Thiersch (q.v.). He is best known for his work in tracheotomy, for his operation to cure varicose veins, and for improvements in pelvic operations.

TRENDELENBURG, trăn'de-len-burk, FRIEDRICH ADOLF (1802-72). A German philosopher, born at Eutin. He was educated at Kiel, Leipzig, and Berlin; was appointed professor extraordinary of philosophy in the University of Berlin, 1833, and full professor in 1837. In this position, which he held until his death, Jan. 24, 1872, he exercised very great influence upon the course of philosophical thought. His criticism of Hegel procured him great renown and was one of the most effective forces that broke the hold of Hegelianism on the German mind. The foundation of his own philosophic doctrine is Aristotelianism, which, however, was modified by Platonic elements. He held and developed the teleological view and maintained that it is confirmed by empirical fact. Mechanical causation he viewed as the servant of teleology, not its enemy. He called his philosophy the "organic view of the world." His most important works are *Elementa Logicæ Aristotelicæ* (1836; 9th ed., 1892; Eng. trans., 1881); *Erläuterungen zu den Elementen der Aristotelischen Logik* (1842; 3d ed., 1876); *Der logische Frage in Hegels System* (1843); *Logische Untersuchungen* (1840; 3d ed., 1870); *Das Naturrecht auf dem Grunde der Ethik* (1860; 2d ed., 1868); *Lücken im Völkerrecht* (1870). His *Historische Beiträge zur Philosophie* (1846-67) and *Kleine Schriften* (1871) are also valuable helps in the study of the history of philosophy. Consult: Bonitz, *Zur Erinnerung an Trendelenburg* (Berlin, 1872); Bratuscheck, *Adolf Trendelenburg* (ib., 1873); Morris, in *The New Englander* (Boston, 1874).

TREN'HOLM, GEORGE A. (1806-76). An American merchant and financier, born at Charleston, S. C. He engaged in business at Charleston and was very successful. During the Civil War he successfully ran the blockade and secured much needed supplies for the Confederacy. From June, 1864, until the end of the war he held the office of Secretary of the Treasury of the Confederate States. After being imprisoned until October, 1865, he was pardoned by President Johnson.

TRENT. A river rising on the northwest border of Staffordshire, England, about 10 miles north of Burslem (Map: England, F 3). It flows first southeast to the border of Derbyshire and afterward, in a generally northeast direction, through the counties of Derby, Nottingham, and Lincoln, then it unites with the Ouse (q.v.) to form the Humber (q.v.). It receives the Derwent, Idle, and Tarn from the west and the Soar from the south; it is navigable for seagoing

steamers to Gainsborough and for barges, 120 miles, to Burton-upon-Trent. Length, 170 miles.

TRENT. The outlet of the series of bays between Lake Simcoe and the Bay of Quinté, Lake Ontario (Map: Ontario, H 5), flowing into the latter body at Trenton. It issues from the northeast end of Lake Rice as a wide and picturesque river and is about 40 miles long.

TRENT (It. *Trento*, Ger. *Trient*). A town of Tirol, Austria, 76 miles northwest of Venice, on the left bank of the Adige (Map: Austria, B 3). It is built largely in the Italian style and has some beautiful old palaces. In the Piazza Grande is the celebrated Fountain of Neptune, made of red marble. A beautiful bronze statue of Dante (by Zocchie, 1896) stands in the Piazza di Dante. The Romanesque cathedral, begun in its present form early in the thirteenth century and completed in the fifteenth, constructed entirely of white marble, is the most striking public building. The church of Santa Maria Maggiore is noted as the sitting place of the Council of Trent (q.v.), and a column in the square before it commemorates the event. Among the other interesting architectural features are the castle (the former residence of the prince bishops) and two ancient towers. The municipal building contains a museum of Roman antiquities and other objects. Trent is the chief town of the Italian or Welsch division of Tirol. The chief industries are silk weaving, the making of salami (a kind of sausage), playing cards, pottery, cloth, and wines, and the quarrying of marble and gypsum. The town is the seat of a bishop. Pop., 1900, 24,908; 1910, 30,049. Trent is the ancient Tridentum, which was a Roman colony. It was under the rule of bishops from the eleventh century to 1803, when it passed to Austria.

TRENT, COUNCIL OF. The most notable of the modern ecumenical councils of the Roman Catholic church, held with intermissions from 1545 to 1563. It was the culmination of the Counter-Reformation (q.v.), and its decrees crystallized the results of that movement into the permanent law of the Church. For centuries those who felt the need of reform within the Church had appealed to a general council, and the long-growing discontent with the condition of things after the Great Schism had led to the great councils of the fifteenth century. The Protestant Reformation had taken many of the most ardent advocates of reform out of the Church and left the conservative-minded party in control. A council was at first desired by Luther and his supporters as a means of closing the great breach. At the Diet of Nuremberg in 1523 the German estates appealed to Adrian VI for the summoning of a council "within a year, in concert with the Imperial Majesty and in a German city." Adrian died in the same year, and his successor, Clement VII, while not refusing a council, did nothing towards calling one; and the political breach between Charles V and the holy see made the Emperor's requests unfruitful. Thus it happened that when the design was put into execution in the pontificate of Paul III the Augsburg negotiations (see REFORMATION) had failed, the break in Christendom was an accomplished fact, and the sincere but reactionary party was left in control.

The council was finally assembled at Trent, Dec. 13, 1545. The Emperor desired to have the discussions opened on points of general agreement, in the hope of gaining the confidence of the

Protestants; but the party in control brought to the front the questions most in dispute—the authority of the Scriptures in the Vulgate text, the right of interpretation, ecclesiastical tradition, and the doctrine of justification, as to which the old positions were maintained. Legates of the Pope presided, and approved of all business presented to the council. Certain administrative reforms were early decreed. Bishops were to provide better schools in their dioceses and were themselves to expound the Word of God; qualifications for the episcopal office were defined, and penalties imposed for the neglect of duties; dispensations and privileges were restricted. The Emperor opposed the course of the council, and on March 11, 1547, its sittings were transferred to Bologna, where it was thought the Imperial influence would not be so much felt. In 1549 Paul III died and was succeeded by Cardinal del Monte as Julius III. The latter reassembled the council at Trent, May 1, 1551; but, after the sixteenth session, the city having become insecure on account of the activity of the Protestant forces under Maurice of Saxony, the sittings were again suspended for two years. After the brief reign of Marcellus II, Cardinal Caraffa, one of the ablest leaders of the uncompromising Catholic party, came to the papal throne as Paul IV.

The council now proceeded to carry out a conservative reorganization of the Church, though its work was again suspended for a time owing to the disturbances of Paul's pontificate. Pius IV, the former Cardinal Gonzaga, reconvened it in 1560. Ecclesiastical laws were codified, questions which had hitherto been open were definitely ruled, uniformity of faith and discipline was established. To regulate some of the abuses of the system of indulgences, it was decreed that bishops should collect the payments made in connection with it, while the power of granting indulgences was affirmed as instituted by Christ and to be retained as useful to Christians. Episcopal control of monastic orders was provided for, though the Jesuits secured a larger measure of freedom. Several matters of detail were referred to the Pope for decision. The decrees were read and subscribed by about 200 bishops on Dec. 3 and 4, 1563, and the council finally adjourned. The decrees were confirmed by the Pope, Jan. 26, 1564, and he also prepared a confession of faith summarizing their doctrinal features. (See PRUS IV, CREED OF.) In spite of opposition the work of the council was so clear, logical, and thorough, and so well supported by the hierarchy, that it had a permanent and far-reaching effect, setting the standard of Roman Catholic faith and practice to the present day. The only things added have been the two definitions of the Immaculate Conception and the Infallibility of the Pope.

Bibliography. The best modern edition of the documents relating to the council is *Tridentinum Concilium; Actorum, Epistularum, Tractatum nova Collectio* (Freiburg, 1901 et seq.), or Theiner, *Acta Genuina Sacri Concilii Tridentini* (Agram, 1874). The approved English translation is that by J. Waterworth (London, 1896); also A. von Druffel, *Monumenta tridentina* (Munich, 1884-87), continued by K. Brandi (1897-99). Works supplementary to that of the council itself were a catechism by the Pope for parish priests and preachers, and authentic editions of the Vulgate Bible, the missal, and the breviary. A permanent tribunal at

Rome, the Congregation of the Council, deals with questions which arise as to the meaning, authority, or effect of the decrees and canons of the council. The contemporary histories of the council were those of Fra Paolo Sarpi (see SARPI, PAOLO), *Istoria del Concilio Tridentino* (London, 1619; in Latin, 1620; Eng. trans. by Brent, 1676), written from a hostile, almost a Protestant, point of view; and Sforza Pallavicini, *Istoria del Concilio di Trento* (Rome, 1656-57; revised by the author, 1666; ed., annotated by Zaccaria, 1833; Fr. trans. by Migne, Paris, 1844), a friendly history, a reply to Sarpi. Consult also: Joseph Mendham, *Memoirs of the Council of Trent* (London, 1834-42); I. H. Wessenberg, *Die grossen Kirchenversammlungen des fünfzehnten und sechzehnten Jahrhunderts* (Constance, 1840), a Roman Catholic work; Güsschl, *Geschichtliche Darstellung des grossen allgemeinen Concils zu Trient* (Regensburg, 1840); L. Maynier (pseud.), *Etude historique sur le concile de Trente* (Paris, 1874); J. J. I. von Döllinger, *Sammlung von Urkunden zur Geschichte des Konzils von Trient* (Nördlingen, 1876); W. Arthur, *The Pope, the Kings, and the People* (2 vols., London, 1877); Martin Philippon, *Les origines du catholicisme moderne: La contre-révolution religieuse au XVIème siècle* (Paris, 1884); Charles Dejob, *De l'influence du concile de Trente sur la littérature et les beaux-arts* (ib., 1884); R. F. Littledale, *History of the Council of Trent* (London, 1888); J. A. Froude, *Lectures on the Council of Trent* (ib., 1896); A. R. Pennington, *The Counter-Reformation in Europe* (ib., 1901); *Cambridge Modern History*, vol. iii (New York, 1905), containing an exhaustive bibliography.

TRENT, WILLIAM PETERFIELD (1862-). An American literary critic, born in Richmond, Va. He was educated at the University of Virginia and at Johns Hopkins. From 1888 to 1900 he was professor of English and history in the University of the South (Sewanee, Tenn.), and from 1893 to 1900 was dean of the academic department of that institution. In 1900 he became professor of English literature at Columbia. The *Sewanee Review*, which he founded in 1892, was edited by him until 1900. In 1904 he turned his attention mainly to the life of Daniel Defoe and to English history and literature of the period 1680-1780. He contributed the article on Defoe, as well as articles on American literature, to the *NEW INTERNATIONAL ENCYCLOPÆDIA*, edited Robinson Crusoe, and wrote a biography and bibliography of Defoe in 10 volumes (in manuscript to 1916). In addition he edited various works and published: *William Gilmore Simms* (1892); *The Authority of Criticism* (1899); *Robert E. Lee* (1899); *John Milton* (1899); *Progress of the United States during the Nineteenth Century* (1901); *A History of American Literature* (1903); *Greatness in Literature, and Other Papers* (1905); *Longfellow and Other Essays* (1910); *Great American Writers* (1912), with John Erskine.

TRENT AFFAIR, THE. A diplomatic episode growing out of the seizure by an American vessel on Nov. 8, 1861, during the Civil War in America, of two Confederate commissioners on board a British mail steamer. In the autumn of 1861 the Confederate government sent John Slidell and James M. Mason (qq.v.) as commissioners to France and England respectively. They embarked at Havana for England on the

British mail steamer *Trent*. On November 8 Capt. Charles Wilkes (q.v.) of the United States vessel *San Jacinto* stopped the *Trent* and took them as prisoners. This act was applauded by many people, but President Lincoln and Secretary of State Seward recognized its impropriety and disapproved it, and when a formal demand was made by the British Minister for the surrender of the commissioners it was complied with and an apology tendered, on the ground that they had been forcibly taken from a neutral vessel on the high seas and upon a voyage from one neutral point to another. Consult T. L. Harris, *The Trent Affair* (Indianapolis, 1896), containing a bibliography, and C. F. Adams, *The Trent Affair: An Historical Retrospect* (Boston, 1912).

TRENTÉ ET QUARANTE, trăn'-tă kă-răn't'. See ROUGE ET NOIR.

TREN'TON. A town and port of entry of Hastings County, Ontario, Canada, on both banks of the Trent, at its outlet in the Bay of Quinté, Lake Ontario, and on the Canadian Pacific, Grand Trunk, and Canadian Northern railways (Map: Ontario, H 5). It is the southern terminus of the Trent Valley Canal and has various manufactures. Pop., 1901, 4217; 1911, 3988.

TRENTON. A city and the county seat of Grundy Co., Mo., 83 miles east by north of St. Joseph, on Grand River, and on the Chicago, Rock Island, and Pacific, and the Quincy, Omaha, and Kansas City railroads (Map: Missouri, C 1). It has the Jewett Norris Free Public Library and the Wright Hospital. Trenton is largely interested in coal mining. The Chicago, Rock Island, and Pacific Railroad maintains repair and machine shops here. The chief manufactures are ice, canned goods, and brick and tile. Large shipments of poultry are made. Trenton was settled in 1840 and was first incorporated in 1857. Pop., 1900, 5396; 1910, 5656.

TRENTON. The capital of New Jersey and the county seat of Mercer County, situated at the rapids on the Delaware River, head of tide-water navigation, and on the Delaware and Raritan Canal, on the main line of the Pennsylvania and of the Philadelphia and Reading railroads, 33 miles northeast of Philadelphia and 59 miles southwest from New York (Map: New Jersey, C 3). Electric lines gridiron the city and the southern portion of the State, reaching to Philadelphia, to north Jersey, and to New York, while there is a large traffic on the canal and by steamships and barges on the Delaware to the south. Bridges over the Delaware connect the city with Morrisville in Pennsylvania.

As a manufacturing centre it is conspicuous among other things for its pottery-ware output. In this industry there are 42 plants, making all the way from the commoner varieties to the finer decorated porcelain and china. The total estimated annual value of these products is about \$9,000,000, in the making of which 6000 persons are employed. The ironworks and wire mills, said to be the largest of the kind in the world, have 7000 employees and turn out from 80,000 to 100,000 gross tons of products annually. There are also vast manufactures of rubber products, brick and tile, electrical machinery, castings, malt products, linoleum, woolen goods, and many miscellaneous iron, steel, and other industries. Total capital invested in manufacturing (1914), \$55,535,000; total value of manufactures (1914), \$53,588,000. The public library contains 73,094 volumes. There are four theatres and 15 mov-

ing-picture houses. Educational facilities include the State Normal and Model School, the School of Industrial Arts, three private schools, and a Catholic college. There were 15,569 public-school pupils enrolled in 1915 and 5376 in other schools. There are also three hospitals, the State Home for Girls, a reformatory, the State Hospital for the Insane, and the State Prison. Among the more important public buildings are the State Capitol, Masonic Temple, and State Armory. Notable, also, is the old stone barracks, built in 1758-59 during the French and Indian War. There are two parks, and a large statue of Washington marks the spot where he planted his cannon at the battle of Trenton.

The total assessed value of Trenton real estate in 1915 was \$69,948,350; the funded debt, \$5,703,796; and its total annual expenditures are \$1,615,319. The annual outlay for schools is \$508,594; for police, \$177,807; for fire department, \$166,748; and for street lighting, \$75,000. In 1911 Trenton adopted the commission form of city government. It has five commissioners—public affairs, revenue and finance, public safety, streets and public improvements, and parks and public property. Each commissioner has absolute control of his own department, but is also individually responsible to his fellow commissioners and to the public. The mayor is director of public affairs and an adviser of the other commissioners.

Pop., 1790, 1946; 1810, 3002; 1850, 6461; 1870, 22,874; 1880, 29,910; 1890, 73,307; 1910, 96,815 (1915), 103,581; 1920, 119,289. The city has an excellent municipally owned water-supply service and ample sewerage. The municipality's reservoirs have a total capacity of 120,000,000 gallons.

First settled about 1676, Trenton was generally known as The Falls until in 1719 it received its present name in honor of William Trent, Speaker of the House of Assembly. It was incorporated as a borough in 1746, was selected as the State capital in 1790, and was chartered as a city in 1792. In 1776 it was occupied by the British in their pursuit of General Washington. Late in December, 1776, Washington planned a movement against Trenton and Bordentown. At the former was Colonel Rahl with about 1500 Hessians, and at the latter General Donop with a small force. Gen. James Ewing with about 550 men was to cross the Delaware just below Trenton, seize the Assanpink, and thus sever communication between Donop and Rahl; Col. John Cadwalader was to cross at Bristol, below Bordentown, and attack Donop from the south; and General Putnam with about 1000 men was to coöperate with about 1000 men from Philadelphia. The main movement, however, was to be made by Washington in person, who with 2400 men was to cross at McConkey's Ferry, 9 miles above Trenton, and assail Rahl at Trenton. The movement was set for the night of December 25-26. By reason of storms and of the river being clogged with ice, Ewing and Cadwalader were unable to effect a crossing, while Putnam was detained in Philadelphia. Washington, however, with the aid of Marblehead fishermen under Glover, crossed in spite of all obstacles by three o'clock in the morning of the 26th, began his march to Trenton at about four o'clock, and at about eight completely surprised the garrison, which, after a night of Christmas festivities, had taken little precaution against surprise and had made little preparation for resistance. Rahl

was soon forced to surrender, and Washington secured about 1000 prisoners. The American loss was 2 killed and 3 wounded, while the Hessians lost about 40 killed or wounded. Soon afterward Washington recrossed the Delaware to his former position. This success, together with that at Princeton on Jan. 3, 1777, greatly revived the spirits of the Americans and did much to prevent the threatened disintegration of Washington's army. Trenton became the State capital in 1790 and served as the temporary capital of the country in 1784 and 1793. Consult: J. O. Raum, *History of the City of Trenton* (Trenton, 1871); S. A. Drake, *The Campaign of Trenton, 1776-77* (Boston, 1895); Lee, *History of Trenton* (Trenton, 1895); W. S. Stryker, *The Battles of Trenton and Princeton* (Boston, 1898); J. M. Lathrop, *Atlas of the City of Trenton and Borough of Princeton* (Philadelphia, 1905); Ernest Volk, *Archæology of the Delaware Valley*, published by the Peabody Museum (Cambridge, Mass., 1911).

TRENTON FORMATION. One of the divisions of the Ordovician system, consisting mainly of limestones and black carbonaceous shales, so named from the type locality at Trenton Falls in central New York. The rocks are distributed in belts along the eastern, southern, and western borders of the Adirondacks; they also occur on the northern shores of Lake Ontario in Canada, in the upper Mississippi valley, and elsewhere in the Central West. In Ohio and Indiana Trenton rocks are the source of oil and gas; while the limestones of the formation are important quarry materials, being utilized for building stone, lime manufacture, and as an ingredient of Portland cement. The black limestones are sometimes polished and sold as black marble. See ORDOVICIAN SYSTEM.

TREPANG (from Malay *tripang*), or **BÊCHE DE MER**. The dried body of a holothurian (q.v.), regarded as good food by the Chinese. They are usually 8 or 9 inches long, but some are 2 feet in length. They are often found in the coral sand, the tentacles only appearing above it. Large ones are sometimes speared in shallow water; but most are taken by divers. Macassar is the centre of the trade, whence several hundred tons are annually sent to China. Trepang is also gathered and prepared to some extent in California. It is gelatinous and nutritious, though almost tasteless, and is an ingredient in soups.

TREPINE, trê-fin' or trê-fên', **TREPHING** (Fr. *tréphine*, for **trépine*, dim. of *trépan*, *trepan*, from ML. *trepanum*, from Gk. *τρύπανον*, *trypanon*, auger). The operation of trephining consists in the perforation of a bone by means of a trephine, which is a small cylindrical or circular saw, with a centre pin on which it works. The trephine produces a hole in the skull varying from $\frac{1}{4}$ to 1 inch or more in diameter. It is customary to make as small an opening as possible with the trephine, enlarging it when necessary by means of rongeur forceps, the chisel, or some special form of saw. Trephining is especially employed in fracture of the skull where the fragments of bone cannot otherwise be raised. In other conditions the operation of trephining is often a mere introductory step, giving a point of entrance at one or more places from which extensive flaps of bone are broken away or turned back for free access into the cranial cavity.

TRÉPORT, trâ'pôr', LE. A town of the De-

partment of Seine-Inférieure, France, situated at the mouth of the Bresle, under a high cliff 45 miles north-northeast of Rouen. Its proximity to Paris has made it a popular bathing resort. Le Tréport has a sixteenth-century tower, now used as the town hall, the sixteenth-century church of Saint-Jacques, an old Renaissance timber house, and a conspicuous casino. There is a considerable trade. Sugar is the leading export. The harbor is good, and a canal extends to Eu. Pop., 1901, 4949; 1911, 4958.

TREPOV, trá'póf, DMITRY FEODOROVITCH (1855-1906). Russian soldier and administrator. He was a son of the chief of police in St. Petersburg whose attempted assassination by Viera Zasulich (q.v.) in 1878 constitutes one of the earliest events of the Russian revolutionary movement. Dmitry entered the army in 1874, fought in the Russo-Turkish War of 1877-78, and retired in 1896 with the rank of colonel to become chief of police in Moscow. Because of the brutalities practiced by the police against the students, he was removed in January, 1905, but after the massacre of "Red Sunday" in St. Petersburg (Jan. 22, 1905), he came to the capital and was appointed Governor-General of St. Petersburg with extraordinary powers. Later in the year he became Assistant Minister of the Interior with control of the police throughout the Empire. In December he was made commandant of the Imperial palace. He escaped assassination in July, 1906, but died a few months later of heart failure. See RUSSIA.

TRES'COT, WILLIAM HENRY (1822-98). An American diplomatist, born at Charleston, S. C. He graduated at Charleston College in 1840, studied law in Harvard and was admitted to the bar in 1843, became Secretary of the United States Legation in London in 1852, and was Assistant Secretary of State from June, 1860, until the secession of South Carolina. A part of this period he was also the confidential agent of his State. In 1862-66 he served in the State Legislature and was also on the staff of General Ripley. In 1877 he was one of the agents of the United States Fishery Commission at Halifax; in 1880 helped to revise the treaties between the United States and China; in 1881 was sent as special envoy to Chile, Bolivia, and Peru, which were then at war; and in 1882 was associated with General Grant in negotiating a new treaty with Mexico. Among his published works are: *Diplomacy of the Revolution* (1852); *An American View of the Eastern Question* (1854); *Diplomatic History of the Administrations of Washington and Adams* (1857).

TRESGUERRAS, trás-gär'rás, FRANCISCO EDUARDO (1745-1833). A Mexican architect, born at Celaya. He began his artistic career as a painter and a sculptor in wood; studied in the Academy of San Carlos in Mexico City and probably for a while under Jesuit teachers, but was largely self-taught as an architect. He nevertheless achieved remarkable success in the designing of religious and civic buildings, as in the church of Nuestra Señora del Carmen at Celaya, a theatre at San Luis Potosí, the bridge of La Laja, and conventual churches at Querétaro, San Miguel de Allenda, and elsewhere. He was a successful painter and widely known also as a musician and poet.

TRESHAM, trësh'am, FRANCIS (c.1567-1605). An English conspirator. He participated in Essex's rebellion in 1601, for this was imprisoned,

and in 1602 was implicated in Thomas Winter's mission to the King of Spain. Initiated into the Gunpowder Plot (q.v.), he disapproved of the plans and revealed the plot to Lord Montague, his brother-in-law. Later he was arrested, and died in prison.

TRESPASS (Lat. *trans*, across + *passus*, pace, OF. *trespasser*, to pass over, depart). In law, the injury to person or property resulting from some wrongful act committed with force. The term at common law meant a certain form of action. In modern law it includes several kinds of torts and is sometimes used as equivalent to tort. Although trespass means either an injury to person or one to property, it is more commonly used in regard to land. Assault and battery and false imprisonment are examples of trespass to the person. The rigidity of common-law pleading made the distinction between action in trespass and actions on the case, e.g., negligence, essential, but modern law has done away with form and looks rather to the matter. An interference with the possession of personal property is a trespass. Such would be the wrongful carrying away of property even with no intention of converting or injuring it.

Trespass to lands is an unauthorized entry thereon. Although no damage result, it is yet trespass. An entry need not be by person. It may be made by beasts, as driving or allowing cattle to stray on another's land, or by throwing something thereon, as in blasting, or attaching anything thereto, such as the posting of an advertisement on a house or the erection of a building. In the view of the law every man's land is presumed to be separated from that of his neighbor by a close or boundary. This may be an actual fence, but the law implies an invisible and effectual boundary, and it is the unauthorized crossing over this line which constitutes the trespass. The entry may have been at first lawful and unauthorized, but the person entering may later become a trespasser. Thus, the purchaser of a ticket to a theatre is licensed to enter, but if he afterward create a disturbance and is requested to leave and refuses, the license having been revoked, he is a trespasser. Inevitable accident, or, e.g., where a highway is obstructed and it is necessary to pass over the lands by the side, is a defense to an action. Generally, however, the intent is immaterial and it is the act itself. A trespass committed by mistake is nevertheless actionable. But when the act is willful or malicious the intent is considered with relation to the question of damages, and in some jurisdictions statutes have made certain acts criminal trespass, allowing exemplary damages. In New York State treble damages are authorized for entering another's land and cutting timber thereon, in Missouri for taking coal. At common law no trespass was a crime unless it amounted to a breach of the peace. Even when the owner or possessor has put up notices "Trespassers will be prosecuted," it is not a crime except under statutes which usually apply to inclosed or cultivated land.

The entry must be unauthorized. The law implies a license where necessary to exercise a public right or to prevent a great public disaster, as blowing up a building to prevent the spread of fire. Authority from the government may be a justification of an act which would in the absence thereof be a trespass. An entry by commissioners appointed by the State to make plans or ascertain boundaries is an example, or the

entry of an officer or person assisting him in the execution of a search warrant. But the entry of an officer without the authority of a warrant is a trespass. In general, the law is that no entry is authorized in the execution of civil process, as in the service of a subpoena. The maxim that "A man's home is his castle" expresses the general view of Anglo-Saxon law. Damages are based on the actual injuries, although they may be slight or nominal, such as the trampling down of grass. The owner may use all the force necessary to prevent a trespass or to eject a trespasser, but if he use more force than is necessary he becomes liable in tort for assault and battery. There are many circumstances under which persons are invited by implication to go upon the property of others and so do not become trespassers. Thus, it is no act of trespass to enter the house of a neighbor upon matters of business or for a social call; so keepers of hotels, stores, and theatres hold out to the public a general invitation to enter. Again, it has been held that a person who by contract has become the owner of property which is on the land of the seller may enter and take his property unless he is forbidden to do so. If an owner of land has wrongfully acquired possession of personalty and placed it on his own land, the rightful owner may retake it.

The person who may maintain an action may be either the owner or possessor. Possession usually gives the right, but ownership without possession allows a right of action for permanent injuries. A continuing or threatened trespass may be restrained by injunction.

TRES'SURE. In heraldry (q.v.), a subordinary, half the width of the orle (q.v.).

TREÜ, troi, GEORG D. C. (1843-). A German archæologist, born at St. Petersburg. He was educated at the universities of Dorpat and Berlin. In 1866-73 he lived in St. Petersburg, and thereafter till 1882 he taught at the University of Berlin. In 1877-81 he had an important part in the excavations at Olympia. His publications include: *Hermes und Praxiteles* (1878); *Ausgrabungen von Olympia*, vols. iii-v (1879-81), with Curtius, Adler, and Dörpfeld; *Bildwerke von Olympia in Stein und Ton* (1894-97); *C. Meunier* (1898); *Maa Klingers Dramagruppe* (1900); *Olympische Forschungen*, vol. i (1907); *Hellenische Stimmungen in der Bildhauerei von einst und jetzt* (1910).

TREVELYAN, tre-vél'yan, SIR CHARLES EDWARD (1807-86). An Anglo-Indian official. He was born at Taunton, Somersetshire, received his education at the Charterhouse and Haileybury College, entered the East India Company's civil service, and in 1827 went to Delhi as assistant to Sir Charles Theophilus Metcalfe, chief commissioner. In 1840 he was appointed Assistant Secretary to the Treasury, retaining the position until 1859. With Sir Stafford Northcote he prepared in 1853 a report entitled *The Organization of the Permanent Civil Service*, which is the basis of all subsequent civil-service legislation. In 1848 he was made Knight Commander of the Bath and in 1859 was appointed Governor of Madras. He was appointed Finance Minister in India in 1862 and retired in 1865

on account of ill health. Important reforms were made in the system of accounts during his financial administration and the resources of India developed by a great expansion of public works. He was created Baronet in 1874. Trevelyan was the author of several valuable treatises, some of his better-known works being: *Education of the People of India* (1838); *The Irish Crisis* (1848); *Christianity and Hinduism* (1882).

TREVELYAN, GEORGE MACAULAY (1876-). An English historian, a son of Sir George Otto Trevelyan (q.v.), educated at Harrow and at Trinity College, Cambridge. His writings comprise chiefly: *England in the Age of Wycliffe* (1899); *England under the Stuarts* (1904); *The Poetry and Philosophy of George Meredith* (1912); *Garibaldi's Defense of the Roman Republic* (1907); *Garibaldi and the Thousand* (1909); *Garibaldi and the Making of Italy* (1911); *The Life of John Bright* (1913); *Olio, a Muse, and Other Essays* (1913).

TREVELYAN, SIR GEORGE OTTO (1838-). An English statesman and author, the only son of Sir Charles Edward Trevelyan (q.v.) by his wife, Hannah More Macaulay, sister of Lord Macaulay. He was born at Rothley Temple, Leicestershire, and was educated at Harrow and at Trinity College, Cambridge. After a short period in the East Indian civil service, he entered Parliament in the Liberal interest for Tynemouth (1865) and for the Hawick Burghs (1868). He represented the Bridgeton Division of Glasgow from 1887 to 1897, when he resigned. He was appointed Civil Lord of the Admiralty under the first Gladstone administration (December, 1868), but resigned (July, 1870) owing to disagreement with the Premier on the Education Bill. In the second Gladstone administration he became Parliamentary Secretary to the Admiralty (November, 1880), Chief Secretary for Ireland (May, 1882), and Chancellor of the Duchy of Lancaster (1884). At the beginning of the third Gladstone administration he was appointed Secretary for Scotland (1886), but he resigned (March, 1886) because of the bill for establishing an Irish Parliament. And again in the last Gladstone administration he was Secretary for Scotland (1892-95). Trevelyan was a leader in the abolition of the purchase of commissions in the army and in the extension of household suffrage to the counties. Among his publications are: *The Competition Wallah* (1864); *Cawnpore* (1865); *The Ladies in Parliament, and Other Pieces* (1868); *The Life and Letters of Lord Macaulay* (1876); *The Early History of Charles James Fox* (1880); *Interludes in Prose and Verse* (1905); *The American Revolution* (4 vols., 1899-1909), a notably valuable work; *George III and Charles James Fox* (vol. i, 1912; vol. ii, 1914).

His son and heir, **CHARLES PHILIPS TREVELYAN**, was a Liberal member of Parliament after 1899. From 1908 to 1914 he was Parliamentary Secretary of the Board of Education, resigning because he opposed England's participation in the European War. See also **TREVELYAN, GEORGE MACAULAY**.

TREVEN'A, JOHN, pseudonym of an English novelist, **ERNEST GEORGE HENHAM** (c.1873-). Attacked by consumption in his seventeenth year, Henham led a wandering and often necessitous life, seeking health at home and abroad, and finding it finally 20 years later by living upon Dartmoor, the scene of his most charac-

teristic novels. Those of his books which were published under his own name include: *Menotah: A Tale of the Canadian North West* (1897); *God, Man, and the Devil* (1897); *Trenbrae* (1897); *Bonzanza: A Story of the Outside* (1901); *Soud: The Story of a Feud* (1902); *The Plowshare and the Sword* (1903); *Krum: A Study of Consciousness* (1904); *The Feast of Bacchus: A Study in Dramatic Atmosphere* (1907). The books that appeared under his pseudonym were: *A Pity in Petticoats* (1906); *Furze the Cruel* (1907), one of his best novels; *Arminel of the West* (1907); *Heather* (1908); *The Dartmoor House that Jack Built* (1909); *Granite* (1909); *Wintering Hay* (1912); *Sleeping Waters* (1913); *Adventures among Wildflowers* (1914); *Matrimony and Moyle Church Town* (both 1915). Consult F. T. Cooper, *Some English Story Tellers* (New York, 1912).

TREVES, trëvz (Ger. Trier). A city of Prussia, in the Rhine Province, on the right bank of the Moselle, 69 miles southwest of Coblenz (Map: Germany, B 4). It is situated in a region of hills, vineyards, and woods and presents a picturesque appearance. The town lies in a compact form, surrounded on three sides by promenades called allées. In the old city proper the streets are narrow and crooked. On the north is the Porta Nigra, an enormous fortified gateway—a splendid Roman relic. In the northeastern part of the city stands the cathedral, one of the oldest churches in Europe. The ancient edifice on whose site it stands appears to have been used as a church already in Roman times. The building has been repeatedly restored as the result of wars and the ravages of centuries. It is regarded as the most important pre-Carolingian church in Germany. Among its contents are an alleged nail from the cross and the famous seamless "Holy Coat." There are fine cloisters leading to the charming church of Our Lady (Liebfrauenkirche), an early Gothic structure said to date from 1143 and to be the oldest Gothic church in Germany.

In the southeastern part of Treves is the spacious Palace Square, at the north end of which stands a brick basilica dating probably from the early part of the fourth century, restored in 1846-56 and now used as a Protestant church. At the south end of the square is the Roman palace, a picturesque mass of ruins. The valuable provincial museum is near by. Among its remarkable antiquities are 60 herms, torso of Cupid, torso of an amazon, a mosaic credited to Monnus, and the Roman tombs from Neumagen, dating from the beginning of the Christian era and representing the costumes and daily life in this region at that period. A short distance southeast of the city is a Roman amphitheatre, built in Trajan's time. In the southwestern part of Treves, close to the Moselle, are the Roman baths, a vast and impressive ruin.

The municipal library, containing over 102,500 volumes and manuscripts, is connected with the Gymnasium and possesses rare works of ancient date. Among them is the illuminated Codex Egberti, dating from the close of the tenth century. There are also the Codex Aureus and the Fust and Gutenberg Bible of 1450. The manufacturing interests are varied and important. There are tanneries, iron foundries, dye works, furniture and piano factories, glass-painting works, etc. The trade is extensive in wine, fruit, and wood. The town possesses a school of viticulture. There are many mines in the vicinity.

including lead, copper, and tin mines. Pop., 1900, 43,324; 1910, 54,827.

History. Treves is usually considered the most ancient town of Germany. It was the capital of the Celtic Treviri, from whom it took its name (anciently Augusta Trevirorum). The Romans made it a colony, and it grew in importance. It was an Imperial residence in the later times of the Roman Empire, which explains the presence of the magnificent Roman relics. Treves had a bishop at a very early date. It fell into the hands of the Franks about the middle of the fifth century. The see appears to have been erected into an archbishopric soon after the beginning of the ninth century. In 870 the city, after having for a time belonged to Lorraine, was permanently united with Germany. It rose to great importance under its archbishops, who exercised temporal sway over a considerable district and who held a place among the Imperial Electors. After a long struggle with its ecclesiastical overlords, Treves was recognized as a free city towards the close of the sixteenth century. The French took Treves in 1794, and within a few years nearly the whole of the archiepiscopal see was in their possession. The archbishopric was abolished. The Congress of Vienna (1814-15) handed the city and the former see over to Prussia. Treves was bombarded by an allied aerial force in the great war which began in 1914. See **WAR IN EUROPE**. Consult: J. N. von Wilmowski, *Der Dom zu Trier* (Treves, 1874); E. A. Freeman, *Historical and Architectural Sketches* (London, 1876); Woerl, *Führer durch die Stadt Trier* (9th ed., Leipzig, 1905).

TREVES, SIR FREDERICK (1853-1923). A British surgeon, born in Dorchester and educated at the Merchant Taylors' School. He was Hunterian professor of anatomy and Wilson professor of pathology at the Royal College of Surgeons from 1881 to 1886 and examiner in surgery at Cambridge in 1891-96. From 1905 to 1908 he served as lord rector of Aberdeen University. In the South African War (1900) he was consulting surgeon and served with the Ladysmith relief column. In 1900-01 he was surgeon extraordinary to Queen Victoria, and in 1902 he operated upon King Edward VII for perityphlitis. In the latter year he was created Baronet. He was especially successful in operations for intestinal obstruction, appendicitis, and peritonitis. Notable among his many medical works is *System of Surgery* (1895). Treves also published books on travel, war experiences, etc.

TREVET, NICHOLAS. See **TRIVET, NICHOLAS.**

TREVI, trā'vê, FOUNTAIN OF. A noted fountain in Rome, with which the superstition is connected that a traveler's return to Rome is assured by dropping a coin in its basin and drinking its waters. It is built against the façade of the Palazzo Poli and was completed in 1762. The water of the ancient Aqua Virgo spouts from the rock crevices and from the nostrils of Neptune's horses, above the fountain.

TREVILLE, LOUIS RENÉ VASSOR, VISCOUNT DE LA TOUCHE. See **TOUCHE-TREVILLE, L. R. V.**

TREVISO, trā-vê'zô. The capital of the Province of Treviso, Italy, situated in a fertile valley on the Sile, 18 miles north by west of Venice (Map: Italy, D 2). It is connected with the lagoons of Venice by a canal. The town has a mediæval appearance with its high walls

flanked with bastions. The imposing twelfth-century cathedral, restored in the fifteenth century, has five cupolas. The Gothic church of San Niccolò has a curious wooden roof and is adorned with admirable frescoes. The Borgo Cavour contains a library of over 50,000 volumes and a picture gallery. Among the educational institutions are a technical school, a school of navigation, a bishop's seminary, and an academy of sciences. The city manufactures silk and woolen goods, metal ware, machinery, chemicals, and paper. Pop. (commune), 1901, 33,987; 1911, 40,219. Treviso, the Roman Tarvisium, was an important city towards the end of the Roman Empire. It figured among the cities of the Lombard League. It came under the rule of Venice in the fourteenth century. In 1797 it was taken by the French under Mortier, who received the title of Duke of Treviso.

TREVISO, DUKE OF. See **MORTIER, E. A. C. J.**

TREVITHICK, RICHARD (1771-1833). A British mechanical engineer and inventor, distinguished for his improvements of the steam engine and as the designer of the first practicable locomotive. He was born at Illogan in Cornwall and received a common-school education previous to becoming an engineer in the mines in his vicinity. Engaged in the construction of pumping and other engines, he was associated with Murdock, Bull, and other well-known engineers and was constantly experimenting with machinery. He effected various improvements in pumps and designed a high-pressure steam engine in 1800 which was soon in wide use in the mines of Cornwall and Wales. Turning his attention to the designing of steam vehicles, as early as 1796 he made a number of models on a small scale and in 1801 completed and operated a full-size vehicle for which he received a patent in the following year. This steam carriage was so successful that Trevithick with the assistance of Andrew Vivian was led in 1804 to build a locomotive engine to operate on the Merthyr Tydfil tram road. This was the first application of steam to the hauling of loads on a railway and led to the construction of further steam locomotives operating on rails, including one which was exhibited in London in 1808 on a circular track. As Trevithick understood that the friction of the wheels on the rails was sufficient for the traction of cars on ordinary grades (in distinction from other inventors who employed a cog and rack), and as he was the first to use a return flue boiler and a steam jet in the chimney, and to couple together the wheels of a locomotive, he is considered by many entitled to the credit of being the real inventor of the locomotive steam engine. It is, however, to Stephenson (q.v.) that we must look for the perfection of a practical application of the machine. See **LOCOMOTIVE**; **RAILWAYS**.

In 1816 Trevithick went to Peru, where a number of his engines had been introduced into the silver mines, and, after being successful in several undertakings, lost his entire property through the outbreak of war. At Cartagena in 1827 he encountered Robert Stephenson (q.v.), who assisted him to return to England. The remainder of his life was spent in further experiments, few of which came to a successful outcome, and he died in poverty. While Trevithick reaped but little material reward for any of his inventions, yet he made many discoveries which were of the greatest use to other engineers when practically applied and successfully de-

veloped. Consult: Smiles, *Lives of Engineers* (London, 1861); Francis Trevithick, *Life of Richard Trevithick* (ib., 1872); E. K. Harper, *A Cornish Giant, Richard Trevithick: The Father of the Locomotive-Engine* (ib., 1913).

TRIAD (from Lat. *trias*, from Gk. *τριάς*, number three, triad, from *τρεῖς*, *treis*, three). In music a chord of three tones built upon any tone with its third and fifth above. According to the character of the intervals (major, minor, augmented or diminished) the character of the triad varies materially. See HARMONY, *Chords*.

TRIAL (OF. *trial*, from *trier*, to try, choose, thresh, from ML. *tritare*, to thresh, rub, frequentative of Lat. *terere*, to rub, thresh). A regular and formal examination or inquiry into the material facts of a controversy in issue before a competent tribunal, in order finally to determine the respective rights of the parties thereto. Trials may be divided into two classes—those by a judge and jury and those before a judge without a jury. In a legal action the trial is usually before a jury. (For the ordinary steps in a jury trial, see JURY.) In courts of equity trials are conducted before the chancellor or judge without a jury, substantially in the same manner as in a jury trial. The codes of reformed procedure and practice acts in most of the United States regulate the details of trials in their various courts. See EVIDENCE; JURY; NOLLE PROSEQUI; NONSUIT; PLEADING; PRACTICE; ETC.; and consult authorities under EVIDENCE; JURY; PLEADING; ETC.

TRIAL BY BATTLE. See BATTLE, TRIAL BY; ORDEAL.

TRIAL BY JURY. The first comic opera by Gilbert and Sullivan (see GILBERT, SIR W. S.; SULLIVAN, SIR ARTHUR), first produced in London, March 25, 1875.

TRIANGLE (Lat. *triangulus*, three-cornered, from *tres*, three + *angulus*, angle). A figure formed by three intersecting lines. The sides of a plane triangle are straight lines, and those of a spherical triangle are geodetic lines or arcs of great circles. Triangles are called equilateral, isosceles, and scalene according as three sides, two sides, or no sides are equal, but the word "scalene" is rarely used. Of two angles of a plane triangle, the one which is opposite the greater side is the greater, but the angles do not vary as the sides, the ratio of two sides being equal to that of the sines of the opposite angles. (See TRIGONOMETRY.) In a spherical triangle the sines of the sides are proportional to the sines of the opposite angles. The sum of the angles of a plane triangle is 180° according to Euclidean geometry (see GEOMETRY), but in the case of a spherical triangle the sum varies from 0° to 540°. The geometry of the triangle is extensive, and a few of the most important propositions are given under CONCURRENCE AND COLLINEARITY AND MAXIMA AND MINIMA. The area of any plane triangle is given by the formulas $\Delta = \frac{bh}{2}$ and $\Delta = \sqrt{s(s-a)(s-b)(s-c)}$,

where b is the base, h the altitude, a , b , c the sides, and s the semiperimeter. In case the triangle is equilateral, $\Delta = \frac{a^2\sqrt{3}}{4}$, where a

is the side. If one angle of a plane triangle is a right angle, the triangle is called a right-angled triangle, the side opposite the right angle being the hypotenuse. In the United States the term "right triangle" is commonly used for "right-

angled triangle." The spherical triangle of one, two, or three right angles is called a rectangular, birectangular, or trirectangular triangle respectively. The spherical triangle in which one, two, or three sides are quadrants is called a quadrantal, biquadrantal, or triquadrantal triangle respectively. The area of a spherical triangle is given by the formula $\Delta = \frac{\pi R^2 E}{180}$,

where R is the radius of the sphere and E the spherical excess (q.v.), or $A + B + C - 180^\circ$. Consult Catalan, "Quelques formules relatives aux triangles rectilignes," in the *Mémoires couronnés* of the Brussels Academy (1891), and Casey, *Sequel to Euclid* (5th ed., Dublin, 1888).

TRIANGLE. A musical instrument consisting of a steel rod bent into a three-sided figure open at one angle. It is hung by a cord at the upper angle and attached to the performer's left hand, to his desk, or to his drums. Modern composers frequently use it in marches, dances, and fantasias. As it is used only for rhythmic figures, the music is written, as for drums and other instruments without fixed pitch, upon a single line.

TRIANGLE. In architectural and engineering drafting, an instrument of wood, hard rubber, or celluloid for drawing lines at given angles to the T-square. There are two forms commonly used, both having one right angle and two acute angles, of 45° in the one form and, in the other, of 30° and 60°.

TRIANGLE OF FORCES. See MECHANICS.

TRIANGLE SPIDER. A spider (*Hyptiotes cavatus*) of the family Uloboridae, common in the eastern United States. Its web is usually stretched between the twigs of dead branches and at first appears like the fragment of an orb web. It consists of four plain radiating lines and a series of double crosslines. From the apex of the triangle a strong line extends to the supporting twig. The spider stations itself on this line and draws up a slack which when loosened jars the whole web, entangling engaged insects in the cross threads. Consult J. H. Comstock, *The Spider Book* (new ed., New York, 1914).

TRIANGULAR NUMBERS. See NUMBER.

TRIANGULATION. A method used in surveying when the area to be surveyed is of considerable extent. It consists, as the name indicates, in laying out a system of triangles by means of which intermediate points are located. See GEODESY; SURVEYING.

TRIANON, tré'á'nôn'. The name given to two villas in the Park of Versailles. The Grand Trianon was built in 1685 by Louis XIV for Madame de Maintenon. The Petit Trianon, built by Louis XV in 1766 for Madame Du Barry, was afterward a favorite resort of Marie Antoinette. See PLATE of INTERIOR DECORATION.

TRIARTHURUS (Neo-Lat., from Gk. *τρεῖς*, *treis*, three + *ἄρθρον*, *arthron*, joint). A genus of Ordovician trilobites with depressed convex carapace of elongate oval outline, of which the middle third is occupied by the broad axis. The thorax has 14 to 16 segments, in the middle of each of which there is a rounded knob, and the pygidium is small and semicircular. The best-known species is *Triarthrus becki* of the Utica shale of North America. See TRILOBITA.

TRIASSIC SYSTEM (from Lat. *trias*, number three, triad). A group of rocks immediately following the Carboniferous and preceding the Jurassic system. It is therefore the oldest for-

mation of the Mesozoic era. The rocks of this system were at first associated with the Permian under the name of the New Red Sandstone (q.v.), but they were finally separated and designated as the Trias by German geologists, who divided the system into three series, the Keuper, Muschelkalk, and Buntersandstein. The Rhætic clays and sandstones were subsequently added to the system.

Much difficulty has been found in subdividing the American Trias and still more in correlating it with the European beds. Indeed, in the United States it is often difficult to separate the Triassic from the Jurassic, and consequently the plan adopted by the United States Geological Survey is to designate them as the Jura-Trias, and consider the deposits as one formation.

The Pacific Coast beds are marine, while those of the Atlantic border are estuarine. In the Eastern States the Triassic formation consists of a series of sandstones and shales extending more or less unbrokenly from the Connecticut valley to South Carolina. The rocks were deposited in shallow water along the continental shores. The Newark rocks are in many places faulted and intruded by igneous rocks, the eruptions having in some cases occurred while the deposition of sediment was still going on, being thus in the nature of submarine outbursts. The Palisades of the Hudson River and the East Rock at New Haven, Conn., are formed of diabase erupted during the Triassic period. Some doubt exists as to whether the Triassic rocks of the Atlantic border were one continuous belt or whether they were deposited in separated troughs. In the interior of the continent along the Rocky Mountains there are extensive beds of red sandstone which were deposited in an inland sea, but whether they belong to the Triassic or Jura-Trias is unsettled. On the Pacific coast the Triassic rocks have a maximum thickness of nearly 5000 feet. Triassic rocks are known in Central and South America, Europe, Asia, and Australasia.

The plant life of the Triassic included ferns, cycads, conifers, and gigantic representatives of the Equiseta, or horsetails. The accumulated remains of these plants contributed to the formation of important coal seams. Among the vertebrates fishes were fairly abundant, the dominant type being ganoids; but the most characteristic class was the Amphibia, which attained its greatest development in this period. Of reptiles the ichthyosaurs, plesiosaurs, dinosaurs, crocodiles, and turtles were present, while the earliest representatives of the Mammalia came into existence.

The Triassic beds of the Atlantic border formerly were quarried extensively, yielding the well-known brownstone once so popular as a building material in the Eastern cities. Deposits of coal are found in the Triassic of Virginia and North Carolina and in parts of Europe, but they are of minor importance compared with the great coal measures of the Carboniferous age.

TRIBE (Lat. *tribus*, tribe; possibly connected with *trabs*, beam, Lith. *troba*, building, OWelsh, OBret. *treb*, habitation, subdivision of the people, OHG. *dorf*, Ger. *Dorf*, Eng. *thorp*, village). A territorial group of varying size, embracing individuals linked together by linguistic, cultural, and perhaps primarily political bonds. It is a matter of judgment whether to regard closely allied groups speaking mutually intelligible dialects as distinct tribes or not. This often depends on the emphasis placed on political independence as compared with, say, similarity of speech. When the term is applied to several groups each of which is restricted to a part of the tribal area, these local subdivisions may be called *bands* or *hordes*. A union of tribes, when definitely organized, is called a *league* or *confederacy*, as in the case of the five Iroquois tribes; while Spencer and Gillen have applied the term "nation" to the much vaguer union of culturally and linguistically related tribes of central and north-central Australia. The essential thing is to confine the term "tribe" to a local unit as contradistinguished from social subdivisions, such as moieties, clans, gentes, or castes.

A few concrete illustrations may elucidate common ethnological usage. The Assiniboin speak merely a dialect of the Dakota language and from this point of view might be classed as one tribe with the Yanktonnais Dakota. Nevertheless, they have broken away so decidedly as a political unit that no one would deny to them the title of a separate tribe. The Blackfoot are sometimes spoken of as a single tribe, comprising as subdivisions the Blood, Piegan, and Northern Blackfoot, while other writers prefer to speak of a union of three distinct tribes. Both usages seem permissible, since here we have certainly a great degree of unity when the Blackfoot divisions are compared with alien groups, while at the same time each preserved an appreciable degree of individuality. In Africa the prominence of the monarchical idea generally simplifies the use of the term. There a tribe comprises usually the entire following of a certain ruler, the political factor even obscuring the territorial principle, i.e., if a king for any reason shifts his headquarters to those of another ruler, the subjects of each would remain distinct units. The term "tribe," then, cannot be rigidly defined, but in its use the territorial and political features are clearly predominant.

TRI' BONIA' NUS. A distinguished Roman jurist of the sixth century A.D. He was of Macedonian parentage, but was born at Side in Pamphylia. He held under the Emperor Justinian (q.v.) the offices of quaestor, master of the Imperial household, and consul. But he is famous chiefly through his labors in connection with the Code of Justinian and the pandects (q.v.). He died in 545.

TRIB'UNE (Lat. *tribunus*, originally a tribal officer, from *tribus*, tribe). In ancient Rome the name "tribune" was applied to two distinct

functionaries, the military tribunes (*tribuni militum*) and the tribunes of the plebs (*tribuni plebis*), which will be considered separately. 1. In the traditional organization of the citizens by Romulus (q.v.) the leader of the quota of warriors furnished by each of the three tribes was called *tribunus militum*; and the same was true when the tribes were increased to four under Servius Tullius, when we read also of *tribuni aerarii*, whose duty it was to collect and pay into the treasury the tribal taxes (tribute). (See ROME, *Ancient Rome, History of Rome During the Earliest or Regal Period*.) Under the Republic each legion was under the command of six military tribunes, at first appointed by the consuls (who were the commanders in chief), afterward elected at the *comitia tributa*. (See COMITIA.) Their importance was greatly diminished at the end of the Republic, when the actual command of the legion in the field was confided to a skilled officer called *legatus legionis*, and the six *tribuni militum* were retained only as an honorary staff of the general. (See LEGION.) With the formal development of the *cursus honorum*, or regular sequence of offices for men of senatorial rank, the military tribuneship took its place in the preliminary service, as a stepping stone by which young nobles might reach the higher positions. Under the Empire the name *tribuni* was given also to the officers of each cohort of the praetorian guard (q.v.), city guards (*cohortes urbanae*), and night watch (*vigiles*). Consult the works named at the end of 2, below; J. Marquardt, *Römische Staatsverwaltung*, vol. ii (2d ed., Leipzig, 1884); G. H. Allen, "The Advancement of Officers in the Roman Army," in *Supplementary Papers of the American School of Classical Studies in Rome*, vol. ii (New York, 1908); G. L. Cheesman, *The Auxilia of the Roman Imperial Army* (Oxford, 1915).

2. In the early period all the perquisites and prerogatives of government in Rome were in the hands of the patricians, while the plebs, the bulk of the people, had only the burdens of taxation and military service. (See ROME, *Ancient Rome, History of Rome during the Earliest or Regal Period*; *The Roman Republic from its Institution to the Abolition of the Decemvirate*, Internal History; *From the Abolition of the Decemvirate to the Defeat of the Samnites, etc.*, Internal History.) This galling condition is said to have been partly remedied by the secession of the plebs in 494 B.C., when they secured the right to have annual magistrates, called *tribuni plebis*, chosen from their number to look after their especial interests and needs. These were six in number (at first perhaps five), served for one year, and were reëligible. They were invested with three important privileges: (1) *ius auxilii*, the right to defend a plebeian on any charge; (2) *intercessio*, the right of vetoing any measure proposed by the Senate (q.v.); (3) personal inviolability during their term of office. After 471 B.C. the tribunes were regularly elected by the popular *comitia tributa*. (See COMITIA.) The power and energy of the plebeian tribunes were responsible for the gradual extension of political rights to all the people, and to the struggle between the patricians and plebeians that marks the history of the Republic. They caused the codification of the laws (Twelve Tables) in 451 B.C.; the recognition of the popular decrees (*plebiscita*) as binding on all alike

(449); the recognition of the right of intermarriage between patricians and plebeians by the *lex Canuleia* (445); the successive opening up of the high offices to the plebeians; the Licinian Rogations (q.v., 367); and the agrarian agitation of Tiberius and Gaius Gracchus. (See AGRARIAN LAWS; GRACCHUS.) Augustus Caesar took to himself the power and rights of the tribunes (*tribunicia potestas*), and hence under the Empire the office lost its importance, becoming a function for senators of plebeian rank, held between the quaestorship and the praetorship. Consult the article "Tribunus" in W. Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891); A. H. J. Greenidge, *Roman Public Life* (ib., 1901); J. E. Granrud, *Roman Constitutional History* (Boston, 1902); G. W. Botsford, *The Roman Assemblies* (New York, 1909); F. F. Abbott, *A History and Description of Roman Political Institutions* (3d ed., Boston, 1911).

TRIBUNE. In architecture, a place or structure from which to address an audience; a use of the term derived from the Roman provisions for the promulgation of decrees of the tribunes or magistrates. The term is variously applied to (a) the apse of a church; (b) any pulpit or platform, civil or ecclesiastical, and especially the platform and desk from which alone, in the French Senate or Chamber of Deputies, the legislator is allowed to address the chamber; (c) a balcony or gallery in a church or hall, for musicians, as, e.g., those once in the cathedral of Florence (now in the Opera del Duomo), sculptured by Donatello and Luca della Robbia with exquisite figures of children singing and playing on instruments.

TRIBUT DE ZAMORA, trē'bu' de zà'mó'rà', LÉ. An opera by Gounod (q.v.), first produced in Paris, April 1, 1881; in the United States, Jan. 12, 1888 (New Orleans).

TRIBUTE (Lat. *tributum*, from *tribuere*, to grant, pay, or assign, originally to a tribe, from *tribus*, a tribe). Money, commodities of value, or services rendered by one ruler or state to another in token of submission, as distinguished from taxation, which is the legal imposition of financial burdens by a state upon its own subjects. This distinction cannot be said, however, always to have prevailed, and, under the feudal system especially, taxation, tribute, and rent were in many cases identical. This was natural under a system where the political superior was at the same time the owner of the land, and where such land was held largely by military tenure. Aids and reliefs were essentially of the nature of tribute, as also were the tolls and services levied upon the cultivators of the soil by their lords, or exactions like that of heriot (q.v.). See FEUDALISM.

TRICAR. See CYCLE CAR; SIDE CAR.

TRICERATOPS (Neo-Lat., from Gk. *τρεις*, *treis*, three + *κέρας*, *keras*, horn + *ὤψ*, *ōps*, face). An interesting fossil reptile, a horned dinosaur of formidable aspect, of which skeletons are found in the Upper Cretaceous rocks of Colorado, Dakota, Wyoming, and Montana. The animal was about 25 feet long, with heavily built legs and powerful tail. The most peculiar feature is the strong armature of the massive head. The skull is larger than that of any other known land animal, with a length of 6 feet and a width across the crest of about 5 feet. It is wedge-shaped and narrow in front of the small orbits and expanded behind into

a broad solid bony crest which projects far backward over the neck and shoulders, with edges armed with a row of sharp projections that were covered by horn. On the facial region are three horns: a long outward spreading pair over the orbits and a small horn on the nose. The jaws have strong turtle-like beaks on their tips and series of two-rooted teeth placed in sockets in their posterior portions. The brain of this creature was smaller than that of any other known vertebrate, with a ratio to bulk of body of two pounds to 10 tons. The feet were three-toed, and the beast walked on all fours and fed on plants. Consult: Zittel and Eastman, *Textbook of Paleontology*, vol. ii (London and New York, 1902); Marsh, "The Dinosaurs of North America," in *Annual Reports of the United States Geological Survey*, vol. xvi, part i (Washington, 1896); Lucas, *Animals of the Past* (New York, 1914), which contains interesting observations on the habits of *Triceratops*. See DINOSAURIA, and Plate of DINOSAURS.

TRICHECHIDÆ, trī-kēk'ī-dē. See CARNIVORA; PANNIPEDIA.

TRICHIASIS, trī-kī'ā-sīs (Neo-Lat., from Gk. *τρίχιας*, from *θρίξ*, *thriw*, *τρίχης*, *trichos*, hair). An inversion of one or more eyelashes, their points rubbing against the globe of the eye. It results from cicatricial contraction or long-continued inflammation of the eyelids. The symptoms, like those of entropion (q.v.), are caused by irritation of the conjunctiva by the rubbing of the eyelashes. The treatment consists in plucking out the offending hairs (if they are few in number) from time to time. Electrolysis may be employed. In other cases it may be necessary to perform a plastic surgical operation on the lid.

TRICHINA, trī-kī'nā (Neo-Lat., from Gk. *θρίξ*, *thriw*, hair). A peculiar nematode worm, which in its sexually immature state inhabits the muscles of mammals, usually the pig. It was discovered in 1835.

The young trichinæ, as seen in human muscle, present the form of spirally coiled worms, in the interior of small, globular, oval, or lemon-shaped cysts, which appear as minute specks scarcely visible to the naked eye. The cysts are sometimes altogether absent and hence must be regarded as formations resulting from local inflammation set up by the presence of the worm, which in this larval condition measures about a millimeter long. These larval worms exhibit a well-marked digestive apparatus and afford evidence of the presence of reproductive organs, which are often sufficiently developed to enable the observer to determine the sex. The number of larval trichinæ that may simultaneously exist in the muscles of a single man or animal is enormous.

When an animal is fed with flesh containing the larval worm and is killed a few days afterward, a large number of minute worms are found in the contents of the small intestines. On the second day after their introduction these intestinal trichinæ attain full sexual maturity, and in six days the females contain perfectly developed and free embryos.

The female is a slender round worm, varying in length from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch. The anterior end presents a beadlike appearance, from which the intestinal canal proceeds. The posterior three-fourths are mainly occupied by the reproductive organ, which is filled partly

with free embryos and partly with eggs in various stages of maturity. The females continue bringing forth young for two or three weeks. The embryos penetrate the walls of the intestine and pass either through the body cavity or by means of the blood vessels into the muscles of the host, where, if conditions are favorable, they are developed into the encysted form. Some of them reach the muscles of the extremities and other distant parts; but the majority remain in those sheathed muscular groups which are the nearest to the cavity of the body (abdomen and thorax), especially in those which are smaller and most supplied with connective tissue. These embryos penetrate the interior of the separate muscle fibres, and in 14 days acquire the size and organization of *Trichina spiralis*. In the adult condition trichinæ perish in cold water in about an hour and cannot survive the decease of their host for more than six hours, but the larvæ remain alive in water for a month and will live for a long time in flesh which has become putrid. In this way a carcass near a marsh or rivulet may communicate the parasites to the ruminants that drink the water or to pigs. The formation of the cysts is the cause of more or less serious injury to the host, according to the number present. When abundant, the weakness is very marked and is often fatal. In man infection occurs almost invariably through the eating of raw or underdone pork containing the cysts. If the meat is properly cooked the worms will be destroyed. Consult Max Braun, *Die thierischen Parasiten des Menschen* (3d ed., Würzburg, 1903). See PARASITE, ANIMAL.

TRICHINIASIS, trik'ī-nī'ā-sīs, or **TRICHINOSIS**, -nō'sīs (Neo-Lat., from *trichina*, trichina). A disease caused by the ingestion of meat (pork or sausage) containing trichina (q.v.), characterized by a number of diverse symptoms. In 1831 Hilton Warmald first noted the characteristic specks while dissecting; but the trichina was demonstrated by Paget and the naturalist Sir Richard Owen in 1835. Zenker first demonstrated, in 1860, that trichiniasis caused death, and Virchow (q.v.) first propagated the nematode in an animal and demonstrated its presence in the intestine in 1859. Leuckart in the following year presented a full, lucid, and complete solution of the whole question. After being swallowed, the trichina worms traverse the connective tissue and gain access to all parts of the body. They are found in the muscles of the trunk and head as well as in the extremities, and thickly placed in the diaphragm, the intercostals, the muscles of the neck and of the eyes. The intestinal canal shows catarrhal changes, and the trichina may be found in the intestinal mucosa. The mesenteric glands are swollen. The heart muscle is almost invariably free from invasion.

The parasite occurs in two forms—one, a sexually mature form (intestinal trichina), the other an immature form (muscle trichina). The intestinal worm is small and hairlike, the male being $\frac{1}{16}$ of an inch long, the female $\frac{1}{8}$ of an inch long. Muscle trichina develops its sexual apparatus after invading the intestinal canal, and the embryos at once migrate from the intestines to the muscular system of the victim, where they set up an inflammatory reaction and become encapsulated in a fibrous envelope, where they lie coiled. Lime salts are

gradually deposited about the capsule and in the parasite itself. Development is very rapid; within two days after infected pork enters the digestive tract the muscle larvæ mature; embryos are born six days later, and in about two weeks migration to the muscle is completed. The mortality of trichiniasis varies between 20 and 50 per cent.

The early symptoms of the disease are nausea, vomiting, colic, and diarrhœa. The muscles become weak, and great weariness is experienced. Between the tenth day and the sixth week the muscles become stiff and tender. This condition is most noticeable in the flexors of the extremities, and occasionally the knees or elbows will be bent and rigid. Edema is characteristic and appears about the seventh day, first in the eyelids and the face, next in the extremities, and is probably due to toxins excreted by the parasites. Profuse sweating is characteristic; insomnia is a common symptom together with headache. In the blood the eosinophile cells are greatly increased. Swine suffer principally, among the lower animals; but rats, mice, rabbits, and guinea pigs are easily infected. Horses, cattle, sheep, goats, and dogs are infected less readily. It has been stated that rats carry the parasites to swine. Cats are occasionally victims of trichiniasis.

It is supposed that the parasite gained access into Europe through the introduction of the Chinese pig early in the nineteenth century. The disease was epidemic in Syria in 1881 and has appeared in Algiers, in South America, in the West and Massachusetts in the United States, in France, in Basel, Switzerland, in Malaga, Spain, in Russia, Sweden, Norway, and Denmark, in England in 1871, in North Germany since 1849, an epidemic occurring in Hettstedt in 1863.

Prophylaxis consists in the careful inspection of swine, after slaughtering, by competent microscopists, who take sections from the muscles of mastication, the laryngeal and abdominal muscles, and the diaphragm. There is no treatment for the disease, and in all probability many nonfatal cases occur which are diagnosed as rheumatism or some acute fever, as well as some cases of pneumonia in which the trichina parasite is the unidentified cause. Consult an article by C. W. Stiles, in William Osler, *Modern Medicine* (New York, 1914).

TRICHINOPOLI, trich'i-nōp'ō-lī. The capital of a district of Madras, British India, on the right bank of the Kaveri, below the island of Srirangam (q.v.), 56 miles from the sea and 190 miles by rail southwest of Madras (Map: India, C 7). The old town, now inclosed by boulevards, stands at the base and on the rugged slope of a granite rock, 273 feet high, crowned by a temple, a much-frequented pilgrimage shrine. The native town is inhabited by a dense population dwelling in low, closely packed huts. The chief building is the former Nawab's palace, now restored and used as government offices. There are several Protestant missions and a college and also a Jesuit college and a fine Roman Catholic cathedral. Beyond the boulevards is St. John's Anglican Church, containing the tomb of Bishop Heber, who died here in 1826; to the south near Golden Rock, a hill about 100 feet high, is the central jail, one of the largest buildings of its kind in Madras. Cheroots are manufactured in large quantities from excellent tobacco grown in the vicinity. Weav-

ing and the manufacture of hardware, cutlery, jewelry, gold chains, harness, and saddlery are extensively carried on. Trichinopoli was governed by a line of rajahs that died out in 1732 when it came under the rule of the Nawab of Arcot. It came under British control in 1801 with the rest of the region. Pop., 1901, 104,721; 1911, 123,512.

TRICHINOSIS, trik'i-nō'sis. See TRICHINIASIS.

TRICHOLOMETHANE. See CHLOROFORM.

TRICHOGYNE, trik'ō-jin (from Gk. *θρίξ*, *thrix*, hair + *γυνή*, *gynē*, woman, female). One of the cells of the female organ (procarp) of the red algæ (see ALGÆ), appearing as a hair-like extension of the female cell. Against it the male cells lodge, and into it they discharge their contents, which pass into the female cell.

TRICHOME (from Gk. *τρίχωμα*, *trichōma*, growth of hair, from *τρίχων*, *trichoun*, to furnish with hair, from *θρίξ*, *thrix*, hair). A hair-like outgrowth from the epidermis of plants, usually arising from a single cell. These structures are known variously as hairs, glands, bristles, bladders, scales, prickles, warts, etc., and may be one or many celled. The long hairs on the seeds of cotton are simple and unicellular. The filaments on the stamens of the spider lily (*Tradescantia*) are multicellular and simple. Branched unicellular hairs may be found on the common shepherd's purse (*Capsella*) and branched multicellular hairs on mullein. Hairs with flattened expansions at the top are called scales. Glandular hairs are widely distributed among plants, being usually unbranched and with a knob at the apex, which secretes such substances as resins, gums, ethereal oils, mucilage, and sugar. When the substance is secreted in a liquid form it moistens the surface, but when volatile it is recognized as an odor. Root hairs are hairlike outgrowths from the epidermal cells of the root. They greatly increase the surface of exposure for the intake of soil water. Many plants and organs which bear hairs during early stages of development become smooth as they grow older. Environment also affects the hairiness of a structure. A plant growing in a very dry situation may be hairy, while another individual of the same species growing in a wet situation may be much less hairy or even entirely smooth. Systematists have made large use of the trichome in describing plants and have developed a large number of descriptive terms.

TRICHOPTERA, tri-kōp'te-rā (Neo-Lat. nom. pl., from Gk. *θρίξ*, *thrix*, *τριχ-*, *trich-*, hair + *πτερόν*, *pteron*, wing). An order of insects containing the caddis fly (q.v.).

TRICHOISM. See DICHOISM.

TRICLINIC SYSTEM. See CRYSTALLOGRAPHY and Plate of CRYSTAL FORMS.

TRICLINUS, DEMETRIUS. See DEMETRIUS TRICLINUS.

TRICOLOR (Fr. *tricolor*, from Lat. *tres*, three + *color*, color). Literally a flag in three colors, which is the case in almost every national ensign, but usually restricted in sense to flags having three colors in equal masses. The principal tricolor ensigns are those of France—blue, white, and red, divided vertically; Germany—black, white, and red, divided horizontally; Russia—white, blue, and red, divided horizontally; Italy—green, white, and red; Belgium—black, yellow, and red; and Mexico—green, white, and

red; the last three all divided vertically. The French tricolor took its use at the outbreak of the revolution of 1789, as the badge of the National Guard. The red and blue were selected as the arms of Paris, and the white was added as the color of the army, to show the intimate union which should subsist between the people and the national defenders.

TRICTRAC. A variety of backgammon (q.v.).

TRIDENT (Lat. *tridens*, three-toothed, from *tres*, three + *dens*, tooth). In classic mythology, the attribute of Poseidon (see NEPTUNE), god of the sea. It consists of a staff, armed at one end with three short prongs, with double barbs at the points.

TRIDOLIN, tré'dô'lân'. See FRIDOLIN.

TRIDYMITE (from Gk. *τρίδυμος*, *tridy-mos*, threefold, from *τρεῖς*, *treis*, three; so called from its frequent crystallization in groups of three). A mineral silicon dioxide crystallized in the hexagonal system. It resembles quartz, from which it differs, however, in having a lower specific gravity. It occurs chiefly in acidic volcanic rocks and was originally discovered in 1868 in the trachyte of San Cristóbal in Mexico. It has been prepared artificially by dissolving a silicate in a bead of phosphorus salt.

TRIENNIAL ACT. A British statute of the reign of William III (1694), directing that no Parliament should last longer than three years. This period was made seven years by the Septennial Act of George I (1716) and reduced to five in 1911. The session of the 1911-16 Parliament was extended, by a special bill, to Jan. 31, 1917.

TRIER, trēr. The German name for Treves.

TRIEST, tré-est', or **TRIESTE**. The principal seaport of Austria-Hungary, situated at the northeast extremity of the Adriatic Sea, on the Gulf of Triest, 367 miles by rail southwest of Vienna (Map: Austria, C 4). Triest and the adjoining district form an Austrian crownland, and the city is the general administrative seat of the Austrian Küstenland (q.v.). The city, which is strongly fortified, extends somewhat in the manner of an amphitheatre along the acclivity of the Karst (q.v.). The old town, with its narrow, crooked, and steep streets, lies at the base of the Castle Hill and between it and the gulf. In its northwestern corner, close to the water, is the Tergesteo, a huge edifice, whose cruciform arcades, roofed with glass, are used for the exchange and for various shops and offices. Near by are the two leading squares, the Piazza della Borsa and the Piazza Grande. From this vicinity the Corso, the principal street, extends eastward, separating the old town from the new quarter, where broad avenues lead up towards the inclosing hills. On the west side of the Castle Hill, in the old town, the cathedral of San Giusto occupies a conspicuous site where a Roman temple once stood. It is a composite structure, dating from the fourteenth century. It was formed by joining three ecclesiastical edifices, which had stood there since the sixth century. On the Piazza Grande are the splendid new municipal buildings. Triest has a Museo Lapidario, an open-air museum of Roman antiquities, occupying a disused cemetery. The town has a nautical academy containing the municipal museum, with Roman antiquities, and the Ferdinand-Maximilian Museum, with its collection of Adriatic fauna.

Towards the southern end of the city is the Museo Civico Revoltella in the palace of that

name. Near by stands the fine bronze monument to Maximilian of Mexico by Schilling. From this point leading south and following the curve of the gulf extends the Passeggio di Sant' Andrea, affording fine views for more than 3 miles, and reaching the vast wharves of the Lloyd Company. The public gardens are in the northeast of the city. Among the attractions of Triest is the famous chateau of Miramar, situated on the sea to the northwest, which belonged to Maximilian. It has a lovely park and offers beautiful sea views. The city contains a Greek church with rich decorations, a Jesuit church, and a Capuchin convent. There are a commercial academy, an astronomical and meteorological observatory, a public library with over 120,000 volumes, and museums of natural history and antiquities.

The harbor, the main attraction of Triest proper, has been greatly extended and improved. There are a number of moles and an immense breakwater. The Canal Grande (only 400 yards long) penetrates the city north of the Corso and permits vessels to load and unload at the warehouses. Triest has a naval arsenal and is the storehouse for the Austro-Hungarian navy. Triest has of late years found a rival in the Hungarian port of Fiume, but its commercial preëminence is vigorously supported by the Austrian government. In 1913 there were entered at the port 14,231 vessels, of 5,480,074 tons, and cleared 14,186, of 5,475,445 tons. There is a very large trade in grain, oil, wine, and many other products. The local mercantile fleet is large. At the Austrian Lloyd shops many vessels are annually constructed. Triest builds ships of all varieties and manufactures marine steam engines, cables, furniture, silks and cottons, clothing, liquors, wax lights, soap, etc.

Pop., 1910 (city), 160,993; crownland, 229,510. The crownland consists of the city and outlying territory; its total area is only 36.9 square miles. In the crownland the percentage of persons whose vernacular was Italian was 62.3; Slovene, 29.8; German, 6.2. Of the inhabitants of the crownland, 94.9 per cent were returned as Roman Catholic, 2.4 Jewish, and 1.1 Evangelical.

History. Triest is the Roman Tergeste. Since 1382 it has been a part of Austria, except in 1797-1805 and 1809-13. It was made a free port in 1719 by Charles VI, which date marks the beginning of its importance. It finally became the commercial rival of Venice. With its territory it was constituted a separate crownland in 1867. Triest was the objective of an Italian campaign in the great war. It was attacked by aerial forces several times. See WAR IN EUROPE. Consult: J. Löwenthal, *Geschichte der Stadt Triest* (Triest, 1857-59); Scussa, *Storia cronografica di Trieste* (new ed., ib., 1885-86); F. H. Jackson, *Shores of the Adriatic: The Austrian Side* (New York, 1908).

TRIFAIL, tré'fíl. A town in Styria, Austria, on a tributary of the Save, 66 miles southwest of Marburg. Trifail has one of the most productive mines of lignite in Austria. There are large cement, chemical, and glass works. Pop., 1900, 10,851; 1910, 11,578.

TRIFOOLIUM. See CLOVER.

TRIFORIUM (ML., from Lat. *tres*, three + *foris*, door, opening), or **TRIFORIUM GALLERY**. The arcade opened up in the wall of the nave of a mediæval church immediately above the pier arches and under the clearstory windows. The name was derived from the cus-

tom of dividing each bay of this gallery into three arches, though this was by no means the constant rule, early galleries having often a single arch and later ones having two, four, or more arches in each bay. The triforium, whose origin is probably the open gallery above the side aisle in Byzantine and Romanesque churches, was in many Gothic churches inserted between the summit of the aisle vault and the top of its slanting roof, though in developed Gothic the roof line was often changed so as to let light into the gallery. The earlier churches had higher galleries, especially in English Norman churches; but during the thirteenth century the French Gothic builders diminished their size and usefulness, retaining them mainly for decorative purposes and as blind or semiblint galleries, not intended to be used by the congregation.

TRIGGER FISH. One of the fishes of the plectognath family Balistidae, characterized by an ovate body covered with large rough scales, and the fact that the first spine of the anterior of the two dorsal fins is high and strong and may be lifted, when it is locked erect by the spine behind it; whence the name. About 50 species are known, mainly in Indo-Pacific regions, where they become rather large and remain near shore; some are herbivorous, others carnivorous. Their flesh is rarely eaten, as it is reputed poisonous. Several species of the genus *Balistes* inhabit the American tropics, of which one, the cicuyo, or leather jacket (*Balistes carolinensis*), is common in the Gulf of Mexico and on the South Atlantic coast, and also in the Mediterranean. See Plate of PLECTOGNATH FISHES.

TRIGLYPH (Lat. *triglyphus*, from Gk. *τρίγλυφος*, three grooved, from *τρεῖς*, *treis*, three + *γλύφειν*, *glyphein*, to carve). In the Doric frieze, the projecting block between the metopes (q.v.). It is supposed to represent the ends of the beams in the original structure of wood and crude brick. Its face regularly contains two triangular vertical furrows, and the edges are chamfered. Consult Allan Marquand, *Greek Architecture* (New York, 1909).

TRIGONAL SYSTEM. See CRYSTALLOGRAPHY and Plate of CRYSTAL FORMS.

TRIGONELINE. See ALKALOIDS.

TRIGONIA (Neo-Lat. nom. pl., from Gk. *τρίγωνος*, *trigōnos*, triangular, from *τρεῖς*, *treis*, three + *γωνία*, *gōnía*, angle). This genus, represented at the present time by only five species living in the Australian seas, was one of the most important types of lamellibranchs in the Mesozoic seas of Europe. *Trigonia* appeared first in the Liassic, became very abundant in the Middle and Upper Jura and the Middle Cretaceous, and then in the Tertiary declined in number of species to the present time. The Mesozoic species, some of which are four or five times the size of the living species, are arranged into groups according to the markings of their shells, which are often elaborately sculptured. Consult Louis Agassiz, *Études critiques sur les mollusques fossiles: Mémoire sur les trigonies* (Neuchâtel, 1840), and John Lycett, "A Monograph of the British Fossil Trigonias," in *Palaeontographical Society Monographs* (London, 1872-79).

TRIGONOCARPUS (Neo-Lat., from Gk. *τρίγωνος*, *trigōnos*, triangular + *καρπός*, *karpós*, fruit). Fossil seed pods and fruits, probably of various kinds of plants, which in cross sec-

tion have a triangular form. See CARPOLITH; CONIFERÆ; CORDAITES; PALEOBOTANY.

TRIGONOMETRIC SERIES. See SERIES.

TRIGONOMETRY (from Gk. *τρίγωνον*, *trigōnon*, triangle, from *τρεῖς*, *treis*, three + *γωνία*, *gōnía*, angle + *-μετρία*, *-metría*, measurement, from *μέτρον*, *metron*, measure, from *μετρέειν*, *metrein*, to measure). Originally the study of triangles, especially the theory of the measurement of their sides, angles, and areas; now the measure of triangles is merely a part of the general subject. That portion of the subject which deals with the measurement of figures in a plane is called plane trigonometry, and that which deals with figures on the surface of a sphere is called spherical trigonometry. That branch of the subject which deals with the circular functions of angles is called goniometry. The pure theory of trigonometric functions, apart from their application to problems of measure-

FIG. 1.

ment, is called analytic trigonometry. Elementary trigonometry has many useful applications, as in the measurement of areas, heights, and distances. It is indispensable to the study of astronomy, physics, and the various branches of engineering.

The common functions of trigonometry may be defined as ratios of certain sides of a right triangle. Thus, in the figure, the ratio $\frac{a}{c}$ is called the *sine* of the angle θ , commonly written $\sin \theta = \frac{a}{c}$. The ratio $\frac{b}{c}$ is called the *cosine* of the angle θ , written $\cos \theta = \frac{b}{c}$. The other functions are *tangent* of θ , symbolically written $\tan \theta = \frac{a}{b}$; *cotangent* of θ , or $\cot \theta = \frac{b}{a}$; *secant* of θ , or $\sec \theta = \frac{c}{b}$; and *cosecant* of θ or $\csc \theta$ ($\operatorname{cosec} \theta$) $= \frac{c}{a}$. There are also used the functions *versine* of θ , or $\operatorname{vers} \theta = 1 - \cos \theta = 1 - \frac{b}{c}$; and *coversine* of θ , or $\operatorname{covers} \theta = 1 - \sin \theta = 1 - \frac{a}{c}$.

Of these functions, the most important are $\sin \theta$, $\cos \theta$, $\tan \theta$, and $\cot \theta$. These admit of easy manipulation by means of logarithms (q.v.). Since $\sec \theta = \frac{1}{\cos \theta}$ and $\csc \theta = \frac{1}{\sin \theta}$, and since it is as easy to find $\frac{1}{\cos \theta}$ and $\frac{1}{\sin \theta}$ by logarithms as to find $\cos \theta$ and $\sin \theta$, it is evident that $\sec \theta$ and $\csc \theta$ are of relatively little importance when logarithms are used. As to $\operatorname{vers} \theta$ and $\operatorname{covers} \theta$, they do not admit of easy treatment by logarithms, and so they, like $\sec \theta$ and $\csc \theta$, have been little used since the invention of these aids to computation. The propriety of calling these ratios functions of the angle θ consists in this, that the value of any ratio depends upon the

value of θ . That is, in any right-angled triangle $AB'C'$, having an acute angle θ , the corresponding ratios $\frac{a'}{c'}, \frac{b'}{c'}, \frac{a'}{b'}$ (Fig. 2) are equal to the ratios $\frac{a}{c}, \frac{b}{c}, \frac{a}{b}$; and in any right-angled triangle in which the acute angle θ' is not equal to θ the corresponding ratios are not equal to those for θ .

FIG. 2.

The trigonometric functions as defined by the above ratios are evidently limited to angles less than 90° , since a triangle contains but one right angle. However, the definition may be extended to angles of any size and the functions may be expressed by line segments.

FIG. 3.

In Fig. 3 the radius $OA (= OB)$ may be regarded as the unit of length, hence the ratio $\frac{B_1M}{OB_2} = B_2M_1$ and $\sin AOB_1 = B_1M$. Similarly $\cos AOB_1 = OM$, $\tan AOB_1 = AT$, $\cot AOB_1 = PQ$, $\sec AOB_1 = OT$, $\csc AOB_1 = OP$, vers $AOB_1 = MA$, and covers $AOB_1 = QR$. If the angle is

FIG. 4.

obtuse as AOB_2 , or reflex as AOB_3 , AOB_4 , the functions are represented by the corresponding lines. For example, $\sin AOB_1 = B_1M_1$, $\tan AOB_1 = AT$. The following convention of signs (see Fig. 4), however, serves to associate these values with the proper angle: Lines measured to the

right of the vertical diameter, as OM , are called positive, and those to the left, as OM_1 , negative; lines measured upward, as B_1M , from the horizontal diameter are called positive, and those downward, as M_4B_4 , negative; the revolving radius OB is always positive. Thus (see Fig. 4), the signs of the functions of an angle not exceeding 90° are all plus. The versine and coversine are evidently always positive. The sine and cosecant are positive in the first and second quadrants and negative in the third and fourth. The cosine and the secant are positive in the first and fourth quadrants and negative in the second and third. The tangent and cotangent are positive in the first and third quadrants and negative in the second and fourth. We have, therefore, the following relations:

$$\begin{aligned}\sin(-\alpha) &= -\sin \alpha \\ \cos(-\alpha) &= \cos \alpha \\ \tan(-\alpha) &= -\tan \alpha \\ \cot(-\alpha) &= -\cot \alpha\end{aligned}$$

For the definition of a negative angle, see ANGLE.

A given value of a function does not, however, uniquely determine the angle, as will appear from the following table of relations:

FIRST QUADRANT

$$\begin{aligned}\sin(90^\circ - \theta) &= \cos \theta & \tan(90^\circ - \theta) &= \cot \theta \\ \cos(90^\circ - \theta) &= \sin \theta & \cot(90^\circ - \theta) &= \tan \theta\end{aligned}$$

SECOND QUADRANT

$$\begin{aligned}\sin(180^\circ - \theta) &= \sin \theta & \sin(90^\circ + \theta) &= \cos \theta \\ \cos(180^\circ - \theta) &= -\cos \theta & \cos(90^\circ + \theta) &= -\sin \theta \\ \tan(180^\circ - \theta) &= -\tan \theta & \tan(90^\circ + \theta) &= -\cot \theta \\ \cot(180^\circ - \theta) &= -\cot \theta & \cot(90^\circ + \theta) &= -\tan \theta\end{aligned}$$

THIRD QUADRANT

$$\begin{aligned}\sin(180^\circ + \theta) &= -\sin \theta & \sin(270^\circ - \theta) &= -\cos \theta \\ \cos(180^\circ + \theta) &= -\cos \theta & \cos(270^\circ - \theta) &= -\sin \theta \\ \tan(180^\circ + \theta) &= \tan \theta & \tan(270^\circ - \theta) &= \cot \theta \\ \cot(180^\circ + \theta) &= \cot \theta & \cot(270^\circ - \theta) &= \tan \theta\end{aligned}$$

FOURTH QUADRANT

$$\begin{aligned}\sin(360^\circ - \theta) &= -\sin \theta & \sin(270^\circ + \theta) &= -\cos \theta \\ \cos(360^\circ - \theta) &= \cos \theta & \cos(270^\circ + \theta) &= \sin \theta \\ \tan(360^\circ - \theta) &= -\tan \theta & \tan(270^\circ + \theta) &= -\cot \theta \\ \cot(360^\circ - \theta) &= -\cot \theta & \cot(270^\circ + \theta) &= -\tan \theta\end{aligned}$$

Thus, to express the trigonometric functions of angles greater than 90° in terms of those of angles less than 90° , determine first the sign of the function to be so expressed, next subtract from the angle whatever multiple of 90° is necessary to make it less than 90° . If an even multiple of 90° is subtracted the name of the original function is retained, but if an odd multiple is subtracted the original function is replaced by the conamed function. For example, to express $\cos(270^\circ - \theta)$ in terms of a function of θ . This angle is in the third quadrant and therefore its cosine is negative. To make the angle $270^\circ - \theta$ less than 90° we must subtract 180° and we have $\cos(270^\circ - \theta) = -\cos(90^\circ - \theta)$. But $\cos(90^\circ - \theta) = \sin \theta$, and we have $\cos(270^\circ - \theta) = -\sin \theta$.

The increasing of an angle by 360° or any multiple of 360° does not alter the value of the trigonometric functions of that angle. (See FUNCTION.) It appears from the geometric representation of the functions that the values of the

sines and cosines of all real angles lie within the interval $+1, -1$; the values of the tangents and cotangents of all real angles lie within the interval $+\infty$ and $-\infty$; those of the secants and cosecants without the interval $+1, -1$, as is shown in the following table:

FUNCTION	0°	90°	180°	270°	360°
Sine.....	0	1	0	-1	0
Cosecant.....	∞	1	$-\infty$	-1	∞
Cosine.....	1	0	-1	0	1
Secant.....	1	∞	-1	$-\infty$	1
Tangent.....	0	∞	0	$-\infty$	0
Cotangent.....	∞	0	$-\infty$	0	∞

The variations of the functions are best exhibited by means of graphs. In the figures the arcs are laid off as abscissas and the functions as ordinates. See COÖRDINATES.

GRAPH OF SIN θ .

From the definition of the trigonometric functions, it is evident that they bear certain relations one to another. Some of the fundamental

GRAPH OF SEC θ .

ones are, $\sin^2 \theta + \cos^2 \theta = 1$, $\sin \theta \csc \theta = 1$, $\cos \theta \sec \theta = 1$, $\tan \theta \cot \theta = 1$, $\tan = \sin \theta / \cos \theta$, $1 + \tan^2 \theta = \sec^2 \theta$, $1 + \cot^2 \theta = \csc^2 \theta$, from

GRAPH OF TAN θ .

which many others readily follow. Besides these relations existing between the functions of a single angle, there are those connecting the functions of several angles. Thus,

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B,$$

$$\cos(A \pm B) = \cos A \cos B \mp \sin A \sin B,$$

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B},$$

$$\cot(A \pm B) = \frac{\cot A \cot B \mp 1}{\cot A \pm \cot B},$$

and $\sin 2A = 2 \sin A \cos A$, $\cos 2A = \cos^2 A - \sin^2 A$, $\tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$, and $\cot 2A = \frac{\cot A}{2 \cot A - 1}$, which are easily derived from the corresponding formulas for $A + B$ by putting $A = B$. Some of the formulas for functions of

half an angle are: $\sin \frac{1}{2}A = \pm \sqrt{\frac{1 - \cos A}{2}}$, $\cos \frac{1}{2}A = \pm \sqrt{\frac{1 + \cos A}{2}}$, $\tan \frac{1}{2}A = \pm \sqrt{\frac{1 - \cos A}{1 + \cos A}}$,

and $\cot \frac{1}{2}A = \pm \sqrt{\frac{1 + \cos A}{1 - \cos A}}$. By reapplying

these formulas it is evident that functions of $3A$, $4A$, ..., nA may be expressed as functions of A and also as functions of various fractional parts of A .

To every function there is an inverse function or antilogarithm, just as to every logarithm there is an antilogarithm. The formula to express the angle whose sine is x is $\sin^{-1} x = \theta$, read " θ is the angle whose sine is x ." In most European countries this is indicated by the symbol arc $\sin x = \theta$, read " θ is the arc (angle) whose sine is x ," or merely "arc sine x is equal to θ ." Similarly $\tan^{-1} y = \theta$ is read, " θ is the angle whose tangent is y ," or antitangent of y equals θ , and this is also written arc $\tan x = \theta$. All inverse functions admit of translation into the direct formulas. Thus, $\sin^{-1} x = \theta$ reduces to $\sin \theta = x$, and $\tan^{-1} y = \theta$ to $\tan \theta = y$. All inverse or antilogarithms can be expressed in series, as in the case of the functions. (See SERIES.) The following will serve as examples:

$$\sin^{-1} x = x + \frac{1}{2} \cdot \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} \cdot \frac{x^5}{5} + \dots + \frac{1 \cdot 3 \dots (2n-1)}{2 \cdot 4 \dots 2n} \cdot \frac{x^{2n+1}}{2n+1} + \dots$$

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \dots + (-1)^n \frac{x^{2n-1}}{2n-1} + \dots$$

The values of the functions of certain angles may be calculated by reference to geometric figures, but the tables of such values for all angles have been calculated to a close degree of approximation by means of the trigonometric series. The equilateral triangle serves to exhibit the values of the functions of 60° and 30° . If the side is taken as 1, the figure shows that $\sin 60^\circ = \frac{1}{2} \sqrt{3}$, $\cos 60^\circ = \frac{1}{2}$, $\tan 60^\circ = \sqrt{3}$, and so on.

Similarly the functions of 45° , as $\sin 45^\circ = \cos 45^\circ = \frac{1}{\sqrt{2}} = \frac{1}{2} \sqrt{2}$, may be obtained from the square.

The following problems will serve to illustrate the use of trigonometry in practical mensuration: (1) Required the height of a hill above the horizontal plane of an observer, the distance of the observer from the point below the summit being 5000 feet and the angle of elevation $10^\circ 30'$. The height of the hill, represented by BC in the figure, is given by the equation $BC = \tan 10^\circ 30'$

5000 feet = 0.1853×5000 feet = 926.5 feet, $\tan 10^\circ 30'$ being taken from a table of natural tangents. (2) Required the distance between

two points A and B separated by an impassable swamp, the line AC , as represented in the figure, being 15 chain lengths, the angle A $40^\circ 15'$, and

the angle C $110^\circ 32'$. The length of the line AB is given by the equation $AB = \frac{AC \sin 110^\circ 32'}{\sin 150^\circ 47'}$ $= \frac{15 \cdot 0.9365}{0.4881} = 28.5$, the sines of the angles being taken from a table of natural sines. Therefore AB is 28.5 chain lengths.

From the expressions of e^x , $\sin x$, $\cos x$ (see SERIES), it follows that $e^{ix} = \cos x + i \sin x$ (see COMPLEX NUMBER), and that $e^{-ix} = \cos x - i \sin x$; whence by adding and subtracting, $\cos x = \frac{e^{ix} + e^{-ix}}{2}$, $\sin x = \frac{e^{ix} - e^{-ix}}{2i}$. Similarly

the other functions may be expressed in terms of e^{ix} , e^{-ix} . These are the exponential expressions for the circular functions of x . If i is omitted from these exponentials, the resulting functions are called the hyperbolic cosine, hyperbolic sine of the angle x . Hyperbolic functions are so called because they have geometric relations with the equilateral hyperbola analogous to those between the circular functions and the circle. The common notation for such functions is $\sinh \theta$, $\cosh \theta$, $\tanh \theta$, corresponding to the circular function $\sin \theta$, $\cos \theta$, $\tan \theta$. The values of these functions have been tabulated and are of service in analytic trigonometry.

The spherical triangle, like the plane triangle, has six elements, the three sides a , b , c , and the angles A , B , C . But the three sides of the spherical triangle are angular as well as linear magnitudes. The triangle is completely determined when any three of its six elements are given, since there exist relations between the given and the sought parts by means of which the latter may be found. In the right-angled or quadrantal triangle, however, as in the case

of the right-angled plane triangle, only two elements are necessary to determine the remaining parts. Thus, given c , A , in the right-angled

triangle, ABC , the remaining parts are given by the formulas $\sin a = \sin c \sin A$, $\tan b = \tan c \cos A$, $\cot B = \cos c \tan A$. The corresponding formulas when any other two parts are given may be obtained by Napier's rules concerning the relations of the five circular parts (q.v.), viz., a , b , complement of A , complement of B , complement of c . In the case of oblique triangles no simple rules have been

found, but each case is dependent upon the appropriate formula. Thus in the oblique triangle ABC , given a , b , and A , the formulas for the remaining parts are $\sin B = \frac{\sin a \sin b}{\sin a}$,

$$\tan \frac{1}{2}c = \tan \frac{1}{2}(a - b) \cdot \frac{\sin \frac{1}{2}(A + B)}{\sin \frac{1}{2}(A - B)},$$

$$\cot \frac{1}{2}C = \tan \frac{1}{2}(A - B) \cdot \frac{\sin(a + b)}{\sin(a - b)}.$$

It is evident in spherical trigonometry, as well as in plane, that three elements taken at random may not satisfy the conditions for a triangle, or they may satisfy the conditions for more than one. The treatment of the ambiguous cases in spherical trigonometry is quite formidable, since every line intersects every other line in two points and multiplies the cases to be considered. The measurement of spherical polygons may be made to depend upon that of the triangle. For if, by drawing diagonals, the polygons can be divided into triangles each of which contains three known or obtainable elements, then all the parts of the polygon can be determined. Since the elements of the spherical polygon measure the elements of the polyhedral angle whose vertex is at the centre of the sphere, the formulas of spherical trigonometry apply to problems involving the relations of the parts of such figures. For example, given two face angles and the included dihedral angle of a trihedral angle, the remaining face and dihedral angle may be determined by the same formulas as apply to the corresponding case of the spherical triangle. By aid of the

formulas of spherical trigonometry the theories of transversals, coaxial circles, poles and polars, may be developed for the figures of the sphere. Spherical trigonometry is of great importance also in the theory of power circles, stereographic projection, and geodesy. It is also the basis of the chief calculations of astronomy; e.g., the solution of the so-called astronomical triangle is involved in finding the latitude and longitude of a place, the time of day, the azimuth of a star, and various other data.

Some traces of trigonometry exist in the earliest-known writings on mathematics. In the Papyrus of Ahmes (see AHMES) a ratio is mentioned called a *segt*, and because of its relation to the methods of measuring the pyramids, this ratio seems to correspond to the cosine or the tangent of an angle. But to the Greeks are due the first scientific trigonometric investigations. The sexagesimal division of the circle was imperfectly known to the Babylonians, but Hipparchus was the first to complete a table of chords. Heron (q.v.) computed the values of $\cot \frac{2\pi}{n}$, for $n = 3, 4, \dots, 11, 12$,

and calculated the areas of regular polygons. Thirteen books of Ptolemy's *Almagest* were given to trigonometry and astronomy. The Hindus, beginning with Aryabhatta (q.v.) and including Brahmagupta and Bhaskara (qq.v.), contributed an important advance by introducing the half chord for the whole chord as used in the Greek calculations. They were familiar with the sine and calculated ratios corresponding to the versine and cosine. The sine, however, first appears with a special name (*jaib*) in the works of the Arab Al Battani (q.v.), and to his influence is due the final substitution of the half for the whole chord. Al Battani knew the theory of the right-angled triangle and gave the relation $\cos a = \cos b \cos c + \sin b \sin c \cos A$ for the spherical triangle. With another Arab writer, Abul Wefa (940-998), begins the first systematic arrangement of the theorems and proofs of trigonometry, the use of the unit radius, and the use of the secant. Nasir Eddin (born 1201) wrote the first work in which plane and spherical trigonometry appears as a science by itself, distinct from astronomy. The celebrated astronomer Jabir ibn Aflah, or Geber, eleventh century, wrote a work confined chiefly to spherical trigonometry and rigorous in its proofs, which was translated into Latin by Gherardo of Cremona. Regiomontanus (1436-76) wrote a complete plane and spherical trigonometry, the *De triangulis Omnimodis Libri quinque* (first printed at Nuremberg in 1533), a work which had very great influence upon the study of the subject. Vieta (1540-1603) made an important advance by the introduction of the idea of the reciprocal spherical triangle. Rhæticus (1514-76) made a great advance by considering the functions as ratios instead of lines. To Napier are due the formulas since called the analogies. Gunter introduced the term "cosine," and Finck (1583) introduced "secant" and "tangent." Growing out of the desire to construct more accurate tables and to simplify the methods of calculation for astronomical purposes, there was evolved by Napier and Bürgi or Byrgius (q.v.) the idea of the logarithm (q.v.). To Euler much is due for simplifying and classifying the treatment of the whole subject. Lagrange, Legendre, Carnot, Gauss, and others expanded the theory

of polygonometry and polyhedrometry. The nineteenth century has contributed the so-called projective formulas and made further generalization of formulas known before.

TRIGONOMETHE'ANE. See IODOFORM.

TRISODON, trī'sō-dōn (Neo-Lat., from Gk. *treis*, *treis*, three, + *isos*, *isos*, equal, + *ōdous*, *ōdous*, tooth). A fossil creodont mammal from the Puerco beds of New Mexico. The skull is the oldest known mammalian skull. Consult Matthew, "Additional Observations on the Creodonta," in *Bulletin of American Museum of Natural History*, vol. xiv (New York, 1901). See CREODONTA; MAMMALIA.

TRIKALA, trē-kā'la, or **TRIKKALA**. A town of Greece, capital of the Nomarchy of Trikala, situated in the valley of the Peneus, on the Trikkalinos River, 37 miles west of Larissa and on the Volos-Kalabaka Railway (Map: Greece, C 4). It manufactures cotton, woolen stuffs, leather, and dye products. Pop., 18,000. Trikala is the Homeric Triikka, which was celebrated for its temple of Æsculapius.

TRIKOUPIS, trē-kō'pīs, CHARILAO (1832-96). A Greek statesman, son of Spiridon Trikoupis, born at Nauplia. He studied jurisprudence in Athens and Paris and in 1852 entered the diplomatic service as attaché to the Legation at London, where in 1863 he became chargé d'affaires. In 1865 he conducted the negotiations with Great Britain regarding the cession of the Ionian Islands. Elected to the Boulé in the same year, he became an adherent of the radical party, was in 1866 appointed Minister of Foreign Affairs, became Premier in 1875, was once more Minister of Foreign Affairs under Canaris, in the coalition ministry of 1877, and Premier again in 1880, 1882-85, 1886-90, 1891-93, and 1893-95, when, owing to the financial embarrassment of the government, he met with a crushing defeat, losing even the seat in the Boulé which he had held for 30 years. While on his deathbed he was re-elected by the District of Valtos. He died at Cannes, France, April 11, 1896. A volume of his speeches, *Δόγαι πολιτικοί*, appeared at Athens in 1888. Consult Tsokopoulos, *Βιογραφία Χαριλάου Τρικούπη* (Athens, 1896).

TRIKOUPIS, SPIRIDON (1788-1873). A Greek author and statesman, born at Missolonghi. He studied in France and England,

became secretary of the Earl of Guilford during his occupancy of the position of Governor of the Ionian Islands, and played an important part in the war for independence. After 1821 he was employed in administrative and diplomatic business, being a member of the provisional government in 1826 and of the National Convention at Træzen in 1827. He was President of the Council and Minister of Foreign Affairs in 1832, was thrice sent to London (1835-38, 1841-43, and 1850-61) as Ambassador, was Minister of Foreign Affairs and of Public Instruction in 1843, Vice President of the Senate (1844-49), and Envoy Extraordinary to Paris (1850) on the occasion of the blockade of the ports of Greece by England. His funeral oration on his friend Lord Byron, delivered in the cathedral of Missolonghi just after the poet's death, was translated into many languages. Other orations, partly religious and partly political, were collected and published (Paris, 1836). His masterpiece is the history of the Greek revolution, *Ἱστορία τῆς Ἑλληνικῆς Ἐπανάστασεως* (London, 1853-57).

TRILBY. 1. A romance by Charles Nodier (1822). 2. A novel by George du Maurier (1895), and its chief character, a beautiful artist's model. The novel was very popular.

TRILL (Fr. *triller*, It. *ML. trillare*, to trill, probably onomatopoeic). In music, an embellishment produced by the continued and rapid repetition of one note alternately with another, either a whole tone or semitone above it. Its sign is *tr* placed over or under the principal note. The trill was known and used at the end of the sixteenth century, but its name was added considerably later.

TRILLIUM (Neo-Lat., from Lat. *tres*, three, so called from the symmetrical arrangement of

to 15 inches high, terminated by three ovate, pointed, broad, beautifully netted-veined leaves. *Trillium grandiflorum*, also called wake-robin, is a pretty wild flower, growing in rich woods from Vermont to Kentucky, Wisconsin, and northward. The flowers, which appear in spring, are at first nearly white, but change with age to rose color. They are borne on a peduncle from 2 to 3 inches long. *Trillium erectum* has brownish-purple, sometimes white or pink pedunculate flowers. *Trillium sessile* has brownish-purple sessile flowers. *Trillium nivale*, a smaller plant, has white flowers that appear very early in spring.

TRILOBITA (Neo-Lat. nom. pl., from Gk. *τρεῖς*, *treis*, three + *λόβος*, *lobos*, lobe). An important group of extinct marine crablike animals, whose fossil body shields are found in rocks of Paleozoic age in most parts of the world. The trilobites constitute a subclass of Crustacea, of which class they are very primitive members. The trilobite body was covered by a hard, calcareous dorsal shield and a thin ventral integument. The dorsal shield or carapace is of elliptical or oval outline and is divided by two dorsal furrows into three longitudinal lobes, the median axis and two lateral pleural lobes. This trilobate division, which characterizes this class of animals, gave the group its name. The shield is also divided into three transverse parts: the anterior head shield or cephalon, the median thorax consisting of several movable segments, and the posterior abdominal shield or pygidium. The cephalon is generally of semicircular outline, and the posterior lateral corners, known as the genal angles, are often produced into spines. The more elevated median portion of the cephalon is the glabella, and this is separated from the cheeks or lateral portions by the usually well-marked dorsal furrows. The surface of the glabella is broken up into a series of lobes by three pairs of transverse furrows, called the lateral furrows. The paired lobes are called the lateral lobes, and the unpaired anterior lobe, which is often very prominently developed, is known as the frontal lobe of the glabella. The cheeks are traversed in most trilobites by a sinuous line, the facial suture, along which the lateral portions or free cheeks break away from the fixed cheeks.

The trilobites possess lateral or compound eyes and median or parietal eyes. The lateral eyes, which in most trilobites are of reniform shape, are situated upon the cheeks. In some species (as *Acidaspis mira*) these eyes are placed at the summits of high immovable peduncles; in certain genera (as *Agnostus*, *Eodiscus*, and *Ampyx*) the lateral eyes become atrophied; and other genera (as *Trinucleus*) have lateral eye spots in their young stages and only median ocelli when adult. Two types of lateral eyes are present—compound, situated

COMMON WAKE-ROBIN (*Trillium erectum*).

the three outer and three inner segments). A genus of about a dozen species of North American perennial herbs of the lily family, growing in moist and shady (not marshy) grounds from Maine to Florida. They have a naked stem, 4

REPRESENTATIVE TRILOBITES

1. Dorsal view of a trilobite (*Triarthrus becki*), a species whose perfect specimens, preserved in the Utica slate (Ordovician), near Rome, N. Y., have yielded most of the known facts as to the external structure and appearance of these animals.
2. Ventral view of the same.
3. Cephalic shield (cephalon) of *Dalmanites hausmanni* (Devonian); *l.*, limb or border; *m.f.*, marginal furrow; *g.s.*, genal spines; *gl.*, glabella; *f.l.*, frontal lobe, beneath which are seen the "side lobes" and "side furrows" of the glabella; *n.f.*, occipital furrow; *n.r.*, occipital ring; *f.s.*, facial suture; *e.*, visual surface of eye; *p.l.*, palpebral lobe.
4. Median antero-posterior vertical section of a trilobite (*Ceraurus pleurexanthemus*); *c.*, cephalon, with hypostoma below it; *p.*, test of the abdomen (pygidium); *m.*, mouth; *s.m.*, ventral membrane; *i.c.*, intestinal canal.
5. A trilobite (*Phacops latifrons*; Devonian), rolled up; *gl.*, glabella; *e.*, eye.
6. Development (ontogeny) of a trilobite (*Sao hirsuta*; Cambrian); 1, 1st larval stage (protaspis); 2-6, successive neopionic stages of development.
7. *Ampyx nasuta* (Ordovician).
8. *Deiphon forbesi* (Silurian).
9. *Proetus bohemicus* (Silurian).
10. *Eoharpes ungula* (Ordovician).
11. *Cryptolithus goldfussi* (Ordovician).
12. Profile view of *Sphaerzochus mirus* (Silurian).
13. *Cheirurus insignis* (Silurian).
14. *Megalaspis extenuata* (Ordovician).
15. *Conocoryphe sulzeri* (Cambrian) without the free cheeks. (After Zittel.)

REPRESENTATIVE TRILOBITES

on the free cheeks, and simple eye spots, ocelli or stemmata. The compound eyes are made up of lenses, which may vary in number from 14 in *Trimerocéphalus* to 15,000 in *Remopleurides*. The median or parietal eyes consist of an ocellus with or without lens situated on the apex of the glabella. It is most prominent in the earlier growth stages, in Ordovician forms and in trilobites with atrophied lateral eyes ("blind" trilobites). The facial suture varies largely in its course across the cephalon, not only in the different species and genera, but also in the individuals that represent different stages of development of a single species. Its position in the adult furnishes an excellent diagnostic character. It is absent in the earliest Cambrian trilobites. In most trilobites a groove, the occipital furrow, runs near to and parallel with the posterior margin of the cephalon, and cuts off the occipital lobe from the glabella.

The thorax is made up of several transverse segments which articulate with one another in such manner that some trilobites were able to roll themselves into a ball like the armadillo. The number of segments of the thorax is usually constant in the adults of each genus, but it varies within the subclass from two in *Agnostus* to 42 in *Menomonia*. The pygidium, or caudal shield, is a solid plate formed by union of several segments, of which traces are still evident in the ribs of its convex dorsal surface. The axis and the pleural ribs are usually present, but in some species of *Asaphus* and *Illanus* they are almost entirely suppressed. The trilobite carapace is generally ornamented by small tubercles. Many genera have smooth or punctate tests; others have the test marked by concentric wrinkles; and in other genera spines are developed.

Ventral Surface. As a rule the ventral surface of the trilobite body is so closely united with the rock matrix that it is only through exceptionally favorable modes of fossilization that anything at all has been learned about the nature of the ventral integument and the appendages. The principal organ on the underside of the head is a rather prominent plate, the upper lip or hypostome, which articulates with the anterior margin of the cephalon, and which protects the small mouth opening at its posterior end. Each segment of the carapace, excepting the hindmost anal segment, bears a pair of appendages. The foremost pair, arising near the sides of the hypostome, are simple slender whiplike antennae, much like those of the higher Crustacea. All the other appendages are biramous; their endopodites are six-jointed crawling legs, and their exopodites are many-jointed feathery organs that probably served both for swimming and respiration. The basal joints of the cephalic limbs form jawlike organs about the mouth.

Development. The ontogeny of several genera of trilobites is known. Small rounded bodies supposed to be the eggs of trilobites have been found. Those species of which continuous series of growth stages have been studied are found to originate in a minute protaspis stage and to attain their adult shape through a series of progressive changes expressed in the successive molts, in much the same manner as do the crabs, and other Crustacea. The protaspis is a circular or ovate shield, generally less than one millimeter in length, with a slightly segmented median axis and an indistinctly marked abdomi-

nal portion. Growth of the animal takes place by increase in the number of segments and through increase in size in the successive molts, and each new segment is intercalated between the cephalon or the last-formed segment and the anterior edge of the pygidium.

Classification. The form and mode of development of the free cheeks are made the principal features of the classification proposed by Beecher, who divides the subclass into three orders: Hypoparia, the most primitive forms of trilobites, mostly small in size, without compound eyes, and with simple eye spots in the higher genera. This order has lately been shown to be based on a misconception and the genera distributed among the other two orders. In its place a new order, Protoparia, has been erected for the *Marellidae*, which still lack the facial suture (genera *Marella* and *Nathorstia*) and link the trilobites to the branchiopods and merostomes. Opisthoparia, with free cheeks dorsal, separate and carrying the genal angles. This group includes a large number of genera ranging from Cambrian to Carboniferous, but the majority of them are found in the Cambrian and Ordovician rocks. The Opisthoparia are divided into the suborders Mesonacida, Conocoryphida, Trinucleida, and Odontopleurida. The Mesonacida comprise the families Mesonacidae, Paradoxidae, and Zecanthoidae. The Mesonacidae contain the most primitive true trilobites: in them facial sutures are not yet distinguishable, segments are very numerous, and the pygidium very small. The Conocoryphida embrace the main body of the Opisthoparia, viz., the families Prætidæ, Olenidæ, Oryctocephalidæ, Ptychoparidæ, Dikelocephalidæ, Bathyruridæ, Asaphidæ, Illænidæ, Calymenidæ, and Homalonotidæ. The suborder Trinucleida contains the families Harpedidæ, Trinucleidæ, Rhaphiophoridæ, Ellipsocephalidæ, Aeglinidæ, Shumardidæ. The last suborder of the Opisthoparia, the Odontopleurida, contains the families Odontopleuridæ, Bronteidæ, and Lichadidæ. The last-named family has among its representatives some of the most specialized as well as the largest trilobites. The Odontopleuridæ, with species ranging from the Ordovician to the Devonian, are remarkable because of excessive development of the spines. In the order Protoparia the free cheeks do not carry the genal angles and they are often united in front of the glabella. The other orders had their origin in pre-Cambrian time, for they appear in the early Cambrian with their diagnostic features fully differentiated and with a considerable degree of evolution, but the Protoparia originated during the late Cambrian and were initiated in the early Ordovician. The order reached its maximum evolution during the Ordovician and declined during the Silurian and Devonian. The members of the family Encrinuridæ recall in the form of their cephalon the more primitive members of the Opisthoparia, and like them they have narrow marginal free cheeks, which do not, however, include the genal angles. The principal genera are *Encrinurus* (Ordovician to Silurian), *Placoparia*, *Cybele*, and *Dindymene* (Ordovician). Cheiruridæ is an interesting family that begins in the Ordovician and ranges into the Devonian and is represented by a number of species. The principal genera are: *Amphion* (Ordovician), *Ceraurus*, *Sphaerexochus*, *Staurocephalus* (Ordovician to Silurian), *Deiphon*, and *Onycopyge* (Silurian). Phacopidæ

is a large family containing perhaps the most highly organized members of the subclass. The frontal lobe of the glabella is large in all genera, and in the successive species in each race there is a general tendency towards coalescence or obsolescence of the lateral lobes of the glabella, and an increased prominence of the frontal lobe. The eyes are well developed and have large distinct facets. The family includes *Phacops* (Silurian to Upper Devonian), *Pterygomotopus* (Ordovician), *Acaste* and *Chasmops* (Ordovician to Silurian), *Trimercephalus* (Silurian to Devonian), *Dalmanites* (Ordovician to Devonian), and a number of subgenera. Here also belong the Cambrian Burlingidae and probably the blind primitive Agnostidae, also of Cambrian age.

Habits. Trilobites appear to have been entirely marine with various modes of existence. Some were bottom crawlers, as *Dalmanites*; others buried themselves in the mud of the bottom, thereby losing their eyesight, and developing a broad brim (as *Harpes*, *Cryptolithus*, and *Trinucleus*); and still others were free swimmers with big eyes, as *Ægina*, or crawled about coral and hydroid masses, like the modern isopods. The remains of trilobites are usually found in dismembered condition, and entire carapaces are rare. This is probably due to the fact that the majority of specimens are the discarded molts, broken in the process of shedding. Trilobites abound in all the Cambrian formations, during which period they were in fact dominant forms of life, and they are abundant in some horizons of the Ordovician and Silurian. During the Devonian they declined rapidly, and only a few genera, represented by rare specimens, continued into the Carboniferous. They are entirely absent from all Mesozoic rocks, and they have no near relatives at the present day. They are one of the most important groups of fossil animals for purposes of correlation. In all about 2000 species and over 200 genera have been described, the majority of them from the Cambrian and Ordovician rock. See ACIDASPIS; HARPES.

TRIL'OGY (from Gk. *τριλογία*, *trilogia*, group of three dramas, from *τρεῖς*, *treis*, three + *λόγος*, *logos*, word). The name given by the Greeks to a group of three tragedies, often connected by a common subject and representing different stages or phases of the same story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a tetralogy. A tragic poet who wished to take part in one of the Athenian poetic contests had to produce a trilogy along with a satyric drama at the great Dionysiac, Lenæan, or Anthesteriac festival. We possess only one perfect specimen of the classic trilogy—the *Oresteia* of Æschylus, which embraces the *Agamemnon*, the *Choephora*, and the *Eumenides*. Consult: Welcker, *Die Aeschyleische Trilogie*, etc. (Darmstadt, 1824); Franz, *Des Aeschylus Oresteia* (Leipzig, 1846); Campbell, *The Oresteia of Aeschylus*, translation and introduction (London, 1893).

TRIM, CORPORAL. The devoted companion of Uncle Toby in Sterne's *Tristram Shandy*.

TRIMBLE, trim'bl, ROBERT (1777-1828). An American jurist, born in Berkeley Co., Va. (now W. Va.). He was admitted to the Kentucky bar in 1803 and subsequently was elected to the Legislature. In 1808 he was appointed second judge of the Court of Appeals, in 1810 Chief Justice of Kentucky, and in 1813 United States district attorney. From 1816 to 1826 he was district judge of Kentucky, and from 1826 until his death a justice of the United States Supreme Court.

TRIMETHYLAMINE (from *tri-* + *methyl* + *amine*), (CH₃)₃N. An organic base with a powerful and disagreeable fishy odor. It is obtained as a colorless gas, readily soluble in water, and, in aqueous solution, acting as a strong alkali. With acids it forms soluble salts. It is obtained by distillation from ergot of rye, from guano, from the juice of the leaves of red beet root, and from putrid yeast. It may be formed artificially by the action of methyl iodide on dimethylamine, but the source from which it is most readily derived is herring brine. See AMINES.

TRIMMER, MRS. SARAH (1741-1810). An English author. Settling with her parents in London, she became one of the pioneers in founding Sunday schools. Her first schools were opened at Brentford in 1786 and were so successful that she was summoned by the Queen to Windsor to help start others there. In 1787 she also established at Brentford a school of industry for girls. Later she introduced into the Sunday school the plan of teaching by prints. Among her books are: *Easy Introduction to the Knowledge of Nature* (1782; 11th ed., 1802); the books with pictures and ex-

planations which after a large circulation were issued as *New and Comprehensive Lessons* (1814; 5th ed., 1830); *Abridgments of the Old and New Testaments*, which, issued separately by the Society for Promoting Christian Knowledge in 1793, circulated a quarter of a million copies.

TRIMORPHISM. See POLLINATION.

TRIMORPHOS. See ISOMORPHISM.

TRIMURTI, trê-mūr'tê (Skt. *tri-mūrti*, triple form). The name of the Hindu trinity, consisting of the gods Brahma (q.v.), Vishnu (q.v.), and Siva (q.v.), when regarded as an inseparable unity of creation, preservation, and destruction, though three in form. The concept is relatively late and cannot be older than the fifth or sixth century A.D. It is probable that the gods Vishnu and Siva were first associated as representatives of the two great Hindu sects (see SAIVAS; VAISHNAVAS) and that Brahma was added at a later time, as he was a later philosophical concept. In Indian art the Trimurti is one body with three heads, and its symbol is the mystic syllable *ōm* (q.v.). Consult E. W. Hopkins, *Religions of India* (Boston, 1895).

TRIN'COMALEE', or **TRINCOMALI**, trîp'-kô-mā'lê. A seaport town and former naval station on the northeast coast of Ceylon, 99 miles northeast of Kandy (Map: India, D 8). It is situated on an elevated and precipitous peninsula on the north side of the fine harbor of Trincomalee, the best in Ceylon. The temple of the Thousand Columns, now in ruins, was erected by the Malabars and destroyed by the Portuguese in 1622. It is still a famous place of pilgrimage of the Hindus. Near the ruins rises Fort Frederick, which was built by the Portuguese from the old material of the temple. Pop., 1901, 13,000; 1911, 11,067. Trincomalee was one of the last towns to surrender to European authority. It was held successively by the Portuguese, Dutch, and French and surrendered to the British forces after a naval siege of three weeks in 1795. Consult H. W. Cave, *The Ruined Cities of Ceylon* (London, 1900).

TRINE, RALPH WALDO (1866-). An American author. He was born at Mount Morris, Ill., graduated at Knox College in 1891, and later studied political and social science at Johns Hopkins. For a time he taught school, lectured, and worked as a bank cashier and special newspaper correspondent; but later he devoted his time to writing on topics related to ethical improvement and especially to New Thought (q.v.). He removed to Croton-on-Hudson, where he engaged also in fruit culture. His publications, some of which have been widely translated, include: *What All the World's a-Seeking* (1896; 21st ed., 1915); *In Tune with the Infinite* (1898), which reached a large circulation; *The Land of Living Men* (1910); *The New Alinement of Life* (1913); and booklets on similar subjects.

TRINIDAD. An island lying off the South American coast (Map: West Indies, G 5). To the northeast is the island of Tobago; together they constitute the British Colony of Trinidad and Tobago. The area of the colony is 1868 square miles, Tobago covering 114 square miles and Trinidad 1754 square miles. Trinidad has only one good natural harbor, at Chaguaramas on the west coast, but the whole Gulf of Paria is safe for anchorage; the north coast is rock-

bound, the south coast steep, and the east coast exposed to heavy surf. At Chaguaramas are a government floating dock and workshops for ship repairs. Trinidad is traversed, roughly from east to west, by three ranges of hills, two being parallel with the north and south coasts and the third crossing the middle of the island. In the northwest Mount Tucuche reaches an altitude of 3100 feet. The mineral resources are becoming important, the minerals now worked being asphalt, manjak, and petroleum. In the southwest is the famous Pitch Lake, near the Gulf of Paria and in La Brea ward; this lake, yielding large quantities of asphalt for export (206,400 tons in 1913), covers 114 acres. Trinidad has numerous streams and a well-watered, fertile soil adapted to the growth of many tropical products; agriculturally the island is one of the most successful of the British West Indian possessions. The staple products are sugar (1913 export, 653,098 hundredweights), cacao (482,534 hundredweights), and coconuts (16,391,000). Commercially the colony ranks first in the British West Indies; imports and exports in 1913 were valued at £4,968,350 and £5,205,673 respectively. Values of leading exports in 1913: cacao, £1,403,379; sugar, £418,067; asphalt, £230,565; coconuts, £85,369; petroleum, £75,020. The trade is mainly with the United Kingdom, the United States, Venezuela, and France. The trade of the United States with Trinidad was in 1915: imports from Trinidad \$6,739,000, exports thereto, \$3,971,000. Imports were chiefly cacao, fruits and nuts, chemicals, and asphalt; exports, flour, coal, meats, mineral oil, and miscellaneous merchandise. Trinidad has 95 miles of railway. The colony is administered by a governor, who is assisted by an executive and a legislative council, all members being appointed. The revenue and expenditure in 1913-14 were £970,789 and £951,982 (customs receipts, £467,374); public debt in 1913, £1,476,614. Education is largely subsidized by the government; the total school enrollment is upward of 51,000. Pop., 1901, 273,899; 1911, 333,552 (312,803 in Trinidad, 20,749 in Tobago). The white population is small, principally English, French, and Spanish; a large number of inhabitants are of mixed European and African blood, speaking a French patois. There are upward of 110,000 East Indian coolies whose immigration is under government control. Port of Spain, capital of the colony, on the northwest coast of Trinidad, has over 60,000 inhabitants and is one of the finest towns in the West Indies. Other towns are San Fernando (pop., 8667), Princess Town (4497), and Arima (4020).

Trinidad was discovered by Columbus, July 31, 1498. A governor was appointed in 1532, but for many years the Spanish colonists made little progress. San José, the capital, was burned by Sir Walter Raleigh in 1595. In 1640 and 1677 Trinidad was raided by the Dutch and in 1690 by the French. Towards the end of the eighteenth century there was a considerable immigration, encouraged by the Spanish government and augmented by many French families driven from Haiti and other islands. In February, 1797, Trinidad capitulated to a British force and in 1802 was finally ceded to Great Britain by the Treaty of Amiens.

TRINIDAD. A small, rocky, and uninhabited island situated in the South Atlantic Ocean in lat. 20° 31' S., long. 29° 20' W., about 750 miles east by north of Rio de Janeiro (Map: World, Western Hemisphere, M 18). It now belongs to Brazil.

TRINIDAD. A town in Cuba, in the Province of Santa Clara, situated about 45 miles southeast of Cienfuegos and 5 miles from its port, Casilda (Map: Cuba, E 5). It is within easy reach of three ports and is of considerable commercial importance. It is one of the most healthful places on the island. Coffee, formerly the chief article of export, is gradually giving place to sugar. Trinidad was founded by Velazquez in 1514 and on account of the repeated attacks by buccaneers was removed from the coast to its present site. Pop., 1907, 11,197.

TRINIDAD. A city and the county seat of Las Animas Co., Colo., 90 miles by rail south of Pueblo, on the Denver and Rio Grande, the Atchison, Topeka, and Santa Fe, the Colorado and Wyoming, and the Colorado and Southern railroads (Map: Colorado, E 4). It has a public library, St. Joseph's Academy, and St. Raphael's Hospital. Trinidad is the centre of large cattle and sheep raising and farming interests and is extensively engaged in coal mining and coke manufacture. There are also railway shops, bottling works, and a powder mill. Pop., 1900, 5345; 1910, 10,204; 1915 (U. S. est.), 13,337; 1920, 10,906.

TRINIL (tré'nîl) **MAN.** See **MAN**, SCIENCE OF, *Ancient Types*.

TRINITARIANS (from *trinity*, Lat. *trinitas*, number three, trinity, from *trinus*, threefold, from *tres*, three). The name most commonly applied in English to the members of the Order of the Holy Trinity for the Redemption of Captives, a Roman Catholic religious society founded by St. John de Matha (1160-1213) and St. Felix of Valois (1127-1212). Devoted to the work of freeing Christian captives among the infidels, they soon received the approbation of Pope Innocent III (1198) and the permission of Philip Augustus to settle in France. The headquarters of the order were at Cerfroid, near La Ferté Milon, in the present Department of Aisne, and the Pope gave them a second convent in Rome. Their first journey resulted in the liberation of 186 captives, who were brought to Paris amid great rejoicings. While Felix remained at home, caring for the order's development, John made numerous journeys to north Africa and the coast of Spain. Later the Trinitarians erected houses for the care of penniless captives after their release, and some of them accompanied the Crusaders to minister to their spiritual needs; they penetrated even to India and Tartary in search of the objects of their charity. It is estimated that in six centuries at least 900,000 prisoners recovered their freedom through the work of this order.

The order spread rapidly, first through France

and Spain, until in the fifteenth century it counted 880 houses; the number diminished from various causes until at the beginning of the eighteenth century there were only 250. The present members are chiefly occupied with other works of mercy, especially the care of the sick, although in the nineteenth century they devoted considerable labor to the work for negro slaves. Besides several branches, due to various reforms, among the male Trinitarians, there were also two female branches, and a third order of associates who labored for the cause and under a simple rule lived in the world. Consult: Carlier, *Les trinitaires de la rédemption* (Lille, 1866); Père Calixte de la Providence, *Vie de Saint Félix de Valois* (3d ed., Paris, 1878); id., *Vie de Saint Jean de Matha* (2d ed., ib., 1884); id., *Corsaires et rédempteurs* (Lille, 1884); Deslandres, *L'Ordre des trinitaires* (Paris, 1903).

TRINITROTOLUENES. Nitrosubstitution compounds produced by the substitution of nitro (NO_2) groups for hydrogen atoms in toluene ($\text{C}_6\text{H}_5\cdot\text{CH}_3$). Toluene is also known as methyl benzene. Because hydrogen atoms can be replaced not only in the C_6H_5 group but also in the CH_3 group, it becomes possible, through the different positions these three NO_2 groups may occupy in the molecule as regards one another, to produce 12 different trinitrotoluenes, each of which exhibits its individual characteristics, such as melting point, boiling point, specific gravity, solubility, sensitiveness to detonation, and the like. All are produced by nitration of the hydrocarbon or its products or by indirect reactions. Trotyl, known also as T. N. T., is that trinitrotoluene which, as obtained in reaction, is at ordinary temperatures a white to pale-yellow crystalline solid having a melting point of 80.6° C. It is now widely adopted as the bursting charge for armor-piercing projectiles and for torpedoes and mines. It is a very stable body, does not attack metals, is nonhygroscopic, and practically insoluble in water. Under the influence of detonating mercury fulminate it explodes with great violence. It is loaded in shells in the molten condition and by cooling under pressure attains a density of 1.7. Its detonation arouses a higher activity in detonating explosives, such as the dynamites and permissible explosives, than mercury fulminate does; hence it is coming into use in detonators and fuse. A form of the latter known as *cordeau detonant* is formed by filling a lead tube with molten trotyl. The tube is drawn through a draw plate until it is so reduced in size as to fit easily into the copper capsules of the commercial detonators or blasting caps. The detonation of the Detonator causes the detonation of the T. N. T. in the lead tube, which is thus communicated at the rate of 4000 meters per second to other detonators or charges of explosives. By its use separated charges of explosive may be fired practically simultaneously.

TRINITY. A port of entry on Trinity Bay, Newfoundland, the capital of Trinity District, 61 miles northwest direct of St. John's (Map: Newfoundland, G 4). It has important fishing industries and a fine harbor. The bay is the landing point of the Atlantic cables. Pop., 1901, 1459; 1911, 1604.

TRINITY, DOCTRINE OF THE. A doctrine of theology which declares that there are three persons in the Godhead, or divine nature—the Father, the Son, and the Holy Ghost—and that

"these three are one true eternal God, the same in substance, equal in power and glory—although distinguished by their personal properties." The most elaborate statement of the doctrine is to be found in the Athanasian Creed, which asserts that "the Catholic faith is this: That we worship one God in Trinity, and Trinity in Unity—neither confounding the persons nor dividing the substance—for there is one person of the Father, another of the Son, and another of the Holy Ghost. But the Godhead of the Father, and of the Son, and of the Holy Ghost is all one; the glory equal; the majesty coeternal."

The doctrine is not found in its fully developed form in the Scriptures. Modern theology does not seek to find it in the Old Testament. In the New Testament the elements out of which it has been constructed are sought in the Trinitarian formula of baptism, the general character of the claims and prerogatives of Jesus Christ by which his deity is established, and in the functions attributed to the Holy Spirit. It is generally conceded, however, that the Christians of the second and even of the third century were content for the most part to use scriptural expressions in speaking of the Father and the Son and the Spirit, without defining articulately their relation to one another. The term *Trinitas* was first used by Tertullian, but the concept took form only in the debates of christology (q.v.). It was not until the progress of opposing parties sought, on the one hand, to degrade the divine dignity of Christ (Ebionitism in its various forms and Arianism), or, on the other hand, to confound the personality of Christ with God the Father (see *MONARCHIANS*), that the Church was led to define in the Nicene Creed the relation of the Son to the Father, and further, in the Niceno-Constantinopolitan Creed, the relation of the Spirit to the Father. This creed (see *NICENE CREED*; *FILIOQUE*) was specially directed against the opinions of Arius (q.v.). There was never much discussion regarding the place and nature of the Spirit.

At the time of the Reformation the Protestant church took over the doctrine of the Trinity without serious examination. The only exception in modern times to the reception of the doctrine is in the case of the Socinians or Unitarians (see *SOCINUS*), who occupy in their teaching very much the position of the ancient Humanitarians (Ebionites).

Norton, *A Statement of Reasons for not Believing the Doctrines of Trinitarians* (10th ed., Boston, 1877); J. F. Clarke, *Orthodoxy: Its Truths and Errors* (4th ed., ib., 1880).

TRINITY CHURCH. The name of a great number of churches in France, England, and the United States. The most famous of these are: in France, that built by Matilda of Normandy at Caen, commonly called l'Abbaye aux Dames (c.1046 A.D.); in England the cathedrals of Bristol, Chichester, Gloucester, and Norwich, and the parish churches of Hull and Stratford-on-Avon; in the United States, parish churches at New York by Upjohn (1843) and at Boston by Gambrill and Richardson (1876).

TRINITY COLLEGE. A college at Cambridge, England, the largest and most splendid collegiate foundation in the realm. It was founded by Henry VIII in 1546 by the consolidation of several earlier foundations, with considerable additional endowments from other sources for a master and 60 fellows and scholars. Edward VI issued the statutes, Mary added 20 scholars and increased the endowment, and Elizabeth interested herself in the college. It is governed by a council, consisting of the master and four other ex-officio members, and eight elective members. The buildings are large and imposing; the great court is the largest in either university, comprising over two acres. The gateway is striking and characteristic, the Hall one of the finest in England. The chapel, though of great size, is not so fine as that of King's. The library is a large and important collection. Among Trinity worthies may be mentioned Bacon, Newton, Barrow, Coke, Dryden, Cowley, Byron, Tennyson, Edward Fitzgerald, Thackeray, Macaulay, Richard Porson, and Peacock. Some distinguished masters were William Bill, John Whitgift, Thomas Neville, Barrow, Bentley, and William Whewell. The master of Trinity is appointed by the crown, and the college has apartments for the occupancy of royalty when on a visit to Cambridge as well as for the judges on assize. There were in 1913-14 in the college 70 fellows, 72 scholars, and 672 other students. Consult Mullinger, *History of Cambridge University* (Cambridge, 1884), and Boughey and Clark, *Trinity College* (London, 1900).

TRINITY COLLEGE. See DUBLIN, UNIVERSITY OF.

TRINITY COLLEGE. A college at Oxford, England, founded in 1554 by Sir Thomas Pope, Privy Councillor to Henry VIII and Queen Mary. The college occupied the site and buildings of a Benedictine mansion called Durham College, which had been founded in 1290 by Richard de Hoton, Prior of Durham, for the education of the monks of that diocese. At the dissolution of the monasteries this passed into the hands of the newly constituted chapter of Durham and thence to Sir Thomas Pope. Trinity College was the first college founded by a layman since Balliol and consisted at first of a president, 12 fellows, and 12 scholars. Pope was a Roman Catholic, and his charter was obtained from Philip and Mary. By the changes made in 17 and 18 Vict., the college consists of a president, 12 fellowships, of which nine are occupied, several honorary fellows and lecturers, a chaplain, college officers, 30 scholars and exhibitioners, and in all about 200 undergraduates. The buildings are of various dates and are arranged in a most attractive open quadrangle. The college presents to 10 livings. Among the distinguished men who have been connected with Trinity may be mentioned Archbishop Sheldon, Bishop Seth Ward, Ludlow and Ireton of Civil War fame, Thomas Warton the poet and critic,

Cardinal Newman, the elder Pitt, Lord North, Landor, Stubbs, Freeman, George Rawlinson, and Bryce. Consult H. E. D. Blakiston, *Trinity College* (London, 1898).

TRINITY COLLEGE. An institution at Hartford, Conn., founded by members of the Protestant Episcopal church in 1823 as Washington College, the present name being assumed in 1845. The college offers two courses, leading to the degrees of B.A. and B.S. It also offers graduate courses leading to the degrees of M.A. and M.S. There is a system of alternative and elective studies, most of the work of the last three years being elective. It has no professional schools, but offers courses in civil engineering. The productive endowment in 1916 was \$1,232,000 with a gross income from endowment and students' fees of \$75,000. The library in that year contained about 80,000 volumes and about 40,000 pamphlets. The students numbered 237 and the faculty 25. The total value of buildings and grounds is about \$1,250,000. The president in 1916 was Rev. Flavel S. Luther, LL.D.

TRINITY COLLEGE. An institution for higher education founded as Normal College in Randolph Co., N. C., in 1851. It passed under the control of the Methodist Episcopal Church South in 1856 and in 1859 took the name of Trinity College. In 1891 the college was removed to Durham and opened its first session in 1892. In 1897 the trustees authorized the admission of women as students to all the departments. A new charter was granted to the college in 1903. The college confers the degrees B.A. and M.A., and its curriculum includes the regular college departments. A school of education was established in 1910, and there is also a department of law established in 1904. The enrollment in all departments of the college in the autumn of 1915 was 653, and the faculty numbered 45. A campaign for an endowment fund carried on in 1912-13 resulted in contributions (in addition to \$800,000 and \$200,000 for buildings, given by Messrs. N. and James B. Duke, and \$150,000 given by the general education board) of \$268,146, making a total of \$1,418,146. The library contains about 48,000 volumes. The president in 1916 was William P. Few, Ph.D., LL.D.

TRINITY HALL. A college at Cambridge, England. It was founded in 1350 by William Bateman, Bishop of Norwich and cofounder of Gonville and Caius College, under the name of the College of the Scholars of the Holy Trinity of Norwich, for a master and 30 scholars, devoted to the canon and civil law. It continues to be the peculiarly legal college of the university. By the new statutes in force since 1832 the college consists of a master and 18 fellows. There are also college officials, two law students, 12 scholars and exhibitors, and, in all, about 150 undergraduates. The college presents to seven livings. Among the distinguished members of the college have been Bishop Stephen Gardiner (Master), Glisson the anatomist, Lord Howard of Effingham, Chesterfield, Thomas Bilney, and Chief Justice Cockburn. Consult H. E. Malden, *Trinity Hall* (London, 1902).

TRINITY HOUSE, CORPORATION OF. A British corporation which controls the greater part of the important lighthouses, light vessels, and fog signals on the English coast, the others being under the supervision of the Admiralty, the Mersey Docks and Harbor Board.

and various local marine authorities. The headquarters of the corporation are in London, and among its chief duties are the lighting and buoyage of the Thames and adjacent coast. Other companies, bearing the same name but with less important duties, exist in some other ports. The London corporation has nothing to do with the Scottish or Irish coast, the former being under the Northern Lighthouse Commissioners and the Clyde Lighthouse Trustees, and the latter under the Irish Lights Commissioners. The London corporation, the original Trinity House, had previously existed as a religious fraternity which took upon itself certain duties connected with pilotage and the safety of mariners. It was incorporated during the reign of Henry VIII and gradually extended its work. It is managed by a board called the Elder Brethren, of which two are selected from the navy and 11 from the merchant service. Consult Mayo, *Trinity House, London Past and Present* (London, 1905). See LIGHTHOUSE.

TRINITY RIVER. A river of Texas, formed by a network of small streams in Montague, Jack, Wise, Denton, and Parker counties, Tex. Above Dallas the stream frequently runs dry (Map: Texas, E 4). It flows southeast through a fertile and well-timbered region and empties into Galveston Bay about 40 miles north of the city of Galveston. It is over 550 miles long and navigable at high water for 300 miles.

TRINITY SUNDAY. The Sunday immediately following Whitsunday, so called as being set aside for the special honor of the Trinity. No such festival was known to the early centuries; the general establishment of Trinity Sunday as a common festival of the whole Western Church dates from a decree of John XXII, who died in 1334. Nevertheless, the mass and office peculiar to the day are of much greater antiquity and may be traced, at least in part, in several liturgical books of the earlier centuries.

TRINO'DA NECES'SITAS (ML, threefold necessity). Three forms of assessment of lands for public purposes during the Anglo-Saxon era. No lands, either in secular or religious hands, were exempt from these three duties, which were known as bridge bot, for the maintenance of bridges and highways; burg bot, for the erection of and keeping fortresses in repair; and fyrd, for the support of the King's military and naval forces. Blackstone mentions that in the time of Henry II no less than 1115 castles were in existence as a result of the tax for the establishment and maintenance of strongholds. Consult Blackstone, *Commentaries*.

TRINUCLEUS, tr'nūklē-ūs (Neo-Lat., from Lat. *tres*, three + *nucleus*, little nut, kernel, nucleus). A genus of trilobites characteristic of the middle and upper Ordovician rocks of North America and Europe. The body is small, seldom exceeding an inch in length, with a relatively large and broad horseshoe-shaped head shield. The glabella is convex and consists of a prominent median and two less elevated lateral lobes, and the head is bordered by a wide pitted margin and provided with long, sometimes bifurcated, genal spines. In some forms the young were provided with simple eyes (ocelli) on the cheeks, and compound eyes, such as are seen in most trilobites, are entirely absent, while probably all had a median eye. The thorax has six segments with narrow axis, and the pygidium is small and of broadly triangular form. See TRILOBITA.

TRINUMMUS. A comedy by Plautus (about 194 B.C.), founded on Philemon's *The-sauros*.

TRIO, trê'd or tri'd (It., musical composition in three parts). In music, in a general sense, a composition for three voices or for three instruments. In instrumental music a trio is usually understood to mean a composition written for piano, cello, and violin. But it is better to apply the name "piano trio." A string trio is generally written for violin, viola, and cello, or two violins and cello. In a specific sense the term "trio" is used to denote a middle section in minuets, marches, or scherzi. It derived its name from the fact that the older composers employed three-part writing in this middle section.

TRIOLEIN, tri-ô'lê-in. See **OLEIN**.

TRI'ONAL (CH_3) (C_2H_5) $\text{C}(\text{SO}_2\text{C}_2\text{H}_5)_2$. A white crystalline compound used as a hypnotic. It is prepared by the action of methyl-ethyl ketone (a substance similar to acetone) upon mercaptan (q.v.) and the oxidation of the resulting product by permanganate of potassium. It melts at 76°C . (169°F .) and is readily soluble in alcohol, but sparingly in water. It is an excellent and harmless hypnotic, and, if used judiciously and administered in connection with a mild purgative, is believed to have no injurious effects. Like sulphonal (q.v.), it is best administered with hot milk. It is prompter in its action and safer than sulphonal.

TRIOSON, ANNE LOUIS GIRODET-. See **GIRODET-TRIOSON**, A. L.

TRIPALMITIN. See **PALMITIN**.

TRIPHENYL-METHYL, (C_6H_5) $_3\text{C}$ (?). A remarkable substance discovered by Gomberg in 1901, one of the carbon atoms in its molecule appearing to be trivalent (instead of quadrivalent, as carbon usually is). It may be prepared by the action of metals (say, silver) upon chloro-triphenyl-methane, (C_6H_5) $_3\text{C}.\text{Cl}$. It forms a colorless crystalline solid that melts at 145°C . (293°F .) and dissolves in various solvents with an orange-yellow color. It acts as a highly unsaturated compound, giving a peroxide by direct union with oxygen, an iodide with iodine, etc. When dissolved in liquid sulphur dioxide, it conducts the electric current. Molecular weight determinations show it to be made up mostly of double molecules, [$(\text{C}_6\text{H}_5)_3\text{C}$] $_2$, the color of its solutions being undoubtedly due to the quinoid structure of these double molecules; but there is now little doubt left but that single molecules of triphenyl-methyl exist, in dynamic equilibrium with the double molecules. Triphenyl-methyl is, obviously, a derivative of the radicle *methyl*, CH_3 , which can only exist as part of a molecule, but not independently. See **METHYL**; **SCHORLEMMER**.

TRIPITAKA. See **PITAKA**.

TRIPLE ALLIANCE. The name given to the alliance between Germany, Austria, and Italy formed in 1882. Bismarck was primarily responsible for the system of alliances which shaped European diplomacy during the last quarter of the nineteenth century. In order to assure the isolation of France after the Franco-Prussian War of 1871 and prevent any effort to regain the territory of Alsace Lorraine, Bismarck sought to bring about a closer understanding between Germany, Russia, and Austria. In September, 1872, the Czar Alexander II and the Austrian Emperor Francis Joseph visited Berlin, and the chancellors of the three empires exchanged notes whereby they agreed to work to-

gether for the following purposes: the maintenance of the territorial boundaries recently laid down, the settlement of questions arising from the Eastern Question, and the repression of revolutionary movements in Europe. This was the so-called Three Emperors League. This league, however, lacked solidarity. Two of its members, Russia and Austria, had conflicting interests in the Balkans, and when at the Congress of Berlin, in 1878, Bismarck supported Austria in her determination to limit Russian influence in the Balkans, the alliance was broken. The withdrawal of Russia led to a closer union of the two central Powers. Bismarck and Count Andrassy came to an understanding in an interview at Gastein, Aug. 27-28, 1879. It was not until Nov. 5, 1887, that the terms of this treaty were made known, when they were published in the *London Times*. The compact provides that, if either Germany or Austria shall be attacked by Russia, each Power must assist its neighbor with all its forces. If, however, the attack shall come from any other Power, the ally is pledged merely to observe neutrality. Bismarck did not abandon his policy of maintaining friendly relations with his eastern neighbor, and in 1884, at a second meeting of the three emperors, he succeeded in renewing the old understanding. He also negotiated a secret "reinsurance compact" with Russia for mutual friendly neutrality in case either were attacked by a third Power. When Bismarck retired from office in 1890, Emperor William II abandoned that part of the former Chancellor's policy which called for a close understanding with Russia. He refused to renew the reinsurance compact and turned his attention to welding more solidly the alliance of the Teutonic Powers.

Italy's alliance with the Teutonic Powers was largely due to her resentment against France because of the latter's acquisition of Tunis in 1881. This territory was regarded by Italy as a field for her colonial expansion. Checkmated by France, Italy turned to the Germanic Powers, and on May 20, 1882, treaties were signed which bound Italy to the central Powers for a term of five years. Italy's position in the Triple Alliance was from the beginning an unnatural one. Bound to Austria, a country which had consistently opposed the movement for Italian unity and which still held provinces which Italy felt should be a part of the Italian nation, any real sympathy between these Powers was difficult to maintain. Moreover, the interests of these Powers clashed in the Balkans. Italy resented the acquisition of Bosnia and Herzegovina by Austria, and the extension of Austrian influence along the eastern shore of the Adriatic Sea was regarded as a menace by Italy. While the treaty was renewed at five-year intervals until 1902 and was then extended for 12 years, it was evident that Italy's allegiance rested on none too solid grounds. Evidence of her weakening support of the Teutonic Powers appeared at the Algeiras Conference in 1906, which attempted to settle the dispute over Morocco. A still more serious blow was given to the Alliance when Italy in 1911 seized Tripoli and declared war on Turkey, which Power had come to be considered a member of the Triple Alliance. It did not cause surprise, therefore, when, at the outbreak of the European War in 1914, Italy refused to join Germany and Austria, claiming that it was not a defensive war contemplated by the Treaty of Alliance. The terms of the treaty were not published, but

during the early months of the war Italy stated that under the treaty she was entitled to "compensations" as a result of Austria's occupation of Servian territory. After several months of fruitless negotiations Italy, on May 3, 1915, formally withdrew from the Triple Alliance. Consult: F. H. Geffcken, *Frankreich, Russland, und den Dreibund: geschichtliche Rückblicke für die Gegenwart* (Berlin, 1893); Vincent Benedetti, *Studies in Diplomacy* (Eng. trans., New York, 1896); Francesco Crispi, *Memoirs of Francesco Crispi* (3 vols., ib., 1912-14). See TRIPLE ENTENTE; WAR IN EUROPE.

TRIPLE ENTENTE. The name given to a number of agreements or "understandings" concluded between the governments of Great Britain, France, and Russia.

The effect of the formation of the Triple Alliance (q.v.) between Germany, Austria, and Italy in 1882 was to draw the other two great continental powers, France and Russia, together. This rapprochement at first took the form of large loans of money by France to Russia. These loans enabled Russia to consolidate her debt on easier terms, to build strategic railroads, and to increase the efficiency of her army and navy. In July, 1891, the French Channel fleet visited Cronstadt, and it is probable that at this time military and naval understandings between the two Powers were drawn up to serve as bases for common action. It was not until 1895 that the alliance was definitely avowed. The terms of the treaty were not disclosed. An unofficial version stated that if either nation were attacked the other would come to its aid with the whole of its military and naval forces.

Although England had always been included in the concert of European powers, she avoided limiting her freedom of action by declining to enter a fixed alliance with any of the great continental powers. Her unique geographical position and her control of the seas gave her great influence in maintaining the balance of power on the Continent. The grouping of the great continental powers into two opposing military alliances made it more difficult for Great Britain to maintain her policy of "splendid isolation." Moreover, Germany's frank adoption of naval policy in competition with Great Britain made the latter consider the dangers of her isolated position. There were, however, serious difficulties which had to be overcome, apart from the abandonment of her policy of aloofness, before England was able to join one of the European alliances. France and Russia were by long tradition hostile to England. With France England had serious disputes in regard to the partition of north Africa, about the boundaries of Siam, and about the Newfoundland fisheries. The two Powers nearly reached a break in 1898, when a French force tried to take possession of the upper waters of the Nile. (See KODOK.) Negotiations, however, led to a final understanding in 1904, by which England was conceded a predominant position in Egypt, and France a similar position in Morocco.

With Russia, Great Britain's causes of friction were chiefly two. In the first place England opposed the extension of Russian influence in the Balkans, and secondly England opposed the Russian advance towards the British possessions in India. The first of these causes of dispute was gradually removed as public feeling in England turned against the Turks in favor of the subject races in the Balkans which had been

protected by Russia. The special point of difficulty in Asia was Persia. This country was in a state of chronic confusion and disorder, which was an invitation to two powerful nations, Great Britain and Russia, to intervene in its internal affairs. Each of these Powers was intriguing to prevent the other from gaining any advantage in this region. In 1907 Sir Edward Grey entered upon negotiations with the Russian government to settle these and other outstanding difficulties between the two Powers. There resulted a series of agreements respecting the countries of Tibet, Afghanistan, and Persia, which bordered the territorial possessions of the two Powers.

The way had thus been cleared for a close understanding between Great Britain, France, and Russia. The precise nature of this understanding was indefinite. There was no treaty agreement specifying its scope. Some light was thrown upon it in a speech made by Sir Edward Grey in the House of Commons on Aug. 3, 1914. He said that the Triple Entente was not an alliance, but a "diplomatic group." As to England's relations with France, he said that at the time of the Moroccan crisis in 1906 he had stated to the representatives of Germany and France that if war were forced on France because of the Moroccan dispute, "in my view public opinion in this country would have rallied to the material support of France." In view of such a contingency the French Minister suggested that, in order to make any coöperation effective, conversations should be held between the military and naval experts of the two countries. To this Sir Edward Grey agreed on the distinct understanding that nothing which passed between the military and naval experts should be binding on either government. In 1912, following the second Moroccan crisis, the British cabinet decided that it would be well to have an understanding in writing that these conversations were not binding upon the freedom of either government. Accordingly Sir Edward Grey wrote to M. Cambon, the French Ambassador, stating clearly that the military conversations were not binding, but at the same time he agreed that in case either country were attacked by a third Power "it should immediately discuss with the other whether both governments should act together to prevent aggression and to preserve peace."

In regard to England's relations to Russia Sir Edward Grey stated, "We are not parties to Franco-Russian alliance. We do not even know the terms of that alliance."

With the outbreak of the European War in 1914, this rather vague and loose Entente was made more binding, when on Sept. 5, 1914, the representatives of the three Powers agreed not to conclude a separate peace with Germany and Austria, and secondly that when the terms of peace should be discussed no one of the allies should demand conditions of peace without previous agreement with the other allies. See WAR IN EUROPE.

TRIPLET (from *triple*, Fr. *triple*, from Lat. *tripplus*, threefold). In music, a group of three equal notes, to be performed in the time of two of like value in the regular rhythm. For instance, when a quarter note is divided into three eighth notes, the group is called a triplet, and it is usual to place the figure 3 over it.

TRIPOLI, trip'ô-li. Formerly a vilayet of the Ottoman Empire. The name is now often

applied to the Italian possession of Libya, situated on the northern coast of Africa between the Libyan Desert on the east and Tunis on the west (Map: Africa, F 2). The southern part of the country is Fezzan, which has the French Sahara on the west. The country is divided into two governments—the one, Tripolitania, corresponding to the old Vilayet of Tripoli, and the other, Cyrenaica, corresponding to the former Mutessarifat of Bengazi (Barca). The boundaries in the desert are only approximate, and the area of Libya cannot be accurately stated. The estimate in the *Annuario statistico italiano*, published in 1915, is 1,000,000 to 1,500,000 square kilometers (1 square kilometer = 0.3861 square mile). Pop., according to a census taken in 1911, 523,176 natives and about 6000 Europeans.

The interior of Tripoli is elevated and sandy, with fertile spots along the wadies. The country is exposed to the clouds of sand from the deserts. The coasts are mostly low and sandy, with the exception of the northeastern part, where some of the mountains attain an altitude of nearly 2000 feet. Tripoli has no permanent rivers, but there are a considerable number of springs, and the dry river courses fill up during the rainy season. The climate is hot during the summer, but it has more of a Mediterranean than an African character. In its flora and fauna Tripoli resembles the rest of the countries on the northern coast of Africa. Owing to the scarcity of productive land and its small population, Tripoli is very little developed.

Agriculture is carried on only to a limited extent. More attention is paid to stock raising. The chief agricultural products are wheat, dates, grapes, and olives. Sheep are raised on a large scale, and cattle are also to some extent. Some sulphur and salt are obtained near the coast, and there are small sponge fisheries. The commerce was formerly very considerable, and the port of Tripoli was once an important outlet for the products of the interior, with which it is connected by numerous caravan routes. The chief exports are hides, sponges, and henna, besides various articles from the interior of Africa, as gold, ostrich feathers, ivory, rubber, and a few other products. The imports from Europe consist chiefly of manufactures and food substances. The centre of foreign commerce is the city of Tripoli (q.v.). Imports in 1912 were reported at 27,782,000 lire, and exports at 4,029,000 lire.

The Italian Governor of Tripolitania resides at the city of Tripoli, and the Governor of Cyrenaica at the city of Bengazi. The population consists largely of Berbers and Moors, the latter living mostly in the cities. The Turkish element is very limited. Italian is the official language, but Arabic is commonly spoken.

History. Tripoli appears early to have formed a portion of the territory of the Carthaginians. It next passed to the Romans, who included it within the Province of Africa and gave it the name of Regio Syrtica. About the beginning of the third century A.D. it became known as the Regio Tripolitana (on account of its three principal cities, Cæa, Sabrata, and Leptis, which were leagued together; whence its present name Tripoli), and was probably raised to the rank of a separate province by Septimius Severus, who was a native of Leptis. Later it passed into possession of the Vandals and Greeks. In the seventh century it was conquered by the Arabs (see BARBARY STATES), and the feeble Christianity of the natives was sup-

planted by a vigorous and fanatical Mohammedanism. In 1510 the city of Tripoli was captured by Ferdinand the Catholic, from 1530 to 1551 it was in possession of the Knights of St. John. Since 1551 the country had formed part of the Turkish Empire, though the authority of the Sultan, down to 1835, had been virtually at zero for more than a century. During this period Tripoli was a piratical stronghold. In consequence it was attacked by successive expeditions of the English and the French. In 1801-05 it was involved in an unsuccessful war with the United States, and in 1815 an American expedition exacted reparation for injuries done to American commerce. (See BARBARY POWERS, WARS WITH THE.) In 1835 an expedition was dispatched from Constantinople; the ruling bey, Karamanli (in whose family the sovereignty had continued uninterrupted since 1714), was overthrown and imprisoned; a new Turkish pasha, with vice-regal powers, was appointed, and the state made a vilayet of the Ottoman Empire. Several rebellions have since taken place (notably in 1842 and 1844), but they have always been suppressed. In 1911 a war broke out between Italy and Turkey. By the terms of the Treaty of Lausanne Italian sovereignty was recognized in Tripoli, although Italy accepted a clause which permitted the Caliph to exercise religious authority.

Abbott, *The Holy War in Tripoli* (ib., 1912); Lapworth and Zimmern, *Tripoli and Young Italy* (ib., 1912), containing a bibliography; Alan Ostler, *The Arabs in Tripoli* (ib., 1912); Arturo Labriola, *La guerra di Tripoli e l'opinione socialiste* (Naples, 1912); Federico Minutilli, *La Tripolitania* (2d ed., Turin, 1912).

TRIPOLI. The capital of Tripolitania, in Africa, on a promontory in the Mediterranean Sea, which forms a small bay. The Sahara approaches within a short distance (Map: Africa, F 1). The town, whose high walls are dilapidated, lies in a fertile plain. It is typically Oriental with its slender minarets and domed mosques. The castle of the beys is handsome. There is a splendid Roman triumphal arch, erected to Marcus Aurelius. Tripoli owes its importance as the commercial centre of the country to the three historic caravan routes of which it is the terminus. The first of these runs south across the Desert of Sahara to Lake Chad; the second, southwest to Timbuktu; and the third, south by east to Wadai and points in Darfur. The city manufactures carpets, scarfs, and Spanish leather. The harbor varies in depth from 15 to 24 feet. The trade is mostly in the hands of the Jews, who are congregated in a quarter of the town called Harra. Tripoli, one of the oldest cities of Africa, is the Cæa of the Phœnicians. In February, 1804, the harbor was the scene of Lieutenant Decatur's brave exploit of recapturing and burning the American frigate *Philadelphia*. Pop., 29,761.

TRIPOLI, trip'ô-li, **TRIPOLIS,** trip'ô-lis

(the classical name), or **TARABULUS**, tá-rá' bu-lus. A town in Syria, Asiatic Turkey, the capital of a liwa in the Vilayet of Beirut, two and a half miles from El Mina, its port, and 40 miles north-northeast of Beirut (Map: Turkey in Asia, C 3). The streets are well paved and covered in some places by arcades. The houses are built of a porous conglomerate, giving the town a picturesque Oriental aspect. There are 14 churches, nearly equally divided between the Latin, Greek, and Maronite sects, an American mission station and girls' school, an orphanage and girls' home of the French Sisters of Charity, a synagogue, 14 mosques, a monastery of dancing dervishes, a castle, and several large khans. Tripoli is famous for its silk sashes. Silk, sugar cane, ivory, ostrich feathers, wool, and sponges are exported. Mulberry trees are extensively cultivated for the silkworms. The hills east of the town contain numerous tobacco plantations. There is a large overland trade by camels with Aleppo. Pop., 30,000, including El Mina. Of the inhabitants, 24,000 are Moslems, 4500 Orthodox Greeks, 1500 Maronites. Tripoli was a member of the Phœnician League. At that time it lay on the coast. In 450 and in 550 it was destroyed by earthquakes. The Saracens took it in 638. It was several times captured by the Greeks. The Romans erected many fine buildings. After a siege of several years it was taken in 1109 by the Crusaders, under whom it enjoyed great prosperity. Destroyed by the Egyptian Sultan, Kalaun, in 1289, it was rebuilt on its present site.

TRIPOLIS. See **TRIPOLITZA**; **TRIPOLI**.

TRIPOLITE, or **TRIPOLI** (-li) (from *Tripoli*, in Africa). A name sometimes applied to diatomaceous earth (q.v.), but belonging properly to certain highly siliceous rocks, used chiefly for abrasive purposes. The best known, or Missouri tripoli, is a light, porous siliceous rock, of very fine texture and containing over 98 per cent silica. Consult Ries, *Economic Geology* (3d ed., New York, 1910), and Parr and Williams, *Journal of Industrial and Engineering Chemistry*, vol. i, p. 692 (Easton, Pa., 1909).

TRIPOLITZA, tré'pô-lyé'tsá, or **TRIPOLIS**. The capital of the Nomarchy of Arcadia, Greece, 34 miles southwest of Argos, on the Argos-Kalamata Railway (Map: Greece, D 6). It is on a plain, 2000 feet above sea level, near the site of the ancient Tegea and Mantinea. Tapestries and leather goods are manufactured. Pop., 11,000. Tripolitza is a modern city and under the Turkish pashas was the capital of the Morea. It was captured and burned by the Greek patriot Kolokotronis (q.v.), Oct. 5, 1821. In 1825 it was taken by Ibrahim Pasha and completely destroyed by him in 1828.

TRIPPOS (from Lat. *tripus*, from Gk. *τρίπους*, *tripous*, tripod). A term peculiar to Cambridge University, denoting the three honor classes composed of successful candidates in the final examinations in the various departments. In mathematics the first-honor men are known as senior and junior wranglers. The term is also used of the examination itself.

TRIP/PANT. In heraldry (q.v.), a term used of a beast of chase represented as walking.

TRIPTOLEMUS (Lat., from Gk. *Τριπτόλεμος*). A Greek legend, the bestower of grain upon mankind. In the Homeric Hymn to Demeter, Triptolemus is merely one of the princes of Eleusis (q.v.) to whom Demeter (see **CERES**)

teaches her sacred rites when she finally leaves her temple for Olympus. Later, however, tradition made him the son of King Celeus and Meteneira, and a special favorite of Demeter, who gave him a winged chariot, or one drawn by winged dragons, and sent him forth to bear the knowledge of her gift of grain among mankind. This scene is frequently represented on Attic vases of the fifth century and later. Triptolemus had a temple at Eleusis and was honored in Athens also in connection with the two goddesses Demeter and Kore. Attic belief also made him one of the judges in the lower world, apparently in place of Minos, who held an unfavorable place in local legends. The Greek type of Triptolemus was used by the Romans for *Bonus Eventus*, who seems to have had much resemblance to the Eleusinian hero.

TRIP TO SCARBOROUGH, A. A comedy by Sheridan (1777), altered from Vanbrugh's *Relapse* (q.v.).

TRIPTYCH, tríp'tík (from Gk. *τρίπτυχος*, *tríptychos*, folded thrice, from *τρεῖς*, *treis*, three + *πτυχή*, *ptychē*, fold, from *πτύσσειν*, *ptyssein*, to fold). An altarpiece of three wings, each painted or carved with a distinct subject, but joined together by hinges and capable of being folded so as to present a new face when closed. During the early Middle Age and especially the high Gothic period small ivory triptychs, exquisitely carved, were frequently used in private devotions. During the late Gothic and early Renaissance the triptych was commonly employed as an important devotional altarpiece in the churches of both northern and southern Europe. The panels were of wood, often with architectural framework, and were decorated with paintings. This was especially the case in Flanders and in Germany, where painting was combined with elaborate wood carving in the decorations of altarpieces.

TRIEME (Lat. *triremis*, galley with three banks of oars, from *tres*, three + *remus*, oar). In ancient times, a galley with three banks of oars; the common form of the ancient ship of war in the fifth and fourth centuries B.C. The credit of the invention was given to the Corinthians, who were said to have used triremes in their war with Coreyra in the seventh century B.C. The details of the structure of the Athenian trireme are still uncertain, as the statements of the ancient writers leave many points obscure, and the testimony of works of art is likewise full of uncertainties. It seems clear that the banks of oars were arranged one above the other, though not perpendicularly; that there was only one man to an oar; and that all the oars could be, and in battle were, used at the same time. For ordinary purposes the crew was, of course, divided into watches. The ancient trireme was of light draft and could be easily hauled on shore, so that a high freeboard seems improbable, for reasons of stability; while the difficulty of keeping an effective stroke with oars of widely different lengths also speaks against any such mode of construction. The trireme was provided with a mainmast which carried a large square sail, that was lowered with its yard, or, if possible, left on shore, before going into action. In the latter case the mast also was unstepped and laid along the deck. There was also a small foremast, which seems to have projected somewhat like a bowsprit and likewise carried a square sail. The Attic trireme of the fourth century carried 170 oars, but probably not over 150

were actually used, the rest being a reserve equipment. Officers, sailors, and 10 or 12 hoplites brought the total crew up to about 200 men. The ship was steered by large paddles on either side of the stern, connected inboard so that they could be handled by a single man. The time was given to the rowers by a special officer, the keleustes. The lowest rank of rowers was called thalamitæ, the second zeugitæ, and the uppermost thranitæ; the thranitæ received the highest pay, as handling the longest oars. In the early battles, such as that at Salamis, the chief endeavor was to lay the ships aboard and fight from the decks, trusting little to manœuvring, in which the Greeks seem to have felt themselves inferior. Later the Athenians developed a high degree of skill in handling their long light vessels and preferred to regard the trireme as the weapon and to aim at disabling or sinking the enemy by the use of the ram, which projected at the water line or below. The attack was aimed at the quarter or side of the hostile ship, and to meet bows on was held unskillful and even dangerous, as the bow was not strongly built. Against the Carthaginians the Romans used boarding bridges in order to neutralize the seamanship of their opponents and bring about a conflict of soldiers.

TRISAGION, trīs-äg'i-ōn or -ä'g'i-ōn. See DOXOLOGY.

TRISECTION OF AN ANGLE (from *trisection*, from Lat. *tres*, three + *sectus*, p.p. of *secare*, to cut). One of the three famous problems of antiquity, the others being the duplication of the cube (q.v.) and the squaring of the circle. (See CIRCLE; QUADRATURE.) This problem, like the quadrature of the circle, is almost as old as geometry itself, but first received thorough investigation at the hands of the Sophists (400 B.C.). Hippias of this school invented the quadratrix (see QUADRATURE), by which any angle may be trisected. In the figure *BD* is a quadrant of a circle, *BG* is an arc of the quadratrix, and the construction involves the relation $\frac{DB}{FD} = \frac{BA}{EH}$. Hence, by dividing *BA* into

segments having any given ratio, the quadrant or any arc *BD* can be divided into arcs having the same ratio. If the arc is to be trisected the line corresponding to *BA* is trisected. The trisection of an angle is also accomplished by means of the conchoid (q.v.) of Nicomedes (180 B.C.). If *AOB* in the figure is the angle to be trisected, *O* any point on *OB*, *CM* is \perp to *OA* and *CP* is \parallel to *OA*, it is easily seen that, if *P* can be found so that *PN* = *2CO*, then *PO* is a trisection line of angle *AOB*. But the trammel of the conchoid with its directrix resting on *CM*, parameter *AM* = *CB* = *2CO*, its pole at *O*, will describe a curve cutting *CP* in the re-

quired point. Many other methods have been devised for the solution of this problem. Viète (1591) showed its relation to the solution of the

cubic equation. Gauss (1801) showed its relation to cyclotomic equations. Other mathematicians of the nineteenth century have declared its solution impossible by means of the

straight edge and compasses (i.e., by the postulates of Euclidean geometry). But the real reason for the failure of this method to solve the problem and also its associates was set forth by Klein.

The argument may be briefly stated as follows: (1) According to the formula of De Moivre (q.v.) the roots of the equation $x^3 = \cos \phi + i \sin \phi$ are $x_1 = \cos \frac{\phi}{3}$, $x_2 = \cos \frac{\phi+2\pi}{3}$, $x_3 = \cos \frac{\phi+4\pi}{3}$. (2) These roots are represented geometrically

by the vertices of an equilateral triangle inscribed in the unit circle with its centre at the origin. The figure shows that to the root α , corresponds the argument $\frac{\phi}{3}$. Hence the equation

$\omega^2 = \cos \phi + i \sin \phi$ is the analytic expression of the problem of the trisection of the angle. No root of the equation can be expressed as a rational function of $\cos \phi$ and $\sin \phi$. That is, the equation is irreducible and can be solved by the aid of a finite number of square roots only for special values of ϕ . Hence the trisection of an arbitrary angle cannot be effected with straight edge and compasses. Consult: Felix Klein, *Famous Problems of Elementary Geometry* (Eng. trans., Boston, 1897); Dickson, "Constructions with Ruler and Compasses," in J. W. A. Young, *Monographs on Topics of Modern Mathematics* (New York, 1911); Arthur Mitzscherling, *Das Problem der Kreisteilung* (Leipzig, 1913).

TRISMEGISTUS. See HERMETIC.

TRISMUS NASCENTIUM (Neo-Lat., lockjaw of the new born). A form of lockjaw occurring in newly born children a few days after birth and usually fatal. In some cases the attack comes in 8 or 10 days after birth. The cause is infection of the umbilical stump with tetanus bacilli. See TETANUS.

TRISSINO, trēs'sē'nō, GIOVANNI GIORGIO (1478-1550). An Italian critic and author, born at Vicenza. Excluded for Imperialistic affiliations from his native territory by the Signoria of Venice in 1509, he spent some time in Germany, at Ferrara, and at Florence, and in 1514 went to Rome, where he was received with favor by Pope Leo X, who sent him on missions to the Emperor Maximilian and to the Signoria of Venice. At the instance of Leo X the ban of proscription was taken off. He enjoyed the esteem of Popes Clement VII and Paul III and passed some time at Venice as Nuncio of the former pontiff. Between 1532 and 1545 he lived at Venice and Padua, maintaining a splendid literary hospitality in his villa at Cricoli. In 1545 he returned to Rome, where he died. Trissino, a man of less than ordinary artistic vision, is an immensely important figure in literary history. His conversations in Florence (1514) gave rise to Machiavelli's *Dialogo intorno alla lingua* and thereafter to the violent polemics of the following decades on the "question of the Italian language." (See ITALIAN LANGUAGE.) His *Epistola* to Clement VII (1527), his *Grammatichetta* and *Dubbj grammaticali* (1529) advocated an orthographical reform of the Italian language (Gk. ϵ = It. open e , ω = It. close o , ζ = It. sonant z , σ = It. sonant s , etc.), which he applied to the printing of his own works. By his (the first) edition of Dante's *De vulgari eloquentia* (1523) and in his dialogue *Il castellano* (1528) he propounded the theory of the "Italian Language," before then referred to as "Tuscan," "Florentine," or simply "vulgar," which aimed at the construction of an Italian dictionary and grammar based on a synthesis of the Italian dialects. This theory triumphed in northern Italy, where Trissino's principal follower was Girolamo Muzio.

In literary theory Trissino was an enthusiastic follower of neo-Aristotelian doctrine and an illustrator of the methods of its application to creative work. So his *Italia liberata dai Goti* (1547-48) is the first "regular" epic poem, and his *Sofonisba* (1515) the first regular

tragedy in modern literature, though not even this sole distinction of priority clings to his *Simillimi*, based on the *Menæchmi* of Plautus. These works illustrate the Renaissance principles of the unities of time, place, and action, the relations of the episodic to the main themes, the use of the supernatural, of realism in manners and customs, etc. Trissino's selection of the unrhymed hendecasyllabic verse for epic and tragedy was a permanent acquisition for the Italian classic stage; though in the epic it was crowded out by the popular Italian octave stanza used by Pulci, Boiardo, Ariosto, and Tasso. Only an erudite curiosity attaches to Trissino's ideas and experiments in the adaptation of Greek and Latin metres to Italian lyric verse. Consult: *Tutte le opere di Giovanni Giorgio Trissino* (Verona, 1729); Ciampolini, *La prima tragedia regolare nella letteratura italiana* (Lucca, 1884); Ermini, *L'Italia liberata dai Goti di G. G. T.* (Rome, 1893); Morsolin, *Giangiorgio Trissino, monografia di un gentiluomo letterato del secolo XVI* (2d ed., Florence, 1894); Trabalza, *Storia della grammatica italiana* (Milan, 1908).

TRIST, NICHOLAS PHILIP (1800-74). An American lawyer and diplomatic agent, born at Charlottesville, Va. He was educated at the United States Military Academy, but did not graduate. He studied law under direction of Thomas Jefferson, whose granddaughter he married and of whose household he was a member, but became a clerk in the United States Treasury Department in 1824 and was private secretary to President Jackson in 1829. He was United States Consul at Havana (1834-36) and chief clerk in the Department of State (1845). During the Mexican War, after American successes at Buena Vista and Vera Cruz, President Polk, in April, 1847, appointed Trist special agent to negotiate for peace, but without notifying General Scott. On the arrival of Trist a quarrel ensued between him and Scott. Negotiations were fruitless until after the capture of the city of Mexico and the resignation of Santa Anna as President. The succeeding government desired peace, and Trist, though his powers had been withdrawn, feeling that the wish for peace in the United States would excuse the irregularity, proceeded with the negotiations, by the advice of General Scott, now his friend. The Treaty of Guadalupe Hidalgo was signed Feb. 2, 1848, and was ratified by the United States Senate. Trist afterward practiced law and in 1870 was appointed postmaster at Alexandria, Va.

TRISTAN. See TRISTRAM.

TRISTAN DA CUNHA, trīs-tän' dá kōon'yá. A group of three small volcanic islands in the South Atlantic Ocean, 1500 miles south-southwest of St. Helena and nearly midway between Cape Town and Buenos Aires (Map: World, Eastern Hemisphere, N 20). Total area, 44 square miles. The largest and only inhabited island consists of an extinct volcano 8500 feet high. The climate is equable and healthful. The inhabitants numbered 102 in 1914. They are chiefly the descendants of the British soldiers stationed there during Napoleon's captivity at St. Helena and of settlers from whaling ships. They are supported by agriculture and have a considerable number of cattle. They are also remarkable in having no organized form of government. Access to the outer world is maintained by the annual visit of a British warship.

The islands were discovered in 1506 by the Portuguese navigator Tristan da Cunha and were taken by Great Britain in 1816.

TRISTAN (trîs'tän) **UND ISOLDE**, è-zôl'dê. An opera by Wagner (q.v.), first produced in Munich, June 10, 1865; in the United States, Dec. 1, 1886 (New York).

TRISTE'ARIN. See **STEARIN**.

TRIS'TIA (Lat., laments). Five books of short poems, in the elegiac metre, written by Ovid between 9 and 12 A.D. during his banishment at Tomi.

TRIS'TRAM, **TRISTREM**, or **TRISTAN**. The hero of a Welsh or Armorican romance originally distinct from the Arthurian cycle, but early incorporated with it. Tristram was the son of Roland of Ermonie (or, according to other versions, of Rivalén of north Britain) by Blanche-fleur, sister to King Mark of Cornwall. His father slain, his mother dead of grief (which she expressed in the child's very name), Tristram was reared by a faithful steward. At the age of 15 he drifted to the court of his uncle, King Mark, whose favor he won by his skill in the chase and in minstrelsy. He slew in mortal combat Moraunt, or Morolt, brother of the Queen of Ireland, who had come to demand tribute from King Mark. After suffering for three years from severe wounds he sailed to Ireland, where they were healed by Iseult (variously spelled), daughter of the Queen. On his return to Cornwall, Tristram told his uncle of the marvelous beauty of the Irish princess and was sent back to Ireland to ask her hand in marriage for the King. On the voyage from Ireland to Cornwall, Tristram and Iseult drank of a love potion intended for King Mark and ever after loved each other. Iseult married Mark, but contrived, with the aid of her clever maid, to have many secret interviews with Tristram. At length the lovers were discovered, and Tristram fled to Wales, and later to Brittany, where he married another Iseult, the White-handed, daughter to Duke Florentine; but he never forgot Iseult of Ireland. Desperately wounded, he sent a messenger to Cornwall to summon her to heal him once more. He directed the messenger to hoist a white sail on the return voyage if the princess were on board; if not, a black sail. The Queen of Cornwall hastened to save her lover. As the vessel neared the shores of Brittany, Iseult of the White Hand saw the white sail; but, fired with jealous hate for her rival, she told her husband that the sail was black. Tristram sank back and died. Iseult of Ireland fell prostrate over the body of Tristram and died of a broken heart. King Mark subsequently learned the story of the love potion and buried the lovers in one grave, planting over Iseult a rose and over Tristram a vine, growing so intertwined that no one could separate them.

This passionate story, probably originating, according to Miss Schoepperle, in a Celtic elopement myth, got into literature in the twelfth century and spread through western Europe. Professor Bédier argues that the various versions preserved to us were all derived from one poem probably composed in England by an Anglo-Norman monk. This poem, of which all traces are now lost, was of such beauty that it gave definite form to the Tristram legend. Though this ingenious theory has been the subject of controversy, it is now becoming more universally accepted. The later versions may, however, be traced back to a poem, now existing only in

fragments, by an Anglo-Norman trouvère named Bérout (about 1150). A little later than this (about 1160) the theme was treated by Chrestien de Troyes (q.v.) in a poem now lost. So far as has been determined, the source of the many later Tristrams is a very prolix poem by an Anglo-Norman named Thomas (about 1170). Before the close of the twelfth century Tristram and Iseult were among the favorite themes of the troubadours. From the French the romance passed into the German *Tristrant* (about 1175) by Eilhard of Oberg and the *Tristan und Isolde* (between 1200 and 1225) by Gottfried of Strassburg. Gottfried's poem, extending to 19,573 lines, is the most beautiful of all early versions. Left incomplete, it was continued by Ulric of Türheim and by Henry of Freiburg. The great popularity of the romance in Germany is further attested by numerous chapbooks. To the year 1226 belongs a Scandinavian version, *Tristram Saga ok Isondar*, and this in turn was put into Icelandic prose. The earliest extant English version is known as *Sir Tristrem*. The only extant manuscript belongs to the middle of the fifteenth century. It was composed in the last part of the thirteenth century and has been ascribed to Thomas the Rhymer (q.v.). In 1469 was published at Rouen an immense prose *Tristram* in French, which was translated into German, Spanish, and Italian. It was also used by Sir Thomas Malory (q.v.) for his *Morte d'Arthur* (1485). In the nineteenth century Tristram and Iseult became a favorite theme in England and Germany. Following Malory, Tennyson wove the story into the *Idylls of the King* ("The Last Tournament"). In his noble *Tristram and Iseult* Matthew Arnold awakened pity for Iseult of Brittany. But Swinburne in his *Tristram of Lyonesse* best expressed the tremendous passion of the mediæval tale. The theme was treated splendidly by Wagner in his operatic poem *Tristan und Isolde* (1859). Consult the English *Sir Tristrem* as edited by G. P. McNeill for the Scottish Text Society (Edinburgh, 1886), and by E. Kölbing in *Die nordische und die englische Version der Tristansage* (Heilbronn, 1878-82); Golther, *Tristan und Isolde* (Leipzig, 1907); M. W. Austin, *Tristram and Iseult* (Boston, 1905). A charming version of the Tristram story is that of J. Bédier, *Le roman de Tristan et Iseut* (5th ed., Paris, 1902; Eng. trans. by Florence Simmonds, London, 1910, and by Hilaire Belloc, New York, 1914). Other works of importance are E. Muret, *Le roman de Tristan par Bérout* (Paris, 1903); Piquet, *L'Originalité de Gottfried de Strassbourg dans Tristan et Isolde* (Lille, 1905); J. Bédier, *Le roman de Tristan par Thomas* (2 vols., Paris, 1902-05); id., *Les deux poèmes de La folie Tristan* (ib., 1907); W. Hertz, *Tristan und Isolde* (Stuttgart, 1907); Gertrude Schoepperle, *Tristan and Isolt* (2 vols., London, 1913); Passerini, *Il romanzo di Tristano e Isotta bionda* (Milan, 1914).

TRISTRAM, HENRY BAKER (1822-1906). An English clergyman, traveler, and author, born at Eglington, Northumberland. He graduated at Lincoln College, Oxford, in 1844 and in 1880 became rural dean of Durham. He traveled extensively in biblical lands and elsewhere and published, among other works: *The Great Sahara* (1860); *Land of Israel* (1865; 2d ed., 1882); *Natural History of the Bible* (1867; 5th ed., 1880); *Bible Places, or Topography of the Holy Land* (1872-97); *Land of Moab* (1873; 2d ed.,

1874); *Pathways of Palestine* (2 vols., 1882); *Fauna and Flora of Palestine* (1884); *Eastern Customs in Bible Lands* (1894).

TRISTRAM SHANDY, THE LIFE AND OPINIONS OF. A novel by Laurence Sterne in nine volumes (1759-67). The chief interest of the work is in its characters: Walter; Captain Shandy (Uncle Toby), the real hero of the story; Corporal Trim; and Yorick.

TRITHEMIUS, JOHANNES (1462-1516). A German Catholic theologian and historian. His name was Heidenberg, but he was called Tritheim or Trithemius from his birthplace, Trittenheim. In 1482 he entered the Benedictine monastery at Sponheim, near Kreuznach, and in 1483 became its abbot. Here he collected a library which made the house famous. His rule was strict, and his monks resented his long absence in the neighboring country; so in 1506 he exchanged Sponheim for the Scottish monastery of St. James at Würzburg, where he died. His writings are very numerous; his sermons to monks were published in 1576, and his letters in 1536. He was also a pioneer author in German Church history and invented a popular system of shorthand, *Steganographia* (Frankfort, 1606; new ed., 1635), for which see Bailey, *John Dee and the Steganographia of Trithemius* (London, 1879). Consult: J. Silbernagel, *J. Trithemius* (2d ed., Landshut, 1868); W. Schneegans, *Abt Johannes Trithemius und Kloster Sponheim* (Kreuznach, 1882); Johannes Janssen, *History of the German People at the Close of the Middle Ages*, vol. i (Eng. trans. by A. M. Christie, London, 1896).

TR'THING. See RIDING.

TRITON (Lat., from Gk. *Tpῑτων*). In Greek mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He seems especially connected with Boeotia and was perhaps originally a local divinity of Alalcomene or Tanagra. In this region took place the conflict of Hercules with Triton, which was a favorite subject in early works of art. In the fourth century B.C. and later, we find a whole race of Tritons, to be compared with Panes, Sileni, and similar multiplications. In art they are at first human to the breast or waist, ending in the tail of a sea serpent or fish. In later art we find the legs replaced by fishes' tails, or else the figure that of a sea centaur, with the head and trunk of a man, the forelegs and body of a horse, and passing into a serpent with a fish tail. Characteristic is Triton's conch shell, on which he is represented as blowing stormily or gently.

TRITON CONVERTED INTO A WAR TRUMPET.

TRITON. 1. A genus of aquatic amphibians, the newts. (See NEWT.) 2. Any of several large gastropod shells, especially a large species (*Triton tritonis*), having a spiral shell more than a foot

long, which is used as a war trumpet by natives of the South Sea Islands, the example illustrated being one from the Admiralty Islands.

TRITONE (from Gk. *τρίτονος*, *tritonos*, having three tones, from *τρεῖς*, *treis*, three + *τόνος*, *tonos*, tone, sound, tension, strength, cord). In music, a term denoting the augmented fourth which is a succession of three whole tones. as F—B. A progression by the interval of

the tritone was strictly forbidden by the older theorists.

TRITONID. A sea slug. See NUDIBRANCHIATA and accompanying Colored Plate.

TRITYL'ODON (Neo-Lat., from Gk. *τρεῖς*, *treis*, three + *τόλος*, *tylos*, knob, knot, callus + *ὀδούς*, *odous*, tooth). A primitive multituberculate mammal from the lower Jurassic beds of South Africa. In some points it seems to resemble the cynodont reptiles and has been placed by some authorities in that group.

TRIUMPH (Lat. *triumphus*, OLat. *triumpus*, triumph, victory, shout of joy; of uncertain etymology). The name given in ancient Rome to the highest public honor bestowed on a general who had been successful in war. The victor, after having pronounced a eulogy on the bravery of his soldiers, ascended his triumphal car and passed through the Porta Triumphalis (which probably stood on the Campus Martius), where the Senate met him, and the procession was organized and entered the city, passing by the Via Sacra to the Capitol. First marched the Senate, headed by the magistrates; next came a body of trumpeters; then a train of carriages and frames laden with the spoils of the vanquished; then a body of flute players, followed by the oxen to be sacrificed and the sacrificing priests; then the distinguished captives with bands of inferior prisoners in chains; after them walked the lictors of the emperor, having the fasces wreathed with laurel. Next came the hero of the day—the emperor—in a chariot. He was attired in an embroidered robe and flowered tunic (the *toga picta* and the *tunica palmata*; see TOGA). He bore in his right hand a laurel bough, in his left a sceptre, and had his brows garlanded with Delphic laurel. He was accompanied by his children and his intimate friends. His grown-up sons, the legates, tribunes, and equites, rode behind; behind came the rest of the soldiery, singing or jesting at their pleasure, for it was a day of carnival and license. When the procession had reached the foot of the Capitoline Hill, some of the captive chiefs were put to death; the procession, after waiting to hear their death announced, mounted to the temple of Jupiter Capitolinus, where the oxen were sacrificed and the laurel wreath was placed in the lap of Jupiter. In the evening the emperor was publicly feasted, and it was customary to provide him a site for a house at the public expense. Under the Empire generals serving abroad were considered to be the Emperor's lieutenants, and therefore, however successful in their wars, they had no claim to a triumph. They received instead triumphal decorations and other rewards.

The ovation, or lesser triumph (Lat. *ovatio*), differed from the greater chiefly in that the emperor entered the city on foot, clad in the simple *toga prætexta* of a magistrate, and wearing a wreath, not of laurel, but of myrtle; that he bore no sceptre, was not preceded by the Senate and flourish of trumpets, nor followed by his victorious troops, but only by the equites and the populace, and that the ceremonies were concluded by the sacrifice of a sheep instead of a bull, whence, doubtless, the name *ovatio* (from *ovis*, a sheep). Some variations of these ceremonies are found in various authorities and on various monuments.

TRIUMPHAL ARCH. See ARCH, TRIUMPHAL OR MEMORIAL.

TRIUMVIRATE (Lat. *triumviratus*, union

of three men, from *triumvir*, one of a board of three men associated in a public office, from *trium*, gen. pl. of *tres*, three + *vir*, man). The name given in Roman history to the private league entered into between Pompey, Cæsar, and Crassus—the three most powerful men of their time. This compact was not a triumvirate in the proper sense of the term, since it had no legally constituted existence. The term is also applied to the division of government between Octavian (Augustus), Antonius, and Lepidus in the civil wars that followed the murder of Cæsar—an arrangement sanctioned by the Senate. The former is usually called the first, the latter the second triumvirate. Consult Charles Merivale, *The Roman Triumvirates* (new ed., New York, 1889).

TRIVANDRUM. A military cantonment and the capital of the native state of Travancore (q.v.), Madras, India, 53 miles southwest of Tinneveli and about 2 miles from the Arabian Sea (Map: India, C 8). Among the features are the fort with its Maharaja palaces, the temple to Vishnu, the observatory, and the Napier Museum. The Maharaja College here is one of the leading institutions for higher education in India. There are also a Sanskrit college and art and medical schools. Wood carving is the principal industry. Pop., 1911, including cantonment, 63,561.

TRIV'ET (or **TREVET**), NICHOLAS (c.1258-1328). An English historian, belonging probably to a Somerset family. He is said to have studied at Oxford and at Paris and to have been a Dominican friar in London, becoming eventually the prior of his house. He wrote extensively on theology and Latin literature, but he is chiefly known for his *Annales Sex Regum Angliæ qui a Comitibus Andegavensibus Originem Traxerunt* (ed. by T. Hog for the English Historical Society, 1845). This chronicle history of the Angevins is particularly valuable for the reign of Edward I, the period in which the author flourished. The entire period covered by the *Annales* is from 1136 to 1307.

TRIV'IUM (Lat., meeting of three roads). In the curriculum of the early universities, the first three of the seven liberal arts, which embraced grammar, logic, and rhetoric. See **QUADRIVIUM**.

TRO'AD. The name of the district in Mysia, Asia Minor, controlled by Troy (q.v.), Priam's city.

TROADES, trô'â-dêz (Lat., from Gk. Τρωάδες, the Trojan Women). A play by Euripides (455 B.C.), the scene of which is laid at Troy in the Grecian camp, where the captured were allotted to their conquerors.

TROBRIAND, trô'bré'ân', (PHILIPPE) RÉGIS (DE KEREDERN) DE (1816-97). A Franco-American soldier and writer. He was born near Tours, France; was educated in Paris, Rouen, Tours, and Poitiers; and in 1841 traveled in America. In 1843 he married an American wife and for 10 years lived part of the time in the United States and part in Paris. From 1854 to 1861 he was joint editor of the *Courrier des Etats-Unis*. He entered the Federal army as colonel of the Fifty-fifth New York Volunteers (Guard Lafayette, a French troop) in 1861; took a conspicuous part in the battles of Fredericksburg, Chancellorsville, and Gettysburg; became a brigadier general of volunteers in January, 1864; and commanded a division in Grant's campaign against Lee. He was brevetted

major general of volunteers in April, 1865; was commissioned colonel of the Thirty-first Infantry in the regular army in 1866; was brevetted brigadier general of the United States army in 1867, and afterward commanded the districts of Dakota, Montana, and Green River. In January, 1875, he put under arrest the Louisiana Legislature in Governor William P. Kellogg's (q.v.) attempt to keep possession of the State government. (See LOUISIANA, *History*.) In 1879 he retired from active service. He published *Les gentilshommes de l'ouest*, a novel of the insurrection of 1832 (1841), and *Quatre ans de campagnes à l'armée du Potomac* (1868), which was translated into English in 1889 by Dauchy. Consult *The Life and Memoirs of Comte Régis de Trobriand* (New York, 1910), by his daughter, M. C. Post.

TROCADÉRO, trô'kâ'dâ'rô'. An elevation on the right bank of the Seine, opposite the Pont d'Iéna, named after a Spanish fort near Cadiz taken by the French in 1823. The ground was laid out in terraces for the exhibition of 1867, and for that of 1878 the present Palais du Trocadéro was erected. The building, by Davioud, an immense structure in Oriental style, consists of a central portion flanked by curving wings each 220 yards in length. It contains an immense concert hall, seating 6000; two towers or belvederes; and in the wings a fine museum of casts of French sculpture.

TROCHEE, trô'kê (Lat. *trochæus*, from Gk. τροχῆος, *trochaïos*, trochee, tribrach, running, from τροχός, *trochos*, a running, from τρέχειν, *trechein*, to run). The name of a foot, or measure, in Greek and Latin verse, consisting of a long and a short syllable (— ∪). This rapid measure was employed both in tragedy and in comedy. By analogy the term is used in modern verse to designate a dissyllabic measure consisting of a stressed and an unstressed syllable, e.g.:

When' shall we' three meet' again' ?

See **VERSIFICATION**.

TROCHELMINTHES, trô'kêl-mîn'thêz (WHEEL ANIMALCULES). A phylum composed of the Rotifera, the Dinophleia, and the Gastrotricha, characterized by having the larva in the form of a trochosphere (q.v.).

TROCHES, trô'kêz. Troches, also called pastilles or lozenges, are small, flattened cakes, consisting of medicinal substances mixed with sugar and mucilage and agreeably flavored. They are intended to be dissolved in the mouth and act locally upon inflammatory conditions of that cavity or the throat. There are nine official troches in the United States Pharmacopœia, as follows: those of tannic acid, ammonium chloride, cubeb, gambir, liquorice and opium, krameria, potassium chlorate, santolin, and sodium bicarbonate.

TROCHILIDÆ, trô'kil'î-dê. The family of the hummingbirds (q.v.).

TROCHILUS, trô'kil-lūs. 1. The typical genus of hummingbirds (q.v.), now being supplanted by the name *Archilochus*. 2. The ancient name of a certain plover. See **CROCOTILE BIRD**.

TROCHOID, trô'koid. See **CYCLOID**.

TROCHOSPHERE, trô'k'ô-sfêr (from Gk. τροχός, *trochos*, wheel + σφαῖρα, *sphaîra*, ball, sphere), or **TROCHOSPHERE**. A larval form common to many of the lower invertebrates, which consists of an oval or pearlike body of microscopic minuteness, with a broader and a nar-

rower end and a distinct bilateral symmetry. The body is encircled by a double zone of strong cilia. The mouth, just behind this circlet, leads into an alimentary canal extending towards the small end, where an anal aperture opens. The broader end exhibits sense organs varying in different species in number and character. From this kind of larva the adult forms of the higher groups (many worms, polyzoans, mollusks, etc.) are developed by some sort of true metamorphosis, resulting in an animal utterly different; but in certain very lowly groups, such as the wheel animalcules (Rotifera) and certain closely allied microscopic aquatic forms, no metamorphosis occurs, and the adult may be looked upon as a somewhat modified trochosphere. These groups have therefore been associated by some zoologists into a phylum termed Trochelminthes. Consult Parker and Haswell, *Text-Book of Zoölogy* (New York, 1910).

TROCHU, trô'shu', LOUIS JULES (1815-96). A French general, born at Palais, in the Department of Morbihan. After studying in the General Staff Academy he fought, after 1846, with great distinction in Algeria and in 1851 became head of a bureau in the Ministry of War. During the Crimean War he served as aid to Saint-Arnaud and Canrobert, was made a general of brigade, and at Sebastopol distinguished himself in the storming of the Malakof bastion, Sept. 8, 1855. As general of division during the Austro-Italian War of 1859 he did excellent service at Solferino, assuming, after the conclusion of peace, an important post in the War Department. In 1867 he published anonymously *L'Armée française en 1867*, in which he criticized severely the defects in the French army organization, thereby losing favor at court. After the outbreak of the war with Germany he became (August, 1870) Governor of Paris and on the downfall of the Second Empire, after Sedan, was made head of the Government of National Defense, remaining at the same time in command of the military forces of the city. His half-hearted defense of the capital subjected him to bitter criticism, and, when further resistance to the besieging forces had become impossible, he laid down the office of Governor, Jan. 22, 1871, a week before the capitulation of the city. In 1873 he resigned from the army and retired to private life. In defense of his conduct during the siege of Paris he published *L'Empire et la défense de Paris devant le jury de la Seine* (1872); *Pour la vérité et pour la justice* (1873); *La politique et le siège de Paris* (1874).

TROELS-LUND, trôls-lund, TROELS FREDERIK (1840-1921). A Danish historian, born in Copenhagen. He took the degree of Ph.D. at Copenhagen University in 1871 and for several years was connected with the Royal Archives. He was professor at the Military School of Frederiksberg (1874-1900). His publications include an important work on Scandinavian history, *Danmarks og Norges Historie i Slutningen af det 16te Aarhundrede* (History of Denmark and Norway at the End of the Sixteenth Century) (14 vols., 1879-1901; in part trans. into Ger.); *Sundhedsbegreberne i Norden i 16de Aarhundrede* (1900); *De tre nordiske Brødrefolk* (1906); *Peder Oxe* (1906); *Historiske Fortællinger, Tider og Tanker* (8 vols.). Troels-Lund's writings, notable for a brilliant narrative style, brought him a reputation not only as one of the most distinguished figures among Dan-

ish writers of his time, but as an author of international importance.

TROELSTRA, trôol'strâ, PIETER JELLES (1860-). A Dutch Socialist leader and editor, born at Leeuwarden. He graduated a doctor of laws from the University of Groningen in 1888 and became an attorney in his native city. After he had been employed in various lawsuits in behalf of striking workers, he became editor in 1892 of *De Sneeker Courant*, which in 1893 was removed to Amsterdam under the name *De Nieuwe Tijd*. *De Baanbreker*, founded by Troelstra at Utrecht in 1893, became, as *De Sociaaldemocrata*, the official organ of the Dutch Social Democratic Workers' party. When this party established its daily paper, *Het Volk*, in 1900, Troelstra was made its chief editor. Later he practiced law at Haarlem, but in 1915 retired because of ill health. He wrote: *De Sociaaldemokratische arbeiderspartij in Nederland* (1896; 2d ed., 1899); *Het kiesrecht en de sociaaldemocratie* (1894); *Van leed en strijd* (1898; 2d ed., 1899); *Woorden van vrouwen* (1898); *Het legerwetschandaal* (1901); *Sociaal christendom* (1902); *Theorie en beweging* (1902); *Inzake partijleiding* (1906); *Het kindje* (1909).

TROËZEN (Lat., from Gk. Τροίη, *Troisēn*). An ancient city of Greece in Argolis, about 2 miles from the Saronic Gulf, nearly opposite Calauria. It played some part in Greek legend, being closely associated with Attica, as the birthplace of Theseus (q.v.), whose mother, Æthra, was daughter of King Pittheus. Here also was localized the story of the fatal love of Phædra (q.v.) for her stepson Hippolytus (q.v.). In historic times it was a Dorian city. During the invasion of Xerxes it took a prominent part in the defense of Greece, sending ships to the Greek fleet and receiving with great kindness the Athenian women and children when driven from their city by the Persian advance. It was later a faithful ally of Sparta during the Peloponnesian and Corinthian wars. Under the Macedonian supremacy it changed masters frequently, now being in the hands of Macedon, again under Sparta, and again brought by Aratus into the Achæan League. In Roman times it seems to have continued to flourish, for Pausanias (q.v.) gives a somewhat detailed account of the objects of interest in the place. The site near the modern village of Damala is marked by few ruins, and excavations undertaken by the French school at Athens have brought to light little beyond the foundations of some large buildings of rather uncertain use.

TROGLODYTES, trôg'lô-dīts (Lat. *troglo-dyta*, from Gk. τρωγλοδύτης, *troglo-dytēs*, cave dweller, one who creeps into holes, from τρώλη, *trôglē*, cave, hole + *δύειν*, *dyein*, to enter, creep into). The name given by the Greeks to tribes or races of uncivilized men, who dwelt either in natural caverns or in holes which they had dug for themselves in the earth. They are mentioned by Strabo as existing as far west as Mauretania and as far east as the Caucasus. Perhaps the best-known troglodytes of ancient times were those of southern Egypt and Ethiopia, where a considerable extent of country was called Regio Troglodytica. According to the Greek accounts they could not speak articulately, but shrieked or screamed like the lower animals. Their chief occupation was herding cattle, and their habits were rude and debased. They are said to have had a community of wives and to have put to

TROGON, HOPOE, ETC.

1. GREEN TROGON or QUETZAL (*Pharomacrus*
molinoi).
2. LESSER HONEY-GUIDE (*Indicator minor*).

3. YELLOW-THROATED BARBET (*Capito richardsoni*).
4. CAYENNE PUFF-BIRD (*Bucco ordi*).
5. MADAGASCAR HOPOE (*Upupa marginata*).

death the aged and infirm. The name is occasionally applied loosely to any class of cave dwellers (q.v.).

TROGLODYTES. See CHIMPANZEE.

TRO'GON (Neo-Lat., from Gk. *τρώγων*, pres. p. of *τρώγειν*, *trōgeîn*, to gnaw). A bird of the family Trogonidae, including about 50 species remarkable for the beauty of their plumage, which is soft, full, and brightly colored. The bill is short, strong, with a wide gape; the tail generally long, in some species very long; the feet small, and frequently feathered almost to the toes. The toes are two in front and two behind, but, unlike all other zygodactylous birds, the reversed toes are the first and second instead of the first and fourth. They are tropical, abounding in South America, but some occur in Asia and a few in Africa. One species, the copper-tailed trogon (*Trogon ambiguus*), is found as far north as the valley of the Rio Grande. It is 11 inches long, bright metallic golden green, throat white, breast and belly carmine, middle tail feathers coppery green, the rest of the tail white and black. The most gorgeous is the quetzal (q.v.). Trogons are usually seen singly or in small flocks and are unsuspicious. They remain most of the time in the thick forest, resting during the heat of the day. The Old World species feed principally on insects, but American trogons eat fruit and also catch insects, crabs, crayfish, small lizards, snails, etc., getting most of this on the wing or by clinging to branches of trees like woodpeckers. Their notes are loud, rather discordant cries, varied by clucking, whistling, and other strange notes. No nest is made, the round whitish eggs being laid in a hole excavated in a rotting tree stub. The group is ancient, as is known by fossil examples, and sufficiently distinct to be ranked as a suborder. Extended accounts of the American trogons are given by Selater and Salvin in *Biologia Centrali-Americana*, vol. iii (London, 1896). See Plate of TROGON, HOOPOE, ETC.

TRO'GUS POMPEIUS. A Roman historian of Gallic origin who lived during the reign of Augustus, son of one of Cæsar's secretaries. He was the author of *Historiæ Philippiæ* (in 44 books), a universal history from the time of Ninus, King of Assyria, down to 5 A.D. The original work, which was drawn from some of the best Greek historical writers, is lost, but an epitome of it by Justin (q.v.) is still extant. In addition to the historical narrative the work is said to have contained interesting accounts relating to geography, ethnography, and natural science. Trogus is said to have written several zoological and botanical works, based largely on Aristotle and Theophrastus. Consult: A. H. L. Heeren, *Commentationes de Trogi Pompeii ejusque Epitomatoris Justinii Fontibus et Auctoritate*, printed in C. H. Frotscher's edition of Justinus (Leipzig, 1827-30); Crohn, *De Trogi apud Antiquos Auctoritate* (Strassburg, 1882); Martin Schanz, *Geschichte der römischen Literatur*, vol. i, part i (3d ed., Munich, 1911).

TRO'ILUS (Lat., from Gk. *Τρωίλος*). A son of Priam, or of Apollo, who was slain by Achilles.

TROILUS AND CRES'SIDA. A drama by Shakespeare, probably originally written about 1602 and revised before 1609, when it was printed in two editions. The sources were probably Chaucer, Le Fèvre's *Recuyel of the Histories of Troye*, Lydgate's *Troy-Book*, and perhaps Chapman's *Homer*, partly translated in 1597.

TROIS MOUSQUETAIRES, trwä mus'ke-

târ', LES (Fr., The Three Musketeers). A romance by Dumas (1844). The scene is laid in the time of Richelieu, in whose affairs the three famous guardsmen Athos, Porthos, and Aramis and their companion D'Artagnan take part.

TROITSK, trō'itsk. A town in the Government of Orenburg, Russia, on the Uya, 394 miles northeast of Orenburg (Map: Russia, K 4). It has a barter court, where an extensive barter trade with the Kirghizes and other tribes is transacted. Pop., 1910, 36,830.

TRO'JAN WAR. A famous legendary war, generally placed about the beginning of the twelfth century B.C.; undertaken by the Greeks for the recovery of Helen, wife of King Menelaus of Sparta, who had been carried off by Paris, son of the Trojan King, Priam. At the marriage of Peleus and Thetis, Eris (Discord), who alone of the gods had not been invited to the wedding, flung among the guests a golden apple inscribed "For the Fairest." This was claimed by Juno, Minerva, and Venus. When the goddesses referred the decision as to which of them was the fairest to Paris, he decided in favor of Aphrodite, thereby securing Helen by her favor and bringing down on the Trojans the lasting wrath of the slighted Juno and Minerva. The expedition to avenge the injury to Menelaus was placed under the command of Agamemnon, King of Argos, and was joined by the Greek heroes, including Achilles, Patroclus, the two Ajaxes, Teucer, Nestor, Odysseus, Diomedes, and Idomeneus. They assembled at Aulis with 100,000 men and 1186 ships and proceeded to Troy, where their demand for the return of Helen was refused. The siege was then begun. It lasted, according to the usual interpretation, 10 years and was terminated only by treachery, when the Greek warriors were introduced into the city in the interior of a great wooden horse. The sack and burning of Troy follow, with the escape of Æneas, whose progeny were to be the founders of Rome. For a very different theory, that the war was in fact a short war, consult B. O. Foster, "The Trojan War Again," in *American Journal of Philology*, vol. xxxvi (Baltimore, 1915).

The story of the war is told in various classical epic poems, of which the *Iliad* is the most famous. (See HOMER.) It terminates with the death of Hector, the principal hero of the Trojans. The *Little Iliad*, ascribed to Lesches of Lesbos, was composed about 660 B.C. (See CYCLIC POETS.) In four books it gave the story of the contest of Odysseus and Ajax, son of Telamon, for the armor of Achilles, the deaths of Ajax, Paris, and Eurpylus, the stealing of the Palladium, and the construction of the wooden horse. At this point the legend was taken up by the *Iliou Persis* or *Sack of Troy*, by Arctinus, in two books, ending with the escape of Polyxena at the tomb of Achilles. The *Nostoi* (Returns), attributed to Agias of Trœzen, in five books, told of the wanderings of Menelaus, Calchas, and Neoptolemus and the murder of Agamemnon. The *Telegonia*, by Eugammon of Cyrene, related various adventures of Odysseus after the slaying of the suitors, his death at the hands of his son Telegonus (q.v.), and the latter's marriage to Penelope.

The legendary history of Troy before the Trojan War, like other Greek myths, varied much in details. It was said that the place owed its name to Ilus, son of Tros, son of Dardanus. Its

walls were built by Poseidon for Laomedon, who, however, cheated the god of his promised reward. Hercules rescued Hesione, the daughter of Laomedon, from the sea monster to which she had been exposed, but was likewise cheated by the King, whereupon he and Telamon attacked and captured the city.

The Trojan legend was very popular in the Middle Ages and formed, with the Charlemagne story and the Arthurian traditions, one of the three great divisions into which the work of the French romance writers falls. Celtic legends tell of a certain Brutus who, driven from Troy, founded Brutannia or Britannia. Geoffrey of Monmouth calls him a great-grandson of Æneas. (See BRUTUS or BRUTE, THE TROJAN.) The spread of the legend is due mainly to Benoît de Sainte-More. The gist of the *Iliad* was used in the Latin of Dictys of Crete and by Dares the Phrygian. Benoît knew both Dictys and Dares, but preferred the drier account of the latter, in which the people of the West were reported to descend from the Trojans. This was used about 1200 by Herbart von Fritzlar and about 1250 by Konrad von Würzburg; before 1288 Guido della Colonna had recast it in Latin prose. Benoît's version may also be traced in Boccaccio's *Filostrato* (1344). This is the main source of Chaucer's *Troilus and Cryseyde* (c.1369), as that is of Shakespeare's play. Consult: Dunger, *Die Sage vom trojanischen Kriege in den Bearbeitungen des Mittelalters* (Dresden, 1869); G. E. B. Saintsbury, *The Flourishing of Romance and the Rise of Allegory* (London, 1897). Consult the article "Troika," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). See TROY.

TROLLE, tröl'le, HERLUF (1516-65). A Danish statesman and admiral, born on the island of Lillö. During the early part of his career he was a statesman and diplomat. He possessed the trust and confidence of the King and in 1559 was appointed inspector of the fleet with the rank of admiral. He applied himself to his new duties with zeal and energy and greatly improved the condition of the navy. In 1563 he succeeded Admiral Peder Skram (q.v.) as commander in chief. In May of that year, with an inferior force, he defeated a powerful Swedish fleet off Öland and captured the Swedish admiral. In August, in an indecisive action, he met a second Swedish force under the celebrated Swedish admiral Klas Horn, and in June, 1565, he again fought Horn at Femern without either side achieving a victory. Trolle, however, was severely wounded and died soon after. When studying at Wittenberg, he became a close friend of Melanchthon. His estate, Herlufsholm, he turned into a school and home for children of nobles and nonnobles alike.

TROLLEY (from *troll*, from OF. *troller*, *trawler*, *troler*, Fr. *trôler*, to ramble, stroll, drag about, probably from MHG., Ger. *trollen*, to roll, run). A word first coined in England and there used in the sense of a handcart and then of a truck. In the United States and Canada it means a sort of grooved metallic sheave or pulley in contact with an overhead electrically charged wire and connected with a rod or flexible conductor to an electric motor on some moving vehicle, such as an electric locomotive or street car, so that the actuating current from the power house may be transmitted, as the trolley rolls on the charged wire. See ELECTRIC RAILWAYS.

TROLLING, tröl'ing. A form of angling. Some trolling is from a moving boat; others troll from the river or lake bank, winding in the bait with the reel or moving it with the rod, and still others troll in the surf, where the current of tides or undertow of the sea carries the bait. If a spinning artificial frog or fish is used, the connection with the line should be made by means of a swivel, to prevent the line from twisting. This is not necessary if the lure is a spoon which revolves without moving the bait. The heaviest fish trolled for in fresh water is the maskinonge, the standard bait for which is a frog alive or imitation, but an effective one is the spoon, preferably showing a golden hue, size No. 8, the feathers at the head of which should be bright scarlet, and a single hook. The bluefish is taken by trolling from a boat in motion or from a stationary boat into the waters around which have been thrown small pieces of menhaden. The Spanish mackerel is taken by trolling, and many other fish of the Atlantic and Pacific and of the Gulf. Off the Florida coast and in the Gulf the tarpon is taken by trolling from a slowly rowed boat. On the California coast the tuna, the yellowtail, and barracuda have been taken on hook. See ANGLING; BAIT FISHING; FLY CASTING; TARPON FISHING.

TROLLIUS. See GLOBE FLOWER.

TROLLOPE, tröl'löp, ANTHONY (1815-82). An English novelist, born in London, April 24, 1815, son of Frances Trollope (q.v.). Educated at Winchester and at Harrow, he proved a dull scholar, and his poverty made his school days most unhappy. In 1834 he obtained an official position in the General Post Office in London. While there he found time to amuse the public with a series of novels of remarkable merit. His first work to attract attention, *The Warden* (1855), was followed by a continuation entitled *Barchester Towers* (1857), perhaps the most widely read of all his books. In rapid succession came *Dr. Thorne* (1858); *The Three Clerks* (1858); *The Bertrams* (1859); *Castle Richmond* (1860); *Framley Parsonage* (1861); *Orley Farm* (1862); *The Small House at Allington* (1864); *Can you Forgive her?* (1864-65); *The Last Chronicle of Barset* (1867); *Phineas Finn* (1869); *The Eustace Diamonds* (1873); *Phineas Redux* (1874); *The Way we Live now* (1875); *Is he Popenjoy?* (1878); and others. Trollope also published volumes of travel, among them being *North America* (1862), *Australia and New Zealand* (1871-72), and *South Africa* (1878). In biography he wrote a *Life of Cæsar* (1870) and one of Cicero (1880), besides sketches of Thackeray (1870) and Palmerston (1882). His *Autobiography* appeared in 1875-76. He died at Harting, Sussex, Dec. 6, 1882.

Trollope is one of the most admirable of English realists. He delineates the English society of his time with wonderful penetration and with an equal command of humor and of pathos. He particularly excels in depicting life in the cathedral towns, and his portraits of bishops, archdeacons, and the minor clergy are remarkable for their truth and humor. His Mrs. Proudie in *Barchester Towers* and again in *The Last Chronicle of Barset* is perhaps the best of the shrewish type since Shakespeare's Katherine. Very attractive, too, are his young girls, as Lily Dale, Mary Thorne, and Grace Crawley. Trollope did not himself lay any especial claim to psychological insight, yet it would be hard to

find in English fiction anything more true and delicate than his analysis of the conscience of Septimus Harding in *The Warden*, or anything more poignant than his study of jealousy in *He Knew he Was Right*. Trollope's snobs, his rustics, and his husband-hunting young women are all drawn with surprising vividness. On the whole, his best work is contained in *The Chronicles of Barsetshire* (13 vols., New York, 1892); yet many of his less read novels, such as *The Way we Live now*, *The American Senator* (1877), and *The Claverings* (1867) are very little inferior. Curious facts concerning his life and methods of composition may be found in his *Autobiography* (New York, 1883). Consult also: Henry James in *Partial Portraits* (New York, 1899); H. T. Peck's Introduction to vol. i of the Royal Edition of Trollope's best-known novels (Philadelphia, 1900); James Bryce, *Studies in Contemporary Biography* (New York, 1903); W. L. Cross, *Development of the English Novel* (new ed., ib., 1905); and for combined criticism and biography, T. H. S. Escott, *Anthony Trollope* (ib., 1913).

TROLLOPE, EDWARD (1817-93). An English clergyman and antiquary, educated at Eton and Oxford, graduating B.A. from St. Mary Hall in 1839. Ordained priest in the Anglican church (1841), he held various preferments, becoming Bishop of Nottingham in 1877. As secretary and as president of the Associated Architectural Societies, he took an active and judicious part in the work of Church restoration. Among his works are: *Illustrations of Ancient Art, Selected from Objects Discovered at Pompeii and Herculaneum* (1854); *Life of Pope Adrian IV* (1856); *Handbook of the Paintings and Engravings Exhibited at Nottingham, Illustrating the Caroline Civil War* (1864); *Notices of Ancient and Medieval Labyrinths* (1866).

TROLLOPE, MRS. FRANCES (1780-1863). An English novelist and miscellaneous writer, and mother of Anthony Trollope (q.v.), born at Stapleton, near Bristol, March 10, 1780. Her father, William Milton, was subsequently vicar of Heckfield in Hampshire. In 1809 she was married to Thomas Anthony Trollope, a barrister. In 1827 she went to America and during a three years' residence in the United States gathered the materials of her first book, *Domestic Manners of the Americans* (1832). This work attracted great attention, and the severity of certain of its strictures was much resented in the United States, as was natural where the author's tendency towards broad humor magnified vulgarity and left a picture not entirely authentic. Indeed, in 1833 appeared a pamphlet entitled *American Criticisms*. After the death of her husband (1835) Mrs. Trollope had to turn to literature for a living. For 20 years book after book came from her pen. Of her novels perhaps the best were: *The Vicar of Wreathill* (1837); *The Widow Barnaby* (1838), and the sequels of the latter, *The Widow Married* (1840) and *The Barnabys in America* (1843). Mrs. Trollope's last years were passed in Florence with her eldest son, Thomas Adolphus Trollope (q.v.). She died at Florence, Oct. 6, 1863. *The Domestic Manners of the Americans* was edited by H. T. Peck (New York, 1896). Consult *Frances Trollope*, by her daughter-in-law, Frances Eleanor Trollope (London, 1895).

TROLLOPE, FRANCES ELEANOR. See TROLLOPE, THOMAS ADOLPHUS.

TROLLOPE, THOMAS ADOLPHUS (1810-92).

An English author, born in London, April 29, 1810. His mother was Frances Trollope (q.v.), and Anthony Trollope (q.v.) was a younger brother. He was educated at Winchester and at Oxford. In 1843 he settled at Florence, where his house on the Piazza Maria Antonia became the gathering place of English and American authors traveling in Italy. To his hospitable wife Landor addressed the lines, "To Theodosia." Like his mother and brother, Trollope wielded a ready pen. Not reckoning a prodigious number of articles contributed to newspapers and other periodicals, he published fully 60 volumes; and, it is said, he was always interesting. His most conspicuous works were connected with Italy. Among them are: *Impressions of a Wanderer in Italy, etc.* (1850); *The Girlhood of Catherine de' Medici* (1856); *A Decade of Italian Women* (1859); *Filippo Strozzi: A History of the Last Days of the Old Italian Liberty* (1860); *A Lenten Journey in Umbria and the Marches of Ancona* (1862); *A History of the Commonwealth of Florence to the Fall of the Republic in 1531* (1865); *The Story of the Life of Pius IX* (1877). Trollope also wrote many novels. His last years were passed in England. He died at Clifton, Nov. 11, 1892.

His second wife, FRANCES ELEANOR TROLLOPE, wrote *Black Spirits and White* (1877); *That Unfortunate Marriage* (1888); *Frances Trollope: Her Life and Literary Work* (2 vols., 1895). Consult Trollope's reminiscences under the titles *What I Remembered* (2 vols., London, 1887) and *Further Reminiscences* (ib., 1889).

TROLLS (Icel., Swed. *troll*, troll; connected with Ger. *Droll*, *Troll*, troll, Eng. *droll*). In mythology, misshapen dwarfs. They inhabited hills and mounds, had abnormal thieving propensities, stole children and substituted their own offspring. They were peculiarly sensitive to noise, which was their especial aversion, as it reminded them of the hammer of Thor, which he was accustomed to throw after them. They were called "the hill people." Though strong, they were easily outwitted by men. They had the power to make themselves invisible, to confer health and prosperity, and to foresee the future.

TROMBONE (It. *trombone*, augmentative of *tromba*, trumpet, probably from OHG. *trumba*, *trumpa*, Ger. *Trommel*, drum; ultimately connected with Eng. *drum*). A musical instrument of the trumpet family, the tones of which are produced by means of a slide mechanism. In its present form it was known as early as the beginning of the sixteenth century. To-day the trombone is made in four different sizes, known as the alto, tenor, bass, and contrabass trombone. The compass of the alto trombone is from A to eb², that of the tenor trombone from E to bb², that of the bass trombone from B to f², and that of the contrabass trombone from E to d³. Besides this regular compass each trombone is capable of producing seven pedal tones, descending chromatically and beginning a tritone (q.v.) below the lowest tone of the compass of the instrument. The intermediate tones between the highest pedal tone and the lowest regular tone are wanting. The trombones are nontransposing instruments, and the notes all sound as written. Recently trombones have been constructed in which the sliding mechanism is replaced by piston or rotary valves. These instruments permit more rapid execution than the sliding trombones, but are much inferior

to the latter in purity of intonation. See ORCHESTRA.

TROMP, trömp, CORNELIS (1629-91). A Dutch admiral, second son of Martin Tromp. He was born at Rotterdam. As a youth he led a squadron against the Barbary pirates. He became rear admiral in 1653. With Opdam he commanded the Dutch forces in the disastrous battle of Lowestoft (June 13, 1665) and in the rout succeeded in saving a part of the fleet. In June, 1666, he was with De Ruyter in a desperate four days' battle in the Downs against an English fleet under Monk and Prince Rupert, the combat resulting in victory for neither side. In August his conduct in the battle of Dunkirk led De Ruyter to prefer charges against him which caused his removal. When war broke out in 1672 between Holland and the allied English and French, Tromp was restored to his command and fought with consummate bravery on June 7 and 14, 1673, against the combined English and French fleets, under Prince Rupert and D'Estrees, driving the enemy into the Thames. On August 21 a third great battle was fought near the Zealand coast. After the conclusion of peace Charles II made Tromp Baron (1675). Tromp subsequently fought in the employ of the Danes against the Swedes and after De Ruyter's death was made commander in chief of the naval forces of the Dutch. He died May 29, 1691, and was buried at Delft by his father's side.

TROMP, MARTIN HARPERTZDOON (incorrectly VAN TROMP) (1597-1653). A celebrated Dutch admiral, born at Brielle. He went to sea at a very early age, was made prisoner in an engagement with an English frigate, in which his father was killed, and for more than two years was held in confinement on board an English vessel. For some time after this his history is obscure, but in 1624 he appears as captain of a frigate in the Dutch navy, and in 1637 was made vice admiral. In 1639 he won a brilliant victory over a Spanish fleet off Gravelines in the Strait of Dover, destroying 49 of the enemy's ships with the loss of only one vessel. His greatest fame, however, was gained in the war against England which broke out in 1652. In May of that year he was worsted by Blake and was compelled to yield the command to De Ruyter, but, restored to his post in November, he inflicted a severe defeat on Blake off the Goodwin Sands and for a time was master of the Channel. In February, 1653, while conveying a large merchant fleet through the Channel, he made a gallant running fight against a superior English fleet under Blake, Penn, and Monk. In June he encountered the English in the Channel and was compelled to seek refuge in the Texel, after losing 17 of his ships. In the first days of August he once more took to the sea, and in a battle against the English fleet, under Monk, off Ter Heyde, which raged from August 8 to August 10, he lost 26 of his ships and his life. He was buried at Delft, and a splendid monument marks the grave of the victor in 33 naval combats.

TROMPETER VON SÄKKINGEN, trömp-tär fön zäk'ing-en, DER. An opera by Nessler (q.v.), first produced in Leipzig, May 4, 1884; in the United States, Nov. 23, 1887 (New York).

TROMPETER VON SÄKKINGEN, DER (Ger., The Trumpeter of Säkkingen). An extraordinarily popular poem by Joseph Viktor

von Scheffel (1853). The story is a legend connected with a seventeenth-century tombstone in the churchyard of Säkkingen which records the death of Werner Kirchhofer, a musician, and Maria Ursula, daughter of the Baron of Säkkingen.

TROMSÖ, tröms'ë. A city on the northwest coast of Norway, in Tromsö Amt (county), and an episcopal city in Tromsö Stift (diocese) (Map: Norway, F 2). Beautifully located on a fertile island, it has magnificent surroundings of well-formed, snow-clad mountains. Owing to the mildness of the Gulf Stream, which sweeps the coast of Norway, its mean temperature is 36.4° F. The vegetation of the island is remarkably luxuriant, and it raises barley and potatoes. It has a town hall, fire department, water works, electric lighting, three hospitals, schools, a seminary for teachers, a navigation school, a school for machinists, an Arctic museum, boat and ship building establishments, fish-oil refineries, net and rope factories, and dairies. All coast steamers call. It engages in very productive fisheries in the Atlantic (near Iceland) and in the Arctic Ocean. Imports are grain, flour, coal, textiles, and salt. The coast scenery, with numerous islands and snow-clad mountains, is wild and beautiful. Tromsö dates from about 1250. Pop., 1910, 7633.

TRONDHJEM, trönd'yem, **THRONDHJEM** (DRONTHEIM). A city of Norway, situated at the mouth of the Nid River, on the south shore of the Trondhjem Fiord, 240 miles north of Christiania (Map: Norway, D 5). Although it is so far north, its climate is remarkably mild, and the fiord never freezes. On one of the surrounding picturesque hills stands the fortress of Christianssten. Another fort is on the small island of Munkholm in the fiord opposite the city, celebrated as the place of imprisonment of the Danish Minister Griffenfeld (q.v.). The town is regularly laid out with wide streets. Many of the houses are built of wood. The principal building is the large cathedral, probably the finest church in Scandinavia. It was founded in the eleventh century over the tomb of St. Olaf and consists of a Gothic nave and choir with a Romanesque transept. It has latterly been restored. Noteworthy also are the arsenal in the old Kongsgaard, the fisheries museum, the leading library, the Stiftsguard, the theatre, the Art Industry Museum, the museum of the Society of Sciences. The industries are represented by saw mills, wood-pulp factories, fish-curing establishments, machine shops, and shipyards. The commerce is very considerable. It amounts to over \$19,315,000 annually, while the shipping in 1913 amounted to 832,400 tons. The chief exports are copper ore from the Röros mines, also iron and pyrites, timber, wood pulp, and fish. Pop., 1901, 38,156; 1910, 44,996. Trondhjem was founded by Olaf Tryggvason, who built a palace there in 997. Its early name was Nidaros. During the Middle Ages it was an important city and a goal of pilgrimage.

TRONEGE, HAGEN VON. See HAGEN, OR HAGEN VON TRONEGE.

TROOP. See ARMY ORGANIZATION; SQUADRON.

TROOPIAL (Fr. *troupial*, from *troupe*, troop). A book name for the American hang-nests and blackbirds of the family Icteridae.

TROOSTITE. See METALLOGRAPHY, *Heat Treatment*; WILLEMITE.

TROPACOCAINE. A drug having the general anæsthetic and mydriatic qualities of co-

caine. It is an alkaloid and is extracted from a small-leaved variety of coca growing in Java. It is used as tropacocaine hydrochloride, and it is said to be more active and less toxic than cocaine.

TROPÆOLIN. See COAL-TAR COLORS.

TROPÆOLUM (Neo-Lat., from Gk. τροπαῖος, *tropaïos*, relating to turning or change, from τροπή, *trōpē*, a turning, from τρέπειν, *trepein*, to turn), **NASTURTIUM**, **INDIAN CRESS**, **YELLOW LARKSPUR**. A genus of the family Tropæolaceæ, containing about 50 South American species of beautiful twining or spreading annuals and perennials, producing orange-yellow and sometimes

GARDEN NASTURTIUM (*Tropæolum majus*).

very dark purple or blue flowers in summer. Many are cultivated for ornament upon arbors and trellises. The pickled fruits are sometimes employed as a substitute for capers, and the fleshy rootstock of several species as a human food. The best-known species is *Tropæolum majus*, a climbing or trailing annual in northern climates, long known in the United States as an ornamental plant. Dwarf varieties of this are commonly grown in beds and borders. *Tropæolum minus* resembles the foregoing, but is of weaker growth and produces smaller flowers. *Tropæolum lobbianum*, a native of Colombia, is a vigorous climbing species, of which several beautiful varieties are in cultivation. *Tropæolum peregrinum*, sometimes called canary-bird flower, is grown as an annual in outdoor culture and as a perennial in conservatories. *Tropæolum tuberosum*, which produces scarlet and yellow flowers in the late summer, yields edible tubers, which are used as food in Peru. In northern climates the tubers are taken up in the fall and kept in a dry place during the winter. The annual species are grown from seeds sown in the spring in ordinary garden soil. The perennial species are propagated by the tubers or by cuttings of the young shoots grown under glass or by seeds. The perennials need rich soil and plenty of moisture.

TROPE, trōp. A figure of speech. See RHETORIC, FIGURES OF.

TROPHŌNIUS (Lat., from Gk. Τροφῶνιος).

An ancient god of the earth, worshiped at Livadia in Bœotia, where he had a famous oracle in a subterranean cavern. He who wished to consult the oracle prepared himself by fasting, sacrifices, and purifications in a building dedicated to Tyche (Fortune) and Agathodæmon (Good Luck). A sheep was sacrificed to Agamedes, brother of Trophonius; water from two springs, Forgetfulness and Memory, was drunk; and the consulter descended by a ladder to a vault opening. Through this the feet were inserted, a honey cake to appease the spirits was grasped in each hand, and then some hidden force swept the visitor into the inner recesses, where he saw visions or heard voices, and finally returned feet foremost through the same opening. He was then seated on the stone of Remembrance and questioned by the priests, who interpreted his visions. Legend also told how Agamedes and Trophonius (sons of Erginos and famous early architects) built the temple at Delphi, a treasury for King Hyrieus of Hyria in Bœotia, and other buildings. According to the story, they left a stone loose in the treasury and thus availed themselves of the King's riches at their pleasure. At length Agamedes was caught in a trap, whereupon Trophonius cut off his brother's head and escaped, but at Livadia was swallowed up by the earth. Another version laid the scene with King Augeas in Elis and represented Agamedes as the father of Trophonius and Cercyon. Trophonius cut off his father's head to escape detection and, while Cercyon went to Athens, retired to Bœotia, where he built himself an underground chamber. The same story is told by Herodotus of King Rhampsinitus in Egypt and is a widely diffused folk tale.

TROPHY (OF. *trophee*, Fr. *trophée*, from Lat. *trophæum*, *tropæum*, from Gk. τροπαῖον, *tropaion*, monument of an enemy's defeat, neut. sing. of τροπαῖος, *tropaïos*, relating to turning or change). A memorial of victory erected on the spot where the enemy had been turned to flight. Among the Greeks (with the exception of the Macedonians, who erected no trophies) one or two shields and helmets of the routed enemy, placed upon the trunk of a tree, served as the sign and memorial of victory. After a sea fight the trophy consisted of the beaks and stern ornaments of the captured vessels, set up on the nearest coast. It was considered wrong to destroy such a trophy and equally wrong to repair it, when it had fallen down through time, for animosity ought not to be perpetual.

TROPIC (from Lat. *tropicus*, from Gk. τροπικός, *tropikos*, relating to a turn or change, or to the solstice, from τροπή, *trōpē*, a turning). One of two parallels of latitude on the terrestrial globe, passing through the most northerly and southerly points on the earth's surface at which the sun can ever be directed overhead. The tropic north of the equator is called the tropic of Cancer, because the sun at the summer solstice (at which time it is vertically over the tropic) enters the constellation of Cancer; and the southern one is, for a similar reason, denominated the tropic of Capricorn. The distance of the tropics from the equator, corresponding to the obliquity of the ecliptic, is about $23\frac{1}{2}$ degrees. They are not absolutely fixed at a uniform distance from the equator, but the limits of their variation are extremely narrow. See PERTURBATIONS.

TROPICAL BIG LEG. See BARBADOS LEG.

TROPIC BIRD, or **BOATSWAIN BIRD**. A seabird of the family Phaethontidae, related to the gannets, having long wings and the two central tail quills long and slender. Only three species are known, all tropical, often wandering hundreds of miles from land to hover about vessels. Their flight is graceful, and they capture fish by plunging in the water, often from a great height. They breed upon rocky cliffs, making no nests and laying a single pale-brown, spotted egg. They are nearly helpless on land, and are often caught at their breeding places and robbed of their long tail feathers, prized among savages as decorations. The yellow-billed tropic bird (*Phaethon flavirostris*) breeds in the Bermudas and West Indies and is white, with black on the wings. The other species belong mainly to the Indian and South Pacific oceans. See Plate of FISHING BIRDS.

TROPISM (from *trope*, from Gk. τροπή, *trōpē*, a turning). The act of turning towards or being oriented by the stimulus of light, gravity, wind, food, and so on. Thus, heliotropism, the first to be used of the many terms ending in tropism, means turning to the light. At first the term was restricted to such plants as the sunflower, which turns after or follows the sun, owing to the stimulus of the sun's rays. It was then found that animals were heliotropic, and further studies on the acts of animals in response to different physical stimuli have resulted in a somewhat extensive nomenclature. Tropism may be positive or negative. Certain plants, as plasmodia, and animals, as the sea cucumber, the starfish, and even the lady beetle, which are positively geotropic, are forced when on vertical surfaces to crawl upward; this is negative geotropism. The investigation of tropism has most important bearings on comparative psychology and the explanation of instinctive acts.

Anemotropism. An orientation of the body with respect to the wind, seen in flies (*Bibio ophyra*, etc.), which poise in swarms in the air, heading directly towards the wind, all the swarms of a given locality oriented in the same direction like weathercocks. On the other hand, the locusts move with the wind and head away from it, i.e., they are negatively anemotropic. (Wheeler.)

Chemotropism. The orientation of an organism by molecules emanating from a centre of diffusion. As the name indicates, it means response to odors or tastes emanating from food, decaying substances, and other matters. Thus, the maggot of the flesh and other flies are positively chemotropic towards certain chemical substances formed in decaying meat and cheese. The female fly is led not so much by a special instinct to these substances as by the stimulus of the rank smelling meat. As soon, says Loeb, as the fly is seated on the meat chemical stimuli seem to throw into activity the muscles concerned in egg laying and the eggs are deposited on the meat. Negative chemotropism is forcibly illustrated by the use of the oil of pennyroyal, of tobacco smoke, or kerosene oil in driving away flies and mosquitoes. For the botanical aspect of this tropism, see CHEMOTROPISM.

Galvanotropism. When certain shrimps, crayfish, and salamanders are subjected to the effect of a galvanic current, such changes of tension take place in the muscles of the appendages that movement towards the anode becomes easier and towards the cathode more difficult. The result is, says Loeb, that if the cur-

rent is continued long enough all the animals collect at the positive pole. It differs from heliotropism chiefly in that the curves of the current take the place of the rays of light.

Geotropism. As the result of the action of gravity, plants and certain animals tend to descend into or towards the earth. The act of righting in a starfish or sea urchin, or in a polyp (sea anemone), is the result of geotropic irritability, i.e., of positive geotropism. The effects of geotropism are seen in any moth or butterfly which has just emerged from the pupa case. It is restless till it finds a perpendicular surface on which to support itself with its abdomen hanging down until the wings are fully expanded. A fly orients its body head downward, a position assumed by many web-weaving spiders. Geotropism plays a part in the depth migrations of pelagic animals. See also GEOTROPISM IN PLANTS.

Heliotropism or **Phototropism**. Originally applied to the property certain plants possess of turning to the light. It has been found that many animals also are oriented towards the light. Loeb claims that in the case of animals which possess nerves "the movements of orientation towards light are governed by exactly the same external conditions and depend in the same way upon the external form of the body, as in the case of plants which possess no nerves." Many young or larval pelagic animals undergo periodic depth migrations. They begin to migrate vertically upward towards the surface of the ocean in the evening, descending in the morning, but since they never sink beyond a depth of about 1200 feet below, where light does not penetrate, this fact suggests that the light is the controlling power in their depth migrations. Loeb finds that the free-swimming animals at the surface of the sea are all permanently or for a short period positively heliotropic. There is a negative as well as a positive heliotropism. If light strikes one side of a positively heliotropic animal, an increase takes place in the tension of those muscles which turn the head to the source of light, while in the negatively heliotropic animal under the influence of one-sided illumination a decrease takes place in the tension of the same muscles, with the result that the negatively heliotropic animal is forced to move away from the source of light. The flight of moths towards a light is a case of heliotropism. Being a rapid flyer, the moth gets into the flame before the heat can check it. See PHOTOTAXIS. For heliotropism in plants, see HELIOTROPISM.

Paraheliotropism. This is defined by Darwin as the movement by which some leaves temporarily direct their edges to the source of light. See PARAHELIOTROPISM.

Hydrotropism. If a king crab is placed on shore a few feet from the water's edge, it will seek the water, perhaps oriented by the moisture not far away. Ants exhibit a reaction to heat (thermotropism) and also hydrotropism, in the care with which they move the eggs, young, and old larvæ and pupæ, as the nest becomes too warm or cold, moist or dry, at different times. For the influence of water on plants, see HYDROTROPISM.

Rheotropism. This is illustrated by the action of fish in heading up stream and by the slime protozoan in creeping against the current. For its botanical aspects, see RHEOTROPISM.

Stereotropism or **Thigmotropism**. This

form of tropism is contact irritability, which forces the animal to bring the ventral side of the body in contact with solid bodies. Thus, the ventral side of the starfish is positively stereotropic; in other words, the starfish, off the bottom, becomes restless if its ambulacral feet are not in contact with solid bodies. If earthworms are placed in a transparent closed vessel, they appear to be positively stereotropic. As soon, says Loeb, as they reach an angle in the aquarium they remain there, crawling along where the glass can touch them on two sides. This form of tropism plays, says Loeb, a very important part in the processes of pairing and in the formation of organs. The tendency of many animals to creep into cracks and crevices has, he claims, "nothing to do with self-concealment, but only with the necessity of bringing the body on every side in contact with solid bodies." The eel is positively stereotropic. It is forced to bring every part of its body, as far as possible, in contact with solid bodies. All the surface of the eel's body is stereotropic, and if touched with the finger on one side there result positively stereotropic curvatures towards the finger. There is in such an act no more consciousness than in the boring of a root in the sand. (Loeb.) Stereotropism is called thigmotropism or thigmotaxis by some authors. Another form of tropism is traumatotropism.

Consult Jacques Loeb, *Introduction to Comparative Physiology of the Brain and Comparative Psychology* (New York, 1900); also Wheeler, "Anemotropism and Other Tropisms in Insects," in *Archiv für Entwicklungsmechanik der Organismen*, vol. viii (Leipzig, 1899).

TROPFAU, tröpfau. The capital of Austrian Silesia, on the right bank of the Oppa, 37 miles northeast of Olmütz (Map: Austria, F 2). It has a Gothic church, a castle, a library of 43,000 volumes, and a museum of natural history and antiquities; also the Franz-Josef Museum of art and industry, the provincial insane asylum, etc. Troppau manufactures large quantities of cloth for army use; also stoves, machines, jute, etc. It was founded in the thirteenth century. At Troppau, in the fall and winter of 1820, a congress of European monarchs assembled for the purpose of dealing with the revolutionary disturbances in Italy. It was one of the series of European congresses which under the inspiration of Metternich (q.v.) sought to check the spread of liberal ideas and to carry out the policy of the Holy Alliance (q.v.). Pop., 1910, 30,762.

TROSSACHS, trös'uks. A picturesque and well-wooded valley in Perthshire, Scotland, between Lochs Acray and Katrine, amid hills rising from 1851 feet to 2390 feet in height (Map: Scotland, D 3). It has been a great tourist resort since its immortalization by Sir Walter Scott in *The Lady of the Lake* and *Rob Roy*.

TROTSKY, LEON. See **BOLSHEVISM** and **SUPPLEMENT**.

TROTTER (from *trot*, from OF., Fr. *trotter*, probably from OHG. *trottōn*, to tread, MHG. *trotten*, to run, frequentative of OHG. *tretan*, Ger. *treten*, to tread, step). A gait of the horse. Notwithstanding that the foundation of America's trotting stock came from England, and that in Russia there are the celebrated Orloff trotters and another breed in Norway, the trotting racer of to-day is distinctly the product of America. The gait was known to the ancients, but was abandoned by them. Trotting was a favorite gait among the English sportsmen of

Suffolk and Lincolnshire at the end of the eighteenth century, and a special breed there performed wonders; Locksmith's Gray trotted 72 miles in 6 hours in 1762. Ten years later, a Lincolnshire horse trotted 30 miles in 2h. 10m., with a rider weighing 220 pounds, and Phenomenon 17 miles in 53m. Yet as an historical fact American trotters owe nothing to these fast English trotters, but everything to the thoroughbred. The modern trotter may be traced back to Messenger, who was imported in 1788 by Thomas Benger, of Bristol, Pa. His father was Blaze, his grandsire Flying Childers, his great-grandsire the Darley Barb. His mother's father was Turf, who was directly descended from the Godolphin Barb. So on both sides of his pedigree Messenger brought the most select thoroughbred blood into America. He was a running-bred horse, yet from him the American trotter derives its dominant characteristics—the grit of the Arab, the gentleness of the Barb, and the hardy endurance of the English thoroughbred. The Hambletonians, comprising 90 per cent of the American trotters, are derived from Messenger on both sides through Rysdyk's Hambletonian, Abdallah, and Mambrino Messenger. Hambletonian's dam was the Charles Kent mare, the daughter of One Eye, and granddaughter of Silver Tail, who was the daughter of Messenger. Hambletonian's family includes Dexter, 2m. 17½s.; Goldsmith's Maid, 2m. 14s.; Rarus, 2m. 13¾s.; Saint-Julien, 2m. 11¼s.; Jay Eye See, 2m. 10s.; Maud S., 2m. 8¾s.; Sunol, 2m. 8¾s.; Nancy Hanks, 2m. 4s.; Alix, 2m. 3¾s.; and Directum, 2m. 5¼s. The second great trotting family, the Mambrinos, great for racing quality and beauty, is derived on the father's side from Messenger and on the mother's side from imported Paymaster. The mingling of the blood of the Hambletonians and Mambrino Chief has resulted in such ideal trotters as Azota, 2m. 4¾s., and Cresceus, 2m. 2¼s. The founder of the Clay family was Young Bashaw, by Grand Bashaw, an imported Barb, but on the female side are Messenger's progeny. The Star family, too, on the mother's side came from the same horse.

In the early trotting days colts were never trained; only matured horses raced, and they were capable of feats of endurance which no modern horse is or could be called upon to perform. Fanny Jenks in 1845 trotted 101 miles in 9h. 57m., drawing a sulky weighing 150 pounds. Lady Suffolk beat Dutchman two three-mile heats in 1m. 40½s. and 7m. 56s. respectively, and she trotted her fastest mile when 12 years old. Goldsmith's Maid trotted a mile in 2m. 14½s. when she was 17 years old. She started 118 times and beat 2m. 30s. in 115 of them, and Maud S. made her then world's record, 2m. 8¾s., when she was 11 years old. These times, too, were all before the days of the kite-shaped tracks, banked and rolled with scientific nicety, and long before the rubber-tired wheel sulky, both of which inventions have helped to reduce the mile record. On Aug. 17, 1903, at the Brighton Beach (N. Y.) track, the trotting record was reduced by J. K. Billings's Lou Dillon to 2m., but in October of the same year Lou Dillon still further reduced the record to 1m. 58½s. Weather conditions were unfavorable, but the mare had the advantage of two pacemakers, one drawing a wire-net guard acting as a wind shield. This form of record making is protested by many authorities, who

claim that such time should be recorded separately. In 1916 the world's record for trotting 1 mile was 1m. 58s., done (against time) by Uhlan at Lexington, Ky., Oct. 8, 1912.

For pleasure driving and friendly road competitions a light wagon was in use as early as 1786, but not until after that did the trotter as a racer become prominent. In that year Boston Blue trotted a mile in little less than 3m. By 1825 the New York Trotting Club was formed, and dashes of speed were daily indulged in on what is now Third Avenue, from the Bull's Head to Harlem. Up to 1898, however, the great bulk of the trotting of the country was done on tracks, 2000 of which were scattered over the continent. These tracks on which regular races are held are either exactly 1 mile or $\frac{1}{2}$ mile from start to finish, and a horse must win two heats to win the race. The courses are in the main elliptical, though some, built after 1890, are kite-shaped.

Since 1898 a great impetus has been given to trotting competitions by the creation of civic speedways, the first of which was constructed by the municipality of New York, along the banks of the Harlem River, from 155th Street to Fort George. Many great cities throughout the country have followed the example. For bibliography, see references under HORSE RACING.

TROTWOOD, BETSY. In Dickens's *David Copperfield*, the hero's great-aunt, eccentric but good-hearted.

TROTYL. See TRINITROTOLUENES.

TROTZENDORF, tröts'en-dörf, VALENTIN. See FRIEDLAND, VALENTIN.

TROUBADOURS, trov'ba-döörz (Fr. *troubador*, from Prov. *troubador*, troubadour, from *trobar*, OF. *trover*, *trouver*, Fr. *trouver*, to find, compose). The mediæval poets of southern France from about 1100 to about 1400, singers of war and love, whose wandering lives, full of passion and adventure, have made them typical romantic figures of their age. The feudal conditions of the region to which they belonged were favorable to the development of the wandering minstrel. Society was divided into three classes, commons, clergy, and nobles, the nobles alone possessing either means or desire liberally to reward literary and musical skill. The nobility, moreover, consisted of many petty independent barons, who tended to attach themselves to powerful local houses, such as that of the counts of Toulouse. There were, therefore, many courts, not too far distant from each other, to which troubadours could resort. Another social condition which had an important influence upon the character of Provençal poetry was the position of noble ladies. They received fiefs (by inheritance or as dowry), and they even governed and presided over a court. Usually married young and for social and political reasons rather than for love, they became queens of society, objects of fervent passion or conventional adoration.

With the accumulation of wealth and the progress of refinement, delight in life became conspicuous. The love of splendor manifested itself in gorgeousness of dress and magnificence of entertainments. Prodigality was the fashion. The ideal prince was he who bestowed gifts lavishly. In addition to the chase and the tourney, a favorite amusement was song—supplied by the jongleurs and troubadours. The jongleurs (*joculatores*) were the successors of the Latin *mimi*. They wandered from town to

town, from castle to castle, supplying amusement to the commons at fairs and in market places and to the higher classes at their feasts. The meaner kind not only recited, sang, and played on musical instruments, but performed as jugglers, dancers, acrobats, and exhibitors of trained animals. Members of this class were also to be found in the following of every great lord, among his permanent domestic servants or *ministeriumales*. They were court minstrels and entertainers.

From such singers sprang the troubadours. It may be said that the jongleur was one who made a trade of poetry and music; the troubadour one who devoted himself to the production of artistic court poetry, whether for gain or not. The jongleurs were therefore always poor, either by origin or by fate, whereas the troubadours, though largely belonging to the humble or the middle class, included knights, barons, counts, and even kings.

The troubadours led a wandering life, though they often lingered for years at the court of some patron, praising the mistress in extravagant terms and supporting the policy of the master by vigorous exhortations to his friends or by bitter denunciation of his enemies. War and courtly service were their chief themes. (See PROVENÇAL LITERATURE.) Conventional as this poetry was, there were no schools in which the art was taught. Each troubadour learned from his predecessors and handed down the tradition. Even the art of writing was not necessary, for the pieces were prepared chiefly for hearers. They were usually sung by the composer to his own accompaniment, but those who could not sing taught words and music to their jongleurs. By this method a wider audience was reached than the individual author could obtain. Whenever a lyric was sent to some friend at a distance it was not intrusted to writing, but to the voice of a messenger. This poetry, therefore, required a pleasure-loving aristocracy for its audience and wealthy and generous patrons for its support. It mirrored the soul of chivalry, an ideal of heroism, generosity, courtesy, and love. For flattering the vanity of the nobles and lending his talent to their taste for pleasure, the singer was rewarded with gifts of money, weapons, horses, or garments. Generosity was naturally praised as the chief of princely virtues, and growing avarice was a sign of the hopeless degeneracy of the times. Richard Cœur de Lion was considered the mirror of knighthood, and the practical statesmanship of Philip Augustus of France was judged low and unworthy. With the disappearance of the society they represented, the troubadours vanished.

The first troubadour whose lyrics have been preserved was William IX, Count of Poitou and Duke of Aquitaine, but he must have had a long line of humble forerunners. His granddaughter, Eleanor, the quick-witted but licentious wife of Louis VII and Henry Plantagenet, was the theme of the impassioned songs of Bernart de Ventadour. Ermengarde of Narbonne was another celebrated patroness of poetry, with many adorers in verse—this was their flourishing period. Among their chief patrons were the counts of Provence, the counts of Toulouse, and several kings of Aragon and Castile, the most notable of whom was Alfonso II of Aragon. In Italy the lords of Este and the Emperor Frederick II harbored the singers

of Languedoc. At these courts minstrels were kindly received and lavishly rewarded, taking part apparently in the social pleasures mirrored in their songs.

Much of the romantic interest that has gathered about the careers of these poets is derived from the Provençal biographies and *razos* which are found in some of the manuscripts containing their works. Many of these are merely imaginative tales in which elements of folklore, combined with a fanciful interpretation of the poems, have been set down as fact. Growing up among the later jongleurs and other lovers of poetry, they represent the conception which the succeeding age had formed of the heroes of Provençal song. Another fact has tended to give a romantic coloring to the lives of the troubadours: the fact that their poems deal so largely with the subject of love. This love was, it is true, chiefly factitious and conventional rather than personal, and the formulas in which it was expressed are exceedingly monotonous; but the modern imagination has built up for these wandering minstrels a sort of butterfly existence of poetry and passion, with the added excitement of constant adventures.

B. Beck, *La musique des troubadours* (ib., 1910); also references under **PROVENÇAL LITERATURE**.

TROUBAT, trôô'ba', JULES SIMON (1836-1914). A French littérateur, born at Montpellier. He was the last secretary of Sainte-Beuve (q.v.), one of his testamentary executors, and his legatee. He published a number of posthumous works of Sainte-Beuve, such as his *Correspondance*, an unfinished monograph on Proudhon, and three volumes of articles originally contributed to the *Premiers lundis*. Troubat himself wrote: *Souvenirs et indiscretions* (1875); *Notes et pensées* (1888); *Souvenirs du dernier secrétaire de Sainte-Beuve* (1890); *Essais critiques* (1902); *Sainte-Beuve intime et familial* (1903); *Souvenirs sur Champfleury et le réalisme* (1905).

TROUBETZKOY, AMÉLIE RIVES, PRINCESS. See RIVES, AMÉLIE.

TROUBETZKOY, PRINCE PAUL (1866-). A Russian sculptor. He was born at Intra, Lago Maggiore, Italy, son of a Russian nobleman who had married an American (Miss Winans). After desultory study under Ernesto Bazzaro, at the Brera in Milan, he worked independently, and in 1894 won recognition with his "Indian Scout" now in the Gallery of Modern Art, Rome. In 1897 he removed to Moscow, where he was appointed professor of sculpture at the Academy, and where he modeled several busts of Russian notables, an equestrian portrait of Tolstoy (1899, Luxembourg Museum, Paris), a seated figure of Prince Leon Golitzin, and statuettes of Grand Duchess Serge, Grand Duke Andre Vladimirovitch, and Count Witte. From 1905 Troubetzkoy lived in Paris. His art is very modern in treatment and technique, with a decided impressionistic effect. The subject matter is handled with originality and refreshing spontaneity; but the surfaces are sketchy and unfinished. Troubetzkoy is represented in many European galleries, and in that of San Francisco. His later works include: portraits of Giovanni Segantini (Berlin Museum), Auguste Rodin, Joaquin Sorolla (Hispanic Society, New York), George Bernard Shaw, Anatole France, Signor Giulio Savarese, and Paul Helleu; the equestrian monument to Alexander III (1909, St. Petersburg), and the "Daughter of Prince Scipione Borghese on Horseback" (1908). He also executed many charming genre statuette groups of children, dogs, etc. Among other honors, he was awarded gold medals at Rome, Dresden, Paris (1900), and Berlin. A representative exhibition of his sculptures was held at the Hispanic Society in New York in 1911. His brother, PRINCE PIERRE TROUBETZKOY, made New York his residence and became known as a portrait painter.

TROUESSART, trôô'e-sâr', EDOUARD LOUIS (1842-). A French zoölogist, born at Angers, and educated at the University of Paris (M.D., 1870). He was a surgeon in the French army (1870-71); professor at Angers (1882); director of the Natural History Museum of Angers (1882-85), and thereafter professor of zoölogy at the Natural History Museum in Paris. He published *Sur les mammifères vivants et fossiles* (1879-1907); *Mémoires sur les Acariens parasites et les Acariens marins* (1880-1907); *Les microbes, les ferments, et les moisissures* (1886; Eng. trans., 1886); *La Géographie zoologique* (1890); *Faune des mammifères de France* (1885); *Les parasites des habitations humaines et des denrées alimentaires* (1895); *Catalogue des mammifères vivants et fossiles* (1898-1904). Trouessart also collaborated on *La Grande Encyclopédie* (1885-1899). He was laureate of the Société entomologique (1895).

TROUP, trôop, GEORGE MCINTOSH (1780-1856). An American politician, born in the present Washington County, Ala. He graduated at the College of New Jersey (Princeton) in 1797, was admitted to the bar in 1800, and practiced in Savannah. From 1801 to 1804 he was a member of the Georgia Legislature; was a member of the United States House of Representatives from 1807 to 1815; was chairman of the Military Committee during the War of 1812, and opposed vigorously the Yazoo compromise. From 1816 to 1818 he was in the United States Senate, and from 1823 to 1827 was Governor of Georgia. During the dispute which arose between the agents of the general government

and the State in regard to the extinguishment of the Creek title to lands in Georgia, he did not hesitate to defy the Federal government. From 1829 to 1833 he was again a member of the United States Senate. He was a strong defender of States' rights, and in 1833 presided over the Georgia States' Rights Convention.

TROUPIAL, trōōp'ī-āl. See **ORIOLE**.

TROUS-DE-LOUP, trōō'de-lōō, or **MILITARY PITS**. Excavations in the shape of an inverted truncated cone or pyramid, with a pointed stake in the bottom. They should not be so deep as to afford cover to the enemy's skirmisher. Two and one-half feet or less is a suitable depth. They are usually dug in 3 or 5 rows and the earth thrown to the front to form a glacis. The rear row is dug first and then the next in front, and so on, so that no earth is cast over the finished pits. An excellent arrangement is to dig the pits in a checkerboard plan, leaving alternate squares and placing a stake in each of them to form a wire entanglement. One man can make 5 pits on a 2-hour relief. Such pits, placed as obstacles in front of defensive positions, may interfere seriously with the advance of infantry, and are not susceptible of destruction by artillery fire. Consult *Engineer Field Manual United States Army* (Washington, Government Printing Office, 1909).

TROUSSEAU, trōō'sō', **ARMAND** (1801-67). A French physician, born at Tours. He became M.D. at Paris in 1825, and after holding other similar posts became professor at the Hôtel Dieu in 1852. Four years later he was elected a member of the Academy of Medicine. Troussseau is best known through his use of tracheotomy in croup: *Nouvelles recherches sur la trachéotomie pratique dans la période extrême du croup* (1851). Among his works are best known: *Traité de thérapeutique et de matière médicale* (1826-37; 8th ed., 1870; Eng. trans., 1842), with H. Pidoux; and *Traité pratique de la phthisie laryngée* (1837; Eng. trans., 1839), for which classical work he received the grand prize of the Academy of Medicine.

TROUT (AS. *truht*, from OF. *truite*, from Lat. *tracta*, *tractus*, from Gk. *trōktēs*, *trōktēs*, sort of sea fish, from *trōgēin*, *trōgēin*, to gnaw). Any of many fishes of the family Salmonidæ. (See **SALMON**.) Some are partly anadromous, but most of the species live exclusively in fresh waters, and occur in most of the lakes and streams of northern regions. They are all voracious and more or less gamy. Their food consists of almost any sort of fresh animal matter—smaller fishes, crustaceans, insect larvæ, and the like. The trout, like the salmon, spawn during the colder months of the year, varying with the latitude and the species.

Trout may be classed into two main groups. The one group, belonging to the genus *Salmo*, has a flat vomer, supplied with teeth, the body with larger scales than the other group, which has a boat-shaped vomer, the shaft destitute of teeth. The latter group is more perfectly restricted to fresh waters than the former. The former group includes the salmon trout, and the latter the chars, such as the brook trout. The salmon trout of European waters (*Salmo trutta*) resides in salt water, and enters the rivers to spawn. Its fresh-water variety, the brown trout (*Salmo fario*), occurs in the lakes of Europe, and has been extensively domesticated in English and North American waters. In consequence of its greater adaptability, it is

now replacing the native brook trout in many localities, much to the disgust of the sportsman. Another Scottish variety, the Lochleven trout, differs from the brown trout in the greater growth of the pectoral and caudal fins, in the greater number of caecal appendages, and in other minor characters.

The American salmon trout (*Salmo gairdneri*) is a large trout, abundant in the Columbia and other rivers flowing to the Pacific coast. (See **STEELHEAD**.) A variety of it, the Kamloops trout, or "stitt-tse," occupies the lakes of British Columbia and northern Washington.

The rainbow or Coast Range trout (*Salmo irideus*) is smaller than the preceding, has larger scales and brighter colors. It is native in the mountain streams of the Pacific coast, and probably enters the sea. It is very variable, presents many geographical varieties, such as the brook trout of western Nevada, the trout of Mt. Shasta, golden trout of Mt. Whitney, the McCloud River trout, and others. It has been transplanted successfully into the mountain streams of the eastern United States, and has been domesticated to some degree. The "cut-throat" or Rocky Mountain trout (*Salmo mykiss*) is a common trout of very wide distribution in all the clear streams of the Rocky Mountains and Sierra Nevada, from Kamchatka and Alaska to northern Mexico. Its scales are smaller than in the nearly related species, hyoid teeth are usually present, and it is very closely related to *Salmo gairdneri*. This species often enters the sea, and is very variable, many geographical races being recognized, one of which, "Clarke's trout" of the Columbia River, is illustrated on the Plate of **SALMON**.

The Great Lakes trout, "longe," "togue," or "namaycush," differs from *Salmo* in the absence of teeth on the shaft of the vomer, and from the brook trout in its larger size and well-developed teeth on the hyoid bone. It inhabits all the larger lakes of eastern North America, and is one of the more important food fishes of the Great Lakes region. The variety "siscowet," found only in the deep water of Lake Superior, has excessively fat flesh, and is not prized as food. See **NAMAYCUSH**.

The principal chars of American waters are the common brook or speckled trout, the Dolly Varden, the ouquassa, and the European brook trout. The brook trout (*Salvelinus fontinalis*) is the best known, abundant in all clear, cold streams of eastern North America south to the headwaters of the Savannah. It differs from the other species of the genus in its back being strongly marbled with olive and black. It has been introduced into the Western streams; and many hybrids between this and the rainbow trout and other species exist. Its extreme length may be 18 inches, but it is usually much smaller. It is a favorite for its gamy qualities and for its flavor. See **Colored Plate of GAME FISHES**.

The Dolly Varden trout (q.v.), or malma, is a native of northwestern America, and has red spots on both back and sides. The ouquassa trout (*Salvelinus ouquassa*), "quasky" or "blue-back," is a small trout of the Rangely group of lakes in western Maine, dark blue, with small red spots, usually confined to the sides. Similar and still smaller varieties of this most beautiful of the trout exist in the lakes of Quebec and in those of subarctic America.

The European brook trout (*Salvelinus al-*

TROUT AND GRAYLING

1. MICHIGAN GRAYLING (*Thymallus tricolor*).
2. OQUASSA TROUT (*Salvelinus oquassa*).
3. DOLLY VARDEN TROUT (*Salvelinus malma*).

4. NAMAYCUSH (*Cristivomer namaycush*).
5. RAINBOW TROUT (*Salmo irideus*).
6. SUNAPEE TROUT (*Salvelinus alpinus*, var. *aureolus*).

pinus) has the red spots only on the sides, and the mouth is rather smaller than in the preceding. It occurs in the cold lakes and mountain streams of northern Europe and Asia, and in northeastern North America. It is variable and is represented by several varieties—such as the Greenland char, the long-finned char, and the sunapee or golden trout. The last named is very local in its distribution, having been taken in Sunapee Lake and a few other lakes in New Hampshire and Maine. It is highly prized because of its brilliant colors and graceful form. Much uncertainty remains as to its origin and relationship. It has strong affinities with the European form and by some is considered to have been introduced from there. Much pains is being taken to increase this species by artificial propagation and transplantation. See FISH CULTURE.

There are other species of trout of minor importance both in America and Europe and Asia; and many fishes not truly trout are locally so called. Compare SALMON; GRAYLING. Consult: D. S. Jordan, *Fishes* (New York, 1908); Jordan and Evermann, *American Food and Game Fishes* (new ed., ib., 1914); Ernest Phillips, *Trout in Lakes and Reservoirs: A Practical Guide to Managing, Stocking, and Fishing* (ib., 1914); Louis Rhead, *American Trout Stream Insects* (ib., 1916); also references under ANGLING; FISH; SALMON.

TROUT FISHING. With the possible exception of the black bass, there is no fish that affords more sport to the angler or that is found over a greater range of country than the brook trout. It may be taken with the fly or with bait, but the former method is considered generally the more sportsmanlike. In bait fishing, the trout is likely to be killed or badly injured, whereas in fly fishing the fish generally is hooked in the lip and can be returned to the water unharmed. In lakes and ponds in summer time, when the surface of the water becomes warm, trout make for deep water, and bait must be used. It is impossible to do more than give the general rules controlling the selection of flies: In size, the fly should be selected to meet the condition of the water rather than the size of the fish; thus, if late in the season and the water of a clear stream is low, sober-colored flies on No. 10 or 12 hooks are usually the best. See FISHING; FLY-CASTING.

TROUT PERCH. One of the small fishes of the North American family Percopsidæ, represented abundantly in the Great Lakes by the "sand roller" (*Percopsis guttatus*) and by a second genus and species in Oregon. This family constitutes the suborder Salmoperca; the form of the body and the head and mouth are perchlike, while the fins are salmon-like. These fishes are of particular interest because of their relationship with generalized archaic forms, of which they seem to be the survivors. Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1896).

TROUVÈRE, trōv'vâr' (Fr., from *trouver*, to find, compose). The Northern French term answering to the Provençal troubadour (q.v.), applied usually to the original poets who composed the works which the jongleur performed. The distinction, however, is not absolute, as there are instances of trouvères who performed their own works, and occasionally of jongleurs who aspired to composition. The trouvère was usually a man of some rank and standing, either

priest or knight. See FRENCH LITERATURE; JONGLEUR.

TROUVILLE, trōv'vêl'. A fishing town and seaside resort of the Department of Calvados, France, at the mouth of the Touques, 136 miles by rail west-northwest of Paris, and 9 miles south of Havre (Map: France, N., F 3). It has risen from the humble fishing village to the rank of the most fashionable watering place in France. Its equable climate, agreeable situation, remarkably fine beach, and many handsome villas make it an ideal resort during the summer and autumn months. There are a Louis XIII Hôtel de Ville and a large well-appointed casino. The harbor is thronged with fishing boats, and there is some trade. Pop., 1901, 6137; 1911, 6901. The port is shared with Deauville, a small but well-known sea-bathing resort, a short distance southwest, with a casino. The August races here are attended by the leading circles of Parisian society.

TROVATORE, IL, èl trōv'vā-tō'rā (It., The Troubadour). An opera by Verdi (q.v.), first produced in Rome, Jan. 19, 1853; in the United States, May 2, 1855 (New York).

TRO'VER (OF, *trover*, *trouver*, to find, compose). One of the old forms of action in common-law pleading, employed to recover damages for the wrongful conversion of personal property. The action was a development of the action of trespass on the case. It is based upon a fiction that the plaintiff has lost his chattels and that the defendant has casually found them, but refuses to deliver them to the plaintiff. Although this fictitious statement must be made in the declaration, it need not be proved, and could not be traversed or denied; and the plaintiff may recover damages on proof of a conversion of his property. Any interest which will entitle a person to the possession of goods is sufficient to maintain this action. See COMMON FORMS; CONVERSION; FORMS OF ACTION.

TROWARD, trō'ard, THOMAS (1847-1916). A British philosopher. He was born at Belgaum in the southern Maharatta country, India, and was educated at Victoria College, Jersey. He prepared for the Indian Civil Service and was appointed to a junior magistracy in the Punjab. Eventually he retired with the rank of divisional judge. Returning to England, he lectured in Edinburgh, London, and other cities on topics relating to Mental Science and New Thought (qq.v.). For this work he was well fitted by experience and scholarship. Thirty years' residence in India, during which period he decided cases according to Hindu, Sikh, and Mohammedan law, and also studied the different religious and philosophical systems, had familiarized him with the best thought of the Orient, practical as well as speculative. On the other hand, the western point of view was his by inheritance. Troward contended that the basic spiritual principles underlying all religions were so developed in the Bible as to make it entirely authoritative as a guide to thought and action. Moreover he found spiritual principles to be paralleled by the laws of nature as revealed by modern science, thus indicating a unity of the visible and invisible. Judge Troward's system has the practical aim of helping the individual to recognize his spiritual freedom by showing that mental attitude controls material conditions. His widely read writings, important in their field, include:

Edinburgh Lectures on Mental Science (1906); *Bible Mystery and Bible Meaning* (1907); *Doré Lectures* (1909); *The Creative Process in the Individual* (1911).

TROWBRIDGE. A market town in Wiltshire, England, on a rocky eminence in the valley of the Biss, 97 miles by rail west of London. Cassimeres, kerseys, tweeds, and woolen cloths of the best qualities are manufactured. The parish church of St. James, which dates from the fourteenth century, contains the remains of Crabbe, the poet, who officiated as clergyman from 1814 to 1832. There are a fine modern town hall and many handsome villas, the residences of wealthy manufacturers. The town owes its origin to an ancient castle, built on the mound called Courthill, which held out for Matilda against Stephen. It was demolished before the reign of Henry VIII, and all traces of it have disappeared. Pop., 1901, 11,562; 1911, 11,815.

TROWBRIDGE, EDMUND (1709-93). An American lawyer, born in Newton, Mass. He graduated at Harvard in 1728, and soon rose to eminence as a lawyer. He became Attorney-General of the State in 1749, was for several years a member of the council, and in 1767 was appointed a justice of the Massachusetts Supreme Court, presiding with great ability and fairness at the trial of Captain Preston and his men after the Boston massacre. In 1772 he retired to private life. Though not in full sympathy with the Patriot party, he was strongly opposed to the policy of the British ministry.

TROWBRIDGE, JOHN (1843-1923). An American physicist. He was born in 1843 and was educated at the Lawrence Scientific School, Harvard, graduating in 1866 and then serving for three years as tutor. After occupying a chair at the Massachusetts Institute of Technology, he returned to Harvard in 1880, was made professor of experimental physics, director of the Jefferson Physical Laboratory (1884), and Rumford professor of the application of science to the useful arts (1888). He established a laboratory course in physics and was one of the pioneers in introducing laboratory work as an essential part of instruction in elementary science. Trowbridge was a member of various international electrical congresses, was elected to the National Academy of Sciences in 1878, and became president of the American Academy of Arts and Sciences. He carried on many important investigations in physics, particularly in electricity, and later investigated the various phenomena connected with the Röntgen rays. Many of his communications were issued under the title of *Contributions from the Physical Laboratory of Harvard College*. Besides these he wrote: *The New Physics* (1884); *What is Electricity?* (1896; new ed., 1903); *Samuel F. B. Morse* (1901). Papers of importance include "The Longitudinal Magnetic Field and the Cathode Rays," in *Proceedings of the American Academy of Arts and Sciences*, vol. xliii (1908), and "Research in Physics," in *Harvard Graduates' Magazine* (1911).

TROWBRIDGE, JOHN TOWNSEND (1827-1916). An American novelist, juvenile writer, and poet, born at Ogden, N. Y. After a common-school education Trowbridge taught for a year in Illinois and afterward was a journalist in New York and Boston, where he settled in 1848. His *Neighbor Jackwood* (1857) was

one of the first realistic novels of New England life. The more noteworthy of his many stories, largely for boys and ranking with the best of their kind, are: *Father Brighthopes* (1853); *The Drummer Boy* (1863); *Cudjo's Cave* (1863); *The Three Scouts* (1864); *Neighbors' Wives* (1867); *Coupon Bonds and Other Stories* (1872); *The Silver Medal* (1908); *A Pair of Madcaps* (1909); *The Jack Hazard Series*; *The Toby Trafford Series*; *The Start in Life Series*; *The Tide Mill Series*. Trowbridge also wrote verse, his "Darius Green and his Flying Machine" being especially well known. A collected edition, *Poetical Works*, appeared in 1903. His autobiography, *My Own Story* (1903), throws some interesting sidelights on American literature during the second half of the nineteenth century.

TROWBRIDGE, S(AMUEL) BRECK PARKMAN (1862-1925). An American architect, born in New York City. He graduated from Trinity College, Hartford, in 1883, and from the School of Architecture at Columbia in 1886, and then had charge of the erection of the building of the American School of Classical Studies at Athens, Greece. After studying at the Beaux-Arts in Paris, he returned to New York, where he was employed in the office of George B. Post (q.v.) for four years. Later he became a member of the firm of Trowbridge and Livingston, which built many residences, business structures, and public buildings. In 1910 Trowbridge was appointed Chevalier of the Legion of Honor, and in 1915 he was elected to the National Institute of Arts and Letters.

TROWBRIDGE, WILLIAM PETIT (1828-92). An American engineer, born in Oakland Co., Mich. He graduated, first in his class, at West Point in 1848; was assigned to the Corps of Engineers as a brevet second lieutenant; was engaged in astronomical observations at the Military Academy Observatory in 1848-50 and performed important work from 1850 to 1856, when he resigned from the army, on the United States Coast Survey. In 1856-57 he was professor of mathematics at the University of Michigan and in 1857-61 was scientific secretary of the Superintendent of the United States Coast Survey. During the Civil War he was in charge of the Engineer Agency at New York City. He was professor of dynamic engineering in the Sheffield Scientific School of Yale College (1870-77), was adjutant general of the State of Connecticut (1872-76), and from 1877 until his death was professor of engineering in the Columbia School of Mines. He is credited by some with having first suggested the idea of the cantilever bridge. Besides numerous magazine articles, he published *Heat as a Source of Power* (1874).

TROY (Lat. *Troia*, from Gk. *Tpola*). The most famous city of Greek legend. It was in the northwest corner of Asia Minor, on a small plain through which flows to the Hellespont the ancient Scamander (now Mendere), entered near its mouth by a small stream from the east, the ancient Simois (now Dumbrek Su). In the angle once formed by these streams (the modern courses have greatly altered) lies a low hill, jutting from the range of Mount Ida, which was known in Roman times as *Ilium Novum*, and was regarded by many as the successor of the Homeric Troy. Near by is the modern village of Hissarlik. The claims of this site had always found defenders, but since the work

of Le Chevalier at the end of the eighteenth century there had been a strong trend of scholarly opinion in favor of the ruins near Bunarbashi on the Bali Dagħ, a steep cliff above the Sca-mander, south of its entrance to the plain. The presence of warm springs near by served to strengthen this identification. The site, as well as the summit on the opposite side of the valley, was certainly fortified in early times as a protection against incursions from the south, but excavation has shown conclusively that the capital of the district lay on the hill of Hissarlik, less than 4 miles from both the Ægean and the Hellespont, and corresponding far more closely than could have been reasonably expected with topographical indications in the *Iliad*. The credit for the exploration of this site belongs to Heinrich Schliemann (q.v.), who began excavations in 1870, and in the three following years had laid bare enough to show that underneath the Roman and later Greek ruins which crowned the hill were remains of a settlement of unknown antiquity, even though the names "Scaean Gate" and "Priam's Palace" seemed extravagant. In 1878-79 another campaign with scientific coadjutors led to more definite results, which were still further increased by excavations in 1882 by Schliemann and Dörpfeld. Another visit (1890) led to further important modifications of previous results, and, though the death of Schliemann in December, 1890, prevented immediate continuation of the work, it was resumed in 1893 by Dörpfeld.

The history of the hill as read in the excavations and later writers is that of a series of at least nine successive settlements, many only small collections of wretched huts, though a convenient terminology has dignified them all as "cities." The first (1) settlement is a small group of dwellings surrounded by a wall, belonging to the end of the Neolithic period. The second (2) city, held by Schliemann to be the Homeric Troy, was defended by a strong wall of rough stone, topped by crude brick, and seems to have extended its circuit twice, the second time with marked alterations in the situation of the gates. Within were several houses, consisting of a great hall and vestibule, of the type found later in Mycenæ and Tiryns, and apparently described in the Homeric poems. The civilization indicated by the pottery and lesser finds shows that the inhabitants were at the beginning of the Bronze age, belonging to the period of the so-called "Island" civilization. (See ARCHAEOLOGY.) The rulers were evidently of some wealth and power, but their identity seems lost forever. The continuity of tradition in the pottery and general type of building, and the similarity with much found in Phrygia, seem to warrant the belief that there was no change of race from the second to the sixth city, and that this people were kindred of the Indo-European Phrygians. Yet they were not at peace with their neighbors, as is shown by the fact that the second city was burned, and the site left desolate. The place was resettled, however, and the houses of the third (3) city were built on the rubbish which concealed their predecessors; the wall also was repaired, and the gates narrowed for greater security. This city, too, was destroyed, or perhaps abandoned, but was again resettled (4), as an open village. To this succeeded (5) another village of little huts, de-

fended by a wall of no great strength. The next city (6) was, however, different. It was defended by a strong wall of smoothed stone, of far greater circuit than that of city No. 2, and of such workmanship that a bit discovered by Schliemann was attributed to the Hellenistic period. This wall was pierced by gates, provided with strong flanking towers. Within were houses of considerable size, but of the same simple plan as those in the second city. Owing to a great terrace built by the Romans, which cut down the top of the hill, the remains of this city are preserved only around the edge, while the centre, which doubtless contained the royal palace, has vanished. As Schliemann's excavations were almost entirely confined to the centre of the hill, it was possible for him to miss this city, which belonged to the Mycenæan period, and certainly corresponds to the Homeric Troy. It seems clear, from the objects found, that the kings of Troy ruled over a people not advanced in artistic work, the old plain pottery continuing in general use. After no very long period another settlement (7) covered the hill. Mycenæan vases have been found in its lower strata, but whether the inhabitants were survivors of the Trojans, or the first wave of Greek settlers, cannot certainly be determined. It is clear that the Cimmerian invasion in the eighth century B.C. reached this hill, and after destroying the inhabitants, either Treres or Cimmerians took up their abode on the site, till in the seventh century they were driven forth and Troja or Ilion was occupied by Greeks (8). The settlers seem to have been a small band of Æolian colonists, who were cut off from the sea by other Greek towns, and seem to have lived with little to recall the ancient glory of the place. The prosperity of the place (9) began with the visit of Alexander in 334 B.C., and the temple of Athena Ilias became after his death the centre of a league of free cities of the Troad. Near the end of the fourth century Lysimachus fortified it with a wall some 5 miles in circumference, and also built on the hill a marble temple of Athena. Later the town was under the control of Seleucus, but its history during this time is obscure. It passed under the Roman protection (189 B.C.) and was honored as the city of Æneas, and thus the parent of Rome. In the first civil war, about 85 B.C., it was stormed and sacked by the Marian general Fimbria. New prosperity came with Julius Cæsar, for the Julian family traced their descent from Ascanius, and Augustus rebuilt the temple of Athena and surrounded it with courts and porticoes. Later emperors favored it, and Constantine planned to make it the seat of his new capital. It was for a long time the seat of a bishopric, but was plundered about 1306 by the Turks and since then has lain in ruins.

For the legendary history of Troy, see TROJAN WAR.

Bibliography. The excavations of Schliemann and Dörpfeld are recorded by them in *Trojan Antiquities* (London, 1874), *Ilios, the City and Country of the Trojans* (ib., 1881), *Troja: The Results of the Latest Researches and Discoveries on the Site of Homer's Troy* (ib., 1884), *Bericht über die Ausgrabungen in Troja im Jahre 1890* (Leipzig, 1891); also C. Schuchardt, *Schliemann's Excavations* (trans. by Eugénie Sellers (London, 1891); W. Dörpfeld, *Troja, 1893* (ib., 1894); W. Dörpfeld and

others, *Troja und Ilion* (2 vols., 1902); Walter Leaf, *Troy: A Study in Homeric Geography* (New York, 1912); id., *Homer and History* (London, 1915); K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914). See also HOMER.

TROY. A city and the county seat of Pike Co., Ala., 52 miles by rail south by east of Montgomery, on the Atlantic Coast Line and the Central of Georgia railroads (Map: Alabama, D 4). It is the seat of a State normal school, and has a Carnegie library. Troy is the shipping centre for large cotton interests, and has some manufactures, of which fertilizers are the most important. Troy was settled in 1843 and incorporated the same year. Pop., 1900, 4097; 1910, 4961.

TROY. An important manufacturing city and the county seat of Rensselaer Co., N. Y., situated at the head of navigation of the Hudson River, 6 miles north of Albany and 149 miles north of New York (Map: New York, G 5). It is the western terminus of the Boston and Maine Railroad and is also on the New York Central and Hudson River, Delaware and Hudson, and Rutland railroads, and five interurban trolley systems. Additional transportation facilities are afforded by the Hudson River and the new State Barge Canal (q.v.). On the west side of the river lie the cities of Cohoes and Watervliet and the villages of Green Island and Waterford, all connected with Troy by bridges and commercially a part of it, making a contiguous urban population exceeding 130,000.

Troy is situated on the level ground along the river front and extends over the hills directly eastward. The water front is seven miles in length and is occupied by large factories and mercantile establishments. There are 100 acres in the parks, the largest being Prospect Park, a well-developed pleasure ground overlooking the lower sections of the city and affording a view of the vicinity for miles around. The Soldiers' and Sailors' Monument is in Washington Square. Oakwood Cemetery is of interest for its natural beauty; it contains many notable monuments and the Earl Memorial Chapel. Among edifices of note are the courthouse, post office, the savings-bank building with the music hall, and the Hart Memorial Library, a fine example of Italian Renaissance architecture. Prominent among the city's features is the Samaritan Hospital, constructed in 1914 at a cost of more than \$600,000. There are two other hospitals, four orphan asylums, four homes for the aged, a Young Men's Christian Association, a Young Women's Christian Association, and Boys' and Girls' clubs.

Industrially Troy ranks fifth among the cities of the State, while in the volume of its commerce it stands fourth. Nearly \$60,000,000 is invested in its manufacturing enterprises and their products have a yearly value of over \$40,000,000. The annual payroll of its 21,000 employees exceeds \$18,000,000. It enjoys exceptional water-power facilities from the State dam across the Hudson at the north end of the city and from two tributary streams which drop more than 200 feet within the city limits. Troy is the world centre for the manufacture of shirts, collars, and cuffs, producing 89 per cent of the collars and cuffs made in the United States. It is the leading city of the country

also in the production of laundry machinery, valves, horseshoes, engineering instruments, and bells. Its brush, stove, ventilator, firebrick, paper-box, hosiery, knit-goods, and malleable-iron factories are also important.

Among the educational institutions are the Rensselaer Polytechnic Institute (q.v.), and the Emma Willard Seminary, the pioneer school in America for the higher education of women (founded in 1815). There are also two musical conservatories with a combined enrollment of 900 pupils.

The government is vested in a mayor and common council, elected every two years, and in various administrative departments. More than \$1,250,000 is spent annually by the city for maintenance and operation. The water works, which represent an outlay of \$4,620,710, are the property of the municipality. The net debt of the city in 1916 was \$4,743,047.92; the assessed valuation of real and personal property, \$60,313,860. The population, in 1800, was 4296; in 1850, 28,785; in 1900, 60,651; in 1910, 76,813; and, according to the State census of 1915, 75,480; 1920, 72,013.

The site now occupied by Troy was visited by members of the crew of Henry Hudson's *Half Moon* in 1609, but it was not until 1659 that Jan Barentsen Wemp, the first settler, arrived. He purchased land from the Indians by the consent of the patroon, this being part of the Van Rensselaer grant of 1629. Derick van der Heyden bought a large farm here in 1707 and his descendants laid out a town along the river eighty years later to accommodate a stream of emigrants from Connecticut. The settlement, known first as Van der Heyden's or Ashley's Ferry, was named Troy in 1789. Two years later a town government was formed and in 1794 Troy was incorporated as a village. It became a city in 1816. The annexation of Lansingburg in 1901 gave it an area of 9.62 square miles. In 1916 its centennial was celebrated with appropriate ceremonies. Consult: A. J. Weise, *History of the City of Troy* (Troy, 1876); id., *City of Troy and its Vicinity* (ib., 1886); id., *Troy's One Hundred Years* (ib., 1891); G. B. Anderson, *Landmarks of Rensselaer County* (Syracuse, 1897); *New Troy*, a pamphlet issued by the Troy Chamber of Commerce (Troy, 1913).

TROY. A city and the county seat of Miami County, Ohio, 83 miles by rail north by east of Cincinnati, on the Cincinnati, Hamilton, and Dayton, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, B 5). Farming is the leading industry of the surrounding country. There are manufactures of carriages, wagons, electric coffee mills, hardware, wind shields, automobile bodies, tile, bricks, bentwood, dashboards, and iron and lumber products. Pop., 1900, 5881; 1910, 6122.

TROY, trwä, JEAN FRANÇOIS DE (1679-1752). A French decorative and genre painter. He was born in Paris and was the son and pupil of the portrait painter François de Troy (1654-1730). He also studied for several years in Italy and on his return to Paris was received at the Academy (1708). Many important commissions for mural decoration were executed by him, among the finest being the "Plague at Marseilles" (excellently engraved by Thomasin), and the "First Chapter of the Order of the Holy Ghost" (Louvre). They are well composed and display a vigorous style. He also

TROYON
"OXEN GOING TO WORK," FROM THE PAINTING IN THE LOUVRE

painted many small canvases in the style of Lancret, such as "The Oyster Breakfast" (Chantilly), "The Hunt Breakfast" (Wallace collection, London), and "The Surprise" (South Kensington Museum). In 1738 he was appointed director of the French Academy at Rome, and about this time designed his celebrated series from the histories of "Esther," "Medea," and "Jason" for the Gobelins tapestries.

TROYENS, LES, lā trwä'yān'. An opera in two parts by Berlioz (q.v.). 1. *La prise de Troie* (The Capture of Troy), first produced in Karlsruhe, Dec. 7, 1890; 2. *Les Troyens à Carthage* (The Trojans at Carthage), first produced in Paris, Nov. 4, 1863. The first complete production of the entire work (both parts) was the one at Karlsruhe, Dec. 7, 8, 1890. In the United States only fragments have been produced in concert form (1877, 1887, New York).

TROYES, trwä. The capital of the Department of Aube, France, on the left bank of the Seine, 104 miles by rail east-southeast of Paris (Map: France, N., J 4). It presents a quaint, mediæval appearance. The fine Cathedral of Saint-Pierre (thirteenth to sixteenth century, with a splendid rose window) is in the Flamboyant style. The small Church of Saint-Urbain, founded by Pope Urban IV, is a charming example of the thirteenth-century Gothic. La Madeleine has a superb rood screen. Saint-Jean (fourteenth to sixteenth century) is noteworthy for its stained glass and its two paintings by Mignard. Saint-Nicolas and Saint-Pantaléon are both in the Gothic style of the sixteenth century. In the old Abbey of Saint-Lupus are the public library (136,000 volumes and 15,095 manuscripts) and an interesting museum. The monument to the children of Aube, in commemoration of the Franco-German War, was erected in 1900. The chief industry is the manufacture of silk, cotton, and woolen stockings. There is a school of history. The Seine is canalized here and divides into several arms in the city. Pop., 1911, 55,486.

The capital of the Celtic *Tricasses*, Troyes was the Roman *Augustobona* (later *Treacæ*). The town was the capital of the counts of Champagne, and early rose to importance as a centre of trade. The treaty of 1420, which provided for the succession of Henry V of England to the French throne, was signed here. Jeanne d'Arc took the town in 1429, and a century later it was partly destroyed by Charles V. The revocation of the Edict of Nantes reduced the population, which was largely Protestant, to less than one-fourth of its former numbers. Consult J. T. Boutiot, *Histoire de la ville de Troyes et de la champagne méridionale* (4 vols., Paris, 1870-74), and A. Prévost, *Histoire du diocèse de Troyes pendant la révolution* (3 vols., ib., 1908-09).

TRO'YLUS AND CRY'SEYDE. A poem by Chaucer, written about 1380, probably largely a translation of Boccaccio's *Filostrato*, though Chaucer may have drawn directly from Benoît de Sainte-More's *Roman de Troyes* of the twelfth century, in which the episode is first introduced, or from Guido della Colonna's prose novel based on it.

TROYON, trwä'yōn', CONSTANT (1810-65). A French animal and landscape painter. He was born at Sèvres, Aug. 25, 1810, and early worked there as a decorator in the porcelain factory, receiving meanwhile lessons in design from Rioceux and later from Poupart. His

first Salon pictures, exhibited in 1833, were mediocre in character, but a fortunate acquaintance with the Romanticist Roqueplan modified his style. Later he became associated with Rousseau, Diaz, and Dupré of the Barbizon group and he soon became known as a successful landscape painter. Of greatest importance for his career was his visit, in 1847, to Holland. Here his observation of the rich animal life of the fields, together with his study of Dutch art, especially the animal painters Potter and Cuypp, turned his attention to animal painting, to which thenceforth he devoted himself. Success and fortune came to him early; he received first-class medals in 1846, 1852, and 1855, and the decoration of the Legion of Honor in 1849. When orders multiplied, his rapidity of execution occasionally resulted in inferior workmanship. In consequence of overwork he lost his reason in 1863, and he died in Paris, Feb. 21, 1865.

Troyon is the principal animal painter of France, if not of modern times. No man has succeeded better in portraying the character of animals—the stolid indifference of the ox, the helplessness of the sheep. His animals, however, were never detached studies, but an integral part of the landscape. More than any other cattle painter he is a consummate master of landscape, which he portrays with an epic simplicity equaled only by Rousseau. At first rather heavy, his execution speedily became broad and impressive; his color is rich and glowing. The poetic treatment of his subject, especially in the handling of light and shadow, classifies him with the Barbizon group. His pictures often bear no distinctive names beyond the general designation of "Landscape with Cattle." In the Louvre are 31 examples, including 18 of the Chauchard collection. Among the most celebrated of these are: "Return from the Farm"; "Oxen Going to Work"; "The Goose Girl"; "White Cow Scratching Herself." He is also well represented in French provincial museums, and in the public collections of the United States. In the Metropolitan Museum, including the Vanderbilt collection, are six examples, of which the finest are "Holland Cattle"; "On the Road," a marvel of bright color; and "Autumn Woods with Cattle."

The Art Institute of Chicago possesses seven examples, including "The Return from Market," "Cattle Scene," and "Landscape with Cattle"; and he is also represented in the Wilstach collection, Philadelphia, the Brooklyn Institute Museum, the Corcoran Gallery, Washington, and the San Francisco Art Museum. Consult: Henri Dumesnil, *Troyon: Souvenirs intimes* (Paris, 1888); A. Hustin, *Constant Troyon* (ib., 1893); J. C. Van Dyke, *Modern French Masters* (New York, 1896); Walther Gensel, *Corot and Troyon* (Bielefeld, 1906); and for a list of his works, Louis Soulié, *Les grands peintres aux ventes publiques* (Paris, 1900).

TROY WEIGHT. See WEIGHTS AND MEASURES.

TRÜBNER, trüb'nër, NICHOLAS (NIKOLAUS) (1817-1884). A London publisher, born in Heidelberg, Germany. After learning the bookseller's trade he went to London in 1843 and was employed by the Longmans. In 1851 he entered into partnership with Thomas Delf and afterward with David Nutt, and soon became the head of the flourishing publishing house of Trübner & Co. One of his successful enterprises

was a development of the American trade. In 1855 he published the admirable *Bibliographical Guide to American Literature*, which was greatly enlarged in 1859. He found time to study Sanskrit, Hebrew, and Basque, and wrote several learned books. He performed great services to scholarship by issuing works shunned by ordinary publishers. Two remarkable series of such works were *Trübner's Oriental Series* and the *British and Foreign Philosophical Library*. He was also the publisher of the Early English Text and other societies.

TRUCE (plur. of obsolete Eng. *true*, *truce*, true, AS. *trēowe*, *trywe*, Goth. *triggws*, Ger. *treu*, true; connected with OPruss. *druwis*, faith). In warfare, a truce closely resembles an armistice (q.v.), the two terms being frequently used as synonyms. Practically the truce is a prelude to or the interval necessary to arrange for an armistice. In either case it is but a temporary cessation of hostilities, and may be merely local, arranged to afford safe conduct for the bearer of a message, or to permit the combatants to bury their dead; or, if general, to admit of peace pourparlers. International agreement as well as the unwritten law of the battlefield forbids either side taking advantage of a period of truce to improve their strategic advantage by changes of position, disposition of troops, bringing up of reserves, or other reinforcements. A general truce is only made by the rulers or governments concerned, while a local truce may be arranged by the local commanders. During a truce a definite arrangement is made detailing the liberties permitted each combatant. It is understood, however, that each side is at liberty to carry out such operations as would have been possible during actual hostilities. Violation of a truce by either party, or any form of treachery regarding it, instantly terminates the truce. See **ARMISTICE**; **FLAG OF TRUCE**; **WAR**.

TRUCE, FLAG OF. See **PARLEY**.

TRUCE OF GOD (ML. *treuga Dei*). In the Middle Ages private warfare was very common, and the Church synods, in order to limit what they could not wholly repress (see **PEACE OF GOD**), in the eleventh century and later, frequently passed decrees that there should be no such warfare during certain holy seasons and on certain days. The seasons during which peace was observed extended from Advent to Epiphany, and from Septuagesima to one week after Pentecost. In addition the time from Wednesday night to Monday morning of each week and all saints' days were included. By the end of the eleventh century only about eighty days in the year were left free for private warfare, but most of these days came in summer when the fighting would naturally be most common. These decrees of the councils, although frequently repeated, had little effect. Sometimes the King, too, lent the truce the weight of his authority and thus made it a peace of the land. Consult: August Kluckhohn, *Geschichte des Gottesfriedens* (Leipzig, 1857); Ludwig Huberti, *Studien zur Rechtsgeschichte der Gottesfrieden und Landfrieden* (Ansbach, 1892); Ernest Lavisse, *Histoire de France*, vol. ii, part ii (Paris, 1901).

TRUCK FARMING. See **AGRICULTURE**; **UNITED STATES**.

TRUDELIN, tru'de-län'. See **FRIDOLIN**.

TRUDEAU, trōō'dō, EDWARD LIVINGSTON (1848-1915). An American physician, noted as an authority on tuberculosis, to the study of which he devoted his life. He was born in New York City and graduated from the College of Physicians and Surgeons there in 1871. After a brief period of practice in New York he was obliged by pulmonary disease, contracted through nursing his brother, to go to the Adirondack Mountains. There he remained from 1873 to the end of his life. In 1884 the guides and residents of Saranac Lake gave money and land enough to enable Trudeau to found his famous sanitarium for the treatment and cure of incipient tuberculosis in working men and women. This was the first American institution to attempt the climatic and open-air method of treatment of the disease. In 1894 Trudeau founded the Saranac Laboratory for the study of tuberculosis, the first of its kind in America. One of his most noted patients was Robert Louis Stevenson. Trudeau contributed a vast number of articles to medical publications. His success in fighting the great white plague received recognition at home and abroad; in 1905 he was president of the Association of American Physicians, in 1910 president of the Congress of American Physicians and Surgeons, and he was also the first president of the National Association for the Study and Prevention of Tuberculosis. Consult his *Autobiography* (Philadelphia and New York, 1916); Stephen Chalmers, *The Beloved Physician* (Boston, 1916).

TRUE, ALFRED CHARLES (1853-). An American educator and agriculturist, a son of Charles K. True (q.v.). Born at Middletown, Conn., he graduated at Wesleyan University in 1873. After teaching in the State normal school at Westfield, Mass., for several years, he studied at Harvard in 1882-84. In 1884-88 he was an instructor at Wesleyan. Afterward in the United States Department of Agriculture, he was successively editor, vice director, and from 1893 to 1915 director of the Office of Experiment Stations, and in 1915 he became director of the States Relations Service. He instituted agricultural investigations in Alaska, Hawaii, Porto Rico, and Guam, and for many years supervised investigations on human nutrition, irrigation, and drainage. He gave special personal attention to studies of agricultural education and was largely instrumental in its improvement and extension. In 1902 he was dean of the first graduate school of agriculture in the United States, held at Ohio State University, and thereafter of several such schools in other States, and in 1914 was president of the Association of American Agricultural Colleges and Experiment Stations. Later he had general supervision of the coöperative extension work in agriculture and home economics under the Smith-Lever Extension Act. For many years he was editor in chief of the *Experiment Station Record* and of *Experiment Station Work*; he also prepared numerous bulletins, and contributed to the **NEW INTERNATIONAL ENCYCLOPÆDIA** and the **NEW INTERNATIONAL YEAR BOOK**.

TRUE, CHARLES KITTREDGE (1809-78). An American Methodist Episcopal clergyman, educator, and author. He was born in Portland, Me., graduated at Harvard in 1832 and the next year entered the New England conference. Subsequently he was agent of the New England Education Society, principal of Amenia Seminary, professor of intellectual and moral science

in Wesleyan University (1849-60), and financial agent of Wesleyan (1870-73). He published: *The Elements of Logic* (1840); *Shavmut; or, the Settlement of Boston by the Puritan Pilgrims* (1845); *John Winthrop and the Great Colony* (1875); *The Life and Times of Sir Walter Raleigh* (1877); *The Life and Times of John Know* (1878); *Memoirs of John Howard* (1878); *The Thirty Years' War* (1878); *Heroes of Holland* (1882); *Life of Captain John Smith* (1882).

TRUE, FREDERICK WILLIAM (1858-). An American zoölogist, born at Middletown, Conn., and educated at New York University (B.S., 1878; M.S., 1881). Becoming connected with the department of biology of the National Museum in 1881, he was head curator from 1897 to 1911, and thereafter served as Assistant Secretary of the Smithsonian Institution. He was the United States delegate to the Seventh International Zoölogical Congress in 1907. In his scientific work he made a specialty of the study of whales, his writings including: *Review of the Family Delphinidae* (1889); *The Whalebone Whales of the Western North Atlantic* (1904); *An Account of the Beaked Whales of the Family Ziphiidae* (1910); *Observations on Living White Whales* (1911).

TRUE, RODNEY HOWARD (1866-). An American botanist and physiologist, born at Greenfield, Sauk Co., Wis. He graduated from the State university in 1890 and studied also at Leipzig (Ph.D., 1895). He taught school for two years, served as principal of the Wisconsin Academy at Madison in 1892-93, and was instructor and assistant professor of pharmacognosy at the University of Wisconsin in 1895-99. He lectured on botany at Harvard from 1899 to 1901, when he became physiologist of the United States Department of Agriculture. His publications comprise government bulletins and contributions to the *Annals of Botany*, *Botanisches Centralblatt*, and other scientific journals.

TRUEBA Y COSÍO, trōō-ā'nā & kō-sē'ō, TELESFORO DE (1798-1835). A Spanish and English author, born at Santander and educated in a Catholic college in England. His studies for a diplomatic career he made in London and in Paris, where he afterward served as attaché to the Spanish Legation until 1822. After his return to Spain he founded an academy uniting the entire younger generation of poets and presided over by Alberto Lista. The two comedies, *El veleta* and *Casarse con 60,000 duros*, which he wrote about this time, entitle him to be ranked with the best Spanish dramatists. In politics an ardent champion of the constitutional party, he took refuge in London on the restoration of the absolute régime and presently earned wide reputation as an English writer. Besides the novels *Gómez Arias* (1828) and *The Castilian* (1829), in imitation of Walter Scott, he published a *Life of Hernán Cortés* (1830); *History of the Conquest of Peru* (1830); *The Romance of History* (1830); *The Exquisites*, *Salvador de Guericilla*, *The Incognito* (1831); produced the comedies *Call Again Tomorrow* (1832), *Mr. and Mrs. Pringle*, *The Man of Pleasure* (1832), and the historical drama *The Royal Fugitive* (1834); but won his greatest success with the descriptive picture of manners, *Paris and London* (1831). Returning to Spain in 1834, he was elected to the Cortes and Secretary of the Second Chamber. He died

in Paris. Consult Marcelino Menéndez y Pelayo, *Estudios críticos sobre escritores montañeses* (Santander, 1876).

TRUEBA Y LA QUINTANA, & lá kên-tā'nā, ANTONIO DE (1819-89). A Spanish poet and novelist, born in the Basque region, of peasant stock. He went to Madrid, where he entered business, but devoted his leisure hours to study, and even succeeded in obtaining a university degree. He was made by Isabella II historiographer of Biscay, but was deprived of his post of historiographer when the Queen was banished in 1868. His verse, contained in the two collections *El libro de los cantares* (1852) and *El libro de las montañas* (1868), is marked throughout by a tender melancholy natural to his native Basque region, of which he sings. His historical novels, such as *El Cid Campeador* and *Las hijas del Cid*, are dreary performances. In the short tale of manners, descriptive of his beloved Basque district, he succeeded. There are various collections of these tales, e.g., the *Cuentos de color de rosa*, the *Cuentos campesinos*, the *Cuentos de varios colores*, the *Narraciones populares*, the *Cuentos de madres & hijos*.

TRUE BILL. See INDICTMENT.

TRUE INSPIRATION CONGREGATION. See COMMUNISM; AMANA.

TRUFFLE, trūf'1 or trūf'f1 (OF. *trufle*, *trufe*, *truffe*, Fr. *truffe*, truffle, perhaps from Lat. *tubera*, neut. pl., but taken as fem. sing. of *tuber*, swelling, tumor, tuber), *Tuber*. A genus of ascomycetous fungi, globose, or nearly so, of a fleshy substance, with a distinct skin, the whole substance pervaded by a network of serpentine threads (*hymenium*) which bear the spore cases in minute cavities. The species, which are not numerous, are found in central and southern Europe; they are subterranean, found frequently in groups of 10 to 20 a foot or more below the surface soil. They generally grow under deciduous trees, some species being found only under oaks. Some of them are among the most highly valued of esculent fungi. The common truffle (*Tuber cibarium*) is black and has a roughened surface. Its size varies from that of a large plum to a large potato. From its agreeable flavor, it is used in the preparation of many dishes. It is common in the central and southern parts of Europe, chiefly in loose soils, in woods and pastures, as in the pine, oak, and chestnut woods of France and Italy. Other species, as

TRUFFLE.

Tuber aestivum, *Tuber brumale*, and *Tuber melanosporum*, are found in some parts of France, Italy, and other countries of Europe, and are sought and used in the same manner as the common truffle. Dogs and pigs are trained to seek them, and readily discover their underground location by the scent. Stirring of the soil in gathering them seems to increase productiveness. The white truffle (*Terfezia leonis*), a species of a nearly allied genus, also found in many places, grows half aboveground, is pinkish, and generally as large as a walnut. It is less aromatic, but is used like the common truffle. Attempts have been made to introduce the culture of truffles in parts of the United States where the edible species are little known. See ASCOMYCETES.

TRUJILLO, trōō-hē'yo (formerly TRUXILLO, from Lat. *Turris Julii*). A town of the Province of Cáceres, Spain, in Estremadura, 24 miles east of the city of Cáceres on the main highway from Madrid to Portugal (Map: Spain, C 3). The surrounding country is mountainous, but produces wheat, wines, oil, and fruits; live stock is raised. The principal manufactures are chocolate, leather goods, pottery, and delftware. There are valuable forests in the vicinity. The town contains many convents and churches, of which the most famous is that of Santa Maria de la Concepción, which holds the tomb of Francisco Pizarro (q.v.). The so-called Tower of Julius and other Roman ruins are found in the vicinity. Pop., 1900, 9304; 1910, 11,530.

TRUJILLO, or **TRUXILLO**. An Atlantic seaport of Honduras, situated on the Bay of Truxillo, 137 miles northeast of Tegucigalpa (Map: Central America, E 2). Formerly the most important port of northern Honduras, it has within recent years again become noted for its banana shipments. Pop. (est.), 2000. Trujillo was founded in 1523 and was formerly the capital of the Republic. Here the American filibuster Walker was captured and executed in 1858.

TRUJILLO, or **TRUXILLO**. A Peruvian city, capital of the Province of Libertad, situated near the mouth of the river Moche, 320 miles northwest of Callao, and connected by rail with its port, Salaverry (Map: Peru, B 5). The town is still surrounded by walls of the seventeenth century. It contains a cathedral, a university, and a theological seminary. It was formerly an important commercial centre. It produces sugar, rum, alcohol, tobacco, and coffee. Near it lie the ruins of the Inca city Gran Chimú. Trujillo was founded by Pizarro in 1535, and named in honor of his birthplace. It was destroyed by an earthquake in 1619. Pop. (est.), 15,000.

TRUJILAN SYNOD. See QUINISEXT.

TRUMBULL, HENRY CLAY (1830-1903). An American clergyman and author, born at Stonington, Conn., and educated at Williston Seminary, at Yale, and at the University of New York. He was ordained a Congregational minister, served as chaplain of the Tenth Connecticut Regiment in 1862-65, and was in several Confederate prisons. In 1875 he became editor of the *Sunday School Times*. He wrote: *The Knightly Soldier* (1865); *Kadesh-Barnea* (1883); *Principles and Practice* (1889); *Studies in Oriental Social Life* (1894); *War Memories of an Army Chaplain* (1898); *Old-Time Student Volunteers* (1902). *Personal Prayer* was posthumously published (1915). Consult P. E. Howard, *Life Story of Henry Clay Trumbull* (Philadelphia, 1906).

TRUMBULL, JAMES HAMMOND (1821-97). An eminent American philologist, born in Stonington, Conn., and educated at Yale. Feeble health prevented the completion of his college work as well as his entering upon active professional life. After 1847 he was a resident of Hartford. He was Assistant Secretary of State (1847-52), and again (1858-61), and in 1861-65 was Secretary of State of Connecticut. He was well versed in American philology and a writer on historical subjects. He also made a thorough study of the Indian tongues and prepared a glossary of Eliot's Indian Bible. Trumbull was State librarian in 1854-56, and from 1863 until his death was librarian of the

Watkinson Library of Hartford; secretary of the Connecticut Historical Society (1849-63), and its president from 1863 until his death. In 1874 he served as president of the American Philological Association. He was one of the editors of the *Colonial Records of Connecticut* (15 vols., 1850-90); he also edited the *Memorial History of Hartford County* (1886); and he prepared an edition of T. Lechford's *Plain Dealing* (1867) and of Roger Williams's *Key into the Indian Language* (1866). His own publications include: *The Composition of Indian Geographical Names* (1870); *The Best Method of Studying the Indian Languages* (1871); *Historical Notes on the Constitution of Connecticut* (1872); *The True Blue Laws of Connecticut, and the False Blue Laws Invented by Rev. Samuel Peters* (1876); *Indian Names of Places in and on the Borders of Connecticut, with Interpretations* (1881); *List of Books Printed in Connecticut 1709-1800* (Hartford, 1904). He wrote numerous articles in his particular fields of study, and also prepared the catalogue of George Brinley's library (1878-97).

TRUMBULL, JOHN (1750-1831). An American judge and poet, born in Westbury, now Watertown, Conn. Precocious in childhood, he passed his examinations for Yale at the age of seven, but spent six further years in preparatory study, and was not graduated until 1767. In 1771 he became tutor at Yale, studied law, and was admitted to the bar in 1773, having already signaled his satiric powers in *The Progress of Dullness* (1772). To this he added a second and third part in 1773, and in that year entered the law office of John Adams in Boston. At New Haven in 1774 he composed the first portion of his most famous satire, *McFingal*, a mock epic after the fashion of *Hudibras*. During the Revolutionary War he lived in Westbury and Hartford, where he completed *McFingal* (1782). This work became very popular, no less than thirty pirated editions being known to collectors. His political writing after the Revolution was Federalist in spirit. His poetical works were collected in 1820. He cooperated with the famous Hartford Wits in the *Anarchiad*, and was State attorney (1789), legislator (1792, 1800), and Superior Court judge from 1801 to 1819, when he moved to Detroit, where he died.

TRUMBULL, JOHN (1756-1843). An American historical and portrait painter. The son of Jonathan Trumbull, Governor of Connecticut, he was born at Lebanon, Conn., June 6, 1756, graduated at Harvard in 1773, and two years later entered the Continental army. Having made for Washington a plan of the British works before Boston Neck, he was appointed an aid-de-camp, and the following year a deputy adjutant general under Gates. He retired from the army in 1777, but in 1778 he took part as a volunteer in General Sullivan's expedition to Rhode Island; and in 1780 he became a pupil of Benjamin West, in London. The news of André's execution fastened upon him the suspicion of being a spy, and he was imprisoned for eight months. In 1782 he returned to America and remained until 1784, when he went back to London to continue his studies under West. Here he painted "Battle of Bunker Hill" (1786), and "Death of General Montgomery" (1786), now in the Yale University Art Gallery. The four pictures, "The Signing of the Declaration of Independence," "Sur-

render of Burgoyne," "Surrender of Cornwallis," "Resignation of Washington at Annapolis," in the Capitol at Washington, were finished in 1824 after eight years of labor. Most of his pictures he presented to Yale in return for an annuity of \$1000. Among the principal ones, besides those mentioned above, are, "Battle of Princeton" (1795), "Battle of Trenton," and portraits of Washington, Hamilton, the Duke of Wellington, and others. In the City Hall, New York, are ten portraits by him, including those of Washington, George Clinton, John Jay, and Alexander Hamilton. The Metropolitan Museum possesses a portrait of Alexander Hamilton, and one of Robert Lenox is in the New York Public Library. Others include General and Mrs. Washington, in the National Museum, Washington; John Adams, Jonathan Trumbull (John Trumbull's father), and Rufus King. His work is good in composition and color, and is pervaded by a healthy realism, but it deteriorated. In 1789 he returned to America and from 1794 he served for seven years under Jay as Secretary of Legation in England. From 1816 to 1825 he was president of the Academy of Fine Arts in New York, in which city he died, Nov. 10, 1843. Consult his *Autobiography* (New York, 1841) and Samuel Isham, *History of American Painting* (new ed., New York, 1915).

TRUMBULL, JONATHAN (1710-85). An American patriot and political leader, born at Lebanon, Conn. He graduated at Harvard in 1727, studied for the ministry, and held a pastorate at Colchester, Conn., but in 1731 joined his father in mercantile pursuits. Meanwhile he began to study law, and in 1733 was sent to the General Assembly, becoming Speaker in 1739. In 1740 he was appointed Governor's assistant, holding this position many years; from 1766 to 1769 he was Deputy Governor, and as such ex officio Chief Justice of the Superior Court of Connecticut. From 1769 to 1783 he was Governor, and at the outbreak of the Revolutionary War was the only one of the Colonial Governors who gave unqualified support to the Patriot party. At the close of the war he was prominent as an advocate of a strong federal government. According to a long-accepted tradition he was called by Washington "Brother Jonathan," a phrase which later came into general use to personify the United States. The story, however, seems to be without foundation. See NATIONAL NICKNAMES.

TRUMBULL, JONATHAN (1740-1809). An American political leader, the son of Jonathan Trumbull (1710-85), born at Lebanon, Conn. He graduated at Harvard, 1759; was for several years in the State Legislature; was paymaster-general of the Northern Department from July, 1775, to July, 1778; and was military secretary to General Washington, with the rank of lieutenant colonel, in 1781-83. He was a Federalist member of Congress from 1789 to 1795, being Speaker of the House in 1791-95; was a member of the United States Senate in 1795-96; was Lieutenant Governor of Connecticut in 1796-98; and was Governor from 1798 to 1809.

TRUMBULL, JOSEPH (1782-1861). An American lawyer, grandson of Jonathan Trumbull (1710-85). He was born at Lebanon, Conn. After graduating at Yale in 1801, he studied law and from 1804 to 1828 practiced at Hartford. In the latter year he became president of the Hartford bank. He was a member of the

Legislature from 1832 to 1848 and in 1851. In 1834-35, on appointment, he served in Congress as a Whig, and again in 1839-43 was a member of that body. In 1849-50 he was Governor of Connecticut. He was actively interested in public internal improvements and in educational matters.

TRUMBULL, LYMAN (1813-96). An American jurist and politician, born at Colchester, Conn. He received an academic education, taught school in Georgia, and was admitted to the bar in 1837. He removed to Belleville, Ill., and in 1840 was elected to the Legislature as a Democrat. In 1841-42 he was Secretary of State, and from 1848-53 was a justice of the Supreme Court. From 1855 to 1873 he was a member of the United States Senate. He early joined the Republican party, was chairman of the Judiciary Committee after 1861, supported the Emancipation Proclamation and suspension of habeas corpus, and drafted the Thirteenth Amendment to the United States Constitution. After the war he was one of the seven Republican Senators who refused to vote for the impeachment of President Johnson, and thereafter acted with the Democrats. In 1873 he returned to the practice of law in Chicago. In 1880 he was the unsuccessful Democratic candidate for Governor of Illinois. He joined the Populists in 1894, and defended the leaders of the great railway strike in Chicago in that year.

TRUMPET (OF., Fr. *trompette*, It. *trombetta*, trumpet, diminutive of Fr., OF. *trompe*, It. *tromba*, trumpet, probably from OHG. *trumba*, *trumpa*, Ger. *Trommel*, drum). A musical instrument of great antiquity, which, in its present form, consists of a tube 8 feet long, less in diameter than the horn, doubled up in the form of a parabola, and sounded by a mouth-piece. By means of crooks the instrument can be adjusted to any degree of the chromatic scale. With the exception of the one in C, all trumpets are transposing instruments. The music is always written in the treble clef. The sound is bright and penetrating. The older composers, including Beethoven, had to be careful in the selection of the trumpets for a particular composition, and even then it was not always possible to have the trumpet play all the notes desired. To remedy this defect the instruments were provided with valves, enabling them to produce all chromatic intervals from *g* to *g*².

TRUMPET, SPEAKING. See SPEAKING TRUMPET.

TRUMPET CALLS. See BUGLE AND TRUMPET CALLS.

TRUMPETER (so called from its note), or AGAMI. One of the birds of the family Psophiidae, allied to the cranes, and natives of South America. They have the plumage of the head and neck short and velvety, while that of the rump is long and loose, and possesses the remarkable character of having a series of sub-orbital bones as in reptiles. The best-known species is *Psophia crepitans*, which occurs in large flocks north of the Amazon, especially in the forests of British Guiana. These birds, of which several species exist, have little power of flight. The flesh is palatable, and they are domesticated by the Indians. Another species (*Psophia leucoptera*) is termed "corcovoda." See Plate of CRANES, ETC.

TRUMPETER FISH. An important commercial food fish of New Zealand, *Latris neotia*, often reaching a weight of 50 pounds. It

is a member of the longfin family Cirrhitidae, related to the sea breams (Sparidae), which furnishes many valuable food fishes throughout the Indo-Pacific region. One species (*Chilodactylus macropterus*) is highly prized both at the Cape of Good Hope and in Australia, and reaches a weight of 25 pounds. These fishes are called "long fins" on account of a prolongation of one of the rays of the pectoral fins. See LONGFIN.

TRUMPETER HORNBILL. See HORNBILL.

TRUMPET FISH. See SNIPEFISH.

TRUMPET FLOWER (so called from the shape of the flower). The popular name of the genus *Tecoma* (family Bignoniaceae), comprising over 100 species of Asiatic, Australian, African, and North American mostly climbing and twining shrubs without tendrils, producing large flowers with a long tubular corolla which suggested the common name. The trumpet

TRUMPET CREEPER (*Tecoma radicans*).

creeper, or trumpet vine (*Tecoma radicans*), is a beautiful North American hardy species which climbs by means of aerial rootlets and has large attractive funnel-shaped orange-yellow and scarlet flowers. *Tecoma australis* is an ornamental Australian climber. *Tecoma jasminoides*, another Australian species, is often grown in greenhouses in cold climates. *Tecoma capensis* is a South African climbing shrub with clustered racemes of orange-scarlet flowers. *Tecoma grandiflora*, a rather tender Chinese and Japanese species, is in common cultivation. *Tecoma stans*, a yellow-flowered Texan species, is an erect shrub. The plants are propagated by seeds, layers, cuttings of well-developed shoots, and most commonly by root cuttings. Species of the closely related genus *Bignonia* are sometimes also called trumpet flower.

TRUMPET HONEYSUCKLE. See HONEYSUCKLE.

TRUMPET WOOD. See CECROPIA.

TRUNK-BACK TURTLE. The leather-back (q.v.).

TRUNKFISH (so called from its incase-mant, which resembles a trunk), or BOXFISH. A fish of the order Ostracodermi, and family Ostraciidae, with a short, cuboid body, covered by a carapace formed of firmly united polygonal bony scutes, the jaws, bases of the fins, and caudal peduncle free and covered by smooth skin.

They swim by means of a curious sculling motion of the small dorsal fins and anal fins, the tail acting as a rudder, while the pectoral fins fan water into the gills. There are about thirty species, all of tropical seas, and dwelling near the bottom, feeding on minute animals. The common trunkfishes, such as the West Indian *Lactophrys trigonus*, have the carapace or "box" three-angled. A somewhat different one (*Lactophrys tricornis*) is the "cowfish" or "toro" of Florida and Cuba, distinguished by the stout spines that form three "horns" on the head. It ranges to the Cape of Good Hope, reaches 18 inches in length, and makes good food when baked in its shell. See OSTRACODERMI, and Plate of PLECTOGNATH FISHES.

TRUN'NION, COMMODORE. In Smollett's *Peregrine Pickle*, a retired sailor.

TRURO. A city in Cornwall, England, 8 miles north of Falmouth, at the junction of the Allen and the Kenwyn with an inlet of the sea called the Truro River (Map: England, B 6). Truro is the centre of a mining district, and trades in tin and copper ore. Its modern cathedral, an early English structure in granite, consecrated in 1887, ingeniously incorporates St. Mary's Church, a Perpendicular edifice of the reign of Henry VII. The grammar school dates from 1546. Anciently called Truera and Truruburgh, Truro was the seat of the Stannary Parliaments of Cornwall, and was a privileged tin coinage town. Pop., 1901, 11,562; 1911, 11,325.

TRURO. A town and the county seat of Colchester Co., Nova Scotia, Canada, on the Canadian Pacific and Intercolonial railways, on the Bay of Fundy, 61 miles by rail north-northeast of Halifax (Map: Nova Scotia, G 6). It contains the Provincial Normal College, the Nova Scotia College of Agriculture, Truro Academy, and nearby there is a 1000-acre park. There are various manufactures. Pop., 1901, 5993; 1911, 6107.

TRURO, THOMAS WILDE, BARON (1782-1855). An English jurist and Lord Chancellor. He was born in London, was educated at St. Paul's School, and was trained as a lawyer. In 1805 he was admitted as attorney and for some years practiced as such, but in 1817 was called to the bar as barrister, and in 1820 made himself celebrated by his defense of Queen Caroline. In 1831 he entered Parliament in the Whig interest and gradually won for himself as great distinction there as he had won in the courts. In 1839 he became Solicitor-General, and in 1841 became Attorney-General, but held the office only a few months. In 1843 he introduced Rowland Hill's plan for postal reforms in the House of Commons, in 1846 was again made Attorney-General on the resumption of office by Lord John Russell, and a few days later was appointed Chief Justice of the Court of Common Pleas. In 1850 he was made Lord Chancellor and created Baron Truro of Bowes, but he resigned on the defeat of the government in 1852.

TRUSS (OF., Fr. *trousse*, from *trousser*, to pack, bind, tie, It. *torciare*, to twist, wrap, tie, from Lat. *tortus*, p.p. of *torquere*, to twist). An instrument employed in the relief of hernia, with the view of preventing its descent or of effecting a cure. It consists essentially of a pad or cushion attached to a metallic spring, with straps so arranged that its position may be retained during varied movements of the

body. The necessity of having recourse to a suitable truss the moment that slight protrusion shows itself in any part liable to hernia cannot be too strongly urged. Many varieties of trusses have been devised. The instrument required in any particular case should be left to the surgeon. See HERNIA.

TRUSS. In engineering and architecture, a device for spanning a space between supports by means of a number of pieces framed together. Trusses are employed when the space is too great to be conveniently spanned by a single beam or girder. The various pieces or members, of wood or metal, are so proportioned and disposed as to resist most effectively the particular strain or stress of tension or compression to which each is subjected. See BRIDGE; ROOF.

TRUST (ME. *trust*, *trost*, *trist*, *tryst*, Goth. *trausti*, covenant, treaty, OHG. *tröst*, Ger. *Trost*, trust, protection). In its broadest sense, a legal relation existing between two or more persons such that a court of equity will compel one to hold property or an interest in property of which he has the legal title for the benefit of the other or others. The person so holding the legal interest in property is called the *trustee*, and the person entitled to the benefit, or, as is sometimes said, "equitable interest" in the property, is known as the *beneficiary* of the trust, or the *cestui que trust*. The *fideicommissum* (q.v.) of the Roman law, which was a form of trust created by will, has been supposed to have been the model of uses, the early form of trust introduced into England by the clergy as a means of avoiding the operation of the mortmain statutes (q.v.). Another analogy has been found in the Roman idea of *usufructus*, or the right of temporary enjoyment of a thing as distinct from the legal ownership of it. The analogy, however, between uses or trusts on the one hand, and the *fideicommissum* and the *usufructus* on the other, fails in many important particulars, and it seems most probable that the use is an independent product of English jurisprudence, although its development was greatly aided by the doctrines of the Roman law with which the clergy were familiar.

The practice of conveying land to uses, that is, the granting of land to one to be held by him for the benefit of another, seems to have existed as early as the reign of Edward III. Such grants were made by debtors to avoid levy of execution by creditors, and by disseisors to avoid the claims of rightful owners of the land. By thus conveying land to another to the use of the grantor, the grantor retained all the benefits of a purely legal ownership, while he divested himself of all its burdens. First, the obligation of the grantee to uses to hold land to the use of his grantor seems to have had only a moral or religious sanction, and, resting as it did upon conscience and good faith, was a proper subject for the then rapidly growing jurisdiction of the Court of Chancery. (See CHANCERY.) There is some evidence that the Chancellor took jurisdiction to enforce such obligations upon equitable grounds in the reign of Richard II, and the jurisdiction became well established during the reigns of Henry VI and Edward IV. By virtue of the Chancellor's power to command things to be done, he could compel the feoffee to uses to carry out fully the equitable obligations imposed upon him by the grantor, and in the reign of Edward IV we

find the Chancellor imposing the same obligations upon those who acquired the legal title from the feoffee by inheritance or by purchase, if the purchaser had notice of the claim of the *cestui que use*. Equity also came to recognize the right or interest of the *cestui* as analogous to a legal interest in the land which might be freely conveyed or assigned and which might be inherited. Thus, in addition to the power of the legal owner of land to divest himself of the burdens of legal ownership by the conveyance to uses, he was also enabled to grant the use in ways not permitted at common law, as, e.g., the grant of the use of property by the husband to his wife.

At this period (Edward IV) there were three recognized methods of creating a use or trust in lands: (1) *By feoffment or transmutation of possession*, as already mentioned. Analogous to this was the practice of enfeoffing another to the uses to be declared in the feoffor's will. Equity in such cases compelled the feoffor or trustee to hold the property for the benefit of those named in the feoffor's will. (2) *By bargain and sale*. When the legal owner entered into a legal contract for the sale of land in which the buyer paid, or agreed to pay, the vendee for the land, a court of equity treated the vendor as a trustee and compelled him to hold the land for the use or benefit of the buyer. (3) *By covenant to stand seized*. This was a covenant by which the legal owner of land covenanted to stand seized or possessed of the land to the use or for the benefit of a blood relative. Courts of equity treated such an instrument as a valid declaration of trust, enforceable against the covenantor for the benefit of the relative named in the covenant.

The use of the trust as a means of evading the obligation of legal ownership led to the enactment of the Statute of Uses, 27 Henry VIII, chap. 10. Its purpose was to abolish the practice of creating uses or trusts of land, and its effect was to declare that, by operation of law, the legal title should be deemed vested in the beneficiary or *cestui que use*. Upon its face the statute was effectual to serve this purpose, and its immediate effect was to permit the creation and transfer of legal estates in the same manner as uses or equitable estates had been created and transferred before the statute, and incidentally to permit the conveyance of a legal interest in land by mere deed of bargain and sale without feoffment as at common law. (See CONVEYANCE; USES.) Influenced, however, by the same powerful motives which were responsible for the development of the system of uses, the early lawyers, by a method of reasoning now difficult to understand, ultimately gave to the statute a meaning and effect the exact opposite of that intended. It was held that when land was granted to A for the use of B, the efficiency of the statute to vest the grantee to uses with the legal title was exhausted, so that if the grant was made to A for the use of B for the use of C, then B, who acquired the legal title by operation of the statute, would hold it for the benefit of C. It was also held that when an active duty was imposed upon the grantee to uses or trustee, as by a grant of real estate to A to collect and pay over the rents to B, the use was not executed by the statute by making B the legal owner, but was enforceable by Chancery as before the statute. The result, there-

fore, was that the system of trusts was preserved and its development stimulated rather than hindered by the statute. In both England and the United States there is a complete system of trusts of both real and personal property, either as developed by courts of equity or modified by statutes.

In order to create a trust all that is now necessary is that one should convey or grant, either by will or by grant *inter vivos*, specific property to one in trust for another, or that one having the legal title to such property should declare that he holds it in trust for another. No consideration is necessary to create a trust, and no writing or other formal document is required, except that trusts of real estate are required by the Statutes of Frauds to be evidenced by writing. No particular words are necessary, but the intention of the person creating the trust must be clear. Any legal person or a corporation if within its corporate powers may become a trustee. Formerly the legal title held by the trustee, according as it was real or personal property, passed upon his death to his heirs or next of kin, whom equity would compel to hold the property for the benefit of the beneficiaries under the trust, but generally by modern statutes provision is made in case of the death or misconduct of a trustee for the appointment by the court of a new trustee, who acquires the title of the first trustee. Any legal person may be a *cestui que trust*, but it has been held upon somewhat unsatisfactory reasoning that trusts for the benefit of unascertained beneficiaries or for the benefit of inanimate objects were invalid, even though the trustee was able and willing to carry out the trust. This rule has been greatly modified by statute, however, thus making it possible both in England and in many of the United States to create a valid trust for indefinite beneficiaries, where the purposes of the trust are charitable. Such is the case of a gift to trustees to apply the income for the benefit of the poor of a certain parish. In general, also, all the rules governing and determining the illegality of agreements are applied by courts of equity in determining the validity of trusts.

Trusts have been classified with reference to the manner of their creation as Express, Implied, Resulting, and Constructive. (1) The express trust is one created by the intent of the person creating or declaring the trust, expressed in written or spoken language, such as the trust created by express clauses in a will or by a formal declaration of trust. (2) The term "implied trusts," which has been sometimes applied to constructive trusts, denotes trusts created by the intent of the person creating or declaring it, when his conduct or language, either written or spoken, is such that the court infers or implies the intention to create the trust. (3) Resulting trusts are trusts which are not created as a consequence of actual intention, but which courts of equity in certain instances treat as trusts intended to be created. As it is said, under certain circumstances, the intention to create a trust is presumed. Thus, if the purchaser of real estate pays the purchase price, but takes the title in the name of a third person, the courts of equity hold that a resulting trust is created in favor of the purchaser, or when one conveys property to a trustee upon a trust which fails or is illegal,

a resulting trust is deemed to be created in favor of the grantor, and in many cases when voluntary conveyances or conveyances without consideration are made a resulting trust is implied in favor of the grantor. In some States, notably New York, the rules applicable to the creation of resulting trusts have been modified by statute. (4) Constructive trusts include all those cases not included in the preceding classes in which courts of equity upon some equitable ground will compel the person having the legal title or interest in property to hold it for the benefit of another. Like resulting trusts, they differ from express and implied trusts in that they are not created as a consequence of intention of the interested parties. Thus, whenever the legal title of property has been wrongfully acquired by fraud, the person guilty of the fraud, or any person claiming under him who is not a bona-fide purchaser of the property for value, will be treated as a trustee and compelled to turn the property over to the person defrauded who is a constructive *cestui que trust*. Equity acts in a similar manner in enforcing equitable liens (q.v.) by compelling the lienee to hold the property subject to the claim of the lienor.

The so-called doctrine of tracing trust funds is a special application of the doctrine of constructive trusts. Not only will equity follow property acquired by fraud or breach of trust into the hands of any person who is not a purchaser in good faith for value, but it may compel any such constructive trustee who has disposed of the property to account for its proceeds in his hands, even though the proceeds have in time been converted into other property. As neither resulting nor constructive trusts are created by intention of the interested parties, neither is within the Statute of Frauds requiring the trust to be evidenced by writing. The trustee is, strictly speaking, the legal owner of the property, with all the rights and obligations of legal ownership, subject only to the right of the *cestui que trust* to compel with the aid of a court of equity performance of the trust. The trustee may sue and be sued with reference to the trust property without joining the *cestui que trust*. He may convey it, giving a complete legal title, although he may act in violation of the trust. With reference to the *cestui que trust*, however, he must perform completely the terms of the trust, and he cannot delegate his authority. He must act in good faith and with due care in administering his trust, and for failure to do this he must account to his *cestui*. When he has funds in hand he must keep them properly invested. In many States the investments which a trustee may make are regulated by statute or by settled practice. Aside from his fees allowed by law or specifically granted by the terms of the trust, he cannot make any gain or profit from his position as trustee. In several of the United States, notably in New York, statutes have been passed defining and generally regulating trusts and attempting to some extent to limit the doctrine of trusts as developed by the English Court of Chancery. It may be said, however, that neither by legislation nor otherwise has there been any material modification of the notion of a legal interest vested in one person and held by him for the benefit of another, the obligation to so hold the property being enforced by courts having equity powers. More changes

have been made in the direction of substituting one trustee for another with facility in case of death or misconduct of a trustee, and in providing for the accounting of trustees and regulating their acts. Breach of trust or misappropriation of trust funds was not a crime at common law. It is now generally made a crime, being punishable as one of the statutory forms of embezzlement. In New York misappropriation of trust funds falls within the statutory definition of larceny and is punishable as such.

TRUST, CHARITABLE. See CHARITABLE TRUSTS.

TRUST COMPANIES. Institutions chartered by the several States of the United States for the purpose of performing, as corporations, the general acts and assuming the general responsibilities imposed upon individuals under the law of trusts. The trust company in the United States exists in various forms, and combines with its trustee business numerous other lines of banking; as, e.g., the private savings bank business in certain States, chiefly in the West; mortgage investment in nearly all States; title guarantee and other insurance; and of recent years a general banking business similar in most respects to that of the ordinary deposit bank.

The growth and extension of trust companies in the United States has been noteworthy in the country's recent financial history. The Comptroller of the Currency, in his annual report summarizing the various banking institutions in the United States, had returns in 1898 from 246 institutions of this class, which number had on June 1, 1905, risen to 633. In 1905, according to the same report, the assets of the 633 companies aggregated \$2,865,976,479. In 1915 there were 1660 companies reporting, with assets of \$5,873,120,341. On Jan. 1, 1899, there had been incorporated in New York State 49 trust companies, having aggregate resources of \$579,205,442. In June, 1905, there were 79 such institutions in existence, with total assets of \$1,487,424,480, and in September, 1914, 81 companies with total resources of \$1,714,953,823. On Jan. 1, 1898, the deposits of the New York trust companies aggregated \$383,328,724. At the opening of 1907 their total was \$1,084,376,517. In 1914 it was \$1,404,809,646. The loan account, which amounted at the opening of 1898 to \$261,765,000, had risen in June, 1905, to \$929,640,957. In 1914 it was \$787,040,209. At the opening of 1898 investments by trust companies in stocks aggregated in New York State \$113,525,797; in June, 1905, such investments had risen to \$341,661,738. In 1914 investments in stocks and bonds aggregated \$457,774,567.

The trust companies have occupied public interest and discussion chiefly because of the exceptional increase of deposits since 1896-97—a result partly of the general practice maintained by these companies of offering interest on

deposits, which has been generally abandoned by banks in the larger cities. The trust companies in New York City offer interest on all deposits at a rate varying from 2 to 4 per cent, according to agreement as to permanency of the deposit. In addition to the amount of deposits thus attracted, the immense credit fund in the hands of the trust companies for loaning purposes has made possible the increase of their deposits, through the making of such loans, at a more rapid rate than heretofore.

The trust companies of New York State may be taken as typical in a study of the problem. The important point to notice in these companies is that the law which created them is acknowledged not to have contemplated the doing of business on precisely the lines now followed by many of the institutions. Seventeen trust companies in New York State were chartered by special act of the Legislature between 1822 and 1887. In the latter year the general trust company law was passed, which, as subsequently amended, is now the basis of authorization for the business of the 60 subsequently incorporated companies. The purpose of the law, as clearly shown in these various enactments, was to create a class of institutions which in their powers, duties, and responsibilities should be able to act as substitute for the individual trustee. The general trust company law of New York State as it now stands authorizes the companies to perform the following functions: (1) To act as the fiscal agent or transfer agent of any State, municipality, body politic, or corporation, etc. (2) To receive deposits of trust moneys, securities, and other personal property from any person or corporation, and to loan money on real or personal securities. (3) To lease, hold, purchase, and convey any and all real property necessary in the transaction of its business, or which the purposes of the corporation may require, or which it shall acquire in satisfaction or partial satisfaction of debts. (4) To act as trustee under any mortgage bond issued by any municipality, body politic, or corporation. (5) To accept trusts from and execute trusts for married women, in respect to their separate property, and to be their agent in the management of such property. (6) To act under the order or appointment of any court of record as guardian, receiver, or trustee of the estate of minors. (7) To take, accept, and execute any and all such legal trusts, duties, and powers in regard to the holding, management, and disposition of any estate, real or personal, and the rents and profits thereof, or the sale thereof, as may be granted or confided to it by any court of record, or by any person, corporation, municipality, or other authority. (8) To take, accept, and execute any and all such trusts and powers of whatever nature or description as may be conferred upon or intrusted or committed to it by any person or persons, or any body politic, corporation, or other authority. (9) To purchase, invest in, and sell stocks, bills of exchange, bonds and mortgages, and other securities. (10) To be appointed and to accept the appointment of executor or of trustee under the last will and testament, or administrator with or without the will annexed, of the estate of any deceased person, and to be appointed and to act as the committee of the estates of lunatics, idiots, persons of unsound mind, and habitual drunkards.

These functions make plain both the nature

of the trust company's business as contemplated by the legislators, and its difference from the banking business as conducted by an ordinary deposit bank. It will be observed that the act above quoted does not specifically in any place authorize the trust company to transact a general deposit banking business. But the statute does not deny such powers, and in section 8 it provides that a company incorporated under the act may accept "any and all such trusts and powers, of whatever nature or description, as may be conferred upon or intrusted or committed to it by any person or persons." This is a sufficiently sweeping proviso to cover the doing of banking business in any deposits intrusted to the company by individuals, and on that basis a great part of the trust company business as nowadays understood has been built up.

The question whether the cash deposited with the banks was a legitimate reserve for all purposes has been the bone of contention. The banks have contended that it is not and that the trust companies should be required to maintain in cash an adequate reserve. The trust companies have in general answered that the funds deposited by them with the banks, if they are properly secured by the bank's own reserve, should be a sufficient guarantee against any sudden demands by the trust companies' depositors. In the early part of 1902 this controversy became acute. At that time 27 trust companies in Greater New York used by arrangement the facilities of the New York Clearing House, for the purpose of exchanging and redeeming checks paid into them. Such checks were delivered by the trust company to a bank specified as its clearing-house agent, and by that agent were properly exchanged in the daily clearings. On April 29, 1902, the New York Clearing House adopted the following resolution: "Every institution which hereafter may be granted permission to clear through a member of this association shall be required to keep in its vaults such cash reserve to its deposits as the clearing-house committee may determine. The percentage of such reserve, however, is not to exceed that required of banks, members of the Clearing House Association." The rule did not apply to any of the numerous trust companies at that time actually using the clearing-house facilities. A year later, on Feb. 8, 1903, the following more drastic resolution was adopted by the clearing house: "Every nonmember institution (not a bank required by law to maintain a specified reserve) now or hereafter sending its exchanges through a member of the association shall on and after June 1, 1903, keep in its vaults a cash reserve equal to 5 per cent of its deposits; and on and after Feb. 1, 1904, such cash reserve shall be at least $7\frac{1}{2}$ per cent of its deposits, and on and after June 1, 1904, such cash reserve shall be such percentage as shall from time to time be fixed by the clearing-house committee, but not less than 10 nor more than 15 per cent of its deposits. The reserve hereby required shall be an average reserve as against the average deposits as shown upon its weekly statements."

A vigorous controversy arose as to whether the trust companies should submit to this regulation. It was pointed out that for many of them the clearing-house facilities were not indispensable, and that they could arrange individually for the redemption of checks paid in to them. On the basis of this reasoning 10 trust

companies, including several of the largest institutions of the kind in New York City, formally withdrew from the clearing house. Those which remained, numbering 17, acceded to the clearing-house rule and began to build up a cash reserve in accordance with its requirements.

TRUSTEE. A person, natural or artificial, acting in a fiduciary capacity towards property, the beneficial ownership of which is in another, generally called the *cestui que trust*. See **TRUST** and authorities there referred to.

TRUSTEE PROCESS. A legal process used in Massachusetts and several other New England States, corresponding to the garnishee process in use in most jurisdictions. In New York there are two methods by which a judgment creditor may reach the income of a beneficiary under a trust: by use of the usual garnishee process which is made expressly applicable to this situation, but by which only a small percentage of the income may be taken; and by a creditor's bill to apply surplus income to the satisfaction of the judgment, i.e., so much of the income as is not necessary for the living expenses of the beneficiary according to his station in life. See **ATTACHMENT** and **GARNISHMENT**, and consult the authorities there referred to.

TRUST-FUND DOCTRINE. A theory adopted at one time by the courts of the United States. This doctrine regarded the entire capital stock of a corporation as a trust fund, held by the directors of the same for the benefit of creditors of the corporation. Based upon this doctrine numerous decisions both of the United States courts and of almost all the State courts in the Union were written which held that unpaid stock subscriptions could not be evaded by the execution of releases by the original subscribers or by cancellation by the corporation itself or by a transfer to third persons made for the purpose of evading payment. Under these decisions corporation creditors could recover the difference between the actual value of property transferred to a corporation in return for stock and the par value of the stock which the corporation issued for the property, which stock is generally referred to as watered. Other results of the application of this theory were the prohibition of a corporation employing its own capital for the purchase of outstanding shares of its capital stock and the illegality of paying dividends out of its capital stock.

The extremes to which this theory was carried in its application to corporation finance eventually brought about a limitation of the doctrine. In 1893 the Supreme Court of the United States questioned its soundness and decided that if the capital stock constituted a trust fund at all, it could be regarded as such only after the corporation had become insolvent and jurisdiction

of its assets had been acquired by the courts through receiverships. In the administration of the bankrupt corporation's estate the application of the doctrine was reaffirmed.

The law as to stock subscriptions, watered stock, the purchase by the corporation of its own stock and payment of dividends out of capital remains as it was before the doctrine was criticized. The only effect which the judicial change of attitude towards the original doctrine has had is that the basis of the reasoning arriving at the same conclusions has been shifted from the concept of trust relationship.

The consideration underlying the decisions which have practically nullified the effects of the trust theory is that a corporation, as an entity entirely distinct from its stockholders, holds its property absolutely and that its title cannot be qualified by the actions of these individual stockholders or creditors. The principle of corporate ownership requires that equitable or trust rights should not encumber its possession and disposition of corporate property. However, upon insolvency, the rights of creditors require the application of the trust doctrine to a limited extent in the administration of its estate after possession by the courts. See EQUITY and the authorities there referred to. See also TRUSTS.

TRUSTS. The word "trusts" in this article is used of large corporations or associations of corporations or of individuals mostly engaged in manufacturing, which possess sufficient power to fix the prices of their products, in part at least, on the principle of monopoly. It does not include railways or combinations of railways, or trusts in the technically legal sense.

Industrial Conditions Leading to Formation of Trusts. The trusts are a late development, since, until late in the nineteenth century, industrial conditions were not favorable for their formation. In earlier times organizations possessing monopolistic power were either created by law or secured their power through the possession of some natural advantage, such as the exclusive possession of certain natural resources, as mines, etc., or through the advantage which comes from the exclusive occupancy of positions of advantage in doing their work—railroads, telegraphs, etc. In the modern trust we often find combined with the advantages of great capital and perfected business organization also some of these natural advantages, but they are not the essence of the trust advantage. The chief causes, from the industrial point of view, which have led to the organization of trusts are: (1) The existence of competition which was practically ruinous in its nature, brought about in part by the ease of intercourse between persons in different localities and by the difficulty of withdrawing readily capital once invested in fixed plants. Such competition almost of necessity at times will become so fierce that all parties concerned will fail of making any profit. (2) The possibility of saving industrially many of the wastes which come from the competitive system, provided the interests of the various competitors are harmonized. Without discussing in detail these wastes of competition, there may properly be mentioned the salaries of traveling salesmen, the expense of keeping up expensive show windows, the cost of competitive advertising, the loss from undue extension of credits, the loss of custom which comes from

carrying only a partial instead of a complete stock, the loss from the payment of cross freights, the loss from running manufacturing plants to only part of their capacity or part of the time. There may be mentioned also as a gain from combination the saving from standardizing the machinery and from prevention of the waste of time due to stopping and changing machinery, the saving from the most efficient organization of laborers and from managing all plants in an enterprise by the most skillful men instead of having part of them directed by men of meagre ability, the certainty of a regular supply of raw material, and the most efficient use of by-products.

Other Influences as Causes. Aside from the industrial conditions that have led to the organization of trusts, certain other influences are to be noted: (1) The promoters of the large enterprises have in many cases succeeded in making very large profits from the organization. Likewise the financiers who have underwritten the stock have been able to exact very large payment for the risks which they have taken. The immediate personal interest of the promoter and financier has thus been a very powerful factor—sometimes even the most powerful factor—in bringing about the combinations. (2) Governmental favors of various kinds have sometimes tended in the same direction. Although the protective tariff can scarcely be mentioned as a direct cause of the organization of industrial combinations, it is doubtless true that when an industry which otherwise would not have prospered has been first made very profitable by a protective tariff, so that numerous rival establishments have invested large sums of money in it, the consequent rivalry has led to the formation of combinations. It is also probable that in certain instances the protective tariff, by lessening foreign competition, has promised to the promoters of a combination the opportunity for greater profits than could have been anticipated without the existence of the tariff. In this indirect way, therefore, we may well consider the legislative favor of the protective tariff under certain circumstances as an indirect cause of the trust. Similarly the monopoly granted by the patent laws, by copyrights, by trade-marks, and other legislative benefits has led to the organization of some of the great combinations.

Extent of Combination Movement. According to the *Report on Manufactures* of the census of 1900 there were in the United States 185 combinations with 2040 plants. The total capitalization was \$1,436,625,910. The total cost of materials used was \$1,089,666,334 and the value of the products \$1,667,350,949. The total gross value of all manufactured products enumerated in the census was \$13,004,400,143. For the purpose of comparison there should be subtracted from this total the value of the products of the hand trades or the mechanical and neighborhood industries, since these are not adaptable to the form of management known as the industrial combination. There remains a total gross product of industries susceptible of combination into trusts of \$11,820,784,665. Comparing this with the product of the industrial combinations, it seems that in 1900 the trusts produced nearly 14.1 per cent of the total gross product of the manufacturing industries of the country, as enumerated by the census.

Between 1900 and 1907 occurred a much more powerful movement towards concentration than any that had appeared earlier, and, although the movement was checked by the crisis of 1907-08, it would still appear that the volume of consolidated industry and its proportionate share in the manufacture of the country have increased. But in consequence of the doubt cast upon the legality of the various forms under which trusts are organized and the adverse decisions in the Standard Oil and Tobacco Trust cases, it was deemed impossible in later censuses to secure figures on combinations. Unofficial estimates, moreover, are of no value because of the discrepancies among authorities as to the forms of organization to be included.

Monopoly Character of the Trusts. Many of the trusts are closely connected with natural monopolies which give them a decided advantage over their competitors. It is well known that the Standard Oil combination in its earlier days derived great advantage from the special rebates which it received from the railroads. There is also reason to believe that many other of the later combinations received somewhat similar favors. Ownership of pipe lines also played an important part in building up the power of the Standard Oil Company. The United States Steel Corporation, as well as some of its constituent companies, has made it evident that one of the great advantages possessed by these organizations is the ownership of mines from which they derive a large part of their raw material. Through this ownership of a large percentage of all the available raw material in the country they are able to put their rivals at a decided disadvantage. Certain trusts also may in certain localities control so large a percentage of the raw material that they may readily crush their rivals in those localities, as, e.g., the salt combination in its control of salt wells and mines. The extent to which a trust therefore may in itself be a monopoly depends often to a great degree upon the extent to which it has a monopoly of the raw material of the industry which it seeks to control. The effects of the trusts upon prices and their legal and social status in the community may in many cases depend upon this one factor.

Promoting and Financing. If, as is often the case, the promoter organizes a new company to take over the various plants which he is intending to combine under one management, or to develop some new patent, it has been the common practice for him to issue stock far beyond the actual cash value of the plants under consideration; then to pay for these plants with as much of the stock of the new company as was necessary to secure them, retaining the balance for his own services. In other cases, when the company is organized, the distribution of the stock among the different parties in interest is agreed upon jointly, and the promoter receives a certain percentage of the entire amount as his reward. Inasmuch as he in many cases takes considerable risk, and as the success of the enterprise is practically due largely if not entirely to his initiative, it has at times been possible for him to secure for his reward as high as 20 per cent of the capital of the organization, paid to him in common stock. With such large rewards as are often hoped for and sometimes obtained, it is evident that the interest of the promoter may become a very direct cause for the formation of the trusts.

Scarcely less prominent than the promoter in this regard is the financier. When either a new enterprise is to be started or a combination of existing establishments is to be made, it is usually necessary to raise a considerable amount in cash in order that the new institution may start with capital in hand. Frequently also many of the plants purchased need to be paid for in cash. The stock of the new company is ordinarily the source from which it is desired that such cash should come. Inasmuch, however, as the general public is not likely to take the stock immediately and pay for it in cash, it is desirable that some one be found who will underwrite it, i.e., who will take the stock and agree to furnish in exchange therefor an agreed-upon sum in cash at a certain fixed date in the future. For this service, so speculative in its nature, the financier ordinarily demands and frequently receives very high compensation. In certain instances, which were cited before the United States Industrial Commission, for each \$100,000 in cash furnished, the promoter received \$150,000 in common stock, while the underwriter, the capitalist, received \$150,000 of common stock and in addition thereto \$100,000 in preferred.

Capitalization and Overcapitalization. In the trusts organized especially around the year 1900 excessive capitalization was a prominent feature. At that time both the economies of consolidation and the possibilities of monopoly profit were greatly overestimated by the investing public. Thus, the Carnegie Company, having in 1899 assets valued at \$75,000,000, was taken by the promoters of the Steel Corporation at a valuation of \$492,000,000. Other properties taken by the corporation presented a still wider discrepancy between independent valuation and valuation for purposes of consolidation. Yet the Steel Corporation was, on the whole, one of the more conservatively capitalized corporations of that era.

The disadvantages of excessive capitalization appear to have fallen chiefly to the unwary investor. Quite conceivably a corporation heavily overcapitalized will take a shortsighted view of market possibilities and charge excessive prices in order to pay dividends. But the weight of opinion appears to be that capitalization policy has had very little to do with price policy. Prices have been kept at a high level or have remained at a low level according to estimates of what the traffic would bear.

The abler trust managers have regarded overcapitalization as a weakness and have pursued a policy of "squeezing out water" by putting profits back into the corporation without increase in capital. Thus the Steel Corporation, which in 1902 had water in its stock to the extent of \$625,000,000, had by 1910 reinvested surplus profits to such an extent as to reduce water to \$281,000,000. The practice has been continued, and by 1916 the water had practically disappeared.

Forms of Organization and Management. While the form of organization of the trust may often not have any material effect upon its economic influence, it is still very frequently true that the form is determined to a considerable extent by the legal institutions of the country, and sometimes the form of organization is of significance not merely from the legal point of view, but also from the economic. In the eighties and nineties of the last century, when

the pressure of competition arising from the large amount of capital for investment in the United States had tended to lessen the profits of manufactures, the first effort to lessen this competition naturally resulted in agreements upon prices or in agreements among different manufacturers to divide the selling territory among themselves, or in some other similar form of agreement which left to each establishment complete autonomy as regards its own management, but which brought about some form of an alliance to lessen the competition. Such agreements were usually and more or less accurately called pools. (See POOLING.) This form of agreement (Kartell) is the usual form of agreement in Germany, where the courts uphold such contracts. In recent years the German government has even taken an active part in encouraging the formation of Kartells. The potash Kartell, e.g., was formed under government pressure and its export policy largely determined by government. In Austria similar conditions obtain. The sugar Kartell is essentially a quasi-public institution. In the United States, on the other hand, the courts have very generally held that such agreements were in unreasonable restraint of trade, and in consequence void, as contrary to public policy. The parties to the pools therefore, knowing that they could not be legally bound, frequently violated the terms of the agreements by increasing their output beyond the amount agreed upon, by cutting prices, and by other similar means. To overcome these difficulties the form of the trust was at length invented and put in practice—in the first place by the Standard Oil Company in 1882. Under this form of organization the stockholders of each of the separate companies assigned their stock to a few trustees, giving thus an irrevocable power of attorney. In lieu of the stock assigned the trustees issued trust certificates to the stockholders of the separate companies, and upon these trust certificates profits were divided. All of the earnings from the different members of the company were pooled, and each manufacturer received his due share as evidenced by the certificates regardless of the question whether his establishment were running or closed. The trustees, having in their hands the voting power of all the stockholders, elected whatever persons seemed to them best as officers of the separate companies. In this way the management was absolutely unified and the interests of all parties concerned became one. The courts finally holding that this trust agreement was illegal, the plan was later adopted of organizing a new company which should buy up all of the separate plants of the different companies entering the combination, so that in this way a unified management was secured that was believed to be within the law.

In order that a more convenient form of handling the properties of the different companies might be secured, and that under certain circumstances somewhat greater flexibility of management could be attained, a third form of organization was later adopted which was in many respects quite like that of the earlier trusts. In this form a new company was organized as a stockholding company. This company then bought up all or a large proportion of the stocks of each of the companies coming into the organization, and held these stocks. The officers of the central organization were thus

in a position, by voting the stocks of the different companies, to elect the directors and officers of those companies and thus control their policy. By the decisions of the Supreme Court in the Standard Oil Case (May 15, 1911) and the Tobacco Trust Case (May 29, 1911), the power of the government to dissolve such forms of organization was established. The form, nevertheless, is employed by most existing trusts, but only in default of action by the Department of Justice.

Prices. Competitive prices, it is frequently assumed, will in the long run be fixed mainly by the cost of production of that part of the stock which is produced at the greatest disadvantage. Monopoly price, on the other hand, is fixed at that point which will secure to the monopolist the greatest net return. If greater return will be secured by lowering the price and increasing the sales, the price will be lowered. If the net returns will be greater by increasing the price, even though the number of sales be lessened, that policy will be adopted. In technical discussions regarding prices the assumption is usually made of either a régime of free competition or of what is substantially monopoly. In a practical discussion of the effects of trusts upon prices we must recognize that there may be certain monopolistic powers which may enable prices to be raised somewhat above the competitive rate, but which are still not sufficient to enable the trust to fix prices entirely regardless of a potential competition. So, also, this monopolistic power may vary in degree in different industries or in the same industry at different times.

If the economies of industrial combination spoken of before are great, it is evident that without lessening profits prices of the finished product might be placed somewhat lower than those under the competitive régime, or prices of the raw materials used might be raised above those prevailing under the competitive régime without lessening profits. We see, therefore, that it is within the power of the managers of the trusts, provided the trust has been carefully organized in an industry adapted for combination to put prices below the competitive rates in order to drive out competitors, and then if they have secured monopolistic power thereby, to put prices, within certain limits at any rate, above competitive rates.

Whatever may be the theoretic possibilities, however, under the trust system, it is essential to note what has in fact been the result, inasmuch as, in addition to the technical economic powers that have been suggested, the psychological factors of public opinion, of demands of laborers, of the boldness of the managers, etc., may all enter into the problem as factors in price determination. It is impossible to make any valid general statement as to the effect of trusts upon prices. In some cases they have raised prices and in other cases have reduced them. While the trust was still comparatively new the Industrial Commission proved conclusively that in many cases the margin between the price of finished product and the cost of raw material had been raised—a fact indicating that profits had been increased at the expense of either the consumer or the producer of raw materials. But in their later history many of the trusts appear to have become more moderate in their price policy. Possibly on account of their strengthened financial position through the

accumulation of reserves, they have taken a broader view of the possibilities of developing markets. It is certain that the fears generally entertained in the early years of the twentieth century of monopolistic extortion have not been justified by experience.

Wages. As indicated in the discussion on prices, so far as the trusts really make savings through their new method of organization, they have a surplus fund which could be used in some way. The United States Steel Corporation raised the average wages of its employees nearly 20 per cent in the 10 years 1902-11. The Standard Oil Company has usually pursued a policy of liberal wages, and the same thing is true of many of the other strong consolidations. It is, however, to be borne in mind that these great aggregations of capital have it in their power to play one body of workers against another, and so of fixing wages and conditions of employment more or less arbitrarily. The Steel Corporation has never recognized unionism, and is generally believed to exert its power to prevent the rise of labor organizations.

Social Effects. It has often been charged that the great corporations and trusts exert a corrupting influence upon legislatures and the courts. It is probable that in individual cases this charge is true. On the other hand, legislatures have not been free from such charges under the competitive system, and it probably would be difficult to prove absolutely that conditions are worse now than they were before the great industrial corporations were formed. The remedy for such an evil would seem to be chiefly in improving the character of our legislatures.

A more significant consideration is whether the trust, by bringing so many individuals under one centralized management, destroys to any material extent the powers of self-reliance and of self-direction on the part of individuals which are naturally developed by the struggles of the competitive system. Opinions differ to a considerable extent on this subject, but there can be no doubt that, although the opportunities for a man to start an independent business in certain lines of industry are lessened, on the other hand the competition for promotion and for positions of responsibility within the combination itself is severer in the case of the great corporation than in the case of the private business or partnership. When a group of two or three partners are managing a business, they may readily give preference to their sons or friends even when the business ability of such persons is not of the highest type. When the interests of thousands of stockholders must be considered, and there are large boards of directors, each feeling that his position depends to a considerable extent upon the success of the business, favoritism cannot be shown to any very great extent.

Legal Position. When a trust or combination is organized, its rights and powers are determined by the ordinary rules of common and statute law applicable to the particular form of organization adopted. That is, if the combination is a trust, its rights and powers are determined by the ordinary rules of law governing trusts; or if the combination is effected by one of the methods of corporate combination, its rights and powers are determined by the general law of corporations. Aside from these questions of the methods of organizing combina-

tions, the trusts raise no peculiar legal issues except that as to their legality when organized.

In ascertaining whether a combination is unlawful at common law, it should be remembered that the mere combination or coöperation of several individuals is not in itself unlawful, and in the case of partnerships and corporations combination of individuals is encouraged by the law. Combination by corporations, however, as has already been indicated, when not authorized by statute, may be such an abandonment or misuse of their corporate franchises as to be illegal under the general law of corporations. In general it may be said that combinations are unlawful per se only when the purpose of the combination is unlawful or against public policy, or when the means adopted by the combination for effecting its purposes are unlawful or against public policy.

The grounds upon which combinations have been held to be unlawful at common law may be somewhat roughly classified as follows: (1) That the contract (when the combination has been effected by contract) is illegal and void at common law because in restraint of trade. (2) That the combination is an unlawful conspiracy, either civil or criminal. (See CONSPIRACY.) Technically the second class includes the first, since there can be no combination without two or more parties to it who are technically guilty of conspiracy where the purpose is to enter into an illegal contract. Since, however, each is recognized as a distinct ground for declaring combinations illegal, the classification may be adopted as both convenient and practical. In the Standard Oil Case the Supreme Court held that the intent of the Anti-Trust Law was to prohibit monopolization, or attempts at monopoly, of interstate or foreign trade, and that the powers of the court under the law were broad enough to reach such monopolization under whatever form it might assume. For a full discussion of the legal doctrines relating to restraint of trade and conspiracy, reference should be made to those topics. (See also MONOPOLY; ENGROSSING; FORESTALLING; REGRATING.) With reference to conspiracy, it may be said that combinations are conspiracies, and therefore unlawful, when the purpose of the agreement or combination is either to do something unlawful or to do something lawful in an unlawful manner. In general, combinations are held to be illegal because of their purposes and methods when they restrain fair competition or create oppressive monopolies.

At common law the remedies of individuals against acts of illegal combination are limited to the recovery of any damage suffered because of the unlawful conspiracy involved in the combination or to the securing of an injunction restraining those joined in the combination from doing some threatened injury to the plaintiff. In either case it is necessary for the plaintiff to show actual damage suffered by him or that the defendant threatened to do some act causing such damage. When the combination is in the corporate form and is acting outside its corporate powers, or its constituent corporations have ceased to act as separate corporations so as to amount to an abandonment of their charters, the State may proceed against the corporate combination or any of the constituent corporations to compel a forfeiture of its charter by quo warranto. There is, however, no other method at common law by which either

the State or a private individual could proceed against a combination on the ground that it is illegal and is working a public injury. As a result of agitation upon the subject of trusts, almost all of the United States have adopted statutes or clauses in their State constitutions restraining or prohibiting all contracts, agreements, undertakings, or combinations in restraint of trade or tending to create monopolies, whether such restraint would have been unlawful at common law or not. In general the courts have held that these statutes are constitutional under both State and Federal constitutions, and not in violation of the constitutional provisions against abridging the freedom of contract, depriving citizens of liberty or property without due process of law, or denying them equal protection of the laws. In the interpretation of these statutes, however, the courts have justly regarded them as an innovation upon the common law to be interpreted with strictness and caution. Moreover, the difficulty of giving such legislation its proper effect without making it subversive of established rights of property has to some extent prevented all these restraining acts from having the effect intended. It may be said that the principal test to be applied in determining whether statutes of this class are violated is whether the act or agreement complained of was done with intent to control prices or whether such would be a natural result of the act or agreement. They usually provide that contracts made in connection with such an act or agreement shall be void, and attach penalties for their violation. In some States parties injured by such violations of anti-monopoly statutes are given rights of action to recover damages for the injury suffered.

A far more effective agency for restricting the growth of monopoly is the exercise of the power of the several States to control all corporate enterprises within their respective territories. A State may grant to a corporation its charter and power to do business upon such terms as the Legislature may choose, and it is also within the constitutional power of a State to impose any terms, however exacting, as a condition to which corporations created under the laws of other States must conform if doing business within its limits, provided such conditions do not interfere with interstate commerce, the power of regulation and control of which is by the United States Constitution lodged with the Federal government.

A State may thus limit the amount of capital of a corporation organized under its laws; and it may by its charter or general laws existing at the time of its creation limit or regulate its business. In the same manner a State may impose similar or even additional conditions upon all foreign corporations wishing to do business that is not interstate commerce within the State. In this connection, however, it should be remembered that the charter or other legislative authority to a corporation to do business once granted is deemed to be a contract, and that the State is forbidden by the United States Constitution to impair the obligation of contract. See *CORPORATION; CHARTER; DARTMOUTH COLLEGE CASE*.

It will be seen that the powers of restriction just referred to are limited to corporations and have no application to natural persons or partnerships. The important above-mentioned limitations upon the power of the States to control

corporations, coupled with the fact that it has been the policy of many of the States to grant to corporations organized under their laws practically unlimited power, have in effect seriously interfered with any effective statutory restriction of monopolies by the several States.

The Federal government may to some extent restrain monopoly under cover of its constitutional power to regulate interstate and international commerce. Its power in this respect has been deemed to be practically absolute. It cannot, however, be said at this time that the power of Congress to control or restrain the business of individuals, or corporations, by enactments that are not intended primarily for the purpose of controlling or regulating interstate commerce, but for the purpose of restricting, or making unlawful, or assuming control over, a business which is lawful and unrestricted in the several States, is without limitation, since that question has not been definitely and finally determined by the Supreme Court of the United States. Acting under its power to regulate commerce, Congress in 1887 enacted the Interstate Commerce Act, having for its purpose the control and regulation of business carried on by common carriers engaged in interstate commerce. Its particular object was the prevention of unlawful discrimination in rates by common carriers engaged in interstate commerce, which had contributed in a large degree to the growth of monopolistic enterprises. This was followed in 1890 by a statute for the protection of interstate and international trade, commonly known as the Sherman Act (26 United States Statutes at Large, 209).

This statute provides that all contracts, combinations in form of trusts or otherwise, or conspiracies in restraint of interstate or international commerce are illegal, and that all persons participating in such agreement, combination, or conspiracy are guilty of a misdemeanor and subject to a penalty for violation of the act. The statute also provides that all goods in transportation in violation of the act may be seized, and their forfeiture compelled by a proceeding brought in behalf of the government, and that proceeding may be brought by the Attorney-General enjoining all acts in violation of the statute and for the dissolution of contracts entered into in violation of it.

It has been held by the courts that this act does not apply to monopolies created and authorized by a State, but that it is intended to apply to all direct restraints of trade by individuals or corporations, whether such restraints would have been deemed reasonable or unreasonable at common law. The restraint or monopoly need not be complete. The statute is violated if the contract or combination tends to such monopoly. As a consequence of a general belief in the inefficiency of the Sherman Law to cope with the trusts, two complementary measures were enacted in 1914, known as the Clayton Law and the Federal Trade Commission Act. The Clayton Law is chiefly significant because it prohibits various practices, such as price cutting and tying contracts, which appear by economic analysis to facilitate the destruction of competition by the consolidated concern. The Federal trade Commission Law created a commission, more or less after the pattern of the Interstate Commerce Commission, with powers of investigation and with extensive authority to prohibit all forms of unfair competition.

Antitrust laws were enacted by Kansas, Maine, and Michigan in 1889. Other States soon enacted similar measures, and at present some 30 States have laws prohibiting combinations in the form of trusts. In some States, as, e.g., in Ohio and Missouri, these laws are very sweeping. In the latter State persons or corporations convicted under the law are deprived of the right to use the State courts in the collection of debts. Such State laws have, of course, no application to the acts of a single corporation, and, as most trusts are organized under that form, are of limited efficacy. In a number of cases the State courts have, after long-continued prosecutions, succeeded in proving the existence of unlawful combinations. Thus in 1906 the Attorney-General of the State of Missouri was successful in compelling the president of the Standard Oil Company to admit that that company controlled certain concerns doing business in the State of Missouri, apparently in competition with the Standard Oil Company. While existing as quasi-independent corporations under the control of the Standard Oil Company, these concerns were operating in violation of the Missouri Antitrust Law, but no such violation would appear when they openly became constituent parts of the Standard Oil Company. In 1909 the Texas courts succeeded in convicting the Waters Pierce Oil Company, as a subsidiary of the Standard Oil Company, of violation of the State antitrust law and forced the dissolution of the company under the then existing form. The principal effect of such State laws is to bring about changes in the form, but not in the essential features, of so-called trusts.

It is of course possible for a State to exclude from business within its boundaries a corporation chartered in another State; but since no State can prevent the shipping of the goods of such a corporation across its boundaries, the advantage of such exclusion is illusory.

In 1905 an attempt was made by the State of Kansas to prevent the Standard Oil Company from controlling the output of the Kansas oil fields. Three laws were enacted, one declaring pipe lines common carriers—a principle introduced into Federal law by the amended Interstate Commerce Act of 1906—a second prohibiting discriminations on pipe lines and railways, and a third providing for establishing a branch penitentiary in the oil fields, to be used in refining oil. The last measure was subsequently declared unconstitutional by the State Supreme Court. Proceedings to oust the Standard Oil Company from the State under the State antitrust laws were instituted, but were eventually dropped.

In 1913 the Legislature of New Jersey passed seven corporation bills, known as the seven sisters, which had the hearty indorsement of Woodrow Wilson, then Governor of the State. New Jersey had long been known not only for its tolerance of monopolistic corporations, but for laws which offered inducements to them. The result was that many great trusts, against which New York State had legislated, moved across the Hudson and took out incorporation papers in New Jersey. At the beginning of 1913 the corporations incorporated in that State were capitalized at \$7,861,499,369. Of course no contemplated measure could be retroactive, and Governor Wilson said: "Every established business can go on without interruption as heretofore, but cannot hereafter expand by the acquisition of the stocks and bonds of other corporations for the purpose of controlling them, and no corporation can in the future be organized to take over, hold, or control other corporations." (New Jersey had been distinguished for the number of its "holding" companies.) The bills passed in 1913 endeavored to fix personal responsibility for the violation of the law upon the directors of offending corporations, and provided that violation should constitute a misdemeanor, i.e., be punishable by imprisonment not exceeding three years or a fine not exceeding \$1000, or both. It was sought thus to overcome the difficulty that had been encountered when a trust sheltered itself by the plea that it was not a person, could not do wrong, and could not be punished.

The English government has gone no further in the way of antimonopoly legislation than the old provisions of the common law against monopoly and the somewhat rigid provisions of their corporation act regarding publicity in the promotion and management of companies.

In France the status of the law seems not to be definitely fixed, for although there are statutes existing against combinations to influence prices, and although there have been certain successful prosecutions under this law, notably in the case of the Copper Syndicate, still industrial combinations in the form of joint selling bureaus do exist without apparent legal opposition.

In Germany, contracts for fixing prices, controlling output, or in other ways tending towards the prevention of destructive competition have been upheld by the courts as reasonable, and the restriction of such combinations is apparently limited to those that can be shown to be contrary to public policy. In Austria the government has made efforts to put the combinations under somewhat more rigid supervision, especially for financial reasons, but although there has been considerable feeling against the trusts, as yet comparatively little has been done by either the legislature or the courts, and some very strong combinations have been in existence there for several years. Both in Austria and in Germany, however, government commissions have been studying the subject with reference to further legislation, and, so far as their recommendations go, the inclination is to recognize the combinations as proper, provided they place themselves sufficiently under government supervision and conduct their business so that it will not be considered by the government officials as contrary to public policy.

TRUXILLO, trōō-hēl'yō. See **TRUJILLO**.

TRUXTUN, THOMAS (1755-1822). An American naval officer, born at Jamaica, L. I. Going to sea at the age of 12, he was first an apprentice on an English packet, was subsequently impressed for service on an English frigate, and finally entered the merchant marine. Coming to Philadelphia late in 1775, he was made captain of the *Congress*, the first American privateer sent out during the Revolution. In command successively of this vessel, the *Independence*, the *Andrew Caldwell*, the *Mars*, the *St. James*, and the *Commerce*, he captured numerous prizes, and overcame many vessels more powerful than his own. After engaging for a time in the East Indian service, he was appointed captain in the newly organized United States navy, 1795, and was put in command of the *Constellation*. On Feb. 9, 1799, during the short naval war with France, he captured, with the loss of only two killed and three wounded, the French frigate *Insurgente*. In the following year (February 1) he likewise defeated the *Vengeance*, which, however, after surrendering, managed to escape. The French loss in killed and wounded was 160, the American 39. Subsequently he was put in command of the West India squadron with the rank of commodore. Retiring from the navy in 1802, he lived for a time in New Jersey, and then removed to Philadelphia, where he was sheriff, 1819-1821. He published *Remarks, Instructions, and Examples Relating to Latitude and Longitude, also the Variation of the Compass* (1794). Consult Barnes, *Naval Actions of the War of 1812* (New York, 1896).

TRYON, trē'ōn', CHARLES FORBES DE. See **MONTELEMBERT**, COUNT.

TRYON, DWIGHT WILLIAM (1849-1925). An American landscape painter. He was born in Hartford, Conn., and studied under C. Daubigny, Jacquesson de la Chevreuse, and Guillemet in Paris. Upon his return to the United States he became director of the Hartford School of Art in 1886, later professor of art at Smith College, Northampton, Mass., and finally settled in New York City, spending his summers in Massachusetts. His New England landscapes, simple in composition and somewhat

restricted in subject, but with a very personal and poetic interpretation, are frequently shimmering misty effects, with delicate color and fine tonalities. Good examples of his works are to be found in all the important public collections in America, including 27 oil paintings and several water colors and pastels in the Freer collection (National Gallery, Washington), and a "Moonlight" in the Metropolitan Museum, New York. Among numerous prizes he received gold medals from the American Art Association (1886, 1887), at Munich (1892), the Carnegie Institute, Pittsburgh (1898), Buffalo (1901), and St. Louis (1904), and a silver medal at San Francisco (1915). In 1891 he was elected a member of the National Academy of Design.

TRYON, Sir GEORGE (1832-93). An English admiral, born at Bulwick Park, Northamptonshire. He was educated at Eton, and entered the navy in 1848. In 1860 he was promoted to commander, and in 1866 to captain. In the following year he showed considerable talent for organization and foresight as director of transports for the Abyssinian expedition. In 1874-77 he was in command of a ship in the flying squadron, and from that time till 1887 served with the Mediterranean fleet. In 1884 he became rear admiral, and in 1889 vice admiral. His appointment in 1891 to the command of the Mediterranean station was a popular one, but there on June 22, 1893, off Tripoli, he was responsible for one of the most terrible naval accidents of modern times. During some manœuvres he ordered the battleships *Camperdown* and *Victoria*, which were proceeding in parallel lines, to turn inward, thus causing the former to ram and sink the latter with great loss of life. He went down with the *Victoria*. Consult C. C. Penrose-Fitzgerald, *Life* (London, 1897).

TRYON, THOMAS (1634-1703). An English zealot, known as the Pythagorean. He was born near Cirencester in Gloucestershire, England. He was taken from school before he had learned to read and put to spinning and carding (1643-46), and thereafter till his eighteenth year he tended his father's sheep. He then drifted to London and joined the Anabaptists, but afterward renounced their doctrines, through the influence of the mystical writings of Jakob Böhme (q.v.). At the age of 48 he began a long series of pamphlets, in which he recommended for drink only water, and for food only bread and fruit, with some liberty in the use of butter and cheese. His book on this theme is known as *The Way to Health* (1691), published originally in 1682 as *Health's Grand Preservative*. It may be said by the way that Benjamin Franklin, in his youth, was much impressed by *The Way to Health*, and for a time became a Tryonist.

TRYON, WILLIAM (c.1725-88). A British colonial governor, born in Ireland. He secured a commission as captain in the British army in 1751, and became lieutenant colonel in 1758. Through his marriage to Miss Wake, a relative of the Earl of Hillsborough, First Commissioner of Trade and Plantations, he was appointed Lieutenant-Governor of North Carolina, June 27, 1764, and succeeded to the governorship, July 20, 1765. Between 1767 and 1771 occurred the insurrection of the Regulators (q.v.), which he suppressed with severity. In July, 1771, he was transferred to New York, where he greatly strengthened the militia. He made a

large grant of land to King's College (Columbia). He visited England in 1774, and on his return in June, 1775, found the Colony in rebellion. In October he took refuge on shipboard and remained in the harbor until Howe's entry in September, 1776. In 1777 he took active command of some Loyalist troops, and in June, 1778, was promoted major general in America. In 1780 he made a raid into Connecticut. During the winter of 1779-80 he was in command of the New York District, but returned to England in 1780, and was promoted to the rank of lieutenant general in November, 1782.

TRYPANOSOMIASIS. See SLEEPING SICKNESS.

TRYP'SIN (from Gk. *τρυειν*, *tryein*, to rub). One of the ferments or enzymes found in the pancreatic juice. Its action is proteolytic, i.e., it acts on the proteids, converting them into peptones. It is most active in an alkaline medium. About 1906 trypsin enjoyed a brief vogue as a cure for cancer, but it was soon discarded. It has also been used in tuberculosis, and as a spray to dissolve the membrane in diphtheritic croup. See DIGESTION, ORGANS AND PROCESS OF, in *Man*; ENZYME.

TRY'SA (Lat., from Gk. *Τρύσα*, now called *Geul-Bashi*). An ancient town, situated on a plateau (2475 feet high) in southern Lycia, a short distance west of Myra. The site is of interest only from the Heroön erected near the end of the fifth century B.C. by a native prince. This is a quadrangular inclosure about 60 by 75 feet, with a door in the south wall. In the northeast corner stood the large sarcophagus, and in the southeast the small booths for the guard and the funeral feasts. The importance of the monument is in its sculptured decorations. Around the inner wall near the top are two rows of sculptured frieze, and a similar decoration adorns the outside of the south wall. Only the sculptures, around the door show any trace of Oriental influence; the rest are evidently derived from good Greek models. On the outside are represented the expedition of the Seven against Thebes, a battle between Greeks and Trojans on the right of the door, and on the left battles of the Greeks with Amazons and centaurs. Inside, on the south wall, on the right are Odysseus slaying the suitors and the Calydonian Hunt, on the left a banquet and dance of youths and maidens. On the east wall can be traced the deeds of Theseus, a battle with centaurs, and a banquet. The north wall contains the Dioscuri carrying away the daughters of Leucippus, a hunting scene, and the conflict of the Lapithæ and centaurs. The west wall contains the battle of Greeks and Trojans between the city and the ships, the storming of the city of Troy, and the battle of Achilles with the Amazon. Apparently the artist was influenced by the great painters of the fifth century. The ruins were excavated between 1881 and 1883 by an Austrian expedition, and the sculptures brought to Vienna. Consult Benndorf and Niemann, *Das Heroön von Gjölbashi-Trysa* (Vienna, 1889).

TS' AIDAM, or **CH' AIDAM**, *chí'däm*. See TIBET.

TSAI-FENG, *tsí'füng'* (PRINCE CHUN) (?-). A Chinese prince regent, brother of Kwang-sü (q.v.) and father of Pu-yi (Hsuan-tung, q.v.), the tenth and last Manchu Emperor of China. He was sent to Germany in 1901 as China's representative to apologize for the

murder of Minister von Ketteler during the Boxer Rebellion. In 1908 he was a member of the Commission of Constitutional Reform and the Government Council. On the death of Kwang-sü, Nov. 14, 1908, Prince Chun was appointed She Chang-wang (Prince Regent), to act during the minority of his son, who now succeeded as the Emperor Hsuan-tung. One of the first decrees of the Prince Regent dismissed Yuan Shih-kai (q.v.) from all of his offices and sent him into retirement, as retaliation for his share in the overthrow of Kwang-sü's reforms in 1898. While in office, Prince Chun was liberally inclined and popular, and on Nov. 26, 1911, took the oath to observe the constitution. But his fairly enlightened policy of reform failed to stave off the growing revolt against the Manchus, and on Dec. 6, 1911, he resigned as Prince Regent. His duties were taken over by the then Empress Dowager, and Yuan Shih-kai was recalled from retirement as a last desperate effort to save the monarchy. After the abdication of Hsuan-tung as Emperor, Feb. 12, 1912, Prince Chun retired to Kiaochau (Tsing-tau). See CHINA, *Modern History*.

TSAI T' IEN, *tsá' tyén'*. See KWANG-SÜ.

TSANA, LAKE. See TZANA.

TSAR. See CZAR.

TSARITSYN, *tsá-ré'tsín*. A district capital and one of the most important ports on the Volga, situated in the Government of Saratov, Russia (Map: Russia, F 5). Connected by rail and water with the interior of Russia, Tsaritsyn is the natural outlet for the region of the lower Volga, and to some extent of the region of the Don. The chief articles of commerce are fish, salt, petroleum, grain, lumber, wool, and mustard. The local manufactures are spirits, beer, and machinery. A large gun factory was established there in 1914. The town is poorly built. There is a fine Lutheran church. Pop., 1910, 100,817.

TSARSKOYE SELO, *tsár'skó-ye sye-ló'* (the Tsar's village). A district town and the summer residence of the Russian Emperor, situated in the Government of St. Petersburg, about 15 miles south of the capital (Map: Russia, D 3). It is a pretty town with extensive parks belonging to the royal residences and villas of the court aristocracy. The Old Palace is characterized by great splendor and contains a fine picture gallery and the celebrated amber room. The Palace of Alexander, built by Catharine II, is less pretentious. Tsarskoye Selo was formerly the seat of the Alexander lycée, where many of the most prominent literary men (including Pushkin) and statesmen of Russia were educated. Pop., 1911, 30,881. The railway line from Tsarskoye Selo to St. Petersburg, constructed in 1838, was the first railway in Russia.

TSCHAIKOWSKY. See TCHAIKOVSKY.

TSCHERMAK VON SEYSENEGG, *chér'mák, GUSTAV VON* (1836-). An Austrian mineralogist. He was born at Littau, Moravia; was educated at the University of Vienna; and in 1868 was appointed a professor in the university and director of the Royal Mineralogical Cabinet. In 1906 he retired. His contributions to the proceedings of the Vienna Academy are numerous, and treat for the most part subjects of crystallography and petrography. He is also a prominent authority on meteorites. In 1871 he established at Vienna the *Mineralogische Mitteilungen*, published since 1878 as the *Mineral-*

ogische und petrographische Mitteilungen. His publications include: *Die Porphyrgesteine Oesterreichs* (1869); *Die mikroskopische Beschaffenheit der Meteoriten* (1883); *Lehrbuch der Mineralogie* (1884; 6th ed., 1905).

TSCHIRNHAUSEN, ch'ern'hou-zen, EHRENFRIED WALTER, COUNT (1651-1708). A German scientist and mathematician. He was born and educated at Leyden. He traveled considerably in France, Italy, and Switzerland, and served in the army of Holland (1672-73). Tschirnhausen erected large glassworks in Saxony, where he constructed burning glasses of unusual perfection and carried on his experiments (1687-88). To him are due some valuable discoveries in the manufacture of porcelain. His *Medicina Mentis* (1687) testifies to the philosophic tendency of his thought. In mathematics Tschirnhausen is known as the founder of the theory of catacaustics, or caustics by reflection. The original articles appeared in the *Acta Eruditorum* from 1682 to 1698. These publications contain also his work on equations and quadratics. In connection with the latter he invented the quadratrix (see QUADRATURE) known by his name. Consult Weissenborn, *Lebensbeschreibung des Tschirnhausen* (Eisenach, 1866).

TSCHISTOPOL. See TCHISTOPOL.

TSCHUDI, chōō'dē, ÆGIUS or GILG (1505-72). A Swiss chronicler, known as the father of Swiss history. He was born at Glarus, studied at Basel, Vienna, and Paris, and after holding several administrative offices entered the French army in 1536, serving till 1544. Once more he held office in various cantons and became, in 1558, chief magistrate of Glarus. He was a bitter opponent of the Reformation and sought to check the spread of the new doctrines by arms. This brought him great unpopularity and necessitated his temporary absence from the canton. During his last years he took little share in political affairs, and devoted his time to a study of the amount of historical material which he had gathered from the public archives and the libraries of monasteries. His *Die uralt wahrhaftig alpsch Rhetia* was published at Basel in 1538, but his great works, the *Schweizerchronik*, or *Chronicon Helveticum*, and the *Gallia Comata*, did not appear till more than one hundred and sixty years after the author's death. The *Schweizerchronik* covers the period 1100-1470, and is valuable for the large number of original documents incorporated in the text. The *Schweizerchronik* has remained a great source for Swiss history. The *Gallia Comata* is in nature antiquarian, and was intended as an introduction to the *Chronicon Helveticum*.

TSCHUDI, CLARA (1856-). A Norwegian author, born at Tönsberg. Intending to become a dramatic singer, she studied at Dresden and Berlin, but presently turned her attention to literature, and after publishing some works bearing on women's rights, such as *Kvindebevægelsen* (1885) and *Tre Nutskvinder* (1887), became known through the historical portraits *Eugenie Keiserinde af Frankrig* (1889; new ed., 1906), *Keiserinde Augusta, Skildringer fra Hoflivet i Berlin* (1892), *Marie Antoinettes Ungdom* (1894); *Marie Antoinette og Revolutionen* (1895-96); *Napoleon's Moder, Silhouetter, Rejsminder, og Skizzer* (all 1898); *En Sommerfest i Trianon* (1903); *En Forglemt Helteinde* (1904); *Ludwig II of Bayern* (1905-06).

TSCHUDI, FRIEDRICH VON (1820-86). A Swiss scholar, brother of Johann Jakob von Tschudi. He studied theology first at Schaffhausen, then at Basel, Bonn, and Berlin; and was made pastor of Lichtensteig in 1843, but resigned in 1847. He settled in Saint-Gall, where he wrote, under the pseudonym of C. Weber, *Der Sonderbund und seine Auflösung* (1848), and under his own name several agricultural studies and the often reëdited and frequently translated *Das Tierleben der Alpenwelt* (1853; 11th ed., 1890). He held several official posts, and was distinguished for his services to education.

TSCHUDI, JOHANN JAKOB (1818-89). A Swiss naturalist, born at Glarus. He studied at Swiss, French, and German universities, and then traveled extensively in South America, visiting Peru (1838-43), and Brazil, the Plata States, Chile, and Bolivia (1857-59). From 1860 to 1862 he was Swiss Ambassador to Brazil, and in 1866 became diplomatic representative at the court of Vienna, retiring in 1883. He published: *System der Batrachier* (1838); *Untersuchungen über die Fauna peruana* (1844-47); *Peru, Reiseskizzen* (1846); *Die Kechuasprache* (1853); *Antiquidades peruanas* (1851), with Don Mariano de Rivero; *Reisen durch Südamerika* (1866-69); *Ollanta*, an ancient Peruvian drama out of the Quichua language (1875).

His son HUGO (1851-1911), born at Jakobs-hof, Austria, studied in Vienna jurisprudence and art history, and after extensive travels through Europe became connected with the royal museums in Berlin in 1884 and was appointed director of the National Gallery in 1896. Besides numerous important essays in various art periodicals, he published, in collaboration with Pulszky, the text to *Die Landes-Gemäldegalerie in Budapest* (1883), and with Bode, *Beschreibung der Bildwerke der christlichen Epoche in den königlichen Museen zu Berlin* (1883). After 1894 he edited the *Reportorium für Kunstwissenschaft* (Stuttgart, 1875 et seq.), conjointly with Thode.

TSENANFU. See TSINANFU.

TSËNG KI-TSEH, ts'ung' k'ēt'sēh' (1837-90). A Chinese statesman and diplomat, better known as the Marquis Tseng, born in Hunan. He served under his father as secretary, and in 1877 succeeded to the paternal title. In the following year he was appointed Minister to Great Britain and France. In 1880 he was further intrusted with an embassy at St. Petersburg (Petrograd), and there negotiated the treaty by which Kulja was restored to China. In 1881 he was created Vice Director of the Imperial Clan Court, and Vice President of the Board of War, and in 1885 arranged a convention with Great Britain in regard to the opium traffic, and was appointed Assistant Director of the newly established Admiralty Board. In 1896 he returned to Peking, became a member of the Tsung-li Yamen (q.v.) (now the Waichiaopu), and in 1887 Vice President of the Board of Revenue. He was director of the Tung Wen Kwan, or Peking School of Languages (1889-90).

TSËNG KUO-FAN, ts'ung' kwō'fān' (1811-72). A Chinese soldier and statesman, descendant of the philosopher Tseng (Cincius), and born in the Province of Hunan. In 1843 he became chief literary examiner, and later was

appointed military examiner. In 1850 he built a fleet of war junks with which he attacked the Taiping rebels. He made a brave defense of Changsha, and the rebels lost 80 days in vainly trying to capture the city. Later Tseng captured Wuchang and Hanyang, and in reward for this was made Vice President of the Board of War. He won other military successes, cleared Kiangsu of the rebels, and in 1857 received chief command in Chekiang. Three years later he was made Viceroy of the two Kiang provinces and Imperial War Commissioner. In 1864 he captured Nanking, and was rewarded with the title of *Hou*, or Marquis. He was less successful in the suppression of the Nienfei Rebellion and was succeeded in the chief command by Li Hung Chang (q.v.), who had been one of his lieutenants. Tseng was Viceroy of Chihli at the time of the Tientsin massacre in 1870. His collected writings of 156 books were edited by Li Hung Chang in 1876. Tseng's son, Tseng Ki-tseh (died 1890), was the first Chinese Minister to Great Britain.

TSEKLAES, tsék'kläs, JOHANN. See TILLY.

TSETSE (tsét'sé) **FLY** (South African name). A biting fly (*Glossina morsitans*) of the family Muscidae, related to the common stable fly (q.v.), which occurs in portions of Africa. The tsetse fly bites all warm-blooded animals, but seems particularly attracted to cattle and horses. Its bite was formerly considered poisonous, and apparently produced death in beasts of burden coming from regions where the fly does not occur. The disease produced by the bite is called nagana. Animals which have once recovered appear to be immune, or "salted." It has been determined that the bite of the tsetse fly is not specifically poisonous, but that the insect acts as the carrier of a hæmatozoan parasite, taking it with the blood of diseased animals and carrying it to non-immunes. The tsetse fly does not lay eggs, but multiplies by producing, one at a time, full-grown larvæ which immediately change to pupæ, just as do the so-called pupiparous Diptera. It was at one time supposed that the tsetse fly would form a serious obstacle to the settlement of Africa, but this is not the case. Only certain animals are affected, and the fly acts simply as a carrier; moreover, cattle became immune after residence in infected regions.

TSETSE-FLY DISEASE. See SLEEPING SICKNESS.

TSHI, tshē, or **CHWI**. A negro people on the African Gold Coast. See SUDAN.

TSIMSCHIAN, **TSIMSHIAN**. See CHIMESYAN.

TSINANFU, ché'nä'fōō, **TSENANFOO**, or **TSINAN**. A city of China, capital of the Province of Shantung. It lies in a large fertile plain, 3½ miles south of the Yellow River, 245 southeast of Peking (Map: China, L 4). The walls of the city proper have a circuit of 12 miles and are well built, but there is a large extramural population protected by a great encircling mud rampart. The principal streets are comparatively clean, and are lined with good shops. The city is noted especially for its silk brocades, its trade in precious stones, and the varied glass and other products of Poshan-hien, the chief city of the "black country" of Shantung. It has a drum tower, a great examination hall capable of accommodating over 10,000 candidates, many fine temples, a Roman Catholic cathedral, besides the Yamens, or of-

fices of the Governor and the high officers of the province. In the western part of the city are several geyser-like springs said to be connected with similar springs in Taishan (q.v.), some 60 miles distant. A splendid highway connects the city with the Hoang-ho, 4 miles to the north. A few miles east of the city are several important iron mines. Pop., 300,000, including 2000 Mohammedan families. Tsinan is on the railway line projected by the Germans from Kiaochow (Tsingtau) through Shantung Province, and this railway was taken over by the Japanese with the capture of Kiaochow. The foreign settlement is beautiful and well kept, and contains some flourishing business firms, mainly German.

TSINGTAO, tsing'tau', or **TSING-TAU**, a city in China. See KIAOCHOW.

TS'ING-TU, or **JÖDÖ**. The Chinese and the Japanese names respectively of "The Land of Bliss," sometimes called the "Paradise of the West," presided over by Amitabha (or Amida) Buddha, rebirth in which is promised to all who put their faith in Amida. Life is there practically eternal, free from pain and misery, and as it can be reached without the performance of works, its attainment has become the aim of the adherents of the Ts'ing-tu sect of Buddhists in China, and the Jödö and Shinshiu sects of Japan. Nirvana is too difficult. Consult J. Edkins, *Chinese Buddhism* (London, 1880).

TSITSIHAR, ché'chē'här'. The largest, the most northerly, and the most thinly populated of the three provinces of Manchuria (q.v.), known to the Chinese as Heilungkiang, and containing about 190,000 square miles (Map: China, N 2). It is generally mountainous, covered with forests, and abounds in both large and small game, and hunting and trapping are extensively carried on. In the southwest are great prairies occupied by the Mongols, who maintain large herds of cattle, horses, etc., upon them. The climate is severe, the mercury falling in winter to 40° F. below zero, and lower. In summer it sometimes rises to 90° F. and 95° F. Agriculture is chiefly confined to the river valleys, where are produced pulse, maize, millet, tobacco, wheat, sesamum, and the poppy. The drainage is to the north through the Sungari. Gold is found in the northwest, north, and east, and is mined at Moho. Much soda is produced and exported to China. The province is crossed by the Trans-Manchurian branch of the Russian Trans-Baikal Railway, which connects at Harbin with the Japanese Railway that runs south-southwest to Port Arthur and Dalny. The population, estimated at 1,500,000, consists of Manchus, Korchin Mongols, Solons, Yakuts from Siberia, 6600 families of whom settled on the banks of the Nonni in 1687, and Chinese, chiefly from the northern provinces. The government is military, but there are two civil officials in as many localities where the population is largely Chinese. Besides the Bannermen a force of 7000 foreign-drilled Chinese troops is maintained. Tsitsihar has long been a penal colony, and there is much brigandage. The capital, Tsitsihar, on the Nonni, was built in 1692 in order to overawe the neighboring tribes. It is a few miles north of the Trans-Manchurian Railway, and is a dirty, poorly built city with a population of between 30,000 and 40,000. It has a great trade in cattle, and the cattle

fairs draw thousands of Mongols to the city, at which time the population is almost doubled. See CHINA; MANCHURIA.

TSONEKAN, tsō'nā-kan, or **TZONECA**, also **CHONEK**. A name sometimes applied to the Patagonian natives. The term Tsonekan is now used to designate the linguistic stock to which the Tehuelches (q.v.) belong. See INDIANS, *Linguistic Map*.

TSONG KHA-PA, tsōng' k'hā'pā', **TSONG-K'A-PA**, or **TSOŃ-K'A-PA** (the man from Tsong-k'a); generally spoken of as *Jé-rim-po-ch'é* (c.1355-1419). A noted Tibetan reformer of Lamaism (q.v.). He was born at Tsong-k'a, in the Province of Amdo, near the Chinese frontier, and while still a child he was devoted by his parents to a religious life. At 16 he began theological studies and a year later proceeded to central Tibet. In southern Tibet he spent eight years as a hermit and became convinced of the need of reform. Identifying himself with the *Kah-dam-pa*, "The Sect bound by the Orders" (of the *Vinaya*, or "Books of Discipline"), which had been purified and reformed by the Indian monk Atisha in the eleventh century, he reorganized it, and gave it the name of *Ge-lug-pa*, "The Followers of the Virtuous Order." In 1409 he built the great monastery of Gah-Idan ("Paradise"), 25 miles from Lhasa (q.v.), where he preached regularly, and by the time of his death his followers numbered over 30,000 in Lhasa alone. His reforms consisted in a stricter observance of the 235 rules of the *Vinaya*, or "Discipline," a life of ethical purity, strict celibacy, simplicity in dress, the abandonment of the red robes which had become common, and the re adoption of the yellow hat and the patched yellow robes worn and prescribed by the Buddha. He also reinstated the fortnightly "disburdenment," or rehearsal of the *Pratimōkṣa Sūtra* in regular assemblies of the order at Lhasa, and restored the custom of retiring yearly for meditation. Tsong Kha-pa was buried in the Gah-Idan, where his embalmed remains form the chief object of veneration.

TSO TSUNG-T'ANG, tsō' tsūng't'āng' (1812-85). A Chinese general and administrator. He was born at Hiangyin, in Hunan, secured his second or master's degree in 1832, and during the earlier years of the Taiping Rebellion served in Hunan and Hupeh. In 1861 he had the command of the army operating in Chekiang, and in the following year was also made Governor of that province. In 1863 he was also appointed Governor-General of the combined provinces of Chekiang and Fukien, and by October, 1864, he had entirely recovered Chekiang and was rewarded with an earldom. When the rebellion ended in 1865 he was also in command of Kiangsi and Kwangtung. Appointed in 1866 Governor-General of Shensi and Kansu, then in the hands of the Mohammedan rebels, he first turned his attention to the Nienfei insurgents, drove them from the neighborhood of Hankow, entered Shensi and defeated them there in 1867, and utterly routed them near Tientsin in August, 1868. He returned to Shensi, pacified that province in 1869, drove the rebels beyond the Great Wall, and captured Suchow in Kansu in 1873. In 1875 he was appointed Imperial Commissioner for Turkestan, and in April, 1876, he advanced with the main body of his army beyond the Great Wall, crossed the desert of Hami, and by Oct. 10, 1877, had captured in succession Urumtsi, Tihua,

Manas, Pidjan, Turfan, and Kuche, north of the Tian-Shan; and by Jan. 2, 1878, Harashar, Aksu, Kashgar, Yarkand, Yengishar, and Khotan—all in eastern Turkestan, south of the Tian-Shan—had been reconquered, and the campaign brought to a close. Tso was made a marquis and received many other honors. On his return to Peking in 1881 he became a member of the Tsung-li Yamen (now the Waichiaopu), and immediately succeeded in having all the Chinese students in the United States recalled. In the same year he was transferred to Nanking as Governor-General of Hunan and Hupeh, whence in 1884, on the outbreak of French hostilities in connection with the Tongking affair, he was ordered to Fuchow to direct the military operations, and died there in the following year.

TSOWHIEN, tsou'hyēn'. A small district or prefectural city of Shantung, China, noted as the birthplace of Mencius (q.v.) and the home of his descendant and representative. It is about 15 miles east of Kiuhfow (q.v.), the birthplace of Confucius, and in a region of great historic interest, hallowed to followers of these two early sages. There is a temple in honor of Mencius, and south of the city is his tomb, approached by a fine avenue of cypress and yew.

TSU, tsōō. The capital of the Prefecture of Miye, central Hondo, Japan, situated on the east coast, 47 miles south-southwest of Nagoya (Map: Japan, E 6). It has a number of fine temples, of which that of Ko-no Amida attracts many pilgrims. Pop., 1898, 33,287; 1908, 41,229.

TSUNG-LI YAMEN (or **YAMUN**), tsōōng' lē' yā'mūn' (Chin., general managing office). The office or bureau through which the foreign ministers in China until recently communicated with the throne and the six departments of government. It was established in 1861 as one of the conditions of peace with the Powers, and was organized by Prince Kung (who became its first president) in conference with Sir Frederick Bruce, the first British Minister, and comprised between 8 and 12 members. In 1901 it was superseded by the Wai Wu Pu, or Department of Foreign Affairs, which was later known as the Waichiaopu.

TSURUGA, tsōō'ru-gā. A seaport of the Province of Echizen, Japan, about 50 miles north of Kioto, with which it is connected by rail (Map: Japan, D 6). It stands at the head of a deep bay, and is well situated for trade with Korea and Manchuria. Its harbor is protected by a breakwater and a lighthouse, and is the best on the northwest coast of the main island. Junk building is the chief industry. It contains one of the oldest Shinto temples of the country. Pop., about 1700.

TSURUOKA, tsōō'rōō'ō'kā, or **TSURUGAOKO**. A town in the Prefecture of Yamagata, north Hondo, Japan, 75 miles north-northeast of Niigata (Map: Japan, F 4). It was formerly a castle town. Pop., 1908, 21,056.

TSUSHIMA, tsōō'shē-mā. An island of Japan, commanding the south entrance to the Sea of Japan, less than 50 miles south of Korea, and separated from the island of Kiushu by Krusenstern Channel (Map: Japan, A 6). It is penetrated by a deep inlet on the west, which at its narrowest is only 16 yards wide. At high water the narrow connecting spit is overflowed, forming two unequal islands. They are both mountainous, with peaks ranging from 1128 to 2130 feet above the level of the sea. Area, 266

square miles. The northern or larger island is indented with many fine bays, and the chief coast town is Waniara. Fishing is the chief industry and dried cuttlefish the chief export. The chief city, Idzunohara or Fuchu, on the south island, has a population of about 10,000. Pop., 30,000. Korean blood is very noticeable among the inhabitants. Near Tsushima Admiral Togo destroyed the Russian fleet under Admiral Rozhdestvensky, May 27-28, 1905. See RUSSO-JAPANESE WAR.

TUA, tōō'a, TERESINA (1867-). An Italian violinist, born in Turin. Her principal teacher was Massart of the Paris Conservatory, under whom she made such rapid progress that in 1880 she won the first prize. She was uniformly successful from the beginning of her artistic career. In 1891 she retired from the concert platform owing to her marriage with Count Franchi-Verney della Valetta, but in the autumn of 1895 she again took up her concert work and was very successful European tours.

TUAILLON, tu'ā'yōn', LOUIS (1862-). A German sculptor. He was born in Berlin and studied there at the Academy and under Begas. After visiting Vienna he spent 17 years in Rome (1885-1902), and after his return to Berlin was appointed director of a master studio at the Academy (1906). Tuailon revived the half-nude statue of the Roman classical age and achieved great success with his austere beautiful bronze "Amazon on Horseback," now before the National Gallery, Berlin (replicas in the Thiergarten, Berlin, and in the Metropolitan Museum, New York). Other works in the same style are "The Horse Trainer" (Bremen), "The Victor" (Wannsee), and the half-nude equestrian statue of the Emperor Frederick (Bremen). He received gold medals at Berlin (1899), Dresden (1889), and Paris (1900).

TUAMOTU, tōō'a-mō'tōō, **PAUMOTU**, pā'u-mō'tōō (Low or Dangerous Archipelago). A group of low coral islands in Oceania, lying east of the Society Islands (Map: World, L 7). It consists of 80 islets, of which 42 are inhabited, with a total area of over 335 square miles, of which 270 square miles may be cultivated at least to the extent of growing coconuts. Owing to the coral surface and scarcity of water the vegetation is scanty. In the western islands are found the breadfruit tree, banana, and pineapple. The chief products of the group are copra, trepang, coconut oil, and pearls, and the trade is chiefly with Tahiti. The inhabitants are Polynesians, and mostly Roman Catholic Christian, and in 1911 numbered 3715. The principal port and seat of administration is Fakarava, on the western island of Fakarava. The group was discovered by the Spaniard Quiros in 1606 and visited by many explorers, including Cook (1769). It came under the protection of France in 1844, and was officially annexed in 1881. Consult Frederici, *Ein Beitrag zur Kenntniss der Tuamotu-Inseln*.

TUAREGS, tōō-ā'ržg. Berber nomads in the Middle Sahara, numbering some 300,000, and perhaps descendants of the ancient Gætulians. (See GÆTULIA.) In various places they have mixed with negroes. They are tall, with slender figures and regular features, dark in complexion, with an occasional blond, and, owing to their frugal diet, are long lived. The costume varies with location, but a common article of dress is the litham, a cloth wrapped about the face to protect the eyes and breathing organs from

the dust of the desert. The Amoshagh or Noble Tuaregs wear a black litham and the Imghad or servile a white one, which gives rise to the epithets Black Tuaregs and White Tuaregs. Their weapons are a long, straight sword, a dagger, a spear 6 feet long, and occasionally a gun. They were monogamists until the Mohammedan conquest, when they began to vary somewhat in this respect. The women have freedom, go unveiled, and take part in public affairs.

Cortier, *D'une rive à l'autre du Sahara* (Paris, 1908); Jean Camille, *Les Touareg du Sud-Est* (ib., 1909); C. Aymard, *Les Touareg* (ib., 1911); M. Delafosse, *Haut-Sénégal-Niger* (ib., 1912); F. De Zeltner, "Les Touaregs du Sud," in *Journal of Royal Anthropological Institute* (London, 1914). See NIGER, MILITARY TERRITORY OF THE.

TUAT, tōō-it'. A group of oases in Algerian Sahara, north Africa, comprising the oases of Gurara and Tidikelt. It is a comparatively well-settled region and abounds in date palms. It is watered principally by the Wadi Saura or Mzaud and also by some subterranean watercourses. The largest lake is the Sebkhā Gurara. Pop., 1906, 49,873, of whom 134 were Europeans, the remainder being Tuaregs, negroes, and Arabs. Tuat was formerly regarded as a dependency of Morocco, but with its occupation by French troops in 1900 has practically become a part of the French sphere of influence. It was connected by road with the Algerian railway system in 1903 and by rail in 1912.

TUATARA, tōō'a-tā'rā (Maori, spiny). A reptile of New Zealand (*Sphenodon* or *Hatteria punctatus*), which looks like a large stout lizard, but whose structure shows it to be the sole surviving representative of a primitive group, the *Rhynchocephali*, otherwise extinct in the Triassic age. Large males reach a length of 2½ feet, are dark olive green, and have a row of short, yellowish, horn-sheathed spines along the vertebral line. The skin is granular, except on the belly, where it is scaly. All its anatomy distinguishes this animal from lizards and allies it with the ancient *Prosauria*—the carpus, e.g., has the primitive number of 10 bones, all separate; and there is an entire absence of external copulatory organs.

The tuataras were once numerous through New Zealand, but have been killed by civilization and bush fires, until now they inhabit only some small parts of the North Island. They dwell in burrows of their own digging, which they share with sundry petrels. They are fond of water, and are able to remain submerged for hours without breathing. During the day they sleep, but at night hunt for food, which consists of insects and worms in the interior and on the coast of small fishes, crustaceans, etc.; all food is taken alive. They move very slowly and lazily, but are fierce fighters when called upon to defend themselves. They lay in summer about 10 eggs, elongated and hard-shelled, which are buried in warm sand and left to hatch; but this does not happen until about 13 months later, although the embryos grow to nearly their full size in half that time or less, and then seem to aestivate. Consult: *Transactions of the New Zealand Institute*, vols. x, xiv (Wellington, 1878, 1881); Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii

(New York, 1901); E. G. Boulanger, *Reptiles and Batrachians* (ib., 1914); Newman, in *Transactions Zoological Society*, vol. xv (London, 1897).

TUATHADEDANAAN, *tū-ā'thā-dā-dā-nān'* (Ir., Race or Tribe of Danaan). A prehistoric people of tall stature and blond type, who, according to the ancient annals of Ireland, invaded the island from the north several centuries before the Christian era, and by defeating the Firbolgs (q.v.) in the battle of Moytura became masters of the country until in turn overcome by the Milesians (q.v.). They were probably of Scandinavian origin.

TU'BA (Lat., trumpet). A name given to the bass instruments of the saxhorn family, also called bombardons. Tubas are made in many keys, and, as they are played from the notes as written, they require no special transposition. They are the lowest of the bass instruments and their range is from B_b to f . Their tone is full and majestic; the most usual sizes are the bass tuba in B_b and the contrabass tuba in B_b . Their introduction into the orchestra is due to Wagner, who obtained fine effects through them. The tuba has since then become a fixture in the orchestra, being used as the bass of the trombone choir. As such it has entirely superseded the ophicleide (q.v.). The instrument is built in two forms, oblong and round. See **HELICON**.

TU'BAL-CAIN'. According to the narrative in Gen. iv. 22, the son of Lamech and Zillah and the instructor of all artificers in brass and iron.

TUBE NOSE. A tube-nosed or harpy bat (q.v.), a small East Indian fruit bat of the genus *Harpyia*, remarkable for the fact that the nostrils are in the form of two extended and somewhat divergent tubes projecting above the upper lip.

TU'BER (Lat., swelling, tumor, knob on plants). A thickened and shortened branch from a subterranean stem. The leaves are usually reduced to minute scales with buds in the axils, forming in the potato the so-called eyes. It serves as a food reservoir, and also gives rise to new plants much more rapidly than do seeds. See **STEM**.

TU'BERCLE (Neo-Lat., from Lat. *tuberculum*, little swelling, pimple, tubercle, diminutive of *tuber*, swelling, tumor, knob on plants). A round, solid nodule on the skin, mucous membrane, or surface of an organ, as in leprosy or tuberculosis. In anatomy a rough elevation for attachment of muscle or ligament. See **BACTERIA**; **DISEASE**, **GERM THEORY OF**; **LEPROSY**; **SERUM THERAPY**; **TUBERCULOSIS**.

TUBER'COLIN, **KOCH'S LYMPH**, or **PARATOL**. A glycerin extract of pure cultures of the *Bacillus tuberculosis*, first prepared in 1891 by Robert Koch (q.v.). Several preparations of tuberculin are made. Old tuberculin (Koch's original preparation, T. O.), a filtered glycerin extract of tubercle bacilli, is a clear, amber fluid. Tuberculin filtrate, known also as "tuberculin Denys" (B. F.) or bouillon filtrate, is made from bouillon cultures of the human bacillus filtered through porcelain. New tuberculin (T. R.) is a glycerinated saline suspension of the major part remaining after centrifugalizing desiccated and pulverized tubercle bacilli. Purified extract is a filtered culture of human bacilli in 50 per cent glycerin. Tubercle bacillus emulsion, or bacillary emulsion, is a glycerinated suspension of devitalized tubercle bacilli. Dixon's tubercle extract, or fluid of Dixon, is an

extract of bacilli dissolved in normal saline solution. Dixon's suspension of dead bacilli is a saline suspension of killed bacilli which have been subjected to prolonged treatment with alcohol and ether. Spengler's *Perlsucht* is prepared from bovine tubercle bacilli in the same way as Koch's old tuberculin. It is but slightly toxic for human beings.

When injected into the tissues of a healthy (nontuberculous) person no reaction follows; but in the presence of tuberculosis, wherever situated, both a local and general febrile reaction is observed. The general symptoms are fever and chills; locally it affects the skin, which becomes red and swollen. A better serum was introduced by Koch in 1897, and efforts in the same direction were made by Klebs in Germany and Hunter in England, the earlier product having been found to contain substances very toxic to man. On its first appearance Koch's lymph, as it was called, was hailed as a specific and widely used by unskilled observers in unsuitable cases and in excessive doses. The results were disappointing and the remedy fell into disrepute. With the production of purer serums, the acquirement of experience, and the use of smaller doses, treatment has been more successful and tuberculin is now recognized as a valuable therapeutic aid. Tuberculin is reliable as a diagnostic agent both in the human subject and in cattle, and is largely used to guard against the consumption of infected milk and meat.

For diagnostic purposes tuberculin may be employed in several ways. The cutaneous test of Von Pirquet (q.v.) consists in scarifying the skin as in vaccination and dropping undiluted tuberculin upon the raw surface. A reaction may be expected in about 48 hours. According to the technique of Calmette and Wolff-Eisner (the ophthalmo-reaction) tuberculin is dropped into the canthus of the eye. Moro's inunction test is performed by rubbing a 50 per cent lanolin ointment into the skin of the abdomen or chest. Consult Bandelier and Roepke, *Tuberculin in Diagnosis and Treatment* (New York, 1913), and Cochrane and Sprawson, *Guide to the Use of Tuberculin* (ib., 1915). See **TUBERCULOSIS**.

TUBER'CULO'SIS (Neo-Lat., from Lat. *tuberculum*, little swelling, pimple, tubercle, diminutive of *tuber*, swelling, tumor, knob on plants), or **CONSUMPTION**. An infectious disease, caused by the *Bacillus tuberculosis*, characterized by the formation, in the tissues, of nodular bodies, called tubercles, and manifested symptomatically by fever, cough, dyspnea, and progressive loss of strength. The disease is widespread and causes about one-seventh of the deaths throughout the world. Its clinical features were recognized many centuries ago, and Hippocrates and Galen described them very accurately; but it was not until the growth of anatomical study in the seventeenth and eighteenth centuries that the characteristic lesions (tubercles), were recognized and associated with the disease. Important additions to the pathological knowledge of tuberculosis were made in the nineteenth century. Virchow's work in cellular pathology and finally Koch's brilliant discovery of the causative bacillus in 1882 settled all doubts as to the genesis and pathology of the disease, and since then nothing essential has been added to our knowledge concerning it.

Consumption prevails in all latitudes. Towards the poles and in very high altitudes the mor-

tality is somewhat lower. No race is exempt, but negroes and Indians, and other races to whom the disease is comparatively new, are especially susceptible. In rare instances the disease is congenital, derived from the mother; there has been found no proof of paternal transmission either in man or animals. Hereditary predisposition has been thought to play an important rôle in determining the disease in individuals. Children of tuberculous parents are believed to be more liable than others to contract consumption. A predisposition to tuberculosis is acquired under conditions that seriously lower vital resistance. Among those are overcrowding, deficient ventilation, poor food, prolonged and exhausting disease, pregnancy and lactation, and unhealthful occupations, such as glass blowing, coal mining, street sweeping, exposure to cold and damp, and the excessive use of alcohol. The pulmonary complications following measles and whooping cough in children are often forerunners of a tuberculous deposit in the lungs.

The direct medium of contagion is the sputum of the tuberculous patient. The number of bacilli thrown off in this manner is enormous. The sputum becomes dry and desiccated, the bacilli are distributed by the dust and obtain entrance to the body again through the respiratory tract. The flesh or milk of tuberculous cattle is capable of transmitting the disease both to man and to other animals. Many cases of intestinal and mesenteric tuberculosis in children are attributable to this source. Finally, infection can be brought about by direct inoculation.

When the tubercle bacilli have once definitely invaded the lungs the disease may be fatal in three or four months, or from 10 to 15 years may elapse between infection and death. During this time it may be quiescent for months or a year or more. Two types are usually recognized. The rapid form (galloping consumption) begins after a cold or exposure, with rapidly rising temperature, pain in the side, difficult breathing, rust-colored sputum and consolidation of one or more lobes of a lung: in other words, like an attack of pneumonia. Instead, however, of improving at the end of the tenth day, the symptoms become graver, the fever continues high, the lung is rapidly softened and destroyed, and the patient rapidly succumbs. The second type, sometimes called chronic ulcerative tuberculosis, comes on more slowly and runs a longer course and includes the majority of cases of pulmonary tuberculosis. The disease begins with a slight but annoying and unproductive cough, a slight afternoon temperature, loss of appetite, and gradually increasing weakness. As the trouble progresses, the cough becomes severe and constant, with yellow or whitish expectoration, containing usually multitudes of bacilli, and sometimes tinged with blood. Fever is higher in the afternoon and evening and the temperature rarely drops to normal. Night sweats, pains in the chest, steadily progressing weakness, dyspnea, and wasting are now present. Occasionally quantities of blood are brought up (hemoptysis) during a paroxysm of coughing. It is bright red, frothy, and due to the ulceration of an artery of some size. The course is not always fatal; the disease may be arrested at any stage, and partial or complete healing take place, leaving scars or cavities in the lung. Improvement may be only temporary and the

process start up again under favorable conditions. In fatal cases the last stage is marked by an exhausting diarrhoea, and swelling of the lower extremities. Death may take place suddenly from hemorrhage or gradually from exhaustion and profound toxæmia. Examination of the chest shows a deficient expansion of the ribs, rapid heart action, exaggerated voice sounds, irregular and high-pitched respiration, and different varieties of râles, depending on the stage of the morbid process. Diagnosis of the disease depends on these symptoms and physical signs, and on finding tubercle bacilli in the sputum. The X-ray photograph is a reliable means of distinguishing lesions in the lungs, peribronchial glands, and bones. Tuberculin (q.v.) is even more widely applicable in diagnosis, but the reaction is apt to occur in patients with healed lesions as well as in those with active processes.

The prevention of tuberculosis is one of the most difficult problems with which the sanitarian has to grapple, the disease being so widely disseminated, and so insidious in its approaches. Efforts in this direction are mainly directed to destroying tuberculous cattle, segregation of tuberculous individuals, and destruction of their sputum. Municipal ordinances against spitting in public places have been passed in many cities. Tuberculous persons should always use for their sputum special receptacles, which should be thoroughly disinfected and burned. Boards of health in the larger cities require physicians to report cases in private life and see that precautions against contagion are observed.

Individuals predisposed to consumption should lead an exceptionally careful life in an equable climate and out of doors. Particular attention should be given to keeping the upper respiratory passages in a healthy condition and guarding against colds. Tuberculosis is a curable disease in its earlier stages. Spontaneous cure is an everyday phenomenon, and a large proportion of individuals dying of other diseases are found on autopsy to possess healed tuberculous lesions in the lungs.

There is no successful specific treatment. Koch's tuberculin and its various modifications and the different antitoxins and antitubercle serums are being used, but have to be administered with great circumspection. The treatment of consumption is in most cases best carried out in well-regulated sanatoria, where the patient's life and habits are under expert surveillance. The main objects in view are to place the sufferer in an environment favorable for the attainment of the best possible nutrition, to relieve the cough, sweats, and other wearing symptoms, and to give medicines that tend to check the progress of the disease. Fresh air is an essential consideration, whether treatment is carried on in sanatoria or at home. In general, a dry, germ-free, bracing atmosphere, with an equable temperature and plenty of sunlight, where the patient can live out of doors, should be selected. There is no advantage in sending patients with inevitably fatal lesions away from home. The patient should sleep out of doors, even in stormy weather, if sheltered. Exercise should stop short of fatigue: The mental condition of the patient is of the utmost importance, and cheerful surroundings and occupation should be chosen where possible. Thus sanatoria for the tuberculous have been established on the seashore, in the

desert, and in the mountains, often supported by private charity, a municipality, or State, by unions of workmen or by employers, in which the treatment consists in living in the open air, with exercise and nourishing food, with or without tuberculin, under medical supervision. Similar sanatoria have been opened for tuberculous children, and a special treatment developed in Switzerland has been accepted in Europe and the United States. It is given in sanatoria, situated in sheltered localities in great altitudes, and consists in exposing the whole body of the tuberculous child in the open, even in snow at a temperature below freezing point, to the rays of the sun for a period ranging from a few minutes to an hour. Astonishingly good results have been reported.

Of drugs, the creosote group, cod-liver oil, and the calcium salts are valuable. Cod-liver oil improves the nutrition, acting better in children than in adults, and better in glandular and bone tuberculosis than in pulmonary. The emulsified fats or cream are good substitutes when cod-liver oil cannot be taken. Iron, arsenic, strychnine, and similar tonics are given according to indications. Fever is combated by rest, fresh air, and small doses of quinine; severe cough by opiates; night sweats by belladonna, strychnine, and the mineral acids; hemorrhage by complete rest, large doses of morphine, and suprarenal extract, with ice over the point of bleeding when it can be located. Vomiting, headache, indigestion, diarrhoea, etc., must be managed as in other diseases.

In 1906 Behring (q.v.) announced that after extracting certain substances from the tubercle bacilli with salt water and then with alcohol and ether, he powdered the bacilli and injected them subcutaneously with success. Practically the same method has been pursued by Von Ruck, of Asheville, N. C., since 1897.

Attempts to treat the disease locally by means of inhalation of antiseptic vapors, and ozonized air, and later by the X ray and concentrated sunlight, have had a small measure of success.

Surgical treatment of tuberculosis of the lungs consists in producing temporary collapse of the affected lung by nitrogen displacement, the lung being flattened against the mediastinum and a pneumothorax established. If such temporary collapse is impossible on account of the adherence of the two layers of the pleura, permanent solidification of the lung is effected by resection. Success has been reported of such surgical treatment of tuberculosis of the lungs in those cases in which (1) the disease is progressive, despite a two or three months' trial of sanatorium and tuberculin treatment, (2) the disease is complicated by marked secondary infection of tuberculous cavities, (3) severe and repeated spitting of blood occurs.

Tuberculosis attacks, primarily or secondarily, the lymph glands, bones, joints, intestines, peritoneum, brain, kidneys, bladder, spleen, liver, pleura, lungs, pericardium, heart, generative organs, eye, and skin. Its manifestations in these situations are described in the articles on ADENITIS; BLADDER; BRIGHT'S DISEASE; LUPUS; MENINGITIS; PERICARDITIS; PERITONITIS; PLEURISY; PYELITIS; SCROFULA; ETC.

Pathology and Bacteriology. Tuberculosis is invariably due to the presence in the body and to the action upon the body tissues of a specific microorganism known as the tubercle bacillus.

The organism is a thin bacillus from three to four micromillimeters long, i.e., about one-half the diameter of a red blood cell. It is often slightly curved and there is a marked tendency of the bacilli to hang together, two often lying in the shape of a letter V. The bacillus grows on ordinary culture media at body temperature, but the growth is extremely slow. Thus, cultures on blood serum or on nutrient agar rarely show any signs of growth earlier than two weeks, when thin grayish dry scales begin to appear on the surface of the medium. Cultures grow best in the dark; in fact, the bacillus is killed by exposure for a few hours to the direct rays of the sun. From a pure culture successive cultures may be made indefinitely. Such cultures show a gradual loss of virulence, but no changes in morphology. See Plate of DISEASE GERMS.

The bacillus stains with difficulty with the aniline dyes, but when once stained retains the dye with great tenacity. This process consists in treating a suspected specimen with a strong solution of a red dye known as fuchsin, to which carbolic acid has been added to increase its penetrating powers. After staining, the specimen is washed in dilute acid, which extracts the stain from all other bacteria. The tubercle bacilli retain the red stain in spite of the action of the acid and may thus be differentiated. Three types of tubercle bacilli are recognizable by their individual characters, the human, bovine, and avian types. The human type, although so named, is not the only one found in man; it is the organism present in the majority of cases, but in some cases of the human disease the bacilli are of the bovine type. The human bacillus produces a fatal tuberculosis in guinea pigs, chimpanzees, and monkeys, but only slight in cattle, goats, and pigs. The bovine tubercle bacillus produces a fatal tuberculosis in cattle, rabbits, guinea pigs, chimpanzees, monkeys, goats, and pigs. Fowls are very susceptible to the avian bacillus, but among the mammals only the rabbit and the mouse are affected, while in the other experimental mammals the bacillus never produces tuberculosis. The differentiation of the three types of bacilli is rather difficult and the differences are not permanent and stable.

The changes which the tubercle bacillus causes in the body tissues are various. Thus it may stimulate the passage of serum and white blood cells from the blood vessels into the tissues, causing an exudative inflammation; or it may stimulate the production of new connective tissue, causing what is known as a productive inflammation; or its effects may be more severe and lead to death of tissue or necrotic inflammation. Any one of these effects may be produced separately, or, as is commonly the case, they are combined. The most distinctive feature of the action of the tubercle bacillus in the body is the production of tubercles or tubercle tissue. This tubercle tissue may occur either as the nodular tubercle or as diffuse tubercle tissue. In the production of the tubercle the bacilli, according to the extensive researches of Baumgarten, first cause a proliferation of the connective tissue elements with the production of epithelioid and giant cells. Following this is an inflammatory reaction with the exudation of serum and white blood cells. The tubercle, which is now fully developed, may next undergo degenerative changes consisting of either caseation or sclerosis. Caseation begins in the centre of the growth and consists in a degeneration of the cells

and their reduction to a homogeneous, structureless mass. Coincident with the caseation or following it is a sclerosis by which the tubercle is converted into a firm, hard substance composed of connective tissue rich in fibres.

Small tuberculous nodules are called miliary tubercles. Seen with the naked eye the nodular tubercle is a small white, gray, or yellowish body, the smallest not visible without a microscope. Microscopically these tubercles show around their edges proliferated connective tissue and endothelial cells, with often some giant cells, while the centre is composed of tissue undergoing caseation or coagulation necrosis. Tubercle bacilli may be few or numerous.

Diffuse tubercle tissue usually results from a rather extensive local infection resulting in many small foci near together. From these tubercles start to grow, and these coalescing form considerable areas of tubercle tissue. In addition to the formation of tubercles the bacilli or the presence of the tubercle tissue may set up secondary inflammatory processes.

Suppuration in connection with tuberculous inflammation frequently occurs. In the so-called cold abscess, however, the fluid is not, properly speaking, pus, but the products of breaking down of the tubercles. True suppuration in tuberculous conditions is due to what is known as mixed infection, i.e., the presence of pyogenic cocci as well as tubercle bacilli.

Acute general miliary tuberculosis is characterized by a rapid development of tubercles, usually of small size, in many parts of the body at about the same time. The number of tubercles is frequently very large. One of the explanations offered for such sudden general diffusion of tubercles is that the infection is secondary to tubercles located in the walls of some of the small blood vessels or lymphatics.

Pulmonary tuberculosis, tuberculosis of the lungs, lung consumption, or most commonly called simply consumption, is a form of tuberculous infection in which the only or the most prominent lesions are in the lungs. The bacilli usually gain entrance by being taken into the lungs with the inspired air. Less commonly infection of the lung may occur through bacteria brought to them by means of the blood or lymph channels from tubercular foci in other parts of the body. Several factors must be considered as determining the character of the inflammation which the tubercle bacillus may induce in the lungs. Among these may be mentioned the number of bacilli introduced, their virulence, the manner in which they enter the lungs, whether in respiration or by means of the blood or lymph, the susceptibility of the individual, etc. As a result of variation in these factors we find a variation in the character of the inflammation set up. Thus there may result an exudative inflammation in which the air spaces of the lung and the smaller bronchi are filled with serum, leucocytes, fibrin, and cast-off epithelium. Such reaction is quite similar to that induced by the pneumococcus in pneumonia. On the other hand, instead of an exudative inflammation, the tubercle bacillus may bring about the production of new tissue, i.e., a productive inflammation. This new tissue is composed of small round cells and epithelioid cells, such as have been described above as tubercle tissue.

While it is common for these different lung-tissue reactions to tuberculous infection to be

associated, the predominance of one or another allows us to differentiate several quite distinct types of tuberculosis of the lungs.

Acute Miliary Tuberculosis of the Lungs. This occurs usually as a part of a general miliary tuberculosis, although it may be difficult to find lesions in other organs. The tubercles are found in both lungs, lying in the lung tissue proper, in the walls of the vessels and bronchi, or in the connective-tissue septa. These tubercles may go on to suppuration. They may coalesce to form larger tubercles. On the other hand, instead of breaking down, the tissue is sometimes converted into masses with or without calcified centres. These are known as healed tubercles, and may or may not contain tubercle bacilli.

Tuberculous Broncho-Pneumonia. In this form of tuberculous infection of the lungs, the tuberculous areas occur in the walls of the smaller bronchi and in the contiguous lung tissue. In its early stages the inflammation is mostly catarrhal, there being a more or less extensive exudate into the affected bronchi. As more and more bronchi are affected, there is frequently a coalescence of adjacent areas, with the formation of quite large masses of consolidation. These breaking down form cavities.

The term "phthisis" is sometimes applied to this form and to diffuse exudative tuberculous inflammation of the lungs, which may be either acute or chronic. In the acute form extensive areas of lung tissues may be involved, become consolidated, and, undergoing necrosis, result in the formation of large cavities. In the chronic form there is a slower involvement of the lung tissues, and there is apt to be more fibrous tissue, especially in the walls of cavities. This fibrous tissue lining often contains enormous numbers of tubercle bacilli, which are cast off in the sputum. It also furnishes a lodging place for pyogenic cocci, which cause suppuration of the membrane, and it is not at all improbable that these pyogenic cocci are very largely concerned in the formation of the cavities themselves. This secondary infection is also largely responsible for the bronchitis and yellow or greenish expectoration which so usually accompanies phthisis. Blood vessels stretch across these cavities or lie exposed in their walls, to be broken either by an extension of the disease itself or from a strain too sudden for their weakened walls. In this way may be caused the hemorrhages so frequently associated with phthisis.

The most frequent site of tubercles in the adult lung is the apex, although the initial lesion may occur in any part of the organ. In children the bronchial lymph nodes are usually first affected. Healed tubercles of the apex are found in a large proportion of autopsies.

Tuberculosis of Serous Membranes. Tuberculous pleurisy may be secondary to pulmonary disease, or may occur independently of any lesion in the lung proper. Tuberculous peritonitis may be primary, but is more frequently associated with tuberculous disease of some adjacent organs. In some cases minute tubercles are scattered over a part or all of the peritoneum and are usually accompanied by a serous or serofibrinous exudate. Tuberculous pericarditis may be primary or secondary, acute or chronic. In the acute miliary form the membrane is studded with tubercles and there is usually some serofibrinous exudate. In chronic cases the membrane is thickened, adherent, and usually

shows several cheesy tubercular masses. The bronchial and mediastinal lymph nodes are regularly involved.

Tuberculosis occurs in bones, periosteum, and joints. Abscesses are sometimes formed, and the adjacent joints are frequently involved. The spongy parts of the bone are more susceptible than the hard parts. The vertebrae, carpal and tarsal bones are most commonly affected. The chronic, purulent periostitis of poorly nourished children is frequently tuberculous. For description of the lesion in tuberculous arthritis, see **SYNOVITIS**.

Genitourinary System. Tuberculosis of the kidney may be primary or secondary. There may be small nodules in the kidney proper, or in the pelvis; or there may be quite large areas of tubercular tissue with necrosis. These may occur in only one kidney or in both kidneys. With much destruction of kidney tissue, cavities or cysts are formed, in some cases the kidney being almost wholly replaced by cysts of various size. There is apt to be thickening of the pelvis and tubercle tissue in its walls. Tuberculosis of the ureter and bladder is almost always secondary, especially to disease of the kidney pelvis. Small tubercles or patches of tubercle tissue are present in the ureter or bladder walls. Tuberculosis of the testes and epididymis occurs as a primary lesion or, more frequently, secondary to lesions elsewhere. In tuberculosis of the Fallopian tubes, the tubes are enlarged, their walls thickened, and the lumen usually filled with cheesy matter. Both tubes are frequently involved. Adhesions and the formation of abscesses are common results.

Liver. Miliary tubercles of the liver are quite common as a part of a general miliary tuberculosis. Sometimes the tubercles are among the liver cells, in other cases they develop in the walls of the smaller bile vessels, forming abscesses. Large tuberculous patches having a diameter of an inch or more are sometimes found. In connection with the tuberculous process there may be a marked increase in the connective tissue of the liver, constituting what is known as a tuberculous cirrhosis.

Lips, Mouth, etc. In tuberculosis of the lips, which is a rare disease, there develops on the lip an extremely sensitive ulcer. This ulcer has much the appearance of an epithelioma or a chancre. Tuberculous laryngitis is most frequently secondary to tuberculosis of the lungs. Miliary tubercles form in the submucosa and are accompanied by a catarrhal inflammation of the mucous membrane. With necrosis of the tubercles, ulcers are formed. These ulcers often run together, involve adjacent parts, and determine extensive destruction of tissue. Tuberculosis of the tongue is marked by the appearance of small nodules on the upper surface or edge of the organ. These open on the surface and become ulcers. It is a rare condition except when associated with tuberculosis of other parts. Tuberculosis also occurs in the palate, tonsils, pharynx, oesophagus, and stomach. The lesions are similar to those described in other mucous membranes, i.e., the formation of nodules, a catarrhal inflammation, and necrosis with the formation of ulcers.

Intestines. In tuberculosis of the intestines there is involvement of Peyer's patches and of the solitary lymph nodules as well as ulcers of the mucous membrane between the patches. As a primary lesion it is extremely rare in adults,

much less rare in children, where there is apt to be involvement of the mesenteric glands or a tubercular peritonitis. In the secondary form of the disease in adults the lungs are the usual seat of the primary lesion. The ulcers occur chiefly in the colon, caecum, and ileum. They may be very extensive, affecting the greater portion of the mucous membrane of both large and small intestines. The ulcers are irregular in shape, rough in outline, their long axes transverse to the lumen of the gut. They usually involve not only the mucous membrane, but also the submucosa and muscular coats. They rarely perforate. With healing of the ulcers, extensive scar tissues may form, so contracting the bowel as to cause stenosis. Not uncommonly tubercles are present on the peritoneum adjacent to the intestinal ulcers. Tuberculosis of the rectum is quite frequently associated with fistula, the fistula being of the nature of a tuberculous ulcer.

Tuberculous lesions may occur in the brain as part of a general process. In such cases it affects the meninges, causing meningitis, usually associated with an increase in the fluid within the ventricles (acute hydrocephalus). In chronic tuberculous of the brain the lesion is a meningoencephalitis, the tubercles affecting both meninges and brain tissue proper. The lesion is usually localized and there are in most cases several nodules, usually attached to the pia mater and extending from the surface into the brain. The nodules may interfere with cerebral circulation, causing softening, or may incite an acute meningitis. The pia is apt to be thickened and adherent to the brain surface. Instead of several nodules there may be one large solitary tubercle. Lesions similar to those described for the brain may occur in the cord either with or without brain lesions. See the articles **BACTERIA**; **DISEASE**, **GERM THEORY OF**.

In the early part of the twentieth century an active fight was waged in the United States against this scourge. According to the National Association for the Study and Prevention of Tuberculosis, there was spent in 1915 over \$22,000,000 for antituberculosis work in the United States; over 100,000 people were employed in the campaign against this disease; there were 800 open-air schools, fresh-air classes, and special institutions for tuberculous and anemic children; 450 tuberculosis dispensaries and clinics which treated annually over 100,000 cases; 600 sanatoria, hospitals, and day camps, having a total bed capacity of over 35,000; 1500 antituberculosis associations and committees, including 50 State organizations. The death rate from pulmonary tuberculosis in the registration area for 1913 was 127.7 per 100,000 population.

TUBERCULOSIS, IN ANIMALS. This disease in the lower animals is now recognized as caused by three types of the *Bacillus tuberculosis* distinct from the human type, viz., the bovine and avian types and the type occurring in cold-blooded animals. Horses, sheep, goats, and dogs are rarely affected; poultry and parrots frequently; cattle and hogs most commonly. The annual loss in the United States due to tuberculosis in farm animals was estimated by the Secretary of Agriculture in 1915 as no less than \$25,000,000 and was surpassed only by the loss from hog cholera and from Texas fever and the cattle tick. In order to emphasize the importance of this affection from the public-health standpoint it should be pointed out that the bovine type when ingested in milk by children may produce tuberculosis—forms other than phthisis. As a result of investigations and statistical studies, Park and Krumwiede, well-known authorities, have found that from 6 to 10 per cent of all deaths of young children due to tuberculosis are caused by the bovine type. The cases of tuberculous adenitis and abdominal tuberculosis of children were indeed found to be more often caused by the bovine than by the human type. It is known that the avian type may be transmitted to other farm stock, particularly the pig. Both the bovine and human types may cause the disease in parrots, the bovine being the more virulent. Other birds of domestication possess considerable resistance to infection with tubercle bacilli of the mammalian types.

European and American statistics from tuberculin tests and from meat inspection indicate that from 5 to 50 per cent of the cattle are affected. Tubercles may be found locally or generally distributed in the respiratory, alimentary, and lymphatic structures and in the bones of the animal examined. For the detection of incipient cases of tuberculosis in cattle tuberculin is usually employed. This substance contains what is called the toxin produced during the growth of the bacillus, but does not contain the living organism. When subcutaneously injected into healthy cattle tuberculin produces no reaction, but in more than 99 per cent of affected cattle an elevation of from 1.5 to 3° or more of body temperature and a slight swelling at the point of injection are looked for. Animals which show these symptoms are tuberculous and should be separated from the rest of the herd. The tuberculin may also be applied in several other ways, which are known as the ophthalmic, dermal, and intradermal tuberculin tests.

Treatment of the disease in the domestic animals is not seriously considered by any authorities at the present time. In suppressing the disease animals reacting to the tuberculin test are slaughtered. In the early stages of the disease much of the meat may be saved for food. Several other methods of procedure have been suggested for use with valuable breeding animals that are affected. Of these, the method of Bang has been the most widely employed, especially in

Denmark, Sweden, and Norway. This consists in the destruction of animals in which the disease can be detected without the aid of the tuberculin test, and the separation and isolation of other animals that react to the test. Since calves reared from affected animals are usually born healthy, they may be removed at birth from the isolated cows and be brought up by hand or upon healthy cows. The milk of reacting cows may be used if it is first boiled or pasteurized. Preventive measures are cleanliness, airy quarters, pure water and food, and free range upon good, well-managed pastures.

TUBEROSE (*Polianthes tuberosa*).

TUBEROSE, tūb'rōs' or tū'bēr-ōs' (from Lat. *tuberosa*, fem. sing. of *tuberosus*, tuberos, from *tuber*, swelling, tumor, knob on plants; associated by popular etymology with Eng. *tube*

rose), *Polianthes tuberosa*. The only species of its genus, which belongs to the family Amaryllidaceae. The plant, which is a native of Mexico, has a tall stem with long leaves at the base and shorter ones towards the top of the several-flowered spike of very fragrant white blossoms. The plant grows well in mild climates, but it bears the open air in northern countries only during the summer. Near Grasse, in southern France, the tuberose is largely grown as a source of perfume. The popularity of a double-flowered form has suffered from its too extensive use in funeral designs, etc. In outdoor culture in mild climates the plants are not disturbed during the winter, but in northern climates the tuberous rootstocks are taken up and stored in a dry, frost-proof place. In the colder regions where the bulbs fail to mature completely they are imported usually towards the end of the year, planted in pots, and given bottom heat. When danger of frost has passed they are set in light, moist, and rich soil and kept well supplied with water.

TUBES. See PIPE.

TUBES OF FORCE. See ELECTRICITY.

TUBES OF INDUCTION, TUBES OF MAGNETIC FORCE. See MAGNETISM.

TUBEUF, tü'béf', KARL, BARON VON (1862-). A German botanist, born at Amorbach. He studied at the University of Munich, where he taught from 1885, becoming professor of the anatomy, physiology, and pathology of plants in 1902. He was chosen a member of the Imperial Board of Health in 1899, and was appointed director of its biological section in 1901. He founded and edited several scientific journals, and published: *Samen, Früchte, und Keimlinge der in Deutschland heimischen oder eingeführten forstlichen Kulturpflanzen* (1891); *Pflanzenkrankheiten, durch kryptogame Parasiten verursacht* (1895; Eng. trans., *Diseases of Plants Induced by Cryptogamic Parasites*, 1897); *Die Nadelhölzer* (1897); *Studien über die Brandkrankheiten des Getreides* (1901); *Wandtafeln über Bauholzerstörer* (1910).

TUBE WEAVER. Any one of the tube-building spiders of the families Drassidæ and Clubionidæ. They are, as a rule, dark-colored spiders, which spin no web, but wander about at night in search of prey and hide during the daytime. They make silken tubes in which they hide in the winter and while molting or laying eggs. See SPIDER.

TUBIÈRES, tü'byâr', ANNE CLAUDE PHILIPPE DE. See CAYLUS, COUNT DE.

TUBIGÓN, too'bë-gôn'. A town of Bohol, Philippines, situated about 28 miles northeast of Tagbilaran (Map: Philippine Islands, E 6). Pop., 1903, 15,168.

TÜBINGEN, tü'bing-en. A town of Württemberg, Germany, crowning a hill on the upper Neckar, 18 miles south-southwest of Stuttgart, on the edge of the Black Forest (Map: Germany, C 4). It owes its celebrity chiefly to the ancient university. (See TUBINGEN, UNIVERSITY OF.) The antique houses and narrow streets of the old part of the town give it a quaint appearance. St. George's Church (*Stiftskirche*) contains a beautiful choir, and the Roman Catholic church is a superb edifice. The town hall is an interesting timber-built structure, recently restored. The poet Uhland, who was born in Tübingen, is commemorated by a fine statue. On a hill above the city stands the interesting Renaissance

castle, Hohentübingen, completed in 1540. It affords a magnificent view. The university library and observatory are here. North of Tübingen is the Cistercian monastery of Bebenhausen (1185), an exceptionally fine example of Gothic architecture. It has beautiful cloisters and an art collection. The Protestant seminary, dating from 1536, became noted under Baur, who founded the Tübingen school of theology. (See TUBINGEN SCHOOL.) There is also a Roman Catholic seminary. Both of these institutions possess good libraries. The town has a surgical clinic, a woman's hospital, and a hospital for the insane. The manufacture of surgical and scientific instruments, book printing, and the cultivation of hops and the vine are the leading industries. Pop., 1900, 15,338; 1910, 16,809, nearly all Protestants.

Consult K. Fink, *Tübingen* (Zurich, 1891), and Klüpfel and Eifert, *Geschichte und Beschreibung der Stadt und Universität Tübingen* (2 vols., Tübingen, 1894).

TÜBINGEN, UNIVERSITY OF. A German university, founded in 1477 by Count Eberhard im Bart of Württemberg. It was organized with the usual four faculties. Reuchlin, Melancthon, and Heinrich Bebel taught there at various times. Under Dukes Ulrich and Christopher, the university took an active part in the Reformation. What made the university famous in its early days and since is the Protestant seminary established in 1536 for the education of evangelical ministers, which is directly under the Minister of Public Worship and Education. It thus became the leading theological university in Germany. The institution maintained a steady growth until the establishment of the Karlschule by Duke Charles Eugene, when it suffered a temporary decline. King Frederick took away from the university in 1811 most of its rights and privileges. In 1817 the Catholic university founded at Ellwangen in 1812 was united with Tübingen, and a Roman Catholic theological faculty was added; at the same time the faculty of political science was created, and in 1863 was added the natural science faculty. In the nineteenth century the institution experienced a vigorous growth, due chiefly to the great theologians, such as Baur, the head of the Tübingen school of criticism, Strauss, and many others. Since 1832 the whole university has practically been rebuilt. The university consists of the following faculties: (1) Evangelical-theological; (2) Catholic-theological; (3) law; (4) medicine; (5) natural science; (6) philosophy; (7) political science. It includes numerous seminaries, laboratories, and clinics. The library now contains over 550,000 volumes and nearly 4213 manuscripts. The attendance in 1913 was 2329. Consult references under TUBINGEN.

TÜBINGEN SCHOOL. A term applied to a modern theological movement which had its origin in the teachings of Ferdinand Christian Baur (q.v.), of the University of Tübingen. Though he was unwilling to admit that he was a disciple of Hegel, Baur's distinctive and guiding principles were those of the Hegelian philosophy. It was his aim to reconstruct the history of early Christianity so that it would be seen to be in harmony with the laws which everywhere govern historical evolution. He began his critical work with the Apostolic age. In 1831 he published his essay *Die Christuspartei in der korinthischen Gemeinde, der Gegensatz des paulinischen und petrinischen Christentums*

in der ältesten Kirche, der Apostel Petrus in Rom. In this were foreshadowed all his later critical results. His position was that the early Apostolic church was split into two hostile factions, Pauline (Gentile) and Petrine (Jewish), between which there was a bitter conflict. Although an element of Jewish Christianity (the Ebionites) remained unreconciled to the last, the Pauline party (mainly after Paul's death) made concessions, and thus brought about a reconciliation which resulted in the establishment of the Old Catholic church. These views were elaborated and fully stated in the works: *Ueber die sogenannten Pastoralbriefe* (1835, the same year in which Strauss's *Leben Jesu* appeared); *Paulus der Apostel Jesu Christi, sein Leben und Wirken, seine Briefe und seine Lehre* (1845; 2d ed., 1866); *Die kanonischen Evangelien* (1847); and *Das Christentum und die christliche Kirche der drei ersten Jahrhunderte* (1853). Baur's position led him necessarily into a thorough reconstruction of the history of the origin of the New Testament literature. His theory demanded that the New Testament books in which the evidences of the conflict were most patent, or in which either of the two conflicting views was positively stated, should be considered earliest in date. Therefore, Paul's four genuine letters (Rom., 1 and 2 Cor., and Gal.) of the Pauline wing, and the Apocalypse by John, with the early Hebrew form of the Gospel of Matthew, of the Petrine or Jewish wing, were named as the earliest productions of the Apostolic church. The other books were dated according to the exigencies of the general theory—Mark, as altogether neutral, being set down as the latest of the Synoptics, and with our Greek Matthew, Luke, Acts, John, and the Pastoral Epistles placed very late, altogether outside of the Apostolic age. In Acts, in particular, the desire to reconcile the two parties, even at the expense of genuine Paulinism, was said to be quite manifest. This criticism, based on the supposed tendency (*Tendenz*) of the New Testament documents and now known as "tendency criticism" (*Tendenzkritik*), was thoroughly under the control of the Hegelian conception of the history, in accordance with which it moves from unity through conflict into reunity, embodying, as Hegel formulated it, the principles of "thesis, antithesis, and synthesis." Baur's theory, practically unaltered, was advocated with great brilliancy by E. Zeller in the organ of the school, the *Theologische Jahrbücher* (from 1842 on), and in *Die Apostelgeschichte nach ihrem Inhalt und Ursprung* (1856), by A. Schweigler in *Das nachapostolische Zeitalter* (1846), and by Karl Planck and Karl Köstlin in various publications. Others of the school differed from the master in important details, though fully accepting his main principle. Of these Volkmar in Switzerland, Hilgenfeld and Holsten in Germany, Scholten in Holland, S. Davidson in England, may be cited as representatives. David F. Strauss (1808–1874) and Bruno Bauer (1809–1882) are often spoken of as representatives of the Tübingen School. This, however, is not strictly correct as far as Strauss is concerned. He was influenced both by Hegel and by Baur in his early years, but that was before Baur himself had fully formulated his views, though Bruno Bauer wrote under the full influence of the movement. In fact, the position of Strauss and of Bruno Bauer was, if anything, hostile to that of the Tübingen School, carrying the natu-

ralistic principles of the school out to their logical results, and saying, in the case of Strauss, that on this basis there was no outcome short of a mythical history, and, in the case of Bauer, that on this basis there was no issue but an unhistorical literature.

The most important defection in the ranks of Baur's disciples was that of Albrecht Ritschl (q.v.), who in the second edition of his *Die Entstehung der altkatholischen Kirche* (1857) asserted that it was a mistake to explain the origin of Old Catholic Christianity as a union of early Jewish, or Petrine, Christianity and modified Paulinism. His trenchant criticism and that of others gradually showed the baselessness of many of Baur's positions. At his death in 1858 it was already evident that the dates he assigned to New Testament books could no longer be defended. The whole theory, in fact, as originally formulated by Baur, has no advocates at the present time, although some scholars, while independent of any formal adhesion to Baur's theory, are at one with the great Tübingen professor on important points.

Bibliography. Besides the writings noted above, consult I. A. Dorner, *History of Protestant Theology* (Eng. trans., 2 vols., Edinburgh, 1871); R. M. Mackay, *The Tübingen School and its Adherents* (London, 1863); E. Reuss, *Geschichte der heiligen Schriften des Neuen Testaments* (2d ed., Brunswick, 1890); Otto Pfleiderer, *Development of Theology in Germany since Kant* (London, 1890); A. C. Zenos, *The Elements of the Higher Criticism* (New York, 1895); H. S. Nash, *The History of the Higher Criticism of the New Testament* (ib., 1906); E. C. Moore, *An Outline of the History of Christian Thought since Kant* (1912).

TUBULAR BRIDGE. See BRIDGE.

TUBULIFLORÆ. One of the great divisions of Composite (q.v.), including the forms in which the corolla of all the perfect flowers is tubular. When ray flowers are present they are either pistillate or neutral. The genera *Eupatorium*, *Aster*, and *Helianthus* (sunflower) are good representatives of this series. The contrasting division is *Ligulifloræ*, in which all the flowers are ligulate, as in *Taraxacum* (dandelion).

TUBURÁN, tōōbōō-rān'. A town of Cebú, Philippines, situated on the west coast, 32 miles north of Cebú (Map: Philippine Islands, D 5). Pop., 1903, 19,158.

TUBUS. A Nigritian people. See TIBBUS.

TUCANO, tōō-kā'nō. A tribe residing upon the Uaupés River, on the Brazil-Colombia border, and supposed to be remotely of Arawakan stock (q.v.). They take their name from the toucan bird. They tattoo three lines upon each cheek, build circular houses of poles covered with palm leaves, are good canoemen, and are noted for their skill with the blowgun.

TUCK, FRIAR. The jolly chaplain and boon companion of Robin Hood and his men.

TUCKAHOE, tūk'a-hō'. A village in Westchester Co., N. Y., 4 miles from New York City's northern limits, on the New York Central Railroad (Map: New York, B 2). It is the seat of Concordia College. There are lime and marble-dust works, marble quarries, and manufactories of rubber goods, wire, furniture, grease guns, and cabinets. Pop., 1910, 2722; 1915 (State census), 2753.

TUCKER, ABRAHAM (1705–74). An English moralist, born in London. He studied at Merton

College, Oxford, and was entered at the Inner Temple, but never called to the bar. Inheriting a fortune from his father, he purchased in 1727 Betchworth Castle and estate, near Dorking, in Surrey. During his last years he was blind. Tucker's great work is entitled *The Light of Nature Pursued* (1768-78). It was begun in 1756, and occupied most of his remaining years. It extended to seven volumes, four of which were published in the author's lifetime, under the pseudonym of Edward Search. It consists of disquisitions on metaphysics, theology, and morals, of remarkable originality, simplicity of humor, and ingenuity of illustration. Consult his *Works*, edited with a *Life* by H. Mildmay (London, 1805; several times reprinted).

TUCKER, ALFRED ROBERT (1849-1914). An English bishop, born at Windermere and educated at Christ Church, Oxford. Ordained in 1882, he was curate at Clifton and Durham and was also identified with the work of the Church Missionary Society. He performed notably fruitful service as Bishop of Eastern Equatorial Africa, or Mombasa, from 1890 to 1899, and then, the territory having been divided, as Bishop of Uganda. In 1911 he visited England to raise funds for new buildings for the mission, and while there was offered the canonry of Durham, which he accepted and held until his death. He published *Eighteen Years in Uganda and East Africa* (2 vols., 1908; new ed., 1911).

TUCKER, BENJAMIN R. (ICKETSON) (1854-). An American anarchist, born near New Bedford, Mass. He studied at the Massachusetts Institute of Technology, worked in a printing office, and in 1878 joined the editorial staff of a Boston newspaper. Through the influence of Josiah Warren (q.v.) and others he became interested in radical thought, and made a special study of Proudhon's philosophy. In 1877 he founded a quarterly, *The Radical Review*, which failed of support, but the journal *Liberty*, established in 1881, came to be known as one of the leading anarchist publications. Tucker adopted Proudhon's views on economy, but in other respects his philosophy closely follows Herbert Spencer. Besides translations from Bakunin, Proudhon, and others his writings include *Instead of a Book* (1893; 2d ed., 1897), which, in part, gives his philosophy of anarchism, and *State Socialism and Anarchism* (1899). See ANARCHISM, *History of the Theory*.

TUCKER, GEORGE (1775-1861). An American author, born in Bermuda. He was graduated at William and Mary College in 1797, studied law, practiced at Lynchburg, was a member of the Virginia Legislature, and of Congress (1819-25), gained distinction as a debater and constitutional lawyer, and was (1825-45) professor of moral philosophy and political economy in the University of Virginia. He was a frequent contributor to political periodicals, and published, among many other works, *Letters on the Conspiracy of Slaves in Virginia* (1800); *The Valley of the Shenandoah* (1824), a novel; *A Voyage to the Moon*, a satirical romance (1827); *Principles of Rent, Wages, and Profits* (1837); *Life of Thomas Jefferson* (1837); *The Theory of Money and Banks Investigated* (1839); *Progress of the United States in Population and Wealth in Fifty Years* (1843); *History of the United States (to 1841, 1856-58)*; *Banks or No Banks* (1857); *Essays, Moral and Philosophical* (1860). His *History of the United States* is still a work of some importance.

TUCKER, HENRY ST. GEORGE (1780-1848). An American lawyer, son of St. George Tucker (1752-1828) and father of John Randolph Tucker (1823-97) (qq.v.). Born at Williamsburg, Va., and educated at William and Mary College, he practiced law at Winchester, Va., served as a volunteer officer in the War of 1812, and was a member of Congress in 1815-19, and a member of the Virginia Senate in 1819-23. Tucker served also as Chancellor of the State (1824-31), as president-judge of the Virginia Court of Appeals (1831-41), and as professor of law at the University of Virginia (1841-45). He published: *Commentaries on the Law of Virginia* (2 vols., 1836-37); *Lectures on Constitutional Law* (1843); *Lectures on Natural Law and Government* (1844).

TUCKER, HENRY ST. GEORGE (1853-). An American lawyer and legal scholar, born at Winchester, Va. He was educated at Washington and Lee University (A.M., 1875; LL.B., 1876), and after admission to the bar practiced at Staunton. He served as a Representative in Congress from 1889 to 1897. He then succeeded his father, John Randolph Tucker (1823-97) (q.v.), as professor of constitutional and international law at Washington and Lee, being also dean of the law school from 1899 to 1902, and from 1903 to 1905 was a dean at Columbian (now George Washington) University. In 1904-05 he was president of the American Bar Association and in 1905-07 president of the Jamestown Tercentenary Exposition. In 1914 he was Commissioner General to the Panama-Pacific Exposition. He was editor of *Tucker on the Constitution* (1899), and wrote *Limitations on the Treaty-Making Power* (1915).

TUCKER, JOHN RANDOLPH (1812-83). An American naval officer, born at Alexandria, Va. He entered the United States navy as a midshipman in 1826, and in 1855 reached the rank of commodore. In 1861 Tucker resigned his commission and entered the Confederate service. In command of the *Patrick Henry*, he took part in the Hampton Roads engagements, receiving command of the wooden fleet after the *Monitor-Merimac* battle, and assisted in the repulse of the Union squadron at Drury's Bluff. He was promoted captain in May, 1863, commanded at Charleston and at Drury's Bluff, and after the evacuation of Richmond was with Lee's retreating army. In 1866 Tucker became commander of the Peruvian navy, with the rank of rear admiral, and he commanded the naval forces of Peru and Chile in their war with Spain. Subsequently he explored parts of the upper Amazon region. He died at Petersburg, Va.

TUCKER, JOHN RANDOLPH (1823-97). An American congressman, son of Henry St. George Tucker (1780-1848) (q.v.). He was born at Winchester, Va., and graduated in law at the University of Virginia in 1844. He was elected Attorney-General of Virginia in 1857 and was re-elected in 1859 and 1863. At Washington and Lee University he served as professor of equity and public law in 1870-74, and thereafter until 1887 was a member of the national House of Representatives, where he won distinction as an orator. Subsequently he returned to occupy a chair at Washington and Lee, where later he also became dean of the law school. At his death, Henry St. George Tucker (q.v.), his son, succeeded to his professorship. In 1892-93 he was president of the American Bar Association.

TUCKER, JOSIAH (1712-99). An English economist and divine, the son of a Welsh farmer. He was educated at St. John's College, graduating in 1736. He became rector of St. Stephen's, Bristol (1749), and dean of Gloucester (1758). In 1755 he received from Oxford the degree of D.D. Tucker was a careful writer on political economy and religious subjects. He also published pamphlets advocating separation in the beginning of the contest between the English government and its American colonies. As an economist he has some claims as a forerunner of Adam Smith (q.v.), but Tucker elaborated no system. Consult W. E. Clark, *Josiah Tucker* (New York, 1903).

TUCKER, NATHANIEL BEVERLEY (1784-1851). An American lawyer, son of St. George Tucker. He was born at Williamsburg, Va., was educated at William and Mary College, studied law and practiced in Virginia until 1815, when he removed to Missouri. He was a judge in the Circuit Court until 1830 and professor of law in William and Mary College (1834-51). He published works on *Pleading and Constitutional Law* and several practical essays. His best literary effort was his novel, *The Partisan Leader, a Tale of the Future* (1836). He also wrote *Balcombe* (1836).

TUCKER, ST. GEORGE (1752-1828). An American lawyer, born in Bermuda. He came early to Virginia and was educated at William and Mary College, after which he was called to the bar. During the Revolutionary War he commanded a regiment at Yorktown, where he was badly wounded. In 1778 he married the mother of the afterward celebrated John Randolph of Roanoke. He served in the Legislature, but won his chief distinction as professor of law in William and Mary, and as presiding judge of the Virginia Court of Appeals and of the United States District Court. He is still remembered for a scholarly edition of Blackstone's *Commentaries* (1803) and for a single lyric beginning "Days of my youth." He also published a *Dissertation on Slavery* (1796) and other politicolegal works, and composed poems and dramas. See also **TUCKER, HENRY ST. GEORGE** (1780-1848); **TUCKER, NATHANIEL BEVERLEY** (1784-1851).

TUCKER, SAMUEL (1747-1833). An American naval officer, born at Marblehead, Mass. The son of a shipmaster, he ran off to sea when 11 years old, became commander of a merchantman in 1768, and in January, 1776, was commissioned captain in the American navy. In command of the *Franklin* and later of the *Hancock*, he captured over 30 British vessels, and in March, 1777, was transferred to the frigate *Boston*, which (February, 1778) carried John Adams as Commissioner to France. After taking many prizes, he was forced to surrender at Charleston (May, 1780), but was soon exchanged, and as captain of the *Thorn* secured many prizes. In July, 1781, Tucker was again captured and released on parole. In 1813 he captured a British vessel which threatened the coast near his home (Bremen, Me.). He served in the Massachusetts Legislature (1814-18), helped frame the Maine constitution (1819), and sat in the Maine Legislature (1820-21). Consult Sheppard, *Life of Commodore Samuel Tucker* (Boston, 1868).

TUCKER, WILLIAM JEWETT (1839-1926). An American clergyman and educator. He was born at Griswold, Conn., and graduated from

Dartmouth in 1861 and from Andover Theological Seminary in 1866. He was pastor of the Madison Square Presbyterian Church, New York, in 1875-79; a professor at Andover in 1879-93, and thenceforth president of Dartmouth College until his retirement in 1909. He lectured at Lowell Institute, at Union Seminary, and at Yale Divinity School, was university preacher at Harvard, and founded Andover (now South End) House, a social settlement in Boston. His writings include: *From Liberty to Unity* (1892); *The Making and the Unmaking of the Preacher* (1898); *Public-Mindedness* (1910); *Personal Power* (1910); *The Function of the Church in Modern Society* (1911).

TUCKERMAN, BAYARD (1855-). An American author. He was born in New York, graduated from Harvard in 1878, and completed his studies in Paris. From 1898 to 1907 he lectured on English literature at Princeton. His writings include: *A History of English Prose Fiction* (1882); *Life of General La Fayette* (1889); *Diary of Philip Hone* (1889); *Peter Stuyvesant* (1893); *William Jay and the Constitutional Movement for the Abolition of Slavery* (1893); *Life of Philip Schuyler, 1733-1804* (1903).

TUCKERMAN, EDWARD (1817-86). An American botanist, born in Boston. He studied at Union College, at Harvard University, and abroad. He was professor of botany at Amherst from 1858 till his death. Although devoted to a variety of botanical studies, he made a specialty of lichenology, publishing: *A Synopsis of the Lichens of New England* (1848); *Genera Lichenum: An Arrangement of the North American Lichens* (1872); *A Synopsis of the North American Lichens* (part i, 1882; part ii, edited, with an appendix, by Henry Willey, 1888). His *Lichenes Americae Septentrionales Essiccati* (1847-55) contains 150 species. Consult the *Memoir* by W. G. Farlow (Washington, 1887).

TUCKERMAN, HENRY THEODORE (1813-71). An American critic and essayist, born in Boston and prominent in the literary life of New York City after 1845. The more important of his numerous publications were: *The Italian Sketchbook* (1835), *Isabel, or Sicily: A Pilgrimage* (1839), each the outcome of a residence in Italy; two volumes of verse, *Poems* (1851) and *A Sheaf of Verse* (1864); *Artist Life, or Sketches of American Painters* (1847); *Characteristics of Literature* (1849; 2d series, 1851); *America and her Commentators* (1864); *Thoughts on the Poets* (1864); and *Book of the Artists* (1867), a study of the progress of art in America.

TUCKERMAN, JOSEPH (1778-1840). An American clergyman and philanthropist. He was born in Boston; graduated at Harvard College (1798); studied theology, and became a Unitarian pastor in Chelsea in 1801. In 1826 he was appointed by the American Unitarian Association minister at large, devoting himself to mission work in Boston. He is best known as one of the founders of the first sailors' aid societies in the country (1812), and as one of the pioneers in the scientific direction of philanthropy. He wrote much in behalf of his projects. Consult the collection of his writings under the title *On the Elevation of the Poor* (Boston, 1874) and his *Life* by W. E. Channing (ib., 1841), and by Miss May Carpenter (London, 1849).

TUCO-TUCO, tōō'kō-tōō'kō. A small burrowing ratlike rodent, a spiny rat of the genus

Otenomys, several species of which are so called in imitation of their loud, treble call.

TUCSON, tōō-sōn'. The largest city of Arizona, and the county seat of Pima County, 135 miles southeast of Phoenix, on the Santa Cruz River, and on the El Paso and Southwestern, and the Southern Pacific railroads (Map: Arizona, D 5). It is the seat of the University of Arizona, opened in 1891, and of St. Joseph's Academy, and contains a Carnegie library, the Desert Botanical Laboratory of the Carnegie Institution, and the United States Magnetic Observatory. Cattle raising and copper mining are the leading industries of the surrounding district, which also has considerable agricultural resources. The industrial establishments of the city are for the most part connected with the mining industry, and there are some manufactories of wagons, harness, saddlery, and flour. Tucson adopted the city-manager form of government in 1915. Pop., 1900, 7531; 1910, 13,193; 1915 (U. S. est.), 16,177; 1920, 20,292.

Tucson was first permanently settled as a presidio by the Spaniards about 1776, though there had been previously a small Indian village, or rancharia (abandoned in 1763), under the control of the Spanish authorities. It lies within the territory obtained for the United States by the Gadsden Purchase of 1853. It was the capital of Arizona Territory from 1867 to 1877. Consult Bancroft, *History of New Mexico and Arizona* (San Francisco, 1880).

TUCUMÁN, tōō'kōō-mān'. The smallest and most densely populated province of Argentina (Map: Argentina, F 3). Area, 8928 square miles. The eastern portion is rolling, but the western portion becomes quite mountainous. The mountains, offshoots of the Andes, afford extensive forests in the valleys, and some mines of gold, silver, and copper, but these are not extensively worked. Sugar and rum are the chief products, but cereals, rice, tobacco, grapes, and fruits are raised. The soil generally is fertile, but in some portions use must be made of irrigation. The population, largely mestizo, numbered in 1912 about 325,000. Capital, Tucumán (q.v.). Tucumán was originally a portion of the dominions of the Incas. After the conquest the Gobernación of Tucumán included many of the surrounding provinces, and was first subject to the Audiencia of Charcas, and after 1776 to the Viceroyalty of La Plata.

TUCUMÁN, or **SAN MIGUEL DE TUCUMÁN**. A city of Argentina, capital of the Province of Tucumán, 690 miles northwest of Buenos Aires, on a plateau to the right of the river Tala or Salí (Map: Argentina, F 3). It is a regularly built city, but with narrow streets. The cathedral is modern. It has a university, opened in 1914. It is rapidly becoming a commercial centre of importance. The city was founded in 1565. Here, July 9, 1816, the representatives of the Plata Provinces signed the declaration of independence from Spain. Pop., 1913 (est.), 79,000.

TUCUMÁ (tōō'kōō-má') **PALM**. See **ASTROCARYUM**.

TUCUMCARI, tōō'kūm-kār-i. A city and the county seat of Quay Co., N. Mex., about 350 miles southwest of Denver, Colo., on the Chicago, Rock Island, and Pacific and the El Paso and Southwestern railroads (Map: New Mexico, F 3). It contains a United States Land Office, a government experiment farm, and a city li-

brary. Tucumcari is a distribution point for coal and coke, has cattle-raising and wheat and corn growing interests, and manufactures sisal. Pop., 1910, 2526.

TUCUNA, tōō-kōō'ná. A wild tribe of the upper Amazon. See **TICUNA**.

TUCUXI, tōō-kōō'hě (South American name). A South American dolphin (*Sotalia guianensis*), very abundant in the Bay of Rio Janeiro, where the natives regard it as able to bring ashore drowned persons, and have other fanciful ideas in regard to it. The genus *Sotalia* is represented by other species in various parts of the world, some of which live wholly in fresh water. Consult F. E. Beddard, *Book of Whales* (London, 1900).

TUDELA, tōō-dā'lá. A town of the Province of Navarra, Spain, on the Ebro, here crossed by a bridge of 19 arches. It is 48 miles by rail from Saragossa (Map: Spain, E 1). Most of its important public buildings are modern, but it is especially famous for the Romanesque Colegiata (formerly the cathedral), which is regarded as one of the finest churches in Europe. The chief industries are the sawing of lumber, the manufacture of cloth, silk goods, earthenware, and the production of oil and wine. The best wine of Navarra, resembling Burgundy, is produced in this vicinity. Pop., 1900, 8996; 1910, 9072. Tudela fell into the hands of the Moors in the eighth century, but it was retaken by Alfonso I of Aragon in 1114. In 1808 the Spanish forces under Castaños were here defeated by the French under Lannes.

TUDELA, BENJAMIN OF. A mediæval traveler. See **BENJAMIN OF TUDELA**.

TU'DOR. The family name of the dynasty which occupied the throne of England from 1485 to 1603. Its founder was Owen Tudor, an obscure Welsh squire, who had five children by Catharine, daughter of Charles VI of France. Their son Edmund was made Earl of Richmond by Henry VI, kinsman of Edmund's wife, Margaret. It is through Margaret that the family derived its defective title to the crown. She was the heiress of the Beauforts, children of John of Gaunt by Catharine Swynford, who had been legitimized for every purpose except royal succession. Her son, Henry, Earl of Richmond, became head of the Lancastrian house in 1471, and in 1485, at Bosworth Field, defeated Richard III, who fell in the battle. Henry was able to secure the support of the Yorkist nobles upon promising to marry Elizabeth, the heiress of the York family. Parliament confirmed Henry's claim to reign of his own right, though the lawful heir was either his wife, Elizabeth, or, if females could not succeed her cousin Edward, the Earl of Warwick. The Tudor monarchs were Henry VII (1485-1509), Henry VIII (1509-47), Edward VI (1547-53), Mary (1553-58), and Elizabeth (1558-1603). The Stuart dynasty, which came to the throne in 1603, derived its title through Margaret, daughter of Henry VII, who married James IV of Scotland. During the Tudor period the crown was nearly absolute. The dynasty was strong and purposeful, and while the rights and functions of Parliament were not formally denied, its deliberations were controlled by royal influence over elections or by vigorous and tactful management. The local institutions kept their full vigor and the English people retained their training in self-government. When danger of feudal anarchy and foreign invasion had passed, and public safety

no longer required a strong executive, Tudor absolutism speedily disappeared under the weak and tactless Stuart dynasty. For details and bibliographies, see the names of the separate sovereigns. See also ROSES, WARS OF THE; YORK, HOUSE OF. Consult A. D. Innes, *England under the Tudors* (New York, 1905); C. R. Lumsden, *The Dawn of Modern England* (ib., 1910).

TUDOR, MARY (1496-1533). Queen of France. She was the daughter of Henry VII of England. In 1514 she was married to Louis XII of France and after his death, in 1515, to Charles Brandon, Duke of Suffolk. Her only child, a daughter, Frances, became the wife of Henry Grey, Marquis of Dorset, and was the mother of Lady Jane Grey.

TUDOR, WILLIAM (1779-1830). An American merchant and author, born in Boston. He was founder (1815) and first editor of the *North American Review*. He graduated at Harvard (1796), engaged in business, visited Europe, and on his return took part in founding the Anthology Club and contributed frequently to its magazine, *The Monthly Anthology* (1803-11). Out of this club grew the Boston Athenæum (1807), of which Tudor was also a founder. He originated the movement for erecting Bunker Hill Monument. In commerce he gained distinction as a pioneer in the ice trade with tropical countries. He was a member of the Massachusetts Legislature for some years, appointed United States Consul at Lima, Peru (1823), and chargé d'affaires in Brazil (1827). He published *Letters on the Eastern States* (1820), *Miscellanies* (1821), *Life of James Otis of Massachusetts* (1823), and an anonymous political allegory, *Gebel Teir* (1829), written in Rio de Janeiro, where he died.

TUDOR STYLE. In English architecture, a rather indefinite term applied to the late Perpendicular (q.v.) and the transition from that to Elizabethan (q.v.), especially as developed in nonecclesiastic buildings—schools, colleges, and mansions.

TUFA (It., calcareous rock). A name applied to any cryptocrystalline variety of calcium carbonate which has a cellular structure, especially those varieties deposited from springs or streams. A similar material emanating from volcanoes is known as *volcanic tufa*.

TUFF (Fr. *tuf*, *tuffe*, from It. *tufo*, *tufa*, from Lat. *tophus*, *tofus*, *tufa*, calcareous rock). Fragmental volcanic material when compacted together to form a rock. The material which by cementation of some kind has formed the tuff may be finely comminuted (volcanic ash or sand), or of larger fragments (lapilli and bombs). A large proportion of tuffs have been laid down under water, or have been carried by water in the form of volcanic mud. In rare cases they are composed largely of crystals. Unconsolidated volcanic fragments are called agglomerate, or agglomerate tuff. If large and angular fragments predominate in a tuff it is often called a volcanic breccia. Such breccias are produced when a stream of lava flows over and picks up an agglomerate, and also when certain viscous lavas flow down a slope. In the latter case the lava stream consolidates in a shell about a central molten mass, the shell constantly fracturing and as quickly healing its fractures by outflow and consolidation of molten material.

TUFTS, CORRON (1734-1815). An American physician, born in Medford, Mass. He graduated

at Harvard in 1749, studied medicine, and settled at Weymouth, Mass., and in 1765 wrote the instructions regarding the Stamp Act to the representatives of Weymouth in the Provincial Legislature. He was one of the founders of the Massachusetts Medical Society and of the American Academy of Arts and Sciences, being president of the former in 1787-95, and was a member of the State convention which ratified the Federal Constitution.

TUFTS, JAMES HAYDEN (1862-). An American philosophical scholar, born at Monson, Mass. He graduated from Amherst College in 1884, and from Yale Divinity School in 1889, and later studied at Berlin and Freiburg (Ph.D., 1892). At the University of Chicago, with which he was connected after 1892, he became professor of philosophy in 1900, and head of the department in 1905, and he served also as dean of the Senior College (1899-1904 and 1907-08). In 1914 he was president of the American Philosophical Association. He translated Windelband's *History of Philosophy* (1893; 2d ed., 1910); contributed to Baldwin's *Dictionary of Philosophy and Psychology* (1901); edited the *School Review* in 1906-09; and wrote *James Tufts, a Memorial* (1902), and *Ethics* (1908), with John Dewey.

TUFTS COLLEGE. An institution for higher education founded at Medford, Mass., in 1852. The campus embraces about 80 acres, on which are 20 buildings used for education and dormitory purposes. The associated schools which include the School of Liberal Arts, Jackson College for Women, the Engineering School, the Bromfield-Pearson School, the Crane Theological School, and the Graduate School are located at Medford. The Tufts College Medical and Dental schools and the one-year medical course are in Boston. The college also has an interest in the biological laboratories at Harpswell, Me. The degrees conferred are Bachelor of Arts, Bachelor of Science, Bachelor of Sacred Theology, Master of Arts, Master of Science, Doctor of Medicine, and Doctor of Dental Medicine. The Bromfield-Pearson School is a preparatory institution for the Engineering School. Among the notable buildings on the campus is the Barnum Museum of Natural History, built and maintained by a fund given by Phineas T. Barnum. This museum has a large zoological collection, especially large in skeletons, and mounted skins of mammals, including the skeleton of the famous elephant "Jumbo." The Eaton Library, the gift of Mr. Andrew Carnegie, contains about 73,000 volumes and 64,000 pamphlets. The total enrollment in all departments of the college in 1915-16 was 1541 students. Of these 509 were in the Dental School, 383 in the Medical School, 216 in the College of Liberal Arts, 192 in the Engineering School, and 96 in the Jackson College for Women. The faculty numbered 249, of whom 86 were of professorial grade. The total capital of the college in all departments including buildings at the end of the collegiate year 1915 was \$3,250,000. The buildings and grounds were valued at about \$1,500,000. The president in 1916 was Herman C. Bumpus, Ph.D.

TU FU, 土 浮 (712-770). A noted poet of China. He was born in 712 in Siangyangfu (q.v.) in the present Province of Hupeh, according to one authority, or in Tuling in Shensi, according to another. Through failure in literary examinations he lost official chances, but became

a professional poet, and produced three descriptive poems (742-755) which gained him favor from the reigning Emperor, and a position at court, where he became popular. This Emperor fled from rebels, but Tu Fu fell into their hands, escaping in 757. He was recalled by the new Emperor, and became a censor. Having defended an official who had incurred the displeasure of the Emperor, he fell into disgrace, was banished, and given the position of a subprefect in a small town of Shensi. This he promptly resigned and retired to Sze-chuen. In 761 a post was provided for him in connection with the Board of Works. This he held for six years, when he resumed his wandering life. The edition of his poems published in 1059 contained 1405 compositions. He is the most quoted poet in China. See specimens in H. A. Giles, *History of Chinese Literature* (New York, 1901).

TUGENDBUND, tō'gent-bunt'. An association organized at Königsberg, Prussia, in February, 1808, for the purpose of furthering the physical and moral regeneration of the Prussian people in the period of national degradation following the disasters of the years 1806-07 and the dismemberment of the Prussian Kingdom by Napoleon I at Tilsit. Its secret purpose was the overthrow of the French domination. It was dissolved in December, 1809, after it had accomplished much good in its self-appointed task of bringing to life the spirit of Prussian patriotism.

TUGUEGARAO, tō-gā'gà-rā'ō. The capital of the Province of Cagayán, Luzon, Philippines (Map: Philippine Islands, C 2). Cagayán is the most northern province of Luzon and is exceedingly mountainous. The climate is very severe in the winter, and not healthful in the summer, owing to the excessive humidity. The province is well watered and has a fertile soil; its area is 5052 square miles. Pop., 1903, 156,239. The capital is situated on the river Cagayán, in the southern part of the province. It has a town hall, courthouse, and a government building. Pop., 1903, 16,105.

TUI, tōw'è. See PARSON BIRD.

TUILERIES, twél'rè' (Fr., tile works). A former royal palace in Paris, situated on the right bank of the Seine, on ground originally occupied by tile yards. The site was acquired by Louise of Savoy, mother of Francis I, in 1527, and the erection of the palace was begun about 1565 by Catharine de' Medici, under the direction of Philibert de l'Orme (q.v.). The main structure of the original palace comprised a central pavilion crowned by a cupola, flanked by low wings, forming part of a plan for a grandiose palace of many courts. With the death of De l'Orme in 1570 this vast plan was abandoned, and the wings were completed by Jean Bullant. Henry IV caused the erection of the Pavillon de Flore on the south wing and began the construction of a long gallery connecting it with the Louvre' (q.v.). Under Louis XIV the central pavilion was greatly enlarged, the wings increased in depth and height, and the Pavillon de Marsan on the north wing was erected. In spite of its imposing size, the palace possessed little artistic interest, owing to the inharmonious diversity of architectural form of its long façade. Before the Revolution it was intermittently a royal residence, though frequently the scene of splendid fêtes; in its theatre were given plays of Corneille, Molière, and Voltaire. On Oct. 6, 1789, Louis XVI and the royal family, brought

by the Parisian mob from Versailles, took up their residence in the Tuileries. It was invaded by a mob on June 20, 1792, without great harm. On August 10, however, the organized sections of Paris stormed the Tuileries and after a bloody battle cut down the Swiss Guard, who, after defending its great stairway with devoted courage, were ordered by the King to lay down their arms. The royal family were forced to take refuge in the hall of the Assembly and thence were removed to the Temple. In 1793 the Convention began to hold sessions in the north wing, the Pavillon de Marsan being given up to committee rooms, administrative offices, etc. After the establishment of the Consulate the Tuileries became the residence of Napoleon, and, with changes in internal construction, it remained the residence of the rulers of France to the fall of the Second Empire (excepting 1848-52). During the War of the Commune in 1871 the palace was set on fire (May 24) at the orders, it is supposed, of the Communist leaders. In the night of May 24-25 heavy explosions of gunpowder completed the ruin of the main structure. The right wing, containing the Pavillon de Flore, escaped destruction. The Pavillon de Marsan was restored in 1875-78, and the Pavillon de Flore, with the adjacent Grande Galerie, was reconstructed about the same time on a modified design. The ruins of the main buildings were removed in 1883. The Garden of the Tuileries, covering about 75 acres, lies between the Place de la Concorde, the site of the palace, the Rue de Rivoli, and the Quai des Tuileries. It was laid out by Le Nôtre in the time of Louis XIV, but has undergone extensive changes, especially under the Second Empire. The garden contains notable examples of sculpture; it is a popular resort of Parisians, especially as a playground for children. See PARIS.

TUISTO. See MANNUS.

TUKARAM, tu-ká'rám. See MARATHI.

TUKE, DANIEL HACK (1827-95). A celebrated English alienist, born at York. He studied medicine at St. Bartholomew's Hospital College, of London, and in 1852 became a member of the Royal College of Surgeons, of which he became a fellow in 1857. He was afterward visiting physician to the York retreat for the insane, and subsequently medical practitioner at Falmouth and London. He wrote many essays for scientific periodicals on the treatment of insanity, and was coeditor of the *Journal of Mental Sciences*, 1878-92. He wrote a prize essay on the *Progressive Changes which have taken place since the time of Pinel, in the Moral Management of the Insane* (1854); *Illustrations of the Influence of the Mind upon the Body, etc.* (1872; 2d ed., 2 vols., 1884); *Insanity in Ancient and Modern Life* (1878); *Chapters in the History of the Insane in the British Isles* (1882); and a *Dictionary of Psychological Medicine* (2 vols., 1892).

TUKE, HENRY (1755-1814). A Quaker writer born at York, England. His father was William Tuke (q.v.), one of the founders of the first asylum for humane treatment of the insane. After his education in liberal studies he engaged in business with his father at York, and at the age of 25 he became a minister of the Society of Friends. His books were extensively read at home and some of them were translated into French, German, and Danish. The chief of them are: *The Faith of the People Called Quakers* (1801); *The Principles of Religion as Professed by the Society of Christians Usually called Quakers*

ers (1805); and *The Life of George Fox* (1813). —His son, SAMUEL TUKE (1784–1857), studied medicine and became widely known for his strenuous defense of the asylum at York, and for varied philanthropic work. Among his publications are *Descriptions of the Retreat* (1813), concerned with the establishment which his father and grandfather had founded, and constituting the earliest account of the humane treatment of the insane; and *Practical Hints on the Construction and Economy of Pauper Lunatic Asylums* (1815), which is also important in the history of the treatment of the insane.

TUKE, WILLIAM (1732–1822). An English philanthropist. He was born in York, was a Quaker in religion, and engaged in mercantile pursuits the greater part of his life, but found time for many works of benevolence. His greatest achievement was the opening of the York Retreat in 1796, the first institution in England where the insane were treated with kindness and humanity. In this undertaking he had the aid of his son Henry, Lindley Murray, and other Quakers. His descendants have been prominent in British philanthropy. Tuke's biography was written by his great-grandson (York, 1856).

TULA, тӯла. A government of central Russia. Area, about 11,960 square miles (Map: Russia, E 4). It belongs to the central Russian plateau and has an undulating surface cut by deep river valleys. It is watered chiefly by the Oka and its tributaries and the Don. Tula belongs to the black soil belt of Russia. In the southwest are deposits of coal, and iron ore is found in all parts. Agriculture is the main occupation, but the household industries are also remarkably developed. Bee raising is another important industry. The chief manufactured products are small metal articles, samovars (teakettles), wagons, musical instruments, arms, etc. The trade in grain is extensive. Pop., 1897, 1,419,456; 1912, 1,829,200.

TULA. The capital of the Government of Tula in Russia, situated on the Upa, 121 miles south of Moscow (Map: Russia, E 4). It is an interesting and important town, with an old kremlin rising above the river, an extensive government arms factory and a museum. Tula has also a number of private arms factories, and extensive metal works, where the samovars (see SAMOVAR) for which Tula is famous are manufactured. Its favorable geographical position, together with its mines, have promoted the town's commercial development. Pop., 1911, 136,530.

TULA. A Mexican town of the State of Hidalgo, 45 miles by rail north of the city of Mexico, on the Tula (or Montezuma) River (Map: Mexico, J 7). The town, the ancient capital Tollan, is believed to have been founded by the Toltecs, and contains the ruins known as Montezuma's Palace, and others of interest attributed to those people. It is situated at an elevation of 6766 feet above the sea. The fortress-like church and cloister of San José date from 1553. There are some cotton manufacturing establishments. Pop., about 5000.

TULA. A town in the State of Tamaulipas, Mexico, 61 miles southwest of Victoria (Map: Mexico, J 6). It is an important commercial centre in a rich agricultural district producing chiefly ixtle. Pop., 1910, 6707.

TULALIP, тӯл-л'ип (North American Indian, bay, inlet). A tribe of Salishan stock (q.v.) occupying a reservation of 36 square

miles on Tulalip Bay, an eastern inlet of Puget Sound, Washington. They are a division of the Twana. See SALISHAN STOCK.

TULANE, тū-lān', PAUL (1801–87). An American philanthropist, born near Princeton, N. J. He received a common-school education and in early life removed to New Orleans, where he engaged in business and acquired great wealth. He retired in 1867, and returned to Princeton. He was the founder of Tulane University (q.v.).

TULANE UNIVERSITY OF LOUISIANA. An institution at New Orleans, La., organized on its present basis in 1884, when the State placed the existing University of Louisiana, chartered in 1845, under the perpetual care of the Board of Administrators of the Tulane Educational Fund. In 1882 Paul Tulane (q.v.) gave his property in that city for the higher education of the "white young persons in the city of New Orleans." His donations up to the time of his death amounted to \$1,050,000. The university consists of the Graduate Department, the College of Arts and Sciences, the College of Technology, the H. Sophie Newcomb Memorial College for Women, the College of Law, College of Commerce and Business Administration, and the College of Medicine, consisting of schools of medicine (graduate and undergraduate), pharmacy, hygiene and tropical medicine, and dentistry. It confers the bachelor's degree in arts, science, education, and music, and the professional degrees in engineering, law, medicine, pharmacy, and dentistry. All the departments are situated in the city of New Orleans. The campus contains about 100 acres, including the athletic field. The total attendance in 1915 was 2708, the faculty numbered 301 and the library contained 69,500 volumes. The value of the grounds and buildings was estimated at \$2,215,000, the total valuation of the university property being \$2,664,000. The endowment was \$5,310,914 and the gross income \$371,664.

TULARE, тӯ-lar'ā. A city in Tulare Co., Cal., 45 miles southeast of Fresno, on the Southern Pacific and the Atchison, Topeka, and Santa Fe Coast Line railroads (Map: California, F 6). It carries on an important trade in fruits and cereals, dairying and fine cattle. There are three large creameries. Tulare has a public library. Pop., 1900, 2216; 1910, 2758.

TULASNE, тū-lān', LOUIS RENÉ (1815–85). A French botanist, born at Azay-le-Rideau (Indre-et-Loire). After studying law, he turned his attention to botany and made a specialty of parasite mushrooms, becoming the founder of modern mycology. From 1842 to 1872 he was at first "aide naturaliste," then professor at the Museum of Natural History in Paris. His most important publications include: *Histoire et monographie des champignons hypogés* (1851); *Selecta Fungorum Carpologia* (3 vols., 1861–65), with his brother Charles; and many monographs. Among several discoveries he made, that of polymorphism among fungi marked an epoch in the science.

TULCEA, or TULTCHA, тӯл'chā. A district town of the Dobrudja, Rumania, situated on an arm of the Danube, about 45 miles from the Black Sea (Map: Balkan Peninsula, G 2). It has a good harbor, with a large trade in fish, grain, and wool. Pop., 1900, 18,800.

TULIP (OF., Fr. *tulipe*, from *tulipan*, tulip, *tulipant*, *tulpant*, *toliban*, *tolopan*, turban, from Turk. *tulband*, *dulband*, from Pers. *dulband*, turban), *Tulipa*. A genus of showy hardy

TULIP TREE

TULIP TREE (*Liriodendron tulipifera*)

FLOWERING BRANCH.

plants of the family Liliaceæ, easily recognized by its fleshy brown-skinned bulbs, broad or linear leaves, and generally erect and usually solitary-flowered scapes. About 45 species are described, mostly natives of the warmer parts of Asia and southern Europe. For centuries the tulip has been a popular ornamental plant for spring and early summer, and has recently been used by florists for winter flowering. The species from which most cultivated varieties have been derived, *Tulipa gesneriana*, is a native of Asia Minor and was brought from Constantinople to Germany by Conrad Gesner in 1559. Since then innumerable varieties have been originated, 1800 varieties being offered by Dutch growers,

TULIP (*Tulipa gesneriana*).

who are the leading producers of these bulbs. Several other species have given rise to cultivated varieties, but to a more limited extent. *Tulipa suaveolens*, a native of southeastern Europe, is the wild species from which the early red and orange Duc van Thol tulips have been obtained. They are inferior to the common garden tulip in beauty, but are prized for their fragrance and earliness. (See Colored Plate of LILIACEÆ.) *Tulipa præcox* is the generally cultivated form of *Tulipa oculus-solis*, a beautiful species from southern France, characterized by a large black spot with a yellow border at the base of each petal. *Tulipa greigi*, a native of Turkestan, is a fine species from which several cultivated forms have been developed. The natural species are rarely grown. Tulips are cultivated in gardens and need a rich, sandy loam. The bulbs or offsets are planted in mid-autumn and the flowers appear in spring. When the plants have blossomed and the leaves have begun to dry the bulbs are taken up, dried in a cool airy place, and stored in a dry place

until replanted. For pot culture tulips are treated like hyacinths. Young plants are also obtained by sowing the seed in light sandy soil under a cold frame in late winter. Seedlings seldom flower before they are five years old and are rarely stable; i.e., after flowering one or more times they break or develop a new form of color, which remains stable not only with the individual bulb, but with its offsets.

During the first half of the seventeenth century interest in the tulip rose to a speculative basis. Bulbs sold for fabulous prices, even 13,000 florins (\$5200) being paid for a single specimen of *Semper Augustus*. Ownership in individual bulbs was divided into shares; bulbs were sold before their existence and by men who possessed none; and of some varieties far more were sold than existed. The craze was short-lived, but it financially ruined many. Consult J. Jacob, *Tulips* (London, 1912).

TULIP TREE (*Liriodendron tulipifera*). A beautiful North American tree of the family Magnoliaceæ, found from Massachusetts and Vermont to Wisconsin and south to Florida, Mississippi, and Arkansas, having a stem sometimes 100 to 140 feet high and 5 to 9 feet thick, with a grayish-brown cracked bark and many gnarled and brittle branches. The solitary terminal flowers resemble tulips. The bark has a bitter, aromatic taste, like other members of the Magnoliaceæ. The tulip tree is one of the most beautiful ornaments of pleasure grounds. In some parts of the Mississippi valley it forms considerable forests, seldom or never occurring alone, but in mixed woods. The heartwood is yellow, the sapwood white. The timber is easily wrought, takes a good polish, and is much used for house carpentry and other purposes where a light wood is desired. The timber is usually called poplar, tulipwood, or whitewood. Fossil leaves of ancestors of the tulip tree are found in abundance in the North American and Arctic Cretaceous rocks. These earliest representatives had leaves that were not so distinctly lobed and that resembled, in their entire margins, more nearly those of the very young individuals than those of the full-grown trees of the modern plant.

TULL, JETHRO (1674-1741). A British agriculturist. He was born at Basildon, Berkshire, and entered Oxford in 1691, but two years later took up the study of law at Gray's Inn. In 1699, shortly after becoming a barrister, he settled upon a farm at Howberry, where, having trouble in making his laborers carry out his advanced ideas, he endeavored to make implements which would do the work "more faithfully than such hands would do." The results of his experiments are set forth in his *Horse-Hoeing Husbandry, or an Essay on the Principles of Tilling and Vegetation* (1733; 2d ed., with addenda, 1743; 3d ed., 1751). French translations appeared in 1753 and 1757, and a new and somewhat altered edition was put forth by William Cobbett in 1822. This work, which is the first of its kind, exercised a profound influence on methods of soil management, and upon it Tull's fame chiefly rests. See TILLAGE.

TULLA, tulla, JOHANN GOTTFRIED (1770-1828). A German engineer. He was educated in Heidelberg and Freiburg, and after filling various engineering appointments became chief engineer of the construction of water and road ways for the Grand Duchy of Baden in 1813. He founded the Engineer School of Baden, and

subsequent to 1818 had much to do with the preparation of the plans for the deepening of the river Rhine. He wrote *Ueber die zweckmässigste Behandlung des Rheins* (1822) and *Ueber die Rektifikation des Rheins* (1825).

TULLAHOMA, tül'ä-hö'mä. A city in Coffee Co., Tenn., 69 miles southeast of Nashville, on the Nashville, Chattanooga, and St. Louis Railroad (Map: Tennessee, D 3). Noteworthy features are the buildings of the Fitzgerald and Clarke Preparatory School, city hall, Pythian Home, Chautauqua grounds, State Vocational School for Girls, Cumberland Springs, Pylant Springs, and Hurricane Springs. The chief manufactures are buggies and parts, golf sticks, tobacco products, and overalls. Pop., 1900, 2684; 1910, 3049.

TULLE, tul. The capital of the Department of Corrèze, France, 106 miles by rail southwest of Clermont-Ferrand (Map: France, S., F 3). It is a picturesque town with quaint houses. The cathedral (fifteenth century), with a fine bell tower, and the abbot's house (fifteenth century), are noteworthy. A large government firearms factory is in the suburb of Souilhac. From Tulle first came the famous lace of that name. Pop., 1901, 17,412; 1911, 16,942.

TULLIBEE (North American Indian name). A well-marked and valuable whitefish (*Argyrosomus tullibeei*) of the Great Lakes, Lake of the Woods, and northward. It is bluish with white sides showing silvery stripes.

TULLIUS, SERVIVS. The sixth legendary king of Rome. He is said originally to have been a slave of Tanaquil, the wife of Tarquinius Priscus (see **TARQUINIUS**). The latter befriended him, and Tullius, after marrying the daughter of Tarquinius, practically became the ruling power in the state. This aroused the ire of the sons of Ancus Marcius, who were in line of succession, and they caused Tarquinius to be assassinated. Tanaquil, however, frustrated their plans by concealing the fact of her husband's death until Tullius had obtained a firm hold in the government. According to tradition the reign of Tullius was marked by important reforms, notably the promulgation of a new constitution and the formation of an alliance with the Latins. The new constitution, which aimed to give the plebeians political independence and to make property rather than birth the basis of political influence, was offensive to the patricians, who, under the leadership of Lucius, a son of Tarquinius Priscus, formed a conspiracy, which resulted in the assassination of Tullius. Tradition also adds that Tullia, the daughter of Tullius and wife of Lucius, as she was returning from the Senate, which, countenancing the atrocious murder of Tullius, had recognized the claims of Lucius to the throne, drove her chariot over her father's dead body, which still lay in the street, where he had been struck down by the assassins. See **COMITIA**, 2; **PLEBEIANS**; **ROME, Ancient Rome**, in the section entitled *History of Rome during the Earliest or Royal Period*, last paragraph.

TULLIVER, MAGGIE. The heroine of George Eliot's *Mill on the Floss*.

TULLOCH, JOHN (1823-86). A Scottish scholar and educator. He was born at Dron, Perthshire, was educated at St. Andrews, and ordained at Dundee, in 1845, as a minister in the Church of Scotland, and became principal of St. Mary's College, in the University of St. Andrews. In 1850 he was appointed one of her

Majesty's chaplains for Scotland. He was highly appreciated as a broad-minded, progressive theologian, was moderator of the General Assembly in 1878, was appointed dean of the chapel royal and dean of the Thistle in 1882, and died at Torquay. Among his works are: *Leaders of the Reformation* (1859; 3d ed., 1883); *Beginning Life* (1862); *Rational Theology and Christian Philosophy in England in the Seventeenth Century* (1872; 2d ed., 1874); *The Christian Doctrine of Sin* (1876); *Movements of Religious Thought in Britain during the Nineteenth Century* (1885). Consult Mrs. M. O. W. Oliphant, *Memoir of the Life of John Tulloch* (3d ed., London, 1889), and A. K. H. Boyd, *Twenty-five Years of St. Andrews* (2 vols., ib., 1892-93).

TULLUS HOSTILIUS. See **HOSTILIUS, TULLUS**.

TULPINUS. See **TURPIN**.

TULSA, tül'sä. A city and the county seat of Tulsa Co., Okla., 120 miles northeast of Oklahoma City, on the Atchison, Topeka, and Santa Fe, the Midland Valley, the Missouri, Kansas, and Texas, the St. Louis and San Francisco, and the Tulsa and Sand Springs railroads (Map: Oklahoma, E 2). It is the seat of the Henry Kendall College (Presbyterian), and contains a fine high school, a Carnegie library, and well-kept parks and boulevards. In the vicinity are found natural gas, coal, and enormous quantities of crude oil, the city being the centre of a vast oil-producing region. Among the industries are manufactories of brick and tile, sewer pipe, glass, cottonseed oil, pumps, engines, tools and machinery, and sand, stone, and wood products; oil refining, coal mining, and wheat milling. Tulsa adopted the commission form of government in 1908. Pop., 1900, 1390; 1910, 18,182; 1915, 28,240; 1920, 72,075.

TULTCHA. See **TULCEA**.

TULTCHIN, tül'chën. A town in the Government of Podolia, Russia, 100 miles east of Kamenets-Podolsk. Pop., 1910, 25,904.

TULU'NIDS. A Mohammedan dynasty in Egypt (868-905). The founder was Ahmed ibn Tulun. His father was a Turkish prisoner of war sent by the Governor of Transoxania as a present to al Ma'mun (813-833). Ahmed received a careful education and when, after Tulun's death, his mother married the powerful General Baïk-beg, he was sent as Governor to Egypt (868). He soon made himself practically independent of the Bagdad caliphate. By his administrative ability he developed the resources of the country and the income of the government. He built mosques, garrisons, and hospitals. In 878 he conquered Syria, with the exception of Antioch, and was besieging Tarsus when he died in 884. His son Khumaraweih (884-895) squandered the treasures left him by his father, but was able, through his victory at Ramle in 885, to recover Syria, which had been taken from him. He was assassinated in 895. His son Jeish (895-896) was deposed; another son, Harun (896-904), lost his life in a tumult while Egypt was attacked by the Caliph Muktafi's general, Mohammed ibn Suleiman. Ahmed's son Sheiban (904-905) was unable to resist the attack, and the Tulunid dynasty came to an end in 905. Consult August Müller, *Der Islam in Morgen- und Abendland* (Berlin, 1885), and Clement Huart, *Histoire des Arabes* (Paris, 1912).

TULUS, töl'loo. One of the civilized or half-civilized Dravidian peoples of Hindustan.

They inhabit the coast region about Mangalore, and their language is closely related to ancient Kanarese (q.v.). Consult Brigel, *Grammar of the Tulu Language* (Mangalore, 1872).

TUMACO, tōu-mă'kô. A seaport of the Department of Cauca, Colombia, 150 miles southwest of Popayán (Map: Colombia, B 3). It has an extensive local steamer trade with Guayaquil and Panama. Pop., 1912, 11,702.

TUMBLE BUG. See DUNG BEETLE.

TUMBLER LOCK. See LOCK.

TUMBLEWEEDS. Plants, chiefly annuals, especially abundant in prairie regions. They scatter their seeds as they are rolled or tumbled from place to place by the wind. Among the best-known plants of this sort in the United States are the Russian thistle (*Salsola pestifera*) and two tumbling pigweeds (*Cycloloma atriplicifolium* and *Amaranthus gracizans*). See SEED.

TUMBLING MUSTARD. See HEDGE MUSTARD.

TUMOR (Lat., swelling, state of being swollen). In medicine, an abnormal increase in size of an area of tissue or of an organ; a swelling, excluding swellings occurring in the course of simple inflammation. In pathology, a tumor is an overgrowth or hypertrophy, deviating in size and shape from the normal, with an inherent power and method of growth, this growth being independent of the rest of the body. Pathologists include under the term "tumor" ulcerations and their boundaries, when such boundaries are composed in part, at least, of new tissue. Pathologically, then, a tumor is a growth of new tissue in the body which causes local increase in the size of the part or organ in which it occurs. Tumors are distinctly pathological, subserving no useful physiological purposes; in fact, usually growing at the expense of useful tissues and organs.

The tissues of which tumors are composed conform to the same general types as are normally found in the body, with the exception that in the case of some tumors there is a tendency towards the reversion of the tissue to embryonic forms. Tumors usually originate in tissues of like structure with that of the tumor itself, connective-tissue tumors taking their origin in connective tissue, epithelial tumors in epithelium, etc. When such tumors remain confined to the tissues in which they originate they are known as homologous tumors. When they spread to surrounding tissues of a different type, or when, as in malignant tumors, new tumors are started in distant tissues and organs by the dissemination of bits of tissue from the primary growth through the blood and lymph, they are known as heterologous tumors.

Some tumors are congenital, notably the nævi or vascular tumors. In some cases there appears to be a distinct hereditary tendency to tumor formation; yet ideas as to the heredity of cancer are grossly exaggerated in many minds, for, while the occurrence of cancer in several generations has been observed, the absence of cancer in the children and grandchildren of persons who have been afflicted with the most malignant forms has been equally noted. Inflammation resulting from injury, especially from long-continued slight irritation, seems to be a frequent cause of tumor formation, injuries to bone being frequently followed by development of osteosarcoma. Also injury to an organ, as from a blow or from a fall, often precedes the development of cancer. Cancer of the

tongue or lip is often apparently traceable to constant irritation from a broken clay pipe or a rough tooth. In general it would seem that tumors of the connective-tissue type (sarcoma) most frequently follow a single injury, as from a blow, while tumors of the epithelial type (epithelioma, carcinoma) are more apt to occur as the result of repeated slight irritations. Chronic inflammation seems to bear some causative relation to tumor formation. This is evident in the frequent association of carcinoma of the liver with cirrhosis of that organ. Again, malignant tumors or cancer not infrequently find their starting point in such local malformations as skin nævi or moles. Age and sex play important rôles among predisposing causes of tumors. Epithelial cancer or carcinoma is rare in persons under 30 years of age. Cancer of the breast is more common in the female, this being due to the greater functional activity of that organ in the female. Cancer of the tongue and lip is much more common in the male, probably from the fact that frequent irritation from smoking is common in that sex.

Knowledge is imperfect as to the primary causative factor of tumors. Of the theories which have been advanced in explanation of tumor growth, probably the most ingenious and the one to which most credence is given is one advanced by Cohnheim. According to his theory, during embryonal development some cells stop developing. These cells may either remain in among tissues of their own kind or may become displaced in the course of further development of surrounding tissues and so come to lie among other tissues. Such cells lie dormant for long periods until something in their environment calls them into activity, when they develop with all the potential growth of young embryonal cells. Being unlimited by the wear and tear of physiological function, as is the case with normal tissues and organs, they devote their entire energies to growth. For these two reasons the high potentiality for growth of embryonal tissue and the lack of any control of the growth by the requirements of function, tumor tissue, especially of the embryonal type, is apt to be characterized by irregular, wild cell growth different from the orderly arrangement of normal tissue cells. While Cohnheim's hypothesis offers a satisfactory explanation of most of the phenomena connected with the tumor growth, it must be remembered that it is as yet purely a theory, without basis in known facts; that no one has ever been able to demonstrate any of these dormant islands of embryonal tissue waiting to be excited into tumor formation. Bacteria as excitants have been exploited by some investigators. While some believe that the true cause of cancer will ultimately be found to be bacterial in nature, the majority tend to the opinion that the presence of bacteria in tumors is an external accidental occurrence rather than an internal causative factor.

Tumors grow (1) by direct extension from the periphery, and (2) by a growth of the tumor at its centre and a consequent pushing outward of its peripheral parts, or central growth; (3) tumors also extend by what is known as metastasis. This, with the formation of what are known as metastatic tumors, occurs by dissemination of cancer cells by means of the blood and lymph. In this way bits of cancer tissue are carried to remote parts of the body. This metastasis from a single primary focus may occur

in any tissue or organ, and commonly occurs in many tissues and organs either in succession or at approximately the same time. It is one of the surest evidences of the malignancy of the original tumor. These cancer cells lodging in the tissues set up new centres of growth, of the same nature as the parent growth. As the process of growth goes on in tumors so does the process of degeneration. Tumors may ulcerate or become gangrenous, abscesses may form in them, and they may undergo fatty or calcareous degeneration. Degenerative changes are more frequent in the softer, rapidly growing forms.

Various classifications have been suggested, all of which are somewhat unsatisfactory. Clinically, tumors are frequently simply divided into two classes: (1) benign tumors, or tumors which are in themselves harmless, and (2) malignant tumors, as cancer and sarcoma. The most common and as yet most satisfactory classification of tumors is morphological, based upon their structure relative to the normal body tissues. The following is the usually accepted classification:

CONNECTIVE-TISSUE TYPE	
Normal tissue	Form of tumor
Fibrillar connective tissue	Fibroma
Mucous tissue	Myxoma
Embryonal connective tissue	Sarcoma
Endothelial cells	Endothelioma
Fat tissue	Lipoma
Cartilage	Chondroma
Bone	Osteoma
Neuroglia	Glioma
MUSCLE-TISSUE TYPE	
Smooth-muscle tissue	Leiomyoma
Striated-muscle tissue	Rhabdomyoma
NERVE-TISSUE TYPE	
Neuromata	
VASCULAR-TISSUE TYPE	
Blood vessels	Angioma
Lymph vessels	Lymphangioma
EPITHELIAL-TISSUE TYPE	
Glands	Adenoma
Various forms of epithelial cells and associated tissues	Carcinoma

When, as is not infrequently the case, more than one kind of tissue is present in a tumor, a combination of terms is used to designate its nature. A combination of a tumor composed of embryonal connective tissue with a bony tumor is known as an osteosarcoma; a muscle-tissue tumor in which much more than the usual amount of connective tissue is present, as a fibromyoma, etc. In addition to the new growths included in the classification given there are other forms of tumors or of structures sometimes called tumors which do not fall within any of the subdivisions of the classification. Among these may be mentioned cysts of various kinds, including the so-called dermoid cyst and teratoma; such congenital tumors as moles, naevi, and angiomas, etc. The peculiar placental-tissue tumor known as deciduoma may also be mentioned.

Nonmalignant Tumors. These are composed of tissues of the types found in the adult and are in themselves not dangerous to life, although sometimes serious from pressure upon or involvement of important organs. They do not as a rule grow as rapidly as do malignant tumors; they do not tend to recur when completely removed, do not spread by metastasis, do not involve neighboring lymph glands, and do not as a rule interfere with the general health of the patient.

Fibroma.—This tumor is composed of fibrillar

connective tissue of the type found in the adult. Fibromata vary even more greatly in consistency than does ordinary fibrous tissue, those containing many fibres and few cells being hard and firm, *fibroma durum*; those containing proportionately many cells being soft, *fibroma molle*. They are commonly inclosed in a definite fibrous capsule. The softer fibromata are frequently very vascular, while the harder forms usually contain few vessels. They are found in the skin and subcutaneous connective tissue, in the connective-tissue framework of the various organs, in the mucous membranes, in the intermuscular septa, in nerve sheaths, etc.

Myxoma.—Myxomata are tumors composed of tissue which resembles a type of tissue found only in extremely small amount in the adult and known as mucous tissue. Mucous tissue is therefore essentially embryonic. These growths resemble fibromata in structure, being made up of connective-tissue cells with a fibrillar intercellular substance. The softer tumors are known as *myxoma gelatinosum*, or *myxoma molle*, while those of greater consistency are known as *myxoma medullare*. Myxoma is of comparatively rare occurrence in pure form. Usually myxomata are combined with tumor tissue of other types to form complex tumors of which the most common are lipomyxoma and fibromyxoma.

Lipoma.—Lipomata are fatty tumors. They may be hard or soft depending on the amount of connective tissue present. Lipoma is a common form of tumor, being often superficial, developing in the subcutaneous fat. Lipomata may develop in any situation where fat is found and consequently have a wide distribution. They are generally inclosed in firm fibrous capsules and occur usually on the shoulders, back, or forearms.

Chondroma.—These are tumors in which the new-formed tissue resembles cartilage of either the hyaline or fibrous variety.

Osteoma.—Osteomata or bony tumors are rather rare as pure tumors. Associated with other forms of tumor tissue (as osteosarcoma, osteofibroma, etc.) they are more common.

Glioma.—Gliomata are connective-tissue tumors which follow the structure of the nervous system connective tissue, or neuroglia. Gliomata are soft and usually vascular, thus predisposing to hemorrhage. They are also extremely liable to undergo fatty degeneration. As a pure type they are rare. Associated with other forms of connective-tissue new growths, the gliosarcoma, gliomyxoma, etc., they are more common. They occur chiefly in the brain and spinal cord, the ganglia, and in the optic and olfactory nerves.

Myoma.—Myomata are tumors whose tissue elements are analogous to those found in muscle tissue. Like normal muscle, they may be divided into two forms, one in which the tissue elements are smooth, or involuntary muscle, the other in which the tissue elements are striated, or voluntary muscle. To the former the name "leiomyoma" has been given, to the latter the name of "rhabdomyoma."

Neuroma.—Neuromata are divided into true neuromata and the so-called false neuromata. True neuromata are extremely rare. They consist of nerve tissue and may be of the ganglionic type in which new nerve cells develop, or of the fibrillar type which consist of new-formed nerve fibres. Neuromata may be single or multiple,

the latter frequently occurring along the branches of distribution of a single peripheral nerve. They occur in stumps after amputation of a limb and are often extremely painful. The false neuromata are not neuromata at all, but fibromata, sarcomata, myxomata, etc., of the connective tissue of the nerve trunks.

Angioma.—These tumors consist of newly formed blood or lymph vessels and are of two kinds, hæmangioma and lymphangioma. The former are subdivided into simple angioma or *angioma telangiectoides* and *angioma cavernosum*. The simple angiomata are composed of masses of blood vessels, mainly capillaries, held together by connective tissue. The so-called strawberry marks or vascular nævi, usually of the face, are congenital tumors of this variety.

Tumors sometimes Benign, sometimes Malignant. **Endothelioma.**—These tumors originate from that type of connective tissue known as endothelium which forms the linings of blood vessels, lymphatics, etc. On account of their extremely cellular character and on account of the reduction of their intercellular basement substance to a minimum, these tumors bear a close morphological resemblance to the carcinomata, among which they are often classed. Endotheliomata are most common in the pleura, peritoneum, dura mater, and pia mater. Less frequently they occur in brain, liver, ovaries, testicle, lymph nodes, salivary glands, bone, and skin. They may be single or multiple, and may form metastases.

Adenoma.—Adenomata are epithelial tumors in which the epithelium is glandular in type and is arranged in more or less distinct alveoli. They thus correspond in structure to a gland. The alveoli are supported as tumors in the irregularity of the arrangement of their component elements. Blocking up of the ducts of the glandular tissue sometimes leads to an accumulation of secretion within the alveoli and the formation of cysts. When this cyst formation is a prominent feature of the growth the term "cystadenoma" is used to designate the tumor. Of these the most important is the multilocular cystadenoma of the ovary. Most adenomata are nonmalignant, rather slow-growing tumors. The most common sites are the ovary, mammary gland, kidney, liver, submaxillary, sublingual, parotid, thyroid, and lachrymal. They also occur in those mucous membranes which are supplied with glands, e.g., the mucous membranes of the stomach, intestines, nose, pharynx, etc.

Malignant Tumors. Sarcoma.—Sarcomata are tumors of the connective-tissue group. They differ from connective-tissue tumors in that the connective tissue of which the sarcomata are composed is of the embryonal form. This has, as previously stated, a very distinct bearing upon their malignancy, for embryonal tissues possess much greater powers of growth than adult tissues. Sarcomata are usually classified according to the character and arrangement of their cellular elements—as small round-celled, large round-celled, small spindle-celled, large spindle-celled, giant-celled or myeloid, stellate-celled sarcoma, etc. The ends of long bones like the tibia and humerus are frequently affected. The mammary glands are sometimes the site of sarcoma, as also the sheaths of peripheral nerves. Sarcoma is as a rule an affection of early life, most common from 10 to

40, and uncommon after 40. Both sexes are about equally susceptible.

Carcinoma.—Carcinomata or cancers are malignant tumors of epithelial tissue. The epithelial elements are supported by a more or less abundant connective-tissue framework, or stroma, which forms bundles of fibres irregular in arrangement, in the meshes of which are cavities or alveoli in which the epithelial cells lie loosely without definite arrangement. Generally the epithelial cells conform to the different normal types; but we find, as is usual with all cancerous growths, an irregularity as to shape, size, and arrangement which is much more marked than in normal epithelium. And even in a carcinoma where a particular type of cell predominates, other forms of cell are frequently intermingled.

Carcinoma occurs as a primary tumor in tissues of epiblastic origin. It originates in any of the various forms of epithelium. It is not believed to occur as a primary tumor in such tissues as bone, muscle, etc., which originate in other embryonic layers. Carcinoma may, however, involve any of the body tissues. When it involves tissues other than epithelial, it is probable that the growth is secondary, the primary tumor in epithelium being so small as to have passed unrecognized.

The hard form of carcinoma common in the female breast is known as scirrhus cancer or fibro-carcinoma. Its hardness is due to the large amount of dense fibrous tissue, the cellular elements being comparatively few. Very soft carcinomata, made up chiefly of cells with a minimum amount of connective tissue, are called medullary cancer or *carcinoma molle*. Melano-carcinomata are tumors in which more or less brown or black pigment is deposited in the cells or in the connective-tissue stroma. Carcinomata whose cells have undergone mucoid degeneration or whose stroma is of the type found in mucous connective tissue are known as carcinoma myxomatoides. Gelatinous carcinoma is a form in which the cells become filled with a translucent gelatinous material.

Epithelioma.—Epithelioma is a form of carcinoma originating in squamous epithelium. The structure of the tumor tissue corresponds roughly to that of squamous epithelium as seen in the skin and mucous membranes. Epithelial cancer is most common around the orifices of the body where skin and mucous membranes unite, as around the openings of the mouth, nose, eyes, vagina, etc. Epitheliomata are the most slow growing and least malignant of all forms of cancer. They may, however, recur unless completely removed and may form metastases.

Malignancy of Tumors. Many tumors which are themselves benign in character may be dangerous to life from their position and consequent interference with the functions of important organs. Such tumors, although sometimes causing death, are not classed as malignant. A tumor to be classed as malignant must present certain well-defined characteristics. Among these may be mentioned, first, a tendency to local recurrence after removal. This has led to the rule of the surgeon when operating on cancer to cut wide of the growth, even though the tumor may seem small and insignificant, in the hope of removing all trace of cancerous tissue even at the sacrifice of some healthy tissue. It is customary in some cases to have immediate microscopical examination made of

the periphery of the mass removed, to determine the presence or absence of cancer cells at the outer limits of the operation. Secondly may be mentioned the tendency of a malignant tumor to extend by direct continuity of growth to surrounding tissues. In discontinuous peripheral growth there are at first microscopic extensions outward of cancer cells from the periphery of the tumor. These grow and form nodules near, though at first separated from, the main tumor mass, but which afterward spread and usually join the original tumor. A third characteristic mark of malignancy is the formation of what are known as metastatic tumors. These are secondary growths of the same general nature as the parent neoplasm. They may occur in any tissue or organ, no matter how distant, and spring from cancer cells disseminated through the blood and lymph. From them still other metastatic tumors may arise. A fourth evidence of malignancy is the effect of the presence of the cancer upon the general health of the patient. General impairment of health is due to many factors, such as the drain upon the whole system of a rapid new growth, the absorption of injurious matter from the tumor itself, the effect of suppuration or necrosis, etc., and is known as cancerous cachexia. See PHOTOTHERAPY; X RAY.

TUNA. See PRICKLY PEAR.

TUNA. See TUNNY.

TUNBRIDGE. See TONBRIDGE.

TUNBRIDGE WELLS. An English inland watering place, on the border of Kent and Sussex, 34 miles southeast of London (Map: England, G 5). Its picturesque surroundings, healthful climate, and chalybeate springs have rendered it a fashionable resort since the seventeenth century. It has a large trade in the various articles made of Tonbridge ware. The wells, discovered in 1606, are situated at the head of a promenade called the Pantiles. The principal buildings are the corn exchange, town hall, public hall, sanatorium, and mechanics' institute. The town was incorporated in 1889. Pop., 1901, 33,388; 1911, 35,703. Consult Ward, *Surrey and Sussex* (London, 1897).

TUNDRA, tun'drā (Russ., from Finnish *tuntur*, marshy plain). Regions in Arctic America, Asia, and Europe, characterized as swamps of bog moss with snow-white reindeer moss and various kinds of lichens. A luxuriant growth of flowering plants is also a characteristic of some tundras. They are visited by wild birds in summer, when they are inaccessible morasses, but in winter they may be readily crossed. The soil at a depth of a few feet remains frozen throughout the year, and vegetable growth increases in thickness annually, so that the tundra surface slowly rises. Their rivers expose deep layers of ice and frozen soil, in which bones of the rhinoceros, the mammoth, and other extinct animals are found. See ALASKA; SIBERIA.

TUNG, tung. See KUKUI.

TUNGSTEN (Swed. *tungsten*, from *tung*, heavy + *sten*, stone), or WOLFRAM. A metallic element isolated by the brothers d'Elhujart in 1783, after Scheele had, in 1771, isolated tungstic acid. Tungsten is not found native, but occurs as the tungstate of iron and manganese in the mineral wolframite, as the calcium tungstate or scheelite, as the trioxide or wolfram ochre, and in small quantities in other minerals. Tungsten minerals are almost invariably found in tin ores. The metal itself may be prepared by heating sodium or calcium tungstate with carbon, and later refining in vacuo. The tungstate of sodium is obtained from tungsten ore by heating with a moderate excess of sodium carbonate, at a temperature somewhat below the melting point of the mass, subsequently extracting with water, and purifying the extracted tungstate by crystallization.

Tungsten (symbol, W (wolfram); atomic weight, 184.0) is a bright, steel-gray, hard, ordinary brittle, crystalline substance, melting at 3302° C. (5976° F.). It is used to increase the hardness and tenacity of steel and thus improve it as a material for hard tools. Coolidge has succeeded in rendering tungsten malleable and ductile, and at present drawn tungsten wire is widely used for making incandescent-lamp filaments. Tungsten combines with oxygen to form a number of oxides, including a dioxide (WO₂), a sesquioxide (W₂O₃), and a trioxide (WO₃), the latter of which unites with water to form tungstic acid, which in turn combines with bases to form a series of salts called tungstates. Of these the sodium tungstate is sometimes used to replace sodium stannate as a mordant in dyeing and printing.

TUNGSTEN INCANDESCENT LAMPS. See ELECTRIC LIGHTING.

TUNGSTITE. A mineral tungsten trioxide crystallized in the orthorhombic system. It is of a bright-yellow or green color. It is found with other tungsten minerals in Cornwall and Cumberland, England, and as a coating or in cavities in Monroe, Conn., and Cabarrus County, N. C. The preparation of artificial crystals of this mineral has been reported.

TUNGUS, tun-guz'. A group of peoples of the Ural-Altaic or Sibiric stock embracing the tribes of the Tungus proper, whose territory extends from the Yenisei to the Pacific and from the Arctic Ocean as far south as latitude 40°, and the Manchus. The Tungus proper consist of the northern Tungus, comprising the Olchas or Mangun, at the mouth of the Amur, the Oroks in the northern part of Sakhalin, the Orochons, on both banks of the Amur, the Manezers, on its left bank, east of the Orochons, and the Olennyié or Reindeer Tungus; the southern Tungus, including the Golds of the lower Amur and the Ussuri, the Oroches on the coast, and the Daurians, or Solon-Daurs, mixed with Mongols in Kulja; and the maritime Tungus or Lamuts along the Okhotsk Sea. Among some of the Tungus Shamanism of a primitive sort prevails. Russian influence, which began about 1650, is felt chiefly in the social life of the people. The Golds of the Amur, long under the influence of China, have developed an interesting ornamental art. They show considerable capacity for civilization. The Manchus are being absorbed by the Chinese, whom their ancestors once conquered. The Tungus generally are of medium height, but the Manchus

are often very tall. The skull form tends to be mesocephalic. Consult: Castrén, *Grundzüge einer tungusischen Sprachlehre* (St. Petersburg, 1856); Hiekkisch, *Die Tungusen* (ib., 1879); Schrenck, *Reisen und Forschungen im Amurlande* (ib., 1881-91).

TUNGUSKA, tun-goo'ská. A name given to each of the three large eastern tributaries of the Yenisei River in Siberia. They are distinguished as the Upper Tunguska, or Angara (q.v.), the Middle, or Stony Tunguska, and the Lower Tunguska.

TUNGUSKA, LOWER. The northernmost of the three chief tributaries of the Yenisei River in Siberia (Map: Asia, L 2). It rises on the Vitim Plateau in the Government of Irkutsk, about 200 miles northwest of Lake Baikal, and within 14 miles of the Lena River, and flows first north, then northwest, joining the Yenisei above Turukhansk, not far from the Arctic Circle, after a course of 1600 miles. Its upper course flows between low banks covered with pine forests, but lower down the banks become higher and rocky, and the river penetrates a range of mountains in a series of rapids. The river is navigable about 450 miles, but it is frozen in its lower course for seven months in the year. The ice here blocks the upper waters in the spring, causing extensive inundations.

TUNICA too-nē'ká. A North American Indian linguistic stock. See TONICA.

TU'NICA'TA (Lat. nom. pl. of *tunicatus*, p.p. of *tunicare*, to clothe with a tunic, from *tunica*, tunic). The single class of the Urochorda containing small marine animals inclosed in a soft elastic tunic, which opens by two apertures (oral and anal), and contains tunicin, a substance resembling cellulose. The tunic is usually thick, tough, and leathery, but may be thin and delicate, especially in some of the smaller forms. The mouth, supplied with tactile organs, opens into a capacious pharynx, which contracts abruptly into a narrow cesophagus, then expands into a stomach, followed by a more or less coiled intestine that terminates close to the atrial pore or orifice (the other opening in the tunic). The walls of the pharynx are perforated by numerous slits, through which the water entering at the mouth passes into the cavity of the tunic and thence escapes through the atrial pore, carrying waste matter, reproductive products, etc. The pharynx is an important respiratory organ and is correspondingly richly supplied with blood vessels. The heart is peculiar, in that it reverses its beating, pumping the blood in one direction for a time, then pausing and pumping the blood in the other direction for an equal length of time. The nervous system, contrary to common belief, is not greatly reduced, although sense organs (except touch) are wanting or but slightly developed. The muscular system is well developed in some forms, especially in the tunic, but in others it is reduced and serves chiefly for closing the oral and atrial pores. Reproduction is not only by eggs, but takes place in many forms also by budding. In size and color the tunicates offer great diversity. The smallest forms are, as individuals, only a few millimeters long, though the colonies they form are often many inches in diameter. The largest individuals are six or eight inches high, though some forms are on stalks of much greater length. In color we find some species black

and some species white, and others red, but dull shades of greenish, grayish, or brownish are more common. Many free-swimming forms are almost transparent and nearly colorless.

The number of species is large and the classification has varied greatly with different writers. They are a comparatively well-defined group and are now considered as a considerably degenerated offshoot of the branch from which the Chordata have arisen. (See ASCIDIAN.) The tunicates may be conveniently divided into three orders, Larvalia, Thaliacea, and Ascidiacea. The Larvalia are a very small group, containing only one family and few species, remarkable for their small size and free-swimming habits, and the retention throughout life of certain characters which in the other orders occur only temporarily during development. These larval characters are especially the tadpole form with a tail, the nerve cord, and the persistent notochord or urochord. The Thaliacea are also free-swimming, but are much larger and more degenerate or specialized forms. There are three families, one of which contains the beautiful salpas (q.v.). The order Ascidiacea contains three suborders and a dozen or more families. One suborder is free-swimming like the salpas, and so is called the Salpiformes; the second, called Compositæ, contains fixed forms which multiply extensively by budding and thus form compound organisms, the individuals of which are usually very small; the third suborder, the Simplices, are almost always fixed individuals (see ASCIDIAN); but in many cases large numbers of individuals are united by a common stolon from which they have arisen by budding, and these forms are sometimes known as social ascidians. The simplices are better known, popularly, than the other suborders, and many of them have popular names, as sea pork, sea peach, sea potato, and sea squirt.

Consult Herdman, "Report on the Tunicata," in Thomson and Murray, *Report of the Scientific Results of H. M. S. Challenger: Zoölogy*, vol. vi (London, 1888), and general works on zoölogy.

TU'NICLE. See COSTUME, ECCLESIASTICAL.

TUNING. The process of bringing into perfect musical accord the strings, pipes or membranes which constitute tone-producing elements of the various musical instruments. As a rule the wind instruments do not require special tuning, for their pitch is constant. Keyed instruments (the piano and organ) require only occasional regulation of their strings and pipes; but the stringed instruments need to be tuned constantly. See MUSICAL INSTRUMENTS; PITCH; TEMPERAMENT.

TUNING FORK. A contrivance for regulating the pitch of the voice or of a musical instrument. It consists of two prongs of steel springing from a handle, and so adjusted as to produce a fixed note when struck. It is tuned in a², which has 435 double or 870 single vibrations per second. The *tuning-cone* is a hollow, metal cone used in tuning the metal flue pipes of an organ. To lower the pitch of a pipe, the inverted cone is pushed down over its top; to raise the pitch, the point of the cone is inserted in the pipe.

TU'NIS (Fr. *Tunisie*). A French protectorate in North Africa. It is the most northern of African countries (Map: Africa, E 1). Its boundaries are still indefinite, but the area is probably less than 50,000 square miles. Tunis is physically continuous with the rest of north-

western Africa. The northern part is composed of the Little Atlas Mountains which border the coast, the Great Atlas to the south on an average about 1500-2000 feet, rising in the peak of Sidi Ali, and in other summits to heights of 5700-6500 feet and the inclosed plateau. This plateau region is fairly well watered by numerous small streams, many of which are perennial, and the valley of the Mejerda (ancient Bagradas), a stream which regularly overflows its banks during the winter rains and irrigates the neighboring plains, is the chief area of cultivation. The southern half of the plateau, generally treeless, is covered with esparto grass. On the north coast the plateau falls abruptly in steep wooded cliffs towards the sea; on the east coast, however, there is a low region about 60 miles wide, fertile in the north, but becoming arid in the south. The southern half of Tunis belongs to the Sahara region, and, with the exception of a group of mountains in the southeast, is generally low, in some places even below sea level. In its northern part is the salt incrustated area of the Jerid, surrounded by numerous hot springs, which are used for irrigation. The date palm is here indigenous, and grows in large numbers, but the rest of the Sahara region is arid. The climate of Tunis is healthful, with a temperature ranging from 50° F. to 96° F. The rainfall averages 22 inches in the north, and is there fairly regular. In the south years may pass without any regular rains, though occasionally there are heavy showers which raise the average to nearly ten inches. The flora and fauna are mostly identical with those of Algeria (q.v.). Geologically Tunis is of comparatively recent formation, the mountains being mostly Tertiary, the coast region Quaternary, and parts of the plateau Cretaceous.

The chief mineral products are zinc, lead, iron, salt, gypsum, phosphates, and marble. In recent years, by far the greatest development has been in phosphates. Agriculture, the main industry, shows progress. Cereals and the vine are mainly cultivated in the northern part, where the holdings are small. Farther south the holdings are large and devoted to stockbreeding and the cultivation of olives (about 500,000 acres) and date palms. The chief products are olives and olive oil, grain, fruits, and cork. The leading acreages in 1913 were 1,518,000 for wheat and 1,374,000 for barley. In 1913 there were 29,500 horses, 84,200 asses, 23,500 mules, 157,100 cattle, 843,100 sheep, 561,700 goats, 123,900 camels, and 15,100 swine. Tunis has practically no industries except the native or household. Carpets, saddles, and other leather articles and woolen goods are produced. The fisheries are active and yield principally allaches, sardines, tunny, and sponges. There are sixteen ports, three of them excellent. In 1913 the tonnage entered was 4,666,000, about three-fourths French. Imports and exports in 1912 were valued at 156,294,000 and 154,655,000 francs, respectively; in 1913, 144,254,000 and 178,663,000. The leading exports are phosphates, cereals, olive oil, live animals, and lead. About one-half the total trade is with France. At the beginning of 1914 there were 1428 miles of railway.

The French protectorate dates from 1881. The nominal head of the government is the native Bey, assisted by nine ministers—seven French and two native—who administer nine de-

partments. There is also the Minister of Foreign Affairs, who is the French Resident-General. He is virtually the Viceroy. Tunis has thirteen civil and two military districts and a military post—all in charge of French representatives. French tribunals of justice deal with cases involving foreigners, and native courts with those of the Tunisians. The army of occupation in 1913 numbered 17,500. The capital is Tunis (q.v.). The estimated revenue and expenditure for 1913 were each about 85,000,000 francs. The largest disbursements are for the public debt and public works. The total debt at the end of 1906 amounted to £9,287,000; in 1910 a loan of 10,000,000 francs was authorized.

The census of Europeans, Dec. 15, 1911, and the estimate of Mohammedans and native Jews, Dec. 31, 1911, showed a total population of 1,929,003. Mohammedans numbered 1,730,144; Italians, 88,082; native Jews, 50,383; French, 46,044; Maltese, 11,300; various, 3050. There are some French and many Mohammedan schools, a Mohammedan university in Tunis, and a college. Tunis is rich in antiquities. Punic, Roman, and Byzantine ruins abound, the two former classes representing magnificent epochs. The site of Carthage is still marked by the remains of substructures. A fine museum of relics has been established here. The Bardo collection near the capital is valuable.

The early history of Tunis is connected with that of Carthage (q.v.). After the fall of Carthage the region became the Roman Province of Africa (Africa in the narrower sense), subdivided into the northern District of Zeugitana and the southern district of Byzacium (Provincia Byzacena). Carthage was rebuilt, and in the second and third centuries of the Christian Era was one of the most important cities of the Roman Empire. The Romans were vanquished by the Vandals under Genseric in 429. The Vandals held the country until their King, Gelimor, was conquered and taken prisoner in 534 by Belisarius (q.v.), the general of the Byzantine Emperor Justinian. Tunis then remained under Byzantine rule until the conquest by the Arabs in the seventh century. Under Mohammedan rule the city rose to great splendor. After having formed for more than a century a part of the dominions of the caliphs, the country was ruled successively by the dynasties of the Aglabites, Fatimites, Almohades, and Hafsites. In the middle of the twelfth century it was for a short time under the rule of Roger II of Sicily. In 1270 Louis IX of France, having undertaken a crusade, died during his invasion of Tunis, and in 1390 the French under the Duke of Bourbon were again unsuccessful, being repulsed at Mahdiya. In 1535 Charles V undertook an expedition against the famous corsair Khair-ed Din (Barbarossa), who had established himself at Tunis, captured the city, and liberated over 20,000 Christian slaves. In 1575 Sinan Pasha conquered the country and incorporated it with the Ottoman Empire. The government was placed in the hands of a Turkish pasha, a divan or council, composed of the officers of the Turkish garrison, and the commander of the janizaries.

After a few years, however, an insurrection of the soldiery broke out, and a new government was established, the head of which was a "dey" possessing limited authority, the chief power being at first exercised by the military divan.

But gradually an officer, with the title of "bey," whose original functions were confined to the collection of tribute and taxes, acquired a supremacy over the other authorities, and finally obtained a kind of hereditary sovereignty. The bays of Tunis made conquests on the mainland and piratical enterprises against Christian powers at sea. During the eighteenth century Tunis became tributary to Algeria. About the beginning of the nineteenth century Hamuda Pasha put an end to this dependence, subdued the Turkish militia, and created a native Tunisian army, in consequence of which Tunis virtually attained independence. The subsequent rulers, Achmet Bey (1837-55), Mohammed Bey (1855-59), and Mohammed Sadyk Bey (1859-82), were liberal, enlightened sovereigns. In 1871 the Sultan renounced the tribute formerly exacted, and fixed the future relations of the Sublime Porte to Tunis. The Bey was to receive his investiture from Constantinople; without the Sultan's authority he could neither declare war, conclude peace, nor cede territory; the Sultan's name was to appear on all the coinage; the army was to be at the disposal of the Porte. In internal matters, however, the power of the Bey was to be absolute. In 1881 France, with the ostensible purpose of chastising the Khrumirs, who had made raids into Algerian territory, sent an expedition into Tunis. At the same time a French squadron appeared before the capital and the Bey was forced to enter into an engagement establishing a French protectorate over the country. Thereupon an insurrection broke out, and it was only after much bloodshed that the French were able to compel submission. In July, 1881, they took Sfax, and in October they occupied Kairwan. By the close of the year the country was subdued. The French protectorate has contributed to the material progress and prosperity of Tunis.

TUNIS. The capital of the Protectorate of Tunis. It is situated near the southwestern extremity of the Lake of Tunis, about three miles from the ruins of ancient Carthage (Map: Africa, F 1). The lagoon or Lake of Tunis is shallow, and communicates with the Gulf of Tunis, an inlet of the Mediterranean, by a narrow strait known as the channel of Goletta. The gulf itself is 45 miles broad at the entrance. The town occupies rising ground, and both the city proper and the suburbs are surrounded by walls. The streets of the inner town are narrow, unpaved, and dirty, but the bazars are well furnished, and many of the mosques are splendid, particularly the Mosque of Yussuf. The palace of the Bey is probably the finest building in Tunis. The citadel, begun by Charles V and finished by Don John of Austria, is interesting from its collection of old arms. The newer French or foreign quarter, established since 1893, has a European aspect. The city contains a Mohammedan university and a national museum of arts and antiquities. Water is supplied by means of a restored ancient aqueduct from Jebel Zagħwan. Tunis is the commercial centre of the State, and carries on an important trade with Europe and Central Africa. Ocean-going vessels reach the town directly by means of a canal, 7 miles long and 21½ feet deep, opened in 1893. Tunis has silk and woolen manufactures of shawls, tapestries, mantles, burnouses, caps, turbans, colored cloths; also leather, soap, wax, and olive oil, all of which it exports, together with grain, fruits, cattle, fish, ivory, gold dust, coral, etc. The climate is unhealthy.

Tunis (ancient *Tunes*) was a Carthaginian city, frequently mentioned in connection with the Punic wars. It became important under the Arabs. (See **TUNIS**, Protectorate.) The population is stated for the end of 1911 to consist of about 164,600 Moslems, 43,000 Jews, and about 69,500 Europeans (including 44,237 Italians, 17,875 French, and 5986 Maltese).

TUNJA, טונ'נא. A city and the capital of the Department of Boyacá, Colombia (Map: Colombia, C 2). It is located 9161 feet above the sea and has a cold healthful climate, with an average temperature of 55° F. It has straight paved streets and around the Plaza de Bolívar are the cathedral, the government house, and the college. There are also a penitentiary, a normal school and a seminary. The city manufactures tiles and bricks. Stock-raising, mining, and some agriculture are carried on in the surrounding region. Pop., 1912, 8971. It was founded in 1539 by Gonzalo Suárez Rendón, on the site of the Chibcha town of Zaque Hunza. Near the city is the Boyacá bridge where Bolívar won the decisive battle of that name on Aug. 7, 1819.

TUNKERS. See **CHURCH OF THE BRETHREN**.

TUNKHANNOCK. The county seat of Wyoming Co., Pa., on the Susquehanna River, Tunkhannock Creek, and the Lehigh Valley Railroad, 31 miles by rail northwest of Wilkes-Barre (Map: Pennsylvania, K 3). The chief industry is tanning and there are spool and tub factories, furnaces and machine shops, stave and planing mills, and witch hazel distilleries. Lumbering is carried on extensively. Pop.,

1900, 1305; 1910, 1598. For description of TUNKHANNOCK VIADUCT, see VIADUCT.

TUNNEL (OF. *tonnel*, tunnel, tun, pipe, *tonnelle*, arbor, arched vault, tunnel, diminutive of *tonne*, pipe, tun, ML. *tunna*, OHG. *tunna*, Ger. *Tonne*, AS. *tunne*, Eng. *tun*). An artificial gallery, passage, or roadway beneath the ground, under the bed of a stream, or through a hill or mountain. Tunneling has been known since very early times. A king of Egypt upon ascending the throne began at once to drive the long narrow passage leading to the chamber of the rock-cut tomb at Thebes which was to form his final resting place. Similar rock-cut work was performed by the Nubians and Indians in building their temples, by the Aztecs in America, and by most ancient civilized peoples. The first built-up tunnels known were those constructed by the Assyrians. The vaulted drain or passage under the southeast palace of Nimrud, built by Shalmaneser II (860-824 B.C.), is in essentials a true soft-ground tunnel. A much better example is the tunnel under the Euphrates, which may be claimed to be the first subaqueous tunnel of which any record exists. It was, however, built under the dry bed of the river, the waters of which were temporarily diverted and then turned back into their normal channel after the tunnel work was completed, making it a true subfluvial tunnel only when finished. The Euphrates tunnel was built through soft ground, and was lined with brick masonry, 12 feet wide in its interior and 15 feet high. Only hand work was employed in ancient tunnel construction. In soft ground pick and shovels or scoops were used. For rock work the ancients possessed a greater range of appliances.

Research has shown that among the Egyptians, by whom the art of quarrying was highly developed, use was made of tube drills and saws with cutting edges of corundum or other hard, gritty material. The usual tools for rock work were the hammer, chisel, and wedges; and the excellence and magnitude of the works accomplished with these limited appliances attest the unlimited time and labor available for their accomplishment.

The Romans should doubtless rank as the greatest tunnel-builders of antiquity in the number, magnitude, and useful character of their works and in the improved methods they devised. They introduced fire as an agent for breaking down the rock, and developed the familiar principle of prosecuting work at several points at once by means of shafts. They built large fires in front of the rock to be broken down and when it had reached a high temperature cooled it suddenly by means of water, thus producing cracks and fissures.

The Roman tunnels were designed for public utility—aqueducts and roads. One of the most notable of the tunnels of larger section is that which gives the road between Naples and Pozzuoli passage through the Posilipo hills. It is excavated through volcanic tufa, and is about 3000 feet long and 25 feet wide, with a section in the form of a pointed arch. In order to illuminate this tunnel, its floor and roof were made gradually converging from the ends towards the middle; at the entrances the section was 75 feet high. This double funnel-like construction caused the rays of light to concentrate as they approached the centre, improving the natural illumination. This tunnel was

probably excavated during the time of Augustus, although some authorities place it earlier.

During the Middle Ages tunnel-building was practiced for military purposes, but seldom for public need. Every great castle had its private underground passage from the central tower or keep to some distant concealed place to permit the escape of the family and its retainers in case of victory by the enemy, and during the defense to allow of sorties and the entrance of supplies. The tunnel-builders of the Middle Ages added little to the knowledge of the art. Indeed, until the seventeenth century and the introduction of gunpowder no particular improvement was made in the tunneling methods of the Romans. Although gunpowder had been previously employed in mining, the first important use of it in tunnel work was at Malpas, France, in 1679-81, in the tunnel for the Languedoc Canal. This tunnel was 510 feet long, 22 feet wide, and 29 feet high, and was excavated through tufa.

With the advent of gunpowder and canal construction the first strong impetus was given to tunnel-building in its modern sense as a commercial and public utilitarian construction. Canal tunnels of notable size were excavated in France and England during the latter half of the seventeenth century. These were all rock or hard-ground tunnels. Indeed, previous to 1800 the soft-ground tunnel was beyond the courage of the engineer except in sections of such small size as hardly to deserve the name of tunnels. In 1803, however, a tunnel of 24 feet wide was excavated through soft soil for the Saint-Augustine Canal in France. Timbering was employed to support the walls and roof as fast as the earth was removed and the masonry lining was built closely following it. From the experience gained in this tunnel were developed the various systems of soft-ground subterranean tunneling since employed.

In 1761 coal was shipped in boats from the Duke of Bridgewater's coal mines over a canal from Worsley Mill to Manchester. At Worsley, where the basin was large enough to hold a great many boats, the canal entered a hill by a tunnel which at the time of its construction was about a mile in length and reached the different workings of the mine. It has since been enlarged and comprises about 40 miles of subterranean water passage.

It was through the development of the steam railway, however, that the art of tunneling was to be brought into its present prominence. The Terre-Noir (Black Earth) was the first tunnel built on a horse railroad. It was on a single-track road near St. Etienne, in France, on the Roanne-Andrézieux line. It was begun in 1826 and was 4921.5 feet long, 9.8 feet wide at the springing line, and 16.4 feet in height. In Belgium, the Cumpthie Tunnel was built in 1835 on the Chemin de l'Etat, and seems to have been the earliest in that country. It was single track and 13.7 feet wide at the springing line. The Oberau Tunnel, 1680 feet long, was completed in 1839 on the Leipzig-Dresden line in Saxony. This was the first German tunnel. In Austria, the Gumpoldskirch Tunnel on the Vienna-Gloggnitz line near Wiener-Neustadt was built in 1839. In Italy the Naples-Castelamare line, opened in 1840, had several tunnels on it. In 1856 the total Italian tunnels amounted to 10,181 meters. In Switzerland the Hauenstein Tunnel, finished in 1858, is of interest. The first tun-

nel built in the United States was in the Schuylkill navigation canal above Auburn, at the Orwigsburg landing, commenced in 1818 and opened to traffic in 1821. It was cut through red shale, 20 feet wide by 18 feet high (from canal bottom) and was originally 450 feet long, arched for about 75 feet inward from each portal. The highest point of the hill over the tunnel was only some 40 feet, and had it been located but a short distance down the ridge, where the railway cut now is, the tunnel might have been eliminated. In order to get sufficient height to tunnel under, it was necessary to turn the course of the canal at almost right angles to itself. The novelty of this tunnel was a great factor in promoting general interest in the canal. In 1834-37 the tunnel was shortened to about half its original length, in 1845-46 it was enlarged in width to 22 feet and further shortened to a length of 160 feet, and in 1855-56 it was wholly taken out; so that the first American tunnel no longer exists. Even the names of the engineers who located and built it are not known. The first railway tunnel in the United States was built on the Allegheny Portage Railroad in Pennsylvania in 1831-33.

MODERN TUNNELING

The art of tunneling entered its last and greatest phase with the construction of the Mont Cenis Tunnel in Europe and the Hoosac Tunnel in America. The Mont Cenis was undertaken to facilitate railway communication between Italy and France, or, more properly, between Piedmont and Savoy, the two parts of the kingdom of Victor Emmanuel II separated by the Alps. It is 7.6 miles long and passes under the Col de Fréjus near Mont Cenis. Work was begun in 1857 and finished in 1870. It was from the close study of some of the difficulties, the great length of the tunnel, and the desire of the engineers to finish it quickly, that all the different improvements were developed which marked this work as a notable step in the advance of the art of tunneling. Thus the first power drill ever used in tunnel work was devised by Sommeiller, one of the engineers. In addition compressed air as a motive power for drills, aspirators to suck the foul air from the excavation, air compressors, turbines, etc., found here their first application to tunnel construction. This important rôle played by the Mont Cenis Tunnel in Europe in introducing modern methods had its counterpart in America in the Hoosac Tunnel, completed in 1875. For the first time in America power rock drills, air compressors, nitroglycerin, electricity for firing blasts, etc., were used. There remains now to be noted only the final development in the art of soft-ground submarine tunneling—the use of shield and metal lining. The shield was invented and first used by Sir Marc Isambard Brunel in excavating the first tunnel under the River Thames at London, begun in 1825 and opened in 1843. In 1869 Peter William Barlow used an iron lining in connection with a shield in driving the second tunnel under the Thames at London. From these inventions has grown up one of the most notable systems in tunneling now practiced, known as the shield system. In addition, as will be discussed below, where depth permits, subaqueous tunnels are now constructed by

sinking steel tubes in a trench dredged in the river bottom and surrounding and lining them with concrete. This method was first used on the Detroit River tunnel, completed in 1910 with 10 sections having a total length of 2625 feet.

Construction. Tunnels may be classified, according to the general nature of the materials penetrated, into hard-rock tunnels and soft-ground tunnels. Whatever the material penetrated, the general methods of construction are the same, but many differences in detail exist. In certain kinds of tunnels, such as those under water and those under city streets, other conditions than hardness of material penetrated exercise a controlling influence. For description, therefore, it is common to classify tunnels into hard-rock, soft-ground, open-cut, and submarine tunnels. In open-cut and submarine tunnels the material penetrated may be either rock or earth. When it has been decided to

FIG. 1. DIAGRAM SHOWING CROSS SECTION OF POLYCENTRIC FIGURE.

construct a tunnel the first task is to construct a geological map which will show as accurately as possible the character and inclination of the earth's strata to be penetrated, the probability of water being encountered, etc., all of which exercise an important influence upon the difficulties and cost of the work. The next step is to establish exactly the centre line of the tunnel; this is done on the surface of the ground, and its purpose is to find the exact length of the tunnel and to furnish a reference line by which excavation is directed. The determination of the centre line is a simple problem in surveying, requiring only skill and exactness; the longer the tunnel, and the higher and more inaccessible the mountain is above it, the more difficult the work. So perfect, however, has the skill of the surveyor become that it is a common thing to work within a small fraction of a foot in alignment in driving a long mountain or submarine tunnel.

The centre line being established, the next step is to find the difference in elevation of the two ends. The form and dimensions of the cross section of the hole or passageway which it is proposed to excavate are then decided upon. The form and dimensions of cross section adopted are determined by the purpose to which the tunnel is to be put and by the character of the material penetrated. The best form for the majority of conditions, and the one most commonly employed, is the polycentric figure (Fig. 1), in which the number of centres and length of the radii are fixed by the engineer to meet

the particular conditions which exist. The dimensions to be given to the cross section of a tunnel depend upon the purpose for which it is to be used, as will be observed in the succeeding descriptions of prominent tunnels. In all

FIG. 2. DIAGRAM SHOWING SEQUENCE OF GALLERIES IN DRIFT METHOD OF HARD-ROCK TUNNELING.

cases the form and the dimensions are those of the inside of the completed tunnel, which is of course the inside of the lining in all cases except those of unlined hard-rock tunnels, where it is the inside of the original excavation.

Excavation. The work so far described is of the nature of engineering investigation and design. The actual construction of work consists in excavating in the earth or rock a passageway which follows the established centre line and conforms in dimensions and shape to the established cross section. In performing this work the whole area of the cross section is seldom removed at once, but it is subdivided into two or more galleries, which are excavated in a measure independently of each other and which together form the full cross section. The objects of thus subdividing the work are several in number, the more important being as follows: By driving a number of galleries each somewhat in advance of the succeeding one, several

FIG. 3. DIAGRAM SHOWING SEQUENCE OF GALLERIES IN EUROPEAN HARD-ROCK TUNNEL.

gangs of men can be worked without interfering with each other; the first gallery, being driven far ahead, serves to drain the earth and to disclose in advance the nature of the material to be encountered; in soft material several small galleries can be driven and timbered with much less danger of caving than one large gallery. The number and arrangement of the galleries vary with the materials penetrated and with the system of tunneling adopted. The first gallery excavated is called a heading when it is situated at the top of the cross section, and a drift when it is situated at the bottom of the

cross section. The excavation of the main sections is termed enlarging the profile.

Two general methods of excavating rock tunnels are considered practical by engineers; in one the profile is enlarged from a drift and in the other it is enlarged from a heading. The sketch Fig. 2 shows the usual sequence of galleries by which the full cross section is enlarged from a drift. This method of excavation is quite commonly practiced in Europe, but seldom in America. Among the most notable tunnels built by enlarging a drift are the Mont Cenis and the Simplon, both of which are more fully described farther on. The more common method of tunneling in America through hard rock is the heading and bench method. In the more recently driven tunnels it has been found that the best results can be obtained by keeping the bench close up to the heading so that

FIG. 4. DIAGRAM SHOWING SEQUENCE OF GALLERIES IN AMERICAN HEADING METHOD OF HARD-ROCK TUNNELING.

the broken rock from the heading will be thrown back by the blasting and can be handled at the same time as the bench. This heading may be of small dimensions and the remainder of the section may be removed in successive small parts, or it may be the full width of the section and the enlargement completed in one other cut. When the tunnel is excavated by means of several cuts, the method usually employed in Europe, the sequence of galleries is indicated by Fig. 3. When the excavation is made by a single wide heading and a single other cut for removing the bench, the method preferred by American engineers, the sequence of galleries is the simple one indicated by Fig. 4. The St. Gotthard Tunnel, described farther on, is one of the most notable tunnels excavated by enlarging a heading by means of several cuts; the Cascade Tunnel in Washington is a notable example of the wide heading and single-bench method. In the Rogers Pass Tunnel in British Columbia a pioneer tunnel was driven from each end parallel with but quite independent of the main tunnel. This was done because it was impossible to use vertical shafts, and by making cross cuts to the main line it was possible to prosecute the work from several faces at once.

In all rock tunnel work the various galleries are excavated by drilling and blasting the rock. The most difficult gallery to excavate is the first heading or drift, as the case may be. Based on the mode of blasting employed, there are two methods of driving the advance gallery, known as the circular and the centre-cut methods. In the first method a set of holes is first drilled

near the centre of the front in such a manner that they inclose a cone of rock; the holes, starting at the perimeter of the base of the cone, converge towards a junction at its apex. Seldom more than four to six holes are comprised in the first set. Around these first holes are driven a ring of holes which inclose a cylinder of rock, and if necessary succeeding rings of holes are driven outside the first ring. These

FIG. 5. DIAGRAM SHOWING SEQUENCE OF GALLERIES IN BELGIAN METHOD OF SOFT-GROUND TUNNELING.

holes are blasted in the order in which they are driven, the first set taking out a cone of rock, the second set enlarging this cone to a cylinder, and the other sets enlarging this cylinder.

The success of the work is largely due to the number and length of the holes and the way they are placed. The centre cut with holes from 6 to 12 feet deep is the method mostly used in America, although the greater speed has been attained by the use of shorter holes, four to four and one-half feet deep and a greater number; but it has generally been conceded that on account of the greater quantity of powder consumed this method is more expensive. The holes in the bench are generally put in by power drills mounted on tripods and the holes drilled vertically in a line at right angles to the centre line of the tunnel; the number of holes which are necessary depends wholly on the hardness of the ground. In the large tunnels air-operated steam shovels have been used to take out the muck, but in the majority of tunnels the muck is shoveled into cars by hand and the cars moved by animal or electric power. In conclusion it may be stated that the present high development of labor-saving machinery for excavating rock makes this material one of the safest and easiest to tunnel with which the engineer ordinarily has to deal. A necessary equipment for tunneling through rock requires a steam, electric, or a water-power plant for pumping air under pressure and supplying light and power, and in large tunnels these power plants are often of considerable size. See BLASTING; DRILL.

Soft-ground tunnels are worked in a variety of ways which have been classified according to the country in which they originated, as English, Belgian, Austrian, and American. Obviously the classification, though widely accepted, is far from strict, because each method has many variations, nor has any method been confined to the country for which it was named. The English method is to remove the entire section in short lengths, usually from 12 to 20 feet in advance of a permanent lining. The masons and miners alternate in the possession of the

face, and the work of excavation and the building of masonry is uninterrupted until each is completed for the length. A small drift is generally driven at the bottom of the tunnel section from end to end of the tunnel, both for the purpose of ventilation and drainage and for the establishment of the centre line underground. It also allows the tunnel to be attacked at several points. The main excavation always begins at the top of the tunnel; two roof bars are then placed in this opening with their forward ends resting on posts and their rear ends resting on the completed masonry, transverse polings are then driven over these bars, and the heading is widened for the length of the roof bars. The vertical breast boards are placed under the transverse poling and new side bars placed. When the ground is stiff enough the poling is not driven over the side bars but placed against the roof after excavation. This operation is continued down the sides as far as required by the nature and pressure of the ground. Sometimes it is necessary to carry it to the bottom and at the same time keep the face boarded up and firmly braced against the completed lining. The miners now give way to the masons, who construct a length of lining within the timber and the operation is repeated. This method is best adapted to very firm ground, but has been used successfully in heavy and wet ground. The advantages consist chiefly in a large open space in which the masonry can be built up and the facility with which the muck can be handled. The disadvantages are that

FIG. 6. DIAGRAM SHOWING SEQUENCE OF GALLERIES IN GERMAN METHOD OF SOFT-GROUND TUNNELING.

the miners are laid off half the time, the work thus delayed, and part of the timbering is laid on green masonry.

In the Belgian method the upper half of the tunnel is excavated much in the same manner as in the English, except that the excavation is frequently carried considerably farther ahead of the masonry. A cut is then excavated through the centre half of the tunnel to the invert, leaving a berm on either side to support the arch of the tunnel lining. From the centre trench narrow cuts are made at intervals to the side and the masonry arch is underpinned, the cuts are widened, and the underpinning is extended until a complete side wall is built, and finally the invert is placed. The greatest advantage of this method is the fact that in firm material the successive steps can be carried on at a number of different places, so that the work is hastened. The worst feature of this

method is that the arch is first carried on earth, then on timber, both of which are liable to settle unevenly.

The German method in its most characteristic form consists in driving two separate headings at the foot of each side wall. The invert is put in last, but the rest of the lining is built from the bottom up, the side walls being built up in the two headings as high as pos-

In its final development the Austrian system is characterized by very strong timber supports. It commences with the centre bottom heading, and immediately above this is driven another heading extending to the top of the masonry arch. This last heading is enlarged laterally until it includes the whole arch area, and finally the bottom heading is enlarged laterally until it includes the side-wall area. The side walls

FIG. 7. SYSTEM OF STRUTTING PRACTICED IN ENGLISH METHOD OF SOFT-GROUND TUNNELING.

sible, then on top of these headings two others are driven and the walls brought up to this level; so on until the side walls are joined in the centre heading at the top. In practice only two headings are used, and this brings the wall up to the spring line of the arch, which is placed by widening out the centre top heading. The advantage of the German method is that a large centre core of earth is left upon which

are built first, the arch is then placed, and the invert goes in last.

In the so-called American method the centre top heading is usually driven, and this is enlarged sideways to include the entire arch area. Sills are then placed and an arch of segmental timbers is made and placed which carries the roof. Over these arches longitudinal lagging is usually placed, and the space between the

the timbering can be braced, and also as the openings are small the danger of large cavities is decreased. The method is not widely used, however, as the disadvantages, viz., cramped quarters and bad ventilation, overbalance the advantages.

ground and lagging is packed with loose rock. The bench is usually taken out in two layers and permanent posts set under the arches; this leaves the whole of the tunnel opened and tracks may be laid and trains run before permanent lining is placed. In many tunnels this

was the only lining used for several years after the tunnel was completed.

Tunnels are usually lined even in hard rock to avoid danger from falling rocks which may be shaken loose under constant traffic. The

FIG. 9. CONCRETE LINING FOR TUNNELS.

lining is usually brick, stone, or concrete, but in some cases cast iron has been used. Cast iron is usually placed in subaqueous tunnels where the space is limited and a strong lining is necessary. Concrete has been found to be very serviceable and cheaper to place than brick or stone.

Open-Cut Tunneling. When a tunnel or rapid-transit subway has to be constructed at a small depth below the surface, the excavation is generally performed more economically by making an open cut, building the lining inside it, and filling in the space outside the lining, than it is by subterranean tunneling proper. The necessary condition of small depth which makes open-cut tunneling desirable is generally found in constructing rapid-transit tunnels under city streets. This fact introduces the chief difficulties encountered, since surface traffic makes it necessary to obstruct the streets as little as possible. The two methods of open-cut tunneling commonly practiced may be classed as the longitudinal-trench method and the transverse-

in this trench and then filled around and above with well-rammed earth, after which the surface is restored. Generally the trench is opened in short lengths and each length completed ready for surface traffic before the adjacent length is opened. Another form of longitudinal-trench method is to open two narrow parallel trenches in which are built the side walls. The soil between these walls is then removed to a sufficient depth to permit the roof to be built and covered over, and the final process is to take out the core of earth inclosed by the side walls and roof. Generally one side wall and one-half of the roof arch are completed and covered over before the other side wall and half arch are begun. By this arrangement, one-half of the street is always unobstructed.

In the transverse-trench method a trench about 12 feet wide is opened across the street,

FIG. 10. TYPICAL MASONRY LINING FOR TUNNELS.

and in this trench a short length or slice of the subway is built. Owing to the small size of the opening, it is possible to cover it with a timber platform which carries the street traffic during construction. This method was extensively used in constructing the subway at Boston and at New York. In subway construction in American cities in nearly all cases the contractors are required to support the street

FIG. 11. MASONRY WORK IN TUNNEL.

trench method. The simplest manner by which to construct open-cut tunnels is to open a single cut or trench the full width of the tunnel masonry. This trench is struttled by means of side struttings of vertical planks held in place by transverse beams extending across the trench and abutting against longitudinal timbers laid against the strutting planks. The lining is built

surface so as not to interfere with traffic while excavating below. This involves elaborate and strong timbering systems.

Submarine Tunneling. Submarine or subaqueous tunnels are those excavated under the bed of a river or other body of water, generally to provide land communication between opposite shores. Inflowing water, always a serious

difficulty in tunnel work everywhere, is here the most serious problem with which the engineer has to deal. Where the tunnel is deep below the stream bed and penetrates a material impervious to water it may be excavated by any of the methods commonly employed in subterranean work. When, however, the opposite conditions exist, resort is had to the use of compressed air or to the shield system, or to a combination of the two. In the compressed-air method the forward end of the tunnel where excavation is progressing is filled with air under sufficient pressure to counterbalance the pressure of the water which seeks to enter. In the shield system the work is carried on by the aid of a rather elaborate mechanical device commonly called a shield. The importance of this invention to the tunnel builder can hardly be overestimated.

The shield devised by Barlow already referred to was greatly improved by J. H. Greathead, and was first used in building the London Tower tunnel begun in 1869. The remarkable success of this work led to the rapid adoption of the shield system for tunnel work in England and America. Briefly described, the modern tunnel shield is a steel-plate cylinder, with its forward edge strengthened and sharpened to form a cutting edge. The rear end extends backward so as to overlap the completed lining of the cast-iron rings. Around its inside hydraulic jacks are attached at frequent intervals so that their piston rods bear against the front edge of the completed lining. By applying power to the jacks their piston rods press with great force against the immovable lining and thrust the cylinder forward into the soft earth. Generally the cylinder has a vertical partition or diaphragm near the front end, which prevents the soft earth from rushing back into it except as it is allowed by opening suitable doors. In operation the cylinder is thrust forward until its sharp cutting edge penetrates the earth a little distance. Workmen then withdraw the earth in small quantities through the openings in the diaphragm. After enough material has been thus withdrawn to leave the front of the shield clear, the shield is again thrust ahead and more earth is removed. As fast as the shield moves ahead the lining is erected under the shelter of its tail end. A constant repetition of these processes completes the tunnel.

Cast iron has been used in the majority of subaqueous tunnels for a lining, on account of its strength for relatively thin sections. Its use saves an unnecessarily large excavation, and it also gives a reaction for the shield jacks, as the structure is permanent as soon as the sections are bolted in place.

Generally when shields are used it is necessary to pump in compressed air, although in some cases compressed air has been used without the shield, and vice versa. The amount of air used and the pressure held varies with the nature of the ground through which the tunnel is driven. The average pressure used is between 25 and 30 pounds per square inch. This pressure is employed when there is from 70 to 100 feet to the top of the water. In many cases it has been necessary to dump clay to a depth of 20 or 30 feet on top of the tunnel.

A method of tunnel construction that has found considerable application in the United

States consists in constructing cylindrical steel sections, closing their ends with wooden bulkheads, then floating them into position and sinking them in a trench dredged in the river bottom. The various sections are joined successively and inclosed with concrete as well as given an interior lining of the same material. This system was first used in the Detroit River tunnel of the Michigan Central Railroad between Detroit and Windsor; and then was found available for tunnels under the Harlem River for the New York Subway, and at Chicago and other places. Where dredging can be done, and it is not necessary to go to any considerable depth below the river bottom, this method is distinctly useful.

NOTABLE EUROPEAN TUNNELS

The number of tunnels notable because of their length, the difficulties encountered in their construction or for other reasons, is so great that mention can be made here of only a few of those which are most celebrated. The Mont Cenis Tunnel through the Alps was the first to place France in direct communication with Italy. It passes from a point near Modane, in France, under the Col de Fréjus, about 18 miles west of the actual Mont Cenis, into Italian territory, at a point near Bardonecchia, about 24 miles from Susa. The length of the tunnel between extremities is 7,601 6 miles. It is formed with a rising gradient from each end, at the rate of about 1 in 45½ from Modane and 1 in 2000 from Bardonecchia, the summit or meeting of the gradients being halfway through the tunnel. The railway does not enter at the extremities of the tunnel, but joins it by means of special curved sections of tunnel at each end. The total length of tunnel traversed by trains is 7,980 6 miles. The tunnel is lined with the exception of about 300 yards on the north side. The side walls are 8 feet, 6 inches thick throughout. The arch to the south side is constructed principally of brick, and to the north side of stone, a brick key being applied throughout. There are side paths of flagstones 20 inches wide.

Work was begun in 1857, and for three years hand labor was used entirely, but it was planned from the beginning by the engineers, Sommeiller, Grandis, and Grattoni, to introduce machinery ultimately. In 1861 power drills were put at work at the south end, and in 1862 the north end was similarly equipped. The tunnel was completed and opened for traffic in 1872.

In 1872 work was begun on the St. Gotthard railway tunnel through the Alps between Italy and France, which far exceeded the Mont Cenis in magnitude. This tunnel crosses the mountains between Goeschenen and Airolo, and is 9.25 miles long. The excavation was lined throughout with masonry, the side walls being of rubble stone and the roof arch of brick. Along the bottom there was a culvert of brickwork. The Mont Cenis Tunnel had been excavated by means of a drift as an advance gallery, but at St. Gotthard the advance gallery was a top centre heading. The tunnel was opened for traffic in 1882.

The third great Alpine tunnel was the Simplon Tunnel, which was opened in 1906. Many schemes for the connection of Italy and Switzerland by a railway near the Simplon Road Pass

had been devised. The scheme which was put forward in 1881 by the Jura-Simplon Railway consisted broadly of piercing the Alps between Brigue, in the Rhone valley, and Iselle, on the Italian side, from which village the railway descends to the southern terminus at Domo d'Ossola, a distance of about 11 miles. The tunnel is a double tunnel. That is, there are two parallel tunnels, having their centres 56 feet apart, each carrying one line of railway. By means of cross headings every 220 yards the problems of transport and ventilation are greatly facilitated. In cross section tunnel No. 1 is 13 feet, 7 inches wide at the bottom, and 16 feet, 5 inches wide at the widest part, with a total height of 18 feet above rail level. The material penetrated is rock. The construction was rendered more difficult by the inflows of hot water from springs in the vicinity. The trains are drawn through the tunnel by electric locomotives.

A new or second Simplon tunnel to meet the needs of increased traffic was demanded, and this had progressed to a point where by 1915 the length of completed tunnel at the north and south ends was over half completed, but progress was seriously interfered with by the drafting of workmen for the Italian army.

The third longest tunnel in Europe is the Loetschberg Tunnel, under the Loetschen Pass, on the line from Bern to Brig. This tunnel was begun in 1906, and was opened for international traffic on June 15, 1913. It is 9.04 miles from portal to portal. Another important Swiss tunnel is on the Tauern railway through the Alps at Gastein. It is 27,965 feet in length and was completed in 1909.

At the time of the outbreak of the great war a number of important tunnels were under construction in Europe. In Switzerland the Münster-Grächenberg Tunnel through the Jura Mountains, 5½ miles in length, was pierced through in 1914. In 1915 the Côte d'Or Tunnel, 3¾ miles in length, through the Jura Mountains, on the new direct line of the Paris-Lyons-Mediterranean railway to the Simplon Tunnel route in Italy, was opened to traffic, having been under construction from 1910. This is a double-track tunnel, where it was found possible to use steam locomotives on account of its good ventilation. Considerable tunneling was required in connection with the construction of the Jungfrau railway, where in 1912 the line was completed as far as Jungfrauoch. This tunnel was constructed on a grade to secure the required ascent. In 1916 work was in progress on a tunnel under the Furka Pass, and other schemes were in course of consideration. In Switzerland, on Jan. 1, 1915, there were in operation or under construction 627 tunnels with a total length of 175.01 miles.

AMERICAN TUNNELS

The great European railway tunnels which have been described find their nearest counterpart in America in the Hoosac Tunnel, the Stampede Tunnel, the Cascade Tunnel, the Snoqualmie, and the Rogers Pass Tunnel. The Hoosac Tunnel is on the line of the Fitchburg Railroad in Massachusetts, and passes through a southern extension of the Green Mountains known as the Hoosac Mountains. It is 4¾ miles long, and was driven from the two ends and from an intermediate shaft 1028 feet deep. Work was

begun originally in 1855 and was carried on intermittently, there being many long delays due to lack of funds and the obstacles encountered. The tunnel proper was completed in 1873, but several additional years were consumed in the masonry work. Its cost was about \$11,000,000. The tunnel is 24 feet wide in the widest part and 22 feet, 8 inches high, and carries two lines of railway track.

The Stampede Tunnel carries the Northern Pacific Railway through the Cascade Mountains, and was begun in 1886. From the time it was determined to make Puget Sound the western terminus of the Northern Pacific Railway the question of a feasible route across the Cascade Range was prominently before the company. Between the years 1873 and 1884 several proposed routes were examined by the company's engineers, of which those via the Natchess, Stampede, and Snoqualmie passes were prominent. The Stampede route, lying between the other two, was finally recommended, and was formally adopted by the company in 1884. The altitude of the mountain beneath which it was necessary to tunnel was 3970 feet above sea level, and the greatest thickness over the top of the tunnel is 1400 feet, the average depth being about 1200 feet. The elevation of the east portal of the tunnel above the sea is 2827 feet, and that of the west portal is 2800 feet. Work was begun in February, 1886. The total length of the tunnel was 9850 feet, with a rising grade from each end towards the middle and the total cost was \$1,160,000.

The Cascade Tunnel which carries the Great Northern Railroad through the summit of the Cascade Range in Washington was begun in 1897 and finished in 1900. It is a single-track tunnel, 21.5 feet high, 16 feet wide, and 2.6 miles long.

In 1915 the Snoqualmie Tunnel through the Cascade Mountains between Rockdale and Keschelus, some 60 miles east of Seattle, was completed. This was a single-track tunnel, 11,890 feet in length, the construction of which was estimated at some \$2,000,000, but the saving in snow fighting alone was estimated at \$175,000 per year, while the new line effected a saving of 443 feet of elevation and 1239° of curvature. It was constructed through varying kinds of rock, with about 75 per cent of the distance through hard slate, and the remainder quartzite and granite.

In 1916 the Rogers Pass Tunnel, the longest tunnel in North America, was nearing completion on the Canadian Pacific Railway at the Rogers Pass summit in the Selkirk Mountains between Glacier and Field, B. C. In this tunnel novel methods of construction were adopted, viz., running a pioneer tunnel from each end parallel with but distinct from the main tunnel, to which cross cuts were run at intervals. This double-track tunnel was able to save 540 feet in elevation, and 5 miles in distance, in addition to eliminating long stretches of snow sheds. The total length of the tunnel was 26,400 feet, and it was built without intermediate shafts. The maximum depth of rock above the tunnel was 5690 feet, and the tunnel was 24 feet high and 29 feet wide, with a concrete lining through the softer materials.

The Mount Royal Tunnel, which gives access for the Canadian Northern Railway into the business section of Montreal, was virtually

completed in 1916. It is 3.1 miles long, and leads to a passenger terminal to be located immediately adjacent to its east portal. The tracks at the station are 50 feet below the level of the street, and most of the station proper is underground. The tunnel is built for double track, being 23.5 feet high, 31 feet wide. It is located almost entirely in rock, and centre bottom headings were employed, and as soon as these were pushed forward cars were run so as to remove the muck and broken stone, the latter being crushed for rock material and concrete.

Among the many important railway tunnels which have been built through soft ground only two will be mentioned. The Baltimore Belt Tunnel, 8350 feet long, in Baltimore, Md., was excavated through water-bearing sand, loam, clay, and gravel by the German method of soft-ground tunneling. It provides for a double-track railway line. The St. Clair Tunnel carries the double tracks of the Grand Trunk Railway under the St. Clair River between Michigan and Canada. The excavation consisted of an open cutting on the American side 2500 feet long; a tunnel 6000 feet long under the river, and an open cutting on the Canadian side 3100 feet long. Work was begun by means of two shore shafts in 1888, but these were abandoned, and in 1889 work was commenced on the cuttings. The shields used were $21\frac{1}{2}$ feet outside diameter, and the cylindrical shell consisted of 1-inch steel plates. The cylinder was stiffened by five diaphragms dividing it into 12 cells. As the shield was shoved forward a paste of cement and water was forced out through holes left in the lining to fill the space left between the lining and the clay. The excavation was done in front of the shields, which were then forced forward by hydraulic jacks, and the erection of the permanent cast-iron lining followed up, the ring being erected inside the tail of the shield. The lining is 21 feet in outside diameter. Each ring of lining is 18 inches long, measured on the line of the tunnel, and is made up of 13 segments and a key piece. Each segment weighs 1050 pounds, and the total weight of cast iron in the lining is 27,000 tons.

The Bergen Hill Tunnel of the Erie Railroad which has been in part turned into an open cut is worthy of mention on account of its size rather than its length. The work consisted of four tunnels varying in length from 220 feet to 574 feet. The clear span of the roof was 56 feet and the tunnels carry four standard gauge tracks.

SUBMARINE TUNNELS

Channel Tunnel. The most ambitious scheme of tunneling was the project to connect England and France by a tunnel under the English Channel, which has been discussed periodically, both as an engineering proposition and on account of the political and economic considerations involved. It had been proposed by Hawkshaw and Brunles about 1870 that such a tunnel could be built, but opposition of a sentimental and military nature developed whenever the project was advanced, until 1913, when companies were organized both in Great Britain and in France, in attempts to secure government sanction for the scheme. It was argued that with the experience with the London tubes and other deep tunnels, and in view of the general development in engineering knowl-

edge and experience there would be no difficulty in the way of constructing two distinct sets of bores, one of which would be a drainage heading which could be used also for the removal of excavated materials and to supplement the main system of ventilation. The main tunnels were to consist of two single-track tubes, each of 18 feet interior diameter, and placed 32 feet apart from centre to centre, being lined throughout with cast-iron segments of ample strength to resist any possible pressure. An estimate of the total cost of the undertaking was made of about \$60,000,000, but before the plan, which was advanced seriously, could be discussed, the outbreak of the great war prevented active progress.

The first notable submarine tunnel to be driven through rock is the Severn Tunnel under the river Severn in England. The Great Western Railway system west of Bristol was formerly separated south of Gloucester by the Severn and its estuary, from the lines between Gloucester and the South Wales ports, as well as from the western lines between Hereford and North Wales, Liverpool, Manchester, and the north. This want of connection was only partly remedied by a steam ferry across the estuary of the Severn. A tunnel under the Severn was, accordingly, proposed in 1871 to provide for through traffic, and was authorized in 1872. Work was begun in 1873. The site selected for the tunnel was about 2 miles below the mouth of the Wye, where the width of the estuary at high tide is about $2\frac{1}{4}$ miles. The strata traversed by the tunnel consist of conglomerate, limestone, carboniferous beds, sandstone, marl, gravel, and sand; the least thickness of soil between the top of the tunnel and the deepest part of the channel is $4\frac{3}{4}$ feet. The total length of the tunnel is 4 miles, 624 yards. The tunnel was excavated from four shafts, work being commenced in 1873 and completed in 1886. Great difficulty was experienced with water, which flooded the workings on several occasions.

The Mersey Tunnel, about 1 mile long, connects Liverpool and Birkenhead and was built in 1888. In this work a ventilating tunnel of smaller size than the main tunnel was excavated under the main tunnel by a rotary boring machine which cut out the passageway to full size at one operation.

The Pennsylvania Railroad tunnels in and entering New York City consist of a double tunnel from the west side of Bergen Hill in New Jersey to the New City terminal at Thirty-second Street and Ninth Avenue; the station itself; tunnels under the city to the East River; four single-track tubes under the river to Long Island City, where connection is made with the Long Island Railroad and where there are yards for cleaning and making up the trains. Work was begun on the Hudson River tunnels early in 1904, and by October, 1906, accurate connections had been made under the river. The railroad tracks leaving the original line of the Pennsylvania Railroad at Harrison, N. J., enter the twin tunnels, which are spaced 37 feet centre to centre at the west face of Bergen Hill. As this is in rock (a distance of nearly 6000 feet), each tunnel is simply lined with concrete. Near the river, i.e., on the east side of the hill, the tunnels enter the Weehawken shaft, which is 70 feet deep, and which was sunk for the purpose of not only

driving west under the hill to meet those coming east, but at the same time driving east under the river to meet those coming west from the opposite shore. About 400 feet east of the Weehawken shaft the tunnels strike soft ground, making tubes of cast iron necessary. These are built up in sections and lined with 22 inches of concrete, reducing the exterior diameter of 23 feet to 19 feet. Under the river where the material is soft, for a distance of nearly 5000 feet, to prevent sinking under heavy traffic it was necessary to support the tubes on iron and concrete piles resting on bed rock. Approaching the terminal at Thirty-first to Thirty-third streets, Seventh to Ninth avenues, the tunnels diverge, forming a small section of 34 feet span double-track tunnel, a section of 1096 feet of triple tunnel containing four tracks and three spans, and a section of 605 feet of four tracks under one span. Within the tubes a ledge 3 feet 8 inches wide on the level of the car windows is formed of concrete, to afford the means of egress in case of accident, to provide a path for workmen, and to carry inside the conduits for light, power, telephone, and telegraphic purposes.

The New York City tunnels were driven from several shafts. One of these located at Eleventh Avenue and Thirty-second Street was for the purpose of driving the tunnels westward under the Hudson and at the same time eastward to the terminal. Two others, one in Thirty-second Street and one in Thirty-third Street, between Madison and Fourth avenues, were for the purpose also of driving east and west under the city, and finally a shaft was located on the East River front at Thirty-third Street to permit of work being carried on both beneath the river eastward and beneath the city westward. As the two single-track tunnels from beneath the Hudson approach the terminal they diverge to make track space, and in a similar manner, running east from the station, they converge until they finally become four single-track tubes beneath the East River. At Seventh Avenue they consist of two three-track tunnels, one under Thirty-second and one under Thirty-third Street, but at the west line of Fifth Avenue the three tracks are reduced to two, and each pair enters a separate excavation divided by a 12-foot wall, and spaced 34 feet centre to centre. At First Avenue they are still further reduced to two pairs of single-track tubes.

The East River tunnels consist of four separate tubes beneath the river identical in every respect with those beneath the Hudson. They were driven by the shield process, and connect New York City with Long Island City. On the Long Island side they were begun in the foot of two shafts located just west of Front Street and run beyond up to East Avenue, about 2000 feet, and from there to Thomson Avenue.

The Hudson tunnels between Manhattan and Jersey City and Hoboken represented the successful culmination of several attempts to construct a tunnel under the Hudson River. For financial and other reasons these had proved unsuccessful until the project was taken up by the Hudson and Manhattan Railroad Company, which was able to build two sets of twin tunnels under the Hudson River—one from Fifteenth Street, Jersey City, to Morton Street, Manhattan, and thence northerly to Sixth Avenue and Thirty-third Street, and the other between the Hudson Terminal Building at Cortland and

Fulton streets, Manhattan, to Jersey City, and thence westerly about $\frac{3}{4}$ mile to Brunswick Street, where the tunnel comes to the surface. These tunnels were constructed through the soft ground of the river bed by using shields, and the upper line was opened for traffic Feb. 1, 1908, while the second pair of tubes were opened for regular train service on July 19. The form of construction is segmented cast steel bolted together in the rear of the excavating shields as the latter were advanced. The lower half of each tube is lined with concrete, and the tunnels have a clear diameter of 15 feet.

WATER TUNNELS

Next to their use for railways, tunnels are more frequently built to conduct water than for any other purpose, perhaps. (See *AQUEDUCT*.) A good example of rock tunneling for this purpose is afforded by the Niagara Tunnel, built to carry the water away from the wheel pit of the Niagara Power Company at Niagara Falls, N. Y. This tunnel is 7600 feet long, 19 feet wide, and 21 feet high, and runs through solid limestone rock. In California the Mount Shasta Power Corporation has a 7-mile tunnel to carry water from Pitt River to its power house. This tunnel at first was of 7 × 9 section and subsequently was to be enlarged. The Chicago water-works tunnels, through which the city of Chicago draws its water supply from Lake Michigan, constitute the most elaborate system of water-supply tunnels anywhere in the world. They extend out into the lake as well as under the city, and vary in diameter from 5 to 13 feet. In 1915 there was under construction an addition to this elaborate system, which addition consisted of a 7-mile tunnel extending from a pumping station 4 miles under the city and 3 miles under the lake to an intake crib. This tunnel is of horse-shoe section, 13 feet wide and 12 feet high, and is driven through solid rock for the entire distance.

At Milwaukee, Wis., there is a water-supply tunnel 3200 feet long and 7½ feet in diameter, lined with brick masonry throughout, completed in 1895. At Cleveland, Ohio, there is a water-supply tunnel extending out into Lake Erie that is 26,000 feet long and 9 feet in diameter, and two other older tunnels, one being 5 feet in diameter for 6662 feet and 5½ and 6 feet in diameter for 2580 feet, and the other being 7 feet in diameter and 9200 feet long. Recently the West Side intake was extended 16,000 feet beyond a crib 1½ miles from shore. For many years one of the most notable water-supply tunnels in the world was the Croton Aqueduct, which brings water to New York City. This tunnel is 33 miles long and about 14 feet high and 14 feet wide; it was built through rock. This in turn has been surpassed by the new Catskill Aqueduct. The Los Angeles Aqueduct includes some 43 miles of concrete lined tunnels. (See *AQUEDUCT*.) With the increased demand for water supplies for power and irrigation, tunnels are constantly being constructed by the United States Reclamation Service and similar agencies, of which the Gunnison Tunnel, 30,582 feet in length, is a good example. (See *IRRIGATION*.) The Wyrnwy Aqueduct, 77 miles long, for bringing water to the city of Liverpool, England, has three tunnels, but not comparable in length with those mentioned.

RAPID-TRANSIT TUBES AND SUBWAYS

Within recent years many important tunnels have been constructed to carry rapid transit railways under city streets. Some of these, like the London tunnels, have been deep tunnels; but others, like those of Boston, Paris, Philadelphia, and New York, have been constructed for the most part by open-cut methods at a small depth below the surface. The City and South London Railway, in London, was begun in 1886 and completed in 1890, is $3\frac{1}{4}$ miles long from the city to the Swan at Stockwell, and is entirely underground. Briefly the road consists of two 10 feet, 6 inch cast-iron lined tunnels substantially parallel to each other, which converge into a single tunnel at the termini to permit the transfer of trains from one line to the other. These tunnels were constructed by means of the shield system. The Waterloo and City Railway in London extends from the Waterloo station of the Southwestern Railway to the Mansion House, a distance of 1 mile, 5 furlongs, and 150 yards. It consists of two parallel circular tunnels 12 feet, $1\frac{1}{4}$ inches interior diameter except at the curves, where the dimension is increased to 12 feet, 9 inches. The tunnels were driven by the shield method, work having been begun in 1894 and completed in 1897. A single electric railway track in each tunnel forms a double-track railway between the termini named. The Central London Railway runs from Shepherds Bush to the Bank, a distance of $5\frac{3}{4}$ miles, the whole distance being in deep tunnel at depths varying from 60 to 90 feet. It consists, like the two roads previously mentioned, of two parallel circular tunnels. Each tunnel is $11\frac{1}{2}$ feet in diameter and has a cast-iron lining. The shield system of construction was employed. To be added to these tunnels are the Metropolitan District railways, parts of which are underground, begun in 1853, the Waterloo and Baker Street Railway.

The Blackwall Tunnel for street traffic under the river Thames at London is 6200 feet in length, of which 3088 feet are tunnel proper, 1370 feet are open cut roofed over, and 1742 feet are open cut without covering. The exterior diameter of the tunnel is 27 feet. It was driven by means of a shield 27 feet, 9 inches in diameter and $18\frac{1}{2}$ feet long, with two diaphragms, from horizontal partitions or stages and four vertical partitions. The lining is of cast-iron rings. Work was begun in 1892 and completed in 1897. The tunnel provides a roadway 16 feet wide and two sidewalks each 3 feet, $1\frac{1}{2}$ inches wide. The Rotherhithe Tunnel, completed in 1908 under the Thames, connects Ratcliff on the north shore with Rotherhithe on the south. It has a total length of 6883 feet, of which 3698 feet are in cast-iron tunnel and 3194 feet in cut and cover or open approach. It has an internal diameter of 27 feet. In Glasgow, Scotland, the Glasgow City and District Railway has a length of 3.123 miles. Of this distance 1 mile is deep tunnel, and 3483 feet are tunnel built by the open-cut method. Work was begun in 1883 and completed in 1886. The Glasgow Central Railway has 0.84 of a mile of deep tunnel and 3.13 miles of open-cut tunnel. The Glasgow District Subway, $6\frac{1}{2}$ miles long, consists of two parallel circular cast-iron lined tunnels 11 feet in interior diameter. The tunnels were driven by the shield method. Construction was begun in 1891 and completed in

1894. The subways of Paris were built and are owned by the city and are leased, equipped, and operated by a private company. The metropolitan system (Paris subways) as originally planned included only about 46.6 miles of double track. The first line was opened in 1900. Later extensions provided for 34.1 miles additional. The entire system, including connections, will have 82.9 miles of double track, of which 73.3 will be used for the transportation of passengers and the remaining mileage for terminals and connections. The track is standard gauge, but the tunnel opening is too small to admit steam-railway equipment. The subway equipment can therefore run out on to the steam lines, but the steam-line trams cannot use the subway.

The first Boston Subway, begun in 1894, is an underground tunnel for the surface electric lines entering the business district of the city of Boston. The portion of the line completed in 1898 was 10,810 feet long, divided between double-track and four-track tunnel. The bulk of the tunnel was built by open-cut methods, but on certain portions the shield system was employed. In 1900 work was begun on a $1\frac{1}{4}$ mile extension of the original line under Boston harbor to East Boston. The East Boston Tunnel has a polycentric cross section $23\frac{1}{2}$ feet wide and $20\frac{1}{2}$ feet high, and is lined with concrete masonry. The double-track subway section is approximately rectangular and 24 feet wide by 14 feet high, while the four-track section is a similar form, but twice as wide. The lining consists of concrete side walls and brick roof arches supported by columns and I-beams of steel. These tunnels were followed in 1908 by the Washington Street Tunnel, some 2 miles in length and used by the elevated railway trains. In 1912 there was completed a subway to Cambridge which involved a tunnel 2500 feet in length under Beacon Hill. The Boylston Street Subway, $1\frac{1}{2}$ miles long, was begun in 1912 and completed in 1914. The Dorchester Tunnel, which will be about 12,000 feet long, was begun in 1912, and in 1915 there were 2108 feet completed.

The original New York Subway, as contracted for in 1899, comprises some $20\frac{1}{2}$ miles of line, three-fourths of which is in tunnel. A four-track line runs from the City Hall to 96th Street, above which it divides, one branch running to Bronx Park and the other to Van Cortlandt Park. The cross section of the underground line is of different types. In the rectangular section, used for more than half of the line, the dimensions adopted for two tracks are 25×13 feet, and for four tracks, 50×13 feet. The barrel-vault section, composed of a polycentric arch, is usually 24 feet wide and 16 feet high. The circular sections are 15 feet in diameter, two tunnels being built side by side for double-track line. The work was done partly by open-cut methods and partly underground, according to the depth of the line below the surface.

The new New York Dual Subway, begun in 1913, will increase the single-track mileage of the dual system (subways and elevated roads in Manhattan and Brooklyn) to 620. The new subway will contain about 3,000,000,000 cubic yards of concrete and cost in the neighborhood of \$337,000,000. It includes many types of construction, including open cut, excavation under decking, and subaqueous tunnels driven with and without the use of compressed air. The

work also involves the underpinning of buildings, some of them 20 stories high. See URBAN TRANSPORTATION.

In 1916 eight tunnels, seven of them double-tube, were in actual use or building, to connect Long Island with the west bank of the East River at New York City. The tunnels were original subway tubes, the Whitehall-Montague Street tunnels, the Old Slip-Clark Street tunnels, the Fourteenth Street-Eastern tunnels, of the new dual system, the Pennsylvania tunnels, the Queensboro or Steinway tunnels, the Sixteenth Street tunnels, and the Consolidated Gas Company's Astoria tunnel. Naturally such work was well understood, and construction progressed rapidly and for the most part without incident. Philadelphia opened its subway system in 1908 with a two-track tunnel in connection with its elevated railways. Mention should be made of the system of narrow-gauge tunnels in Chicago for handling freight, built in 1901. Other American and European cities were engaged in developing subway or tunnel schemes, but they indicated little departure from the general systems outlined.

OTHER NOTABLE TUNNELS

Among other notable tunnels the following may be briefly mentioned: Arlberg Tunnel, in Austria, begun in 1880 and completed in 1884 for a double-track railway, 6.38 miles long. Tequixquiac Tunnel, begun in 1888 to drain the valley of Mexico, 6 miles long and about 14 feet wide and 14 feet high, completed in 1898. Trans-Andean Railway Tunnel, through the summit of the Andes on the railway line between Buenos Aires and Santiago, 3 miles long, at an elevation of 10,460 feet above the sea. First Thames Tunnel at London, England, begun in 1825 and completed in 1843, 1200 feet long with two parallel ways of horseshoe section, each 13¾ feet wide and 16½ feet high. East River Gas Tunnel, between New York and Brooklyn, 2516 feet long and 10 feet, 2 inches in diameter, begun in 1892 and completed in 1894. East River Tunnel of Consolidated Gas Company, New York to Astoria, 4662 feet in length, of sufficient size to accommodate four 72-inch gas mains. Khojak Tunnel, on the Northwestern State Railway in India, 12,870 feet long, begun in 1889 and completed in 1891. Parsik Hill Tunnel, the second longest in India, 3900 feet in length. Graveholz Tunnel, on the Bergen Railway, in Norway, single track, 17,400 feet long. Arthurs Pass Tunnel, through the Southern Alps range on the line of the New Zealand government railway in South Island, 5 miles, 1660 feet in length, begun in 1908. The Otira Tunnel, also in New Zealand, is notable for length, being 5½ miles in length.

TUNNEL NET. See DECOY.

TUNNY (from OF. *ton*, *thon*, Fr. *thon*, from Lat. *thunnus*, *thynnus*, from Gk. *θύννος*, *thynnōs*, *θύρος*, *thynnos*, tunny, from *θύειν*, *thymein*, to dart along), or HORSE MACKEREL. The largest species of mackerel (*Thunnus thynnus*), also called tuna and great albacore. It has the typical form of mackerel (q.v.), except that its body is thicker, and the tail is widely forked, becoming crescent-shaped. It is pelagic, and occurs in all the warm seas, attaining a length of 10 feet and a weight of 1500 pounds. The flesh, even of large specimens, is good, and in southern Europe there are important fisheries. Tunny fisheries were early established by the Phœnicians, and salted tunny was esteemed by the Romans. The fish are captured by nets, and, besides the large sale of them fresh, vast numbers are disposed of by canning. Every part of the body is utilized, the parts being packed and sold separately, especially in Italy, under distinctive names. A closely related species is the long-finned albacore (*Germo alalunga*), common in the Mediterranean and widely distributed elsewhere, and abundant in the spawning season on the southern coast of California. It is about 3 feet long, and very handsome, but its flesh is poor. See Plate of MACKERELS.

TUN SHELL. One of the large, thin, globose, finely ribbed shells of the gastropod mollusks of the family Doliidae, closely related to the helmet shells and cowries (qq.v.). They are mainly tropical, but a well-known one

TUN SHELL.

(*Dolium galea*) inhabits the Mediterranean, and becomes 10 inches in length, making it the largest mollusk of that region. The fig shells (q.v.) also belong to this family.

TUN'STALL. A modern manufacturing and

market town in Staffordshire, England (Map: England, D 3). Since 1910 it has formed part of Stoke-on-Trent (q.v.).

TUNSTALL or **TONSTALL**, CUTHBERT (1474-1559). An English bishop and author. He was born at Hackforth, Yorkshire; was educated at Oxford and Cambridge, and studied at Padua; became rector of Harrow-on-the-Hill, 1511; Archdeacon of Chester, 1515; and was appointed Master of the Rolls in 1516, after his return as Commissioner to Brussels, where he made the acquaintance of Erasmus and negotiated two treaties with Charles I of Spain, afterward Charles V. He was appointed dean of Salisbury, 1521, Bishop of London in 1522, Lord Privy Seal in 1523, Ambassador to Spain in 1525, and to France in 1527, and became Bishop of Durham in 1530. He was deprived of his bishopric in 1552, and committed to the Tower on a charge of treason; was reinstated by Mary, but, declining the oath of supremacy to Elizabeth, was again deprived in 1559, shortly before his death. He was considered one of the ripest scholars and wisest diplomats of his period, and was the author of various theological and educational works, including *In Laudem Matrimonii, Oratio* (1518); *De Arte Supputandi Libri Quatuor* (1522), an arithmetical treatise frequently republished (1522); and *De Veritate Corporis et Sanguinis Domini nostri Jesu Christi in Eucharistia* (1551), one of the best contemporary statements of the doctrine of the Eucharist.

TUPAC AMARU (tōō'pāk ā'mā-rōō) II (1742-1781). A Peruvian revolutionist, whose real name was José Gabriel Condorcanqui, born at Tinta (south of Cuzco). He was a direct descendant of the original Incas and has been called the last of the Incas, though it seems he did not himself lay claim to that title. Under the Spaniards he ruled several villages, and in 1780, failing to get better treatment for the Indians, he organized an uprising of 60,000 natives. The insurgents soon controlled all the country between Lake Titicaca and Cuzco, but in 1781 Tupac was defeated and captured and, with some of his family, was executed with frightful torture. It has been estimated that 80,000 Indians were killed, the Spaniards' object apparently being to exterminate the Inca race. Fernando, Tupac's son, was condemned to life imprisonment, and sent to Spain when a child 10 years old. His fate is not known, although in 1828, a man calling himself Fernando Tupac Amaru was pensioned at Buenos Aires, and afterward was a monk at Lima.

TUPAIA, tā-pā'yā, or **BANXRING**. See TREE SHREW.

TUPELO, tū'pē-lō (North American Indian name), *Nyssa*. A genus of North American trees, including those commonly known as the cotton gum, Ogeechee lime, black gum, etc. See BLACK GUM.

TUPELO. A city and the county seat of Lee Co., Miss., 50 miles south by west of Corinth, on the Mobile and Ohio and the St. Louis and San Francisco railroads (Map: Mississippi, H 2). Noteworthy features are the United States Fish Hatchery, Tupelo Military Institute, courthouse, city hall, and the public parks. There are cotton and cottonseed-oil mills, a fertilizer factory, compress, brick and tile works, etc. Pop., 1900, 2118; 1910, 3881.

TUPI, tōō-pē' (allies, or village), or **TUPINAMBA**. An ancient tribe from which the wide-

spread Tupian stock (q.v.) takes its name, and whose language is the basis of the lingua geral or Indian trade language of the Amazon region. About 1550 they were populous and powerful. Being broken and driven back by the whites, they went into the interior, the bands taking different names. In 1640 some of them were still settled, under their own name, along the Lower Amazon. Their religion was a simple animism, with little ceremonial. Those yet remaining in the same vicinity are now called, improperly, Tapuya (q.v.). They are civilized, quiet, and intelligent. The men are strong, and supply the bulk of the crews for the Amazon River trade.

TUPIÁN (tōō-pē'an) **STOCK**, or **TUPI-GUARANA**. The most widespread and important linguistic stock of South America. When the Portuguese took possession of Brazil the Tupian tribes held the greater portion of the territory from the Río de la Plata (Paraguay or Paraná) on the south to the Amazon on the north, and extended far inland. The two principal tribes were the Tupí (q.v.), about the mouth of the Amazon, and the Guaraní (q.v.), on the Lower Paraguay. Of numerous other cognate tribes, the most important were the Chiriguano, Guayay, Mündurucú (q.v.), Mura (q.v.), and Omagua (q.v.). Many of the eastern tribes were gathered into missions by the Jesuits at an early period, the Guaraní missions in particular at one time containing more than 300,000 Indians; but through slave-hunting raids and the subsequent expulsion of the Jesuits the missions were broken up, the more civilized Indians remaining to be incorporated with the Spanish settlements, while others retired into the unexplored western wilderness. In general culture the Tupian tribes as a rule were superior to other aborigines of Brazil, though much inferior to the Quichua of Peru. They practiced agriculture to some extent, raising corn, manioc, and tobacco, and were expert stone workers, hammock weavers, and makers of pottery. They kept monkeys and peccaries for food, but their main dependence was upon hunting and fishing. Their houses were light structures, usually communal, and most of them went naked. With the exception of the Omagua, who had acquired considerable of the Quichua culture, they had no metals. The Tupian languages have been extensively cultivated, the Guaraní having been adopted by the Jesuits for use in all the missions of the Paraguay, while the Tupí, in its corrupted form, is still the trade medium throughout the Amazon region. Consult: Lucien Adam, *Matériaux pour servir à l'établissement d'une grammaire comparée des dialectes de la famille Tupí* (Paris, 1896); D. G. Brinton, *Linguistic Cartography of the Chaco Region* (Philadelphia, 1898); Hermann von Ihering, *The Anthropology of the State of S. Paulo, Brazil* (2d ed., S. Paulo, 1906); F. Pierini in *Anthropos*, vol. iii (Salzburg, 1908).

TUPPER, SIR CHARLES (1821-1915). A Canadian statesman. He was born at Amherst, Nova Scotia, and graduated in medicine at Edinburgh University in 1843. For 12 years he practiced his profession in his native county of Cumberland, which in 1855 elected him as a Conservative member of the Legislative Assembly. He was Provincial Secretary in 1856 and Premier in 1864-67. He strongly supported the movement for Canadian Confederation, overcame the opposition of Joseph Howe (q.v.), at-

tended the conferences in 1864 at Charlottetown and Quebec as a delegate, later joined the conference of delegates with the British government in London, and shared in the accomplishment of Confederation in 1867. In the first Dominion administration of Sir John A. Macdonald (1867-73) he was successively President of the Council (1870), Minister of Inland Revenue (1872), and Minister of Customs (1873), but resigned the last office the same year, after the defeat of Macdonald on charges of political corruption in connection with contracts for the proposed Canadian Pacific Railway. During five years of opposition he was Macdonald's chief aid and political adviser and had a prominent part in the electoral campaign which resulted in the Conservative victory of 1878 and the establishment of the national policy of a protective tariff the following year. As the first Canadian Minister of Railways, he aided importantly in the construction of the Canadian Pacific by a private company until 1884, when he was appointed High Commissioner for Canada in London. Returning in 1887, he was Minister of Finance until May, 1888, shortly afterward resuming his position as High Commissioner, in which office he remained until 1896. The death of Sir John A. Macdonald in 1891 having been followed by five years of brief ministries and Conservative ineptitude, Tupper was again brought from London to Ottawa, succeeded Sir Mackenzie Bowell as Premier in 1896, and made strong though unsuccessful efforts to extricate the Conservative government from the difficulties into which it had fallen over the educational question (see CANADA, *History*; MANITOBA, *History*; GREENWAY, THOMAS). After his defeat in 1896 he was Conservative opposition leader until 1900, when he retired from public life. He afterward resided in England. Both in Nova Scotia before Confederation and afterward in federal affairs he procured the enactment of many important laws. Imperial federation had his ardent support. He was a man of great physical force and political courage, distinguished both as debater and orator. He was made K.C.M.G. in 1879, G.C.M.G. in 1886, a Baronet in 1888, and a member of the Imperial Privy Council in 1903. He died in England, but was buried at Halifax. His *Recollections of Sixty Years* has much historical value (Toronto, 1914). Consult also Charles Thibault, *The Biography of Sir Charles Tupper* (Montreal, 1884), and E. M. Saunders, *Three Premiers of Nova Scotia* (Toronto, 1909).

TUPPER, SIR CHARLES HIBBERT (1855-1927). A Canadian statesman, son of Sir Charles Tupper. He was born at Amherst, Nova Scotia, studied at McGill and Harvard universities, and in 1878 was admitted to the bar. In 1882 he was returned as a Conservative to the Dominion Parliament, and subsequently also in 1887, 1888, 1891, and 1896-1900. In 1888-95 he was Minister of Marine and Fisheries, and in 1895-96 Minister of Justice and Attorney-General. In 1893 he served as agent for the British government in the Paris tribunal of arbitration on the Bering Sea question. (See *BERING SEA CONTROVERSY*.) After 1897 he practiced law at Vancouver, B. C. In 1904 he retired from political life. He was knighted (K.C.M.G.) in 1893.

TUPPER, MARTIN FARQUHAR (1810-89). An English versifier, born in London. His father, Martin Tupper, was a well-known London sur-

geon belonging to a German family which had long been settled in Guernsey. Martin was educated at the Charterhouse, and at Christ Church, Oxford. In 1832 he entered Lincoln's Inn, where he was called to the bar three years later. He never practiced law, but turned at once to literature. He visited the United States in 1851 and 1876. He died at Albury, near Guildford, Nov. 29, 1889. Tupper published 39 volumes. His first work, poems called *Sacra Poesis* (1832), attracted slight attention. *Geraldine* was published in 1838; it was a ludicrous attempt to complete Coleridge's *Christabel*. In 1838 also appeared the first installment of *Proverbial Philosophy*. The work was completed in 1876. The earlier parts were enormously popular. Large sections of the poems were translated into German, French, and Danish. It is hard to account for this vogue, as the poem is an endless chain of canting moral commonplaces. Consult the autobiography, *My Life as an Author* (London, 1886), and reviews in contemporary periodicals, especially *Fraser's Magazine* (ib., October, 1852).

TUPPER LAKE. A village in Franklin Co., N. Y., 108 miles northeast of Utica, on the New York Central Railroad (Map: New York, F 2). Lumbering is carried on and among the chief industrial establishments are saw mills and a coöperage. Pop., 1910, 3067.

TUR. See GOAT.

TURA, COSIMO (c.1430-95). An Italian painter of the early Renaissance, the founder and most important master of the Ferrarese School. He was born in Ferrara, studied at Squarcione's school in Padua, and was influenced by Donatello and the early works of Mantegna. His powerful, realistic figures are hard in color, but well drawn and modeled. He delighted in the symbolic and the grotesque. His most important paintings include the impressive "Pietà" (Museo Civico, Venice); the "Annunciation" in the cathedral at Ferrara; a "Dead Christ Upheld by Angels" (Vienna); "Christ on the Cross" (Brera, Milan); and the altarpiece "Madonna with Saints" (Berlin Museum). Panels of saints are at Dresden, London, in the Uffizi (Florence), and at Modena and Paris.

TURACO, tōō-rā'kō (African name). A bird of the African family Musophagidæ or plantain-eaters (q.v.). The species are numerous, of large size and brilliant plumage, and have strong, thick bills, more or less curved on the top, the cutting edges jagged or finely serrated, so as to render them very efficient instruments for cutting soft vegetable substances, on which they feed. The colors are chiefly bright green, greenish-blue, crimson, and yellow; red and green predominate. These birds have a helmet-like crest, which they elevate when excited. One of the largest species is the giant turaco (*Corythæola cristata*) of western and Central Africa, which is 28 inches long. It is blue-green without red, but the tail has a broad, black, sub-terminal bar, and the bill is red and yellow.

TURANIAN. A term formerly applied loosely to all Asiatic peoples, excepting those of Indo-Germanic or Semitic stock. In the early Iranian chronicles of the Persian era the term Turan, in contrast with Iran (the home of the Aryan Iranians), was given to the region to the northeast, including modern Turkestan, the home of non-Aryan, nomadic, uncivilized peoples. The theory once put forth according to which, in prehistoric times, western Asia and

most of Europe were peopled by Turanians, whose descendants could be seen in Pelasgians, Hittites, Etruscans, Iberians, Basques, Picts, Finns, and Lapps, has now no currency among the best authorities. The term Turanian still has, however, some scientific currency, although in a much modified sense. Thus De Morgan styles the peoples of the Caucasus Turanians, and Deniker uses the word as synonymous with Turko-Tatars. In linguistics Turanian formerly had some vogue as a term proposed by Max Müller for all languages of Europe, Asia (excepting China), and Oceania, which are neither Indo-Germanic nor Semitic. The division of these languages into Ural-Altaic or Finno-Ugric, Dravidian, Kolarian, Tibeto-Burman, Khasi, Tai, Mon-Anam, and Malayo-Polynesian is now adopted.

TURATI, *tūr-ā'tē*, FILIPPO (1857-). An Italian Socialist leader, born at Canzo (Como). He graduated in law at the University of Bologna in 1877, and was appointed counselor from the Province of Milan. Later he was elected from Milan as a member of the Chamber of Deputies. From 1891 to 1903 he served as manager and editor of the *Critica sociale*, the monthly organ of the Socialist party. As the chief spokesman of the Reformists or Constitutionalists, Turati became the leader of the Italian Socialists, but in 1904 Enrico Ferri (q.v.) succeeded in supplanting him temporarily. The Milan Congress, however, in 1910 indorsed Turati's Reformist policy by a vote of two to one, and he continued to lead the more numerous section of the Socialists. A close personal friend of King Victor Emanuel III, he was frequently consulted by him before the entrance of Italy into the European War in 1915.

TURBAN SHELL. An herbivorous scutibranchiate mollusk, closely allied in habits and structure to the top shell (q.v.). It takes its name from a resemblance in the shell to an Oriental turban. When denuded of its outer coating the shell is richly pearly, and is one of the shells most widely sold as an ornament. In the Orient, where most of the species live, the animals are often eaten. The aperture is large and flaring, and the operculum calcareous. The typical genus *Turbo*, the genus *Phasianella* (see PHEASANT SHELL), and the spiny genus *Delphinula*, constitute the family Turbinidæ, which may be traced back to Ordovician time, and especially flourished during the Silurian period.

A TYPICAL TURBAN (*Turbo argyrostomus*).

TURBELLARIA (Neo-Lat. nom. pl., from Lat. *turba*, disturbance, crowd; referring to the whirlpools caused by the movements of their cilia). The first and most highly organized of the three classes of flatworms, composed of free-living worms. The body epithelium is densely ciliated. The turbellarian worms are found in both salt and fresh water in the warmer parts of the world, and in moist places on land in the tropics. They are usually of small size, less than 2 inches long, but some species are 4 or 5 inches long. The body is generally very flat and leaflike, but in some

species, especially among the land forms, is narrow, elongated, and slightly arched. The colors are sometimes dull, but many of the marine forms are brightly colored, and are very beautiful objects. Most of the Turbellaria are carnivorous, and are very active, especially in swimming. The class is divisible into three orders, based chiefly on the arrangement of the intestine.

TURBERVILLE or **TUBERVILLE**, GEORGE (c.1540-c.1610). An English poet of an ancient Dorset family. He was born at Whitechurch, in Dorsetshire, and was educated at Winchester and at New College, Oxford, of which he became a fellow in 1561. Leaving Oxford the next year without a degree, he studied law at one of the inns of court in London. In 1568 he accompanied Thomas Randolph, a special ambassador of the Queen, to Russia, where he wrote verses describing the manners of the people (reprinted in part in Hakluyt's *Voyages*, 1589). Of his later life nothing is known. He probably died about 1610. Turberville occupies an interesting place in English literature as a translator from the Latin and the Italian and as one of the first among English poets to employ the ottava rima (q.v.) and blank verse (q.v.). Chief among his works are *Epitaphs, Epigrams, Songs, and Sonnets* (1567, in Chalmers's *British Poets*, vol. ii, London, 1810); *The Booke of Faulconrie, or Hawking*, with which is bound *The Noble Art of Venerie, or Hunting*, ascribed to Turberville (1575; enlarged 1611); *Tragical Tales* from the Italian, with original epitaphs and sonnets (1587; reprinted, Edinburgh, 1837); and *The Heroicall Epistles of Ovidius in English* (1567). To Turberville have been doubtfully ascribed two versions of Tasso's *Jerusalem Delivered* (manuscript in Bodleian Library at Oxford). Selections from Turberville's poems are in *Early English Poetry*, edited by H. M. Fitzgibbon (London, 1887).

TURBINE. A term used to distinguish a variety of steam engines, water wheels, and centrifugal pumps. The general distinguishing characteristics of turbine machinery, compared with older apparatus, is the employment of uniform rotary motion in place of reciprocating, and the use (in one form or another) of impeller and guide vanes instead of pistons and ports. Some steam turbine engines replace the initial guide vanes with nozzles in which the steam is expanded before discharge upon the first impeller vanes. Turbine pumps are commonly distinguished from ordinary centrifugals by the presence of guide vanes which receive the water from the impeller and change its velocity head into pressure more efficiently than does the simple open casing. See PUMPS AND PUMPING MACHINERY; SHIPBUILDING, *Machinery*; STEAM TURBINE; WATER WHEEL AND TURBINES.

TURBIT. A fancy breed of domestic pigeons, varying in colors and crest, with a flattened head, very small beak, ruffled breast, and other oddities. See Colored Plate of PIGEONS.

TURBOT (OF *turbot*, from Lat. *turbo*, top). The most valuable of the flatfishes (*Rhombus maximus*), and one of the most toothsome of all fishes. It abounds off the northern coast of Europe, and attains a large size, sometimes 70 to 90 pounds in weight. Its form is shorter, broader, and deeper than that of almost any other flatfish. It is brown in color on the upper surface, which is studded with hard roundish tubercles. Like the other flatfishes, it gener-

ally keeps close to the bottom of the sea; and is found chiefly on banks where there is a considerable depth of water. See FLATFISH; and Plate of FLATFISH and FLOUNDER.

TURCARET, tur'ká'rá'. A comedy by Lesage (1709), satirizing financial corruption.

TURCO-ITALIAN WAR. With the realization of national unity in 1871, Italy entered the field of world politics. Emulating other Great Powers of Europe, the country strove for colonial possessions. Northern Africa appeared to be a possible place for Italy to satisfy territorial ambition. The decline of Turkish control there had already tempted the European Powers to extend "spheres of influence" over these semicivilized territories. France had a foothold in Algeria and Great Britain in Egypt. Italy at first hoped to bring Tunis under her control, but the French had gradually penetrated this territory and in 1881 France proclaimed a protectorate over Tunis. Italian resentment at this action led Italy to join the Triple Alliance (q.v.) with Germany and Austria. Frustrated in ambitions as to Tunis, Italy turned attention to the Turkish territory further east in Tripoli and Cyrenaica. Italian colonists began to settle there and Italian capitalists began "peaceful" penetration of the country. Friction developed between the European financial interests and the weak and corrupt Turkish administration.

After the Turkish revolution of 1908 (see **TURKEY**), which was characterized by an outburst of Turkish nationalism, the Young Turk party opposed the pretensions of Italy in Tripoli. The Italians, on the other hand, declared that their merchants and citizens in Tripoli were being mistreated by the Turkish authorities. The crisis was reached when, in September, 1911, Italy sent an ultimatum to Turkey enumerating her complaints against Turkish misgovernment, informing the Sultan that Italy had determined upon the military occupation of Tripoli and demanding acquiescence within a period of twenty-four hours. The Porte's reply was considered unsatisfactory by Italy, and on Sept. 29, 1911, the Italian government declared war on Turkey.

Italy's action caused great apprehension in the chancelleries of the Great European Powers. Any disturbance in the Turkish dominions was liable to precipitate trouble in the Balkans and might lead to serious and unforeseen consequences. Germany and Austria-Hungary were especially concerned. Turkey had come to be regarded as a member of the Triple Alliance group. Both the German and Austrian governments appealed to Italy, as a member of the alliance, to compromise the issue. They could hardly do more, for if pressure was brought to bear upon Italy it might readily lead her to join forces with the rival diplomatic group (the Triple Entente). Under these circumstances Germany and Austria-Hungary were forced to stand by and see their protégé despoiled by their ally Italy.

Naval and Military Operations. The war opened with the sinking of three Turkish torpedo boats off the coast of Epirus by an Italian squadron. In October, 1911, the Italian fleet blockaded the Tripolitan coast and, after a bombardment, the port of Tripoli was occupied. An expeditionary force was landed but no serious resistance was offered by the Turks, who withdrew into the interior. An uprising of

the Arabs led to vigorous reprisals on the part of the Italian authorities. All Arabs who were found with firearms were condemned to death and several thousand others, accused of treachery, were transported to Italian islands. The Italian forces took possession of many coast towns and on Nov. 5, 1911, Italy formally proclaimed annexation of Tripoli and Cyrenaica. Little effort was made, however, to push into the interior.

After the war had continued several months the European Powers tried to bring about peace. Russia, in particular, tried to obtain an agreement among the Great Powers to prepare some feasible means of intervention, but the mutual jealousy and suspicion prevented any concerted action. It appeared as though Turkey might stand out indefinitely. To surrender a large Mussulman population to a Christian Power would have weakened the influence of the Young Turk party in control at Constantinople. Moreover, Italy's hands were tied in that she had bound herself, under pressure from Austria-Hungary, not to carry on military operations in the Balkans or the Aegean Sea. After four months of indecisive warfare Italy made an effort to force matters to a final issue by sending a squadron into the Red Sea and bombarding the port of Hodeida. This was followed by the sinking of two Turkish war vessels in the port of Beirut. The extension of the war to the Turkish Asiatic dominions was regarded by the European Powers with apprehension. It was probably the intention of Italy, by this move, to force the European Powers to bring pressure to bear upon Turkey to yield to the Italian demands. Diplomatic representations were made by the Powers to Turkey, and in the hope of making these effective an Italian squadron appeared in the Dardanelles and bombarded the Turkish forts there.

The Porte replied to the communication from the Powers in regard to mediation that this could only be accepted on the condition that the sovereign rights of Turkey should be maintained and that Tripoli should be evacuated by the Italians. In answer to the Italian attack on the Dardanelles, the Turkish government closed the Straits to commerce, but upon the energetic protest of the Powers, especially Russia, this action was revoked. Further action by the Powers against Turkey was not deemed expedient and it appeared as though the war had resolved itself into a stalemate. In Italy the situation was critical. The government could not revoke its decree annexing Tripoli without compromising Italy's position among the Powers of Europe. The expenses of the war aggravated the financial stringency in the country, and it was essential to bring the war to a close as speedily as possible. As a further effort to influence Turkey, and possibly also the European Powers, the Italians seized twelve of the Turkish islands in the Aegean. This action aroused serious concern, especially in Great Britain, for if Italy retained these islands it would seriously modify the balance of power in the Mediterranean. A second appearance of the Italian fleet in the Dardanelles in July, 1912, threatened further complications. In August, 1912, Turkey first indicated a desire to end the war. This move was due, not so much to the activities of the Italians, as to reports of serious unrest among the Balkan states.

In the latter part of August, 1912, negotiations were begun between representatives of Italy and Turkey looking to a restoration of peace. The meetings were held at Ouchy, Switzerland. The chief difficulty arose from Italy's decree annexing the province of Tripoli, which Turkey would not accept. The precipitation of the Balkan War (q.v.), however, forced Turkey to accept such terms as she could obtain, and on Oct. 15, 1912, preliminaries to peace were signed. The terms of the Treaty of Lausanne provided that Italy should retain full sovereignty in Tripoli and Cyrenaica. At the same time Turkey was not required to recognize expressly the annexation, and Italy agreed to recognize the religious authority of the Sultan over the Moslem subjects in the territory. The Aegean Islands were restored to Turkey on condition that a general amnesty should be granted to the inhabitants and local autonomy respected.

The wider aspects of the war, in its effects upon the international situation in Europe, were of far-reaching importance. As had been anticipated, the disturbance of the status quo in one part of the Turkish dominions precipitated trouble elsewhere. The Balkan States, taking advantage of Turkey's difficulties, organized the Balkan League and began a war which reached its culmination in the tremendous conflict of 1914. See WAR IN EUROPE, *Underlying Causes*.

TURENNE, tu'rén', HENRI DE LATOUR D'AUVERGNE, VICOMTE DE (1611-75). A marshal of France, born at Sedan, Sept. 11, 1611, the second son of Henry, Duke of Bouillon, and brought up in the Reformed faith. He entered the French army in 1630, served with distinction under Bernhard of Weimar in 1637-38, and won a victory over the Spaniards before Casale in 1640. He conquered Roussillon from Spain in 1642, and was rewarded with the baton of a marshal of France. In 1643 he commanded the army operating in Germany, where the French had sustained defeat by the Bavarians and Imperialists. With the Duke of Enghien (later Condé) he fought against General Mercy at Freiburg in August, 1644. After suffering his defeat by Mercy at Marienthal, May 5, 1645, he shared in Condé's victory near Nördlingen, August 3. The next year Turenne united with the Swedes to complete the conquest of Bavaria, and by his successes hastened the close of the Thirty Years' War (1648). Under the influence of his elder brother and the Duchess of Longueville (q.v.) he joined the Fronde (q.v.), but, with his Spanish allies, was defeated by Duplessis at Rethel in December, 1650. In 1651 he became reconciled with the court, and successfully commanded the royal armies against Condé, who meanwhile had gone over to the Fronde. In 1667, on the outbreak of the so-called War of Devolution (see LOUIS XIV), the King gave him the supreme command of the army, with which he overran Flanders and Franche-Comté. Louis XIV succeeded in in-

ducing him to embrace the Catholic faith (1668). Turenne's campaign in Holland (1672) was a triumphant one; and the Elector of Brandenburg, who had ventured to side with the Dutch, was forced to sue for peace. In the following campaign, however, Turenne was outmaneuvered by the Imperialist general, Montecucculi. In 1674 he laid waste the Palatinate and defeated the Duke of Lorraine at Sinzheim. Forced from Alsace by superior forces, Turenne executed a masterly retreat, and found safety behind the Vosges Mountains; in a midwinter campaign he reconquered the country after two decisive victories at Mülhausen and Türkheim. Once more he crossed the Rhine to meet his old rival, Montecucculi, but was killed while reconnoitring before Sasbach, near Offenburg, July 27, 1675. He was buried at St. Denis, and his body was placed by Napoleon in the Invalides.

Bibliography. Turenne left memoirs of his campaigns from 1643 to 1658, which are of interest to the student of military history (Paris, 1782; new ed., 1872); they are supplemented by the *Memoires* by Deschamps (ib., 1901); his letters were edited by Barthelemy (ib., 1874). Consult also: Henri Choppin, *La campagne de Turenne en Alsace, 1674-1675* (Paris, 1875); Paul Lümekemann, *Turennes letzter Feldzug, 1675* (Halle, 1883); L. de Piépape, *Turenne et l'invasion de la Champagne, 1649-1650* (Paris, 1889); Jules Roy, *Turenne: sa vie, les institutions militaires de son temps* (2d ed., Paris, 1898); F. des Robert, *Les campagnes de Turenne en Allemagne* (Nancy, 1903); Hardy de Périni, *Turenne et Condé, 1626-1675* (Paris, 1907); C. G. Picavet, *Les dernières années de Turenne, 1660-1675* (ib., 1914); id., *Documents biographiques sur Turenne, 1611-1675* (Lille, 1914).

TURGAI, tūr-gī'. A territory of Russian Central Asia, an administrative division of the Governor-Generalship of the Steppes (Map: Asia, H 4). Area, 176,219 square miles. The larger part is flat, with sandy deserts in the south. The western part is covered with the Mugajar Mountains, offshoots of the Ural system. The region is watered by the Ural and the Tobol, which are almost waterless during the dry season. The flora is poor and the forests are few. The fauna, on the other hand, is very rich, especially in fur-bearing animals. The climate is continental, with extremely hot summers and severe winters.

Agriculture is as yet little developed. The nomadic Kirghizes are engaged principally in stock raising and hunting. The mineral deposits of the region, which include iron, copper, silver, coal, etc., are practically untouched. The natives export small articles of metal, saddles, musical instruments, carpets, etc. There are also exported furs and animal products. The barter system still prevails. Pop., 1913, 689,500.

TURGENEV, tur-gén'yé, ALEXANDER IVANOVITCH (1785-1846). A Russian historian. He traveled extensively in Germany, Italy, France, and Denmark, making investigations in regard to the mediæval history of Russia. He published *Historiæ Russiæ Monumenta* (2 vols., 1841-42) and a *Supplementum* (1848).

TURGENEV, IVAN SERGEYEVITCH (1818-83). A Russian novelist. He was born at Orel, the son of a wealthy nobleman. At home he learned German and French, besides some English, while a self-taught serf implanted in him a love for the Russian poets. At 16 he entered the University of St. Petersburg. Here he

came to know Pushkin, Belinsky, and other literary lights. After graduating, he went to Berlin to complete his studies, returning to St. Petersburg in 1841. His relations with his mother, formerly strained, were now openly broken off on account of her treatment of the serfs. He had to take service as a government clerk, but soon gave up his position and set himself to write. His poem *Parasha* (1845) was heartily praised by Belinsky. But it was the great success of *Kolosov* (1846) and *Khor and Kalinytch* (1847) that induced him to write the *Annals of a Sportsman* (1847-51). These sketches, pervaded with the spirit of humanity and a sincere love for the oppressed peasants, became the favorite book of Alexander II, then heir to the throne. When Turgenev's mother died in 1850 he immediately liberated all the serfs belonging to the estate. Meanwhile, he had incurred the suspicion of the government by his liberal utterances and in 1852 he was exiled to his estate, but was pardoned two years later. In 1855 Turgenev left Russia, and, except for a few visits to the country of his birth, spent most of his life abroad, mainly at Paris. He died at his Bougival villa, near Paris, in 1883, and was buried at St. Petersburg in the Volkov Cemetery, the funeral procession exceeding anything of the kind previously witnessed in Russia.

The great fame of Turgenev rests on his *Yakov Pasyonkov* (1855); *Rudin*, *Faust* (1856); *Asya* (1858); *Nobles' Nest* or *Liza* (1859); *On the Eve*, or *First Love* (1860), and *Fathers and Sons* (1862). In these he turned to the mental and moral bankruptcy of the upper classes as resulting from a life of idleness amid hundreds of overworked serfs. *Fathers and Sons* marks an important point in Turgenev's career. Its hero, Bazarov, a young student disdaining all but utilitarian science, was called by the author by the newly coined name *nihilist* , meaning "a man who looks at everything from a critical point of view." With one or two exceptions the radical critics savagely attacked what was considered a caricature on the young generation. With the reactionaries Nihilism soon became equivalent to "respect for nothing," or "political unreliability," and this helped to widen still further the breach with the Liberals. The animosity of Turgenev's critics turned the melancholy manifest in his earlier works into pessimism, and his *Smoke* (1867) depicted the whole liberal movement of the sixties as a mirage. *Virgin Soil* (1876) pictured the new generation of the seventies. Here, as in his essay on *Hamlet and Don Quixote* of 1860, Turgenev fully applied his favorite division of all people into two types, one representing endless self-analysis and skepticism, the other enthusiastic devotion to the ideal. But Turgenev, living abroad, was no longer a faithful painter of the new social currents in Russian life. *Olara Militch* (1883), in spite of its mystical effect, is a story of the real life of the great Russian singer and actress Kadmina, who ended life by suicide on the stage of Kharkov. His *Senilia*, or *Prose Poems* (1883), are poetic gems in the most perfect prose.

Turgenev, the lineal literary descendant of Pushkin, is the greatest prose artist in the history of Russian letters. His figures do not stand out boldly against the background, but form an harmonious organic part of the whole scheme, and as such impress one still more forcibly when

the whole scheme is comprehended. The language of Turgenev has been at once a model and source of despair for the young Russian writers. His influence on modern literature has been very great. His works appeared in 10 vols. (3d ed., St. Petersburg, 1891). There are English translations by Constance Garnett (London, 1894-97), and by Isabel F. Hapgood (New York, 1904). Consult: George Moore, *Impressions and Opinions* (New York, 1891); Borkowski, *Turgenjew* (Stuttgart, 1903); Haumant, *Tourguénief* (Paris, 1906); J. A. T. Lloyd, *Two Russian Reformers* (New York, 1911); W. L. Phelps, *Essays on Russian Novelists* (ib., 1912); P. S. Moxom, *Two Masters, Browning and Turgenev* (Boston, 1912), and in Russian the studies of A. Soloviev (St. Petersburg, 1908) and I. Ivanov (ib., 1914).

TURGENEV, NIKOLAI IVANOVITCH (1790-1871). A Russian historian, brother of Alexander Ivanovitch. He studied at Göttingen, entered the civil service, and in 1813 was associated as Russian commissary with Baron Stein in governing the German provinces taken from France. He was afterward Deputy Secretary of the Interior and Agriculture in Russia. He advocated the emancipation of the serfs, and in 1825 was sentenced to death in *contumaciam*, for his connection with the insurrection of the Decembrists. He lived thenceforth in Paris, where he published *La Russie et les Russes* (1847).

TURGIDITY. See **TURGOR**.

TURGITE, tür'jit (from *Turginsk*, a copper mine in the Ural Mountains). A hydrated ferric oxide that is found massive, with a dull, earthy lustre, and is reddish-black to dark-red in color. It is found in the Urals, in Prussia, and in the United States at Salisbury, Conn., where it occurs in large botryoidal masses with limonite which latter mineral it much resembles. Turgite is regarded as an intermediate stage in the alteration of limonite to hematite by the loss of water, and is a valuable ore of iron.

TURGOR (Lat., a swelling). The condition of a plant cell when it is stretched by the internal pressure of the cell sap. The word is also applied to the stretching force. The mature plant cell usually consists of a protoplasmic body, surrounded by an elastic membrane composed of cellulose and other materials, and inclosing one or more vacuoles filled with water, the cell sap. This is not pure water, but a solution of various substances, whose total osmotic pressure (see **OSMOSIS**) is usually equal to 4-30 atmospheres, and sometimes rises as high as 150 or more atmospheres. Whenever such a cell is surrounded by a solution of lower osmotic pressure, water will enter the cell and find its way to the vacuole. On account of the high osmotic pressure, the protoplasm is driven outward against the cell wall as water enters, and the cell wall itself is stretched (unless this is prevented by the opposing pressure of adjacent cells) until its resilience balances the outward pressure. This stretched state of the cell is favorable for growth (q.v.), and is the opposite of the condition known as plasmolysis (q.v.). Turgor may be reduced by the withdrawal of water from the cell, either by evaporation or by surrounding the cell with a solution of higher osmotic pressure than that inside it. Turgor of all the cells of a tissue renders the mass rigid. By the combined turgidity of all the tissues in the young parts of the plant or those whose cells are thin walled (e.g., leaves), such parts main-

tain their normal form. When turgor diminishes, the parts become flaccid.

TURGOT, tūr'gô', ANNE ROBERT JACQUES, BARON DE L'AULNE (1727-81). A French economist and statesman. He was born in Paris, May 10, 1727, of an old family of Normandy, and was destined for an ecclesiastical career, but after studying awhile at the Sorbonne, where he won distinction, he turned from the Church and devoted himself to jurisprudence and political economy. Here he allied himself with the philosophical and liberal thought of his time. He was a contributor to the *Encyclopédie* and became a member of the physiocratic school of economists. He became counselor to the Parliament in 1752, and in 1761 was made intendant of Limoges, administering affairs there for 13 years, and carrying out within this field such reforms as ancient prejudices would allow. He introduced a more equitable administration of imposts, and succeeded in abolishing the old method of repairing roads and bridges by the compulsory labor of the poor inhabitants of the district, the *corvée* (q.v.). He also exerted himself for the protection of commerce. A wider field opened before him when he was called into the ministry after the death of Louis XV. The finances were in disorder, and the social and political system of France needed regeneration and reform. Turgot was first made Minister of Marine, and afterward Comptroller-General of France, when to fill that post was to be virtually Prime Minister. His first achievement was so far to reduce expenditure as to leave a surplus of 20 millions of francs a year to be applied to the liquidation of old debts. He augmented public revenue without imposing new taxes. An early measure was the carrying out of free trade in corn through the interior of France. He desired complete freedom of trade within the country, and to make the nobility and clergy contribute to the public revenue in the same proportion as the third estate. He wished, by means of provincial assemblies, to accustom the nation to public life, and prepare it for the restoration of the States-General. But the privileged classes whose exemptions were threatened, nobles, courtiers, farmers of the revenue, and financiers, united against him. The King forsook him, and Turgot retired in May, 1776, having held office only 20 months, afterward devoting himself to literary pursuits and scientific studies. His most important work, *Réflexions sur la formation et la distribution des richesses* (1766), is one of the chief productions of the physiocratic school. See **PHYSIOCRATS**.

Bibliography. His complete works were published in nine volumes (Paris, 1808-11), and have since been reprinted (1844). Consult also: M. J. Condorcet, *Vie de M. Turgot* (Paris, 1786); C. J. Tissot, *Turgot: sa vie, son administration, ses ouvrages* (ib., 1862); Alfred Neymarck, *Turgot et ses doctrines* (2 vols., ib., 1885); Léon Say, *Turgot* (2d ed., ib., 1891); W. W. Stephens, *Life and Writings of Turgot* (London, 1895); R. P. Shepherd, *Turgot and the Six Edicts* (New York, 1903); Gustave Schelle, *Turgot* (Paris, 1909); A. D. White, *Seven Great Statesmen in the Warfare of Humanity with Unreason* (New York, 1910); Francis de Ferry, *Les idées et l'œuvre de Turgot en matière du droit public* (Paris, 1911), containing a bibliography.

TÜRHEIM, ULRICH VON. See **ULRICH VON TÜRHEIM**.

TURIN, tūr'in or tū-rin' (It. *Torino*, pron. tō-rē'nō). The capital of the Province of Turin, in Piedmont, Italy, situated on the Po, here navigable near the junction of the Dora Riparia, 76 miles west-southwest of Milan (Map: Italy, A 2). Turin is an open unfortified town. It is unique among Italian cities because of its rectangularity of construction—long, straight, in part arcaded streets, rectangular blocks of houses or islands, and regular squares. It is well built, and is embellished with numerous squares, statues, and monuments, and beautiful parks. The extensive Piazza Castello, in the northeastern part of Turin, is the centre of the city's life. Thence the most important thoroughfares diverge, the fine Via di Po (the Corso of Turin) leading southeast to one of the four bridges over the Po, and traversing the large Piazza Vittorio Emanuele. In the Piazza Castello rises the mediæval Palazzo Madama, a huge ungainly pile, now occupied by various institutions. Northward looms the royal palace, a plain brick edifice, dating from 1660. Within it are located the valuable royal armory (with many historic relics of interest), a fine collection of coins, etc. Adjoining the palace is the royal park. Near it stands the commonplace Gothic cathedral of St. John the Baptist (1402-98), containing the fine impressive chapel of the Santissimo Sudario, treasuring some of the linen reported to have covered the body of the Saviour. The Palazzo Carignano, in the Carignano Square to the south, in which met the Sardinian Chamber of Deputies (1848-59), and the Italian Parliament (1860-64), holds natural history collections. The fine square of San Carlo is situated south of the Castello. The gardens of the Citadella, southwest of the royal palace, as well as the gardens of Carlo Felice, to the south, are both attractive. The public park is in the southeastern part of the city, along the left bank of the Po, where are also located the Botanical Gardens. On the eastern side of the Po rises the wooded Monte dei Cappuccini, 164 feet above the river. A short distance east of the city, on a height ascended by a cable railroad, is the royal burial church of the house of Savoy—the Superga—a splendid edifice affording a fine view. The most important monuments are those of Duke Victor Amadeus I, King Charles Albert, Duke Emmanuel Philibert, and the imposing monument of Cavour. The city has very little architecture of the Renaissance.

Turin is industrially and commercially prosperous. It manufactures mainly steel and iron products, silks, lace, velvet, ribbons, cotton and woolen stuffs, jewelry, porcelain, pianos, and furniture. Prominent among the exports are wine and silk.

Educationally Turin is prominent. (For the university, see **TURIN, UNIVERSITY OF**.) The valuable National Library has some 350,000 volumes and 1500 manuscripts. Turin has among its numerous educational institutions a royal polytechnic school, an astronomical observatory (in the Palazzo Madama), a royal military school for artillery and engineer officers, a military school and hospital, a Liceo Musicale, an archiepiscopal seminary, an agricultural school, a philharmonic academy, four gymnasia, and an industrial school. In the Palace of the Academy of Sciences are the picture gallery and museums of antiquities and natural history. There are an Italian Industrial

Museum, the civic museum, and the museum of the Risorgimento Italiano, in honor of Victor Emmanuel II. The last is located in the modern Mole Antonelliana, a curious tower-shaped edifice, having a total height of 538 feet, thus overtopping the Cologne Cathedral and being probably the highest brick edifice in the world. The Royal Albertine Library, in the royal palace, contains 60,000 volumes and 3000 manuscripts. The Municipal Library has about 104,000 volumes.

Turin is an important military station, owing to its nearness to the French frontier and to the passes of the western Alps. The municipal debt is more than offset by the value of the municipal properties. Pop., 1911 (commune), 427,106; 1914 (est.), 445,582.

History. Turin was the chief city of the Ligurian Taurini. It was taken by Hannibal, and became a Roman colony in the time of Augustus, when it received the name of Augusta Taurinorum. It was prominent under the Lombards, became later the seat of marquises, and in the eleventh century passed to the house of Savoy. It has been repeatedly in the hands of the French. Here Prince Eugene won a brilliant victory over the French on Sept. 7, 1706. From 1861 to 1865 Turin was the capital of the new Kingdom of Italy. Consult: Promis, *Storia dell' antica Torino* (Turin, 1871); Borbone, *Torino illustrata e descritta* (ib., 1884); E. C. Babut, *Le concile de Turin: Essai sur l'histoire des églises provençales au Ve siècle* (Paris, 1904).

TURIN, CLAUDIUS OF. See **CLAUDIUS OF TURIN.**

TURIN, UNIVERSITY OF. An Italian university founded in 1405 by Louis of Savoy. It became at once a refuge for the professors at the universities of Pavia and Piacenza, then suffering from civil wars. Towards the latter part of the fifteenth century it shared the general reputation and prosperity of the Italian universities of that period. It comprised two colleges, one founded in 1457 (Collegio Grassi), and one in 1482. The university was reorganized in 1632, and in 1713 the present building was erected. The university has faculties of law, medicine and surgery, philosophy and letters, and physical, natural, and mathematical sciences, and a school of pharmacy. In 1912-13 there were about 2199 students. There are connected with the university the Collegio Carlo Alberto and the Instituto Dionisio.

TURIN PAPYRUS. A hieratic papyrus, preserved in the Museum of Turin, containing a dynastic list of the kings of Egypt. It formed part of the collection offered for sale to the French government in 1818 by M. Dovretti, the French Consul General in Egypt, and was at that time perfectly preserved. The French government declining to buy it, the papyrus afterward was acquired by the King of Sardinia and was finally sent to Turin. It was, however, carelessly packed, and on its arrival it was found to be broken into 164 fragments. Champollion (q.v.) was the first to recognize its nature and value, and in 1824 collected from it between 160 and 180 royal prænomena, but, except in a very few cases, was unable to determine the order of succession. In 1826 Seyffarth (q.v.) attempted to piece together the broken fragments and reconstruct the papyrus, but his attempted restoration is altogether unreliable; partly on account of his limited knowledge of the hieratic char-

acter, and partly because a large proportion of the fragments are so minute as to afford little or no indication of their proper order. Subsequent attempts to restore the text have met with little success. In its original condition the Turin Papyrus contained a list of the kings of Egypt, beginning with the mythical period and ending with Dynasties XV and XVI, with the exact duration of each monarch's reign in years, months, and days. It would supply, if complete, an invaluable guide for the earlier period of Egyptian history, but in its present mutilated state it is of little use for historical and chronological purposes except in the portions covering the thirteenth and fourteenth dynasties, where the text is somewhat better preserved. Elsewhere the papyrus serves at best to confirm data derived from other sources, and furnishes scarcely any independent information. The text is published in Lepsius, *Auswahl der wichtigsten Urkunden des ägyptischen Alterthums* (Berlin, 1842), and in Wilkinson, *The Fragments of the Hieratic Papyrus at Turin* (London, 1851). Consult: *Transactions of the Royal Society of Literature*, 2d series, vol. i (London, 1843); *Revue archéologique*, vol. vii (Paris, 1850); K. A. Wiedemann, *Ägyptische Geschichte* (Gotha, 1884-88); E. A. T. Wallis Budge, *A History of Egypt* (New York, 1902); J. H. Breasted, *Ancient Records of Egypt* (Chicago, 1907).

TURKESTAN, tūr'kē-stān', Turk. pron. tōōr'-ke-stān'. An extensive region in Central Asia, included between the Russian territory of the Steppes on the north, the Mongolian Desert on the east, Tibet, India, Afghanistan, and Persia on the south, and the Caspian Sea on the west. A portion of Turkestan territory is comprised within Afghanistan. Politically the region is divided into western or Russian Turkestan and eastern or Chinese Turkestan. The Russian protectorates of Khiva and Bokhara and the Russian Province of Transcaspia are now considered and treated as separate divisions.

Russian Turkestan. This region embraces the territories of Ferghana, Samarkand, Semir'yetchensk, and Syr-Darya (Map: Asia, F 4). Total area, about 420,807 square miles; total population in 1912, 6,416,700; on Jan. 1, 1914 (estimated), 6,250,300. Together with the Transcaspian province and a portion of the Pamir, it constitutes the general government of Russian Turkestan. It is bordered by the territory of the Steppes on the north, Sungaria and Chinese Turkestan on the east, Bokhara and Khiva on the south, and Khiva and the Sea of Aral on the west. The western and northern parts are gently rolling surfaces sparsely clothed in spots with bushes and shrubs. Here are the great deserts of Kara-kum, Kizil-kum, and Mujun-kum. In the northeast is the extensive Lake Balkhash. In the south there are mountains belonging to the three systems of the Hissar, the Alai, and Tian Shan, and form a wild Alpine-like district, interspersed with fertile valleys. The Karatau chain stretches northwest across the territory of Syr-Darya and divides it into two parts. There are numerous oases. The Syr-Darya, rising on the central mountain border, flows west through the centre of Ferghana, then northwest along the southwestern side of the Karatau, finally reaching the Sea of Aral. The Ili, an affluent of Lake Balkhash, is the chief river in the East. It flows northwest through the centre of Semir'yetchensk. These

streams have numerous tributaries. The southern section of Russian Turkestan is subject to earthquakes. The climate is continental. The summers are hot and dry and the winters comparatively severe and accompanied by destructive snowstorms. The flora in the west belongs to the Aral Sea district, in the east to the mid-Asiatic region. The fauna, though essentially of the Central Asiatic type, comprises many tropical representatives, among them the tiger. Salt, coal, and asphalt are obtained, and precious stones are exported. Ferghana and Samarkand are connected with the Caspian Sea by a railroad.

Numerous irrigation canals tap the rivers and provide agricultural conditions which would otherwise be impossible. This is especially true in the southern part of the country, where the bulk of the population is located. The staple crops are wheat, rice, millet, and oats. Cotton is a promising crop in Ferghana. Rice and cocoon silk are also produced in noteworthy quantities. Various kinds of fruit, including the grape, thrive. Stock raising, however, is the leading occupation. Great numbers of sheep are reared. The reported number of live stock in 1914 was: horses, 2,028,494; horned cattle, 2,151,465; sheep and goats, 7,236,055 (of which 5,223,208 in Syr-Darya); swine, 59,183. There are said to be over 1,000,000 camels. The domestic industries are widespread, and some of the native products, such as carpets and rugs, are highly valued in Europe. The manufacturing industries properly so called are in their infancy. The exports consist chiefly of raw products, which go largely to Russia. The Transcaspian Railway has been a great pacifier in Russian Turkestan. It reached Samarkand in 1888 and has been extended to Tashkent and Andijan. From Tashkent a line runs northwest to Orenburg on the European frontier. While the general administration is intrusted to Russian officials, the natives suffer little interference, and taxation is scarcely more than nominal. Public education is almost entirely in the hands of the native religious bodies, although the Russian government has shown considerable concern for the instruction of the natives. The inhabitants are almost wholly Mohammedans. The Kirghizes form about 36 per cent, the Sarts 24 per cent, and the Usbegs and Kiptchaks together 19 per cent. The Russians, therefore, constitute but a small element. The leading cities are Tashkent, Khokand, Namangan, and Samarkand. Andijan was ruined by an earthquake in 1902.

Chinese or Eastern Turkestan. A dependency of China, bordered on the north by Sungaria, on the east by Mongolia, on the south by Tibet, on the southwest by Kashmir, and on the west and northwest by the Pamir and Russian Turkestan. The country is isolated and forbidding in many aspects; a large and elevated desert plateau, surrounded by lofty mountain ranges, of which the Tian Shan lines the northern frontier, and the Kuenlun, Altyn Tag, and the spurs of the Karakorum the southern. The southern range reaches more than 18,000 feet. The desert of Gobi occupies a portion of the eastern section. The mean elevation of Chinese Turkestan is assumed to be about 3500 feet, but there are a number of markedly low levels, and along the southern face of the Bogdola mountains, in the depression of Luktehun, the surface drops 425 feet below sea level. The region is watered chiefly by the Tarim River (q.v.), which rises in the west, and its tribu-

taries. At the foot of the frontier ranges, over 4000 feet above sea level, there are chains of extraordinarily fertile oases which mark the chief caravan routes of the region. Along the foot of the Tian Shan stretches a series of lakes, of which the largest is the Bagrach Kul.

The climate is severe and extremely dry. Domestic animals abound, and the tiger, jackal, wild camel, bear, and wolf are found. The oases and the strips along the base of the mountain ranges alone offer conditions for permanent habitation. The people are engaged principally in agriculture, stock raising, commerce, and hunting. Cotton, silk, and animal products are exported, and in some of the larger cities, such as Yarkand, Khotan, Aksu, and Kashgar, there are manufactured copper ware, silk, carpet, felt, and leather goods. There are extensive mineral resources, but mining is engaged in only by the natives and accordingly in a primitive way. Asbestos, sulphur, and saltpetre are obtained. A heavy caravan commerce traverses eastern Turkestan en route to and from China, this region being in the direct central western route. Administratively, eastern Turkestan has formed since 1885 a part of the Chinese Province of Sinkiang, and is divided into the three dao-tais of Kashgar, Aksu, and Urumchi (qq.v.). The seat of the administration is at Urumchi (Tihwafu). The population is estimated at 2,000,000 and is of mixed Aryan and Turanian descent. The most numerous are the Kirghizes, Sarts, Kal-mucks, Usbegs, and Tajiks. The language is eastern Turkish with an admixture of Chinese words.

History. (See BOKHARA, KHIVA, MONGOL DYNASTIES, SAMARKAND, ETC.) The invasion of Central Asia by Russia began soon after the conquest of Siberia, and desultory raids on Khiva by pioneers from the north were made as early as the end of the sixteenth century. The expedition into Central Asia sent out by Peter the Great in 1714 ended in disaster, but the submission of the Kirghizes during the eighteenth century gave Russia the territory between the Ural and the Lake of Balkhash. In 1839 a well-equipped Russian army sent against Khiva under the command of Perovski succumbed to cold, hunger, and sickness. By the end of the first half of the nineteenth century Russian forts were established at the mouth of the Syr-Darya and during the following decades a chain of Russian forts was built along the southern frontier. In 1854 a second expedition under Perovski against Khiva met with success. In 1867 the Governor-Generalship of Turkestan was established with Tashkent as the capital. In the following year Samarkand was taken and a treaty of peace was concluded with the Ameer of Bokhara by which Russia acquired a considerable part of the Zerafshan valley, and Bokhara became practically a vassal state of Russia. In 1873 a Russian expedition forced the Khan of Khiva to cede to Bokhara the Khivan territories on the right bank of the Amu-Darya, which were soon annexed by Russia. In 1876 Russia annexed the Khanate of Khokand (Ferghana). The subjugation of the Tekke-Turkomans was terminated with the capture of Geök-Tepe by Skobelev in 1881. The Turkomans of Merv submitted in 1884. In 1887 the Afghan boundary was demarcated by an Anglo-Russian commission.

The authentic history of Chinese Turkestan can be traced almost to the beginning of the

Christian era, when the region was partly under the rule of China. Buddhism was then the predominating religion, but there were also sects of Nestorian Christians. In the seventh century the western part of the country fell under the sway of Tibet, whose rule had been extended by the end of the century to the entire region. Islam began to spread over eastern Turkestan in the tenth century, but even with the conquest of the country by Genghis Khan (q.v.) at the beginning of the thirteenth century there was perfect toleration. It was only with the arrival of the mollahs from Bokhara in the fourteenth century that Islam became a cause of strife, and gave rise to the two factions of White and Black Mountaineers, whose struggles gave China an opportunity to reconquer the country at the end of the eighteenth century. The history of eastern Turkestan during the nineteenth century is largely made up of repeated attempts on the part of the followers of Islam to wrest the country from the rule of China. From 1872 to 1876 eastern Turkestan was practically independent under Yakub Beg, but the rule of China was restored soon after his death.

R. Rickmers, *Duab of Turkestan* (Chicago, 1913), containing a bibliography.

TURKESTAN. A town in the Territory of Syr-Darya, Russian Turkestan, situated about 20 miles east of the right bank of the Syr-Darya, about 180 miles northwest of Tashkent (Map: Asia, H 4). The Mosque of Hazret-Yassavi, erected by Timur, is a noted place of pilgrimage. Pop., over 16,000.

TURKEY, or **THE OTTOMAN EMPIRE** (so named from its founder, Othman). An Empire in Europe and Asia, with its capital at Constantinople. The bulk of the territories over which the Turkish Sultan exercises actual sovereignty is Turkey in Asia which has an area of 699,342 square miles. This includes Asia Minor, Armenia and Kurdistan, Mesopotamia, Syria, and a broad strip of country extending the whole length of Arabia along the west coast, containing Mecca. The European territory under Turkish rule, which before the Balkan War (q.v.) amounted to 65,370 square miles, has been lessened by division among the states of Bulgaria, Servia, Montenegro, Greece, and Albania, so that in 1915 it comprised but 10,882 square miles. Turkish territory has been further depleted by the loss of Tripoli, annexed to the Italian Empire in 1912; of Egypt, proclaimed a

British Protectorate in 1915, and of Samos held by Greece. See **WAR IN EUROPE**.

The European possession has lost since the Balkan War one-half of her sea coast on the Black Sea, all of the Adriatic coast line and about four-fifths of the Aegean Sea border. The area, unlike the remaining Balkan states, possesses no great elevations. Above the low coasts of the Black Sea rise hills of small relief, west of which is the fertile valley of the Maritza River. A shaggy range of hills skirts the Sea of Marmora and continues into the Gallipoli Peninsula. The rocks on both sides of the Bosphorus are Devonian and the coast hills, which are separated from the rest of the Balkans by a wide plain covered with recent formations, are more connected with Asia than with Europe. The Maritza valley and its main tributary in Turkey, the Ergene, forming a broad lowland less than 600 feet high and comprising over one-half the state, are of great fertility and yield easy lines of communication.

The Black and Aegean seas are poor in havens, but the winding river-like strait of the Bosphorus, which connects the Black Sea with the Sea of Marmora, and through it with the Mediterranean, has ample depth for the largest vessels. Here is the magnificent harbor of Constantinople, the great meeting place of eastern and western trade. On the strait of the Dardanelles, leading from the Sea of Marmora into the Mediterranean, is the harbor of Gallipoli. Turkey has a Mediterranean climate which is characterized by a high percentage of sunshine and limited rain, in this case about 20 inches per year. At Constantinople the mean temperature in January is 43° F., and in July 72.5°. For other parts of the empire, see articles on **ANATOLIA** (Asia Minor), **SYRIA**, **ARMENIA**, **HEJAZ**, **YEMEN**, ETC.

Agriculture, etc. Most of the people of Turkey live by farming and sheep raising, but as these industries are in a backward condition, the rural population is very poor. This condition is due to misgovernment, ignorance, lack of roads and railroads, and an unfavorable system of land distribution. Little land is held in freehold, the greater part being either crown property or vakuf, i.e., held in mortmain for the benefit of the Moslem church. A system of agrarian reform laws was promulgated in 1913, and a number of government agricultural schools have been recently established. In parts of the Empire the problem of insufficient rainfall is being met by extensive irrigation projects, notably in Mesopotamia and Palestine. The use of fertilizer is practically unknown, but the soil is so productive that Turkey is an exporter of foodstuffs. Agricultural products include cereals of all sorts, grapes, raisins, and wine, olives and olive oil, coffee, opium, nuts, sesame, flax, hemp, coleseed, licorice, oranges and lemons, dates, figs, and attar of roses. The cotton industry, which dates only from 1905, is rapidly developing, and probably reaches 200,000 bales annually. Silk culture is encouraged by the government, most of the raw silk being shipped to France. Turkish tobacco is world-famous. In Asiatic Turkey there are about 16,500,000 acres under cultivation. In eastern Asia Minor, sheep, goats, and small horses are raised, and wool, goats' hair, hides, and gut are exported. In Palestine, recently established Zionist colonies have been successful exporting cereals, cotton, and fruits. In 1913, 1,608,500 boxes of

oranges were shipped from Jaffa. Turkey has been badly deforested, its wooded area being now about 20,000,000 acres. Forestry laws modeled on those of France have been passed and the reforestation has begun. Sponge fishing is an industry of the Mediterranean coast, and the local fisheries of the Bosphorus are valued at about \$1,000,000 a year.

Mining. Asia Minor and Kurdistan are exceedingly rich in minerals, though these are little known and less worked. Silver is found near Konia, and rich copper deposits near Trebizond, Diarbekr, and in the Armenian Taurus Mountains. Considerable coal fields exist in several districts, that near Heraclea on the Black Sea being operated by French capital. Salt, a government monopoly, is exported. Gold, zinc, lead, and iron have been found but are little exploited. Petroleum has been discovered near Rodosto, Jerusalem, and in the Tigris-Euphrates valley.

Manufactures. There is little manufacturing. At Constantinople, there are flour mills, two glass factories, a soap factory, a dry dock and arsenal. Cloth is manufactured in Constantinople, Smyrna, and Ismid; and some silk in Brusa and Damascus. Olive oil and soap are made and exported. Artisans produce brass and copper utensils of considerable beauty, and the hand-woven Turkish rugs are a very valuable export. The reasons for the state of manufacturing in Turkey are the lack of skilled labor, and the impossibility of competing in the local market against Europe and America.

Commerce. The commerce of the Empire is largely in the hands of Greeks, Jews, Armenians, and foreigners. The imports always exceed the exports in value. The leading exports are barley, and other cereals, raisins, goats' hair, wool, opium, rugs and carpets, tobacco, dried and fresh fruits, nuts, licorice, coleseed, attar of roses, raw silk, hides, gut, and cotton. Manufactured goods of all kinds are imported. Trade is chiefly with the United Kingdom, Austria-Hungary, France, Germany, Russia, Bulgaria, and Italy. Commerce with the United States is growing rapidly, Turkey exporting rugs, tobacco, hides, olive oil, and wool, in return for cloth, petroleum, and iron and steel goods. Total exports and imports for years

	1910-11	1911-12
Imports	\$187,238,298	\$193,024,000
Exports	97,150,710	105,009,000

In 1914, imports from the United States, \$3,328,519; exports to the United States, \$20,843,077.

Transportation and Communication. Lack of means of transportation has always been a hindrance to Turkish development, but within recent years the railway system has been extended rapidly. In Europe, Constantinople has direct rail connection with Paris and Berlin through the Balkans, and with Dedeaghat and Saloniki on the Aegean. In Asia, Haidar Pasha (Constantinople), Smyrna, and Beirut are railroad centres. From Haidar Pasha the Bagdad Railway has been completed as far as the Taurus Mountains, which must be pierced by one of the longest tunnels in the world. Beyond the Taurus, the line has been run to Nisibin, and from the Bagdad terminus back to Samara. Three

lines run in from Smyrna—one to the Marmora Sea at Panderma, one south and east to Eyerdir, one meeting the Bagdad Railway at Afium-Kara-Hissar. From Beirut there is rail connection with Aleppo and with Damascus, the head of the Hedjaz Railway. At the outbreak of the European War in 1914, there were about 1050 miles in European Turkey and 2836 in Asiatic Turkey.

The Turkish mercantile marine in 1911 listed 120 steamers of 66,878 tons, and 963 sailing vessels of 205,641 tons. In 1913, 18,285 vessels of 17,397,888 tons entered and cleared at Constantinople. English, Russian, Austrian, German, Turkish, French, Greek, Rumanian, and Italian lines call regularly at Constantinople, and there are direct sailings to New York.

Up to Oct. 1, 1914, most of the Powers maintained extraterritorial post offices in Turkey. Since that date the postal service, mail and parcel, has been in Turkish hands exclusively. There are 28,890 miles of telegraphs in the Empire. Constantinople, Smyrna, Damascus, and Beirut have electric street railways.

Government. Turkey is a limited monarchy, at the head of which is the Sultan or *Padishah*, who is also Caliph (successor of the prophet Mohammed, and head of the orthodox Moslem world). Imperial succession vests in the oldest member of the reigning house of Othman.

The constitution, which was granted in 1876, suspended in 1878, and restored by the revolution of July 23, 1908, provides for a ministerial form of government, the Grand Vizier, or Prime Minister, being assisted by a cabinet of 11, including the Sheik ul Islam. The latter is appointed by the Sultan with the approval of the *Ulema* (Moslem clergy) and has the power of vetoing any imperial decree or parliamentary law by declaring it contrary to the Sacred Law. The Empire is divided into 23 *vilayets* (provinces), besides several separately organized *sanjaks*, and the Lebanon district. The *vilayets* are divided into *sanjaks*, *cazas*, and *nahichs*. Each *vilayet* is governed by a *vali*, appointed by the Sultan, and assisted by a provincial council. The *vali* appoints the subordinate officials of the *vilayet*.

The Parliament consists of a Senate and a Chamber of Deputies. The senators are appointed for life by the Sultan; the deputies are chosen by indirect election, one deputy for 6000 qualified electors. The two-party system obtains. There is no legal discrimination by reason of race or creed.

Turkish law is very complicated, there being two recognized systems in force. One is the Sacred Law (*Sheriat*) which rests upon the Koran, the traditions of the Prophet, and the precedents of the early Caliphs. This system applies in certain cases involving real property, or the personal status of Mohammedans. The other system, which includes the bulk of modern legislation, and is applicable in most civil and criminal cases, is based upon the French *Code Napoléon*.

Foreigners in Turkey formerly enjoyed unusual extraterritorial privileges guaranteed by a series of treaties called Capitulations. In September, 1914, Turkey abrogated these treaties, but none of the Powers recognized this unilateral act.

Finance and Banking. Imperial revenues are derived from direct taxes, from the tobacco, salt, and explosives monopolies, and from the

tariff. The largest expenditures are for military purposes and for the national debts. Definite figures for revenue and expenditure are unobtainable, but the estimates for the fiscal year 1913-14 put the revenue at about \$120,000,000 and the expenditures at \$185,000,000. Up to 1914 the national debt amounted to \$667,286,430.80, of which 62 per cent was held in France and 29 per cent in Germany. There was also a floating debt of \$176,000,000. The Imperial Ottoman Bank in 1910 had a capital of \$44,000,000. This bank issued the paper currency of the Empire in notes of five pounds Turkish and one pound Turkish, secured on a gold reserve of not less than one-third of the value of the issue.

Up to 1914 the Turkish tariff was fixed by the Powers. In 1907 it was raised from 8 per cent to 11 per cent *ad valorem* for seven years. In October, 1914, without the consent of the Powers Turkey raised the tariff to 15 per cent *ad valorem*.

Army. The reorganization of the Turkish army, since 1909, has been directed and controlled in large part by German officers. Under Enver Pasha, the Turkish Minister of War, in the early part of the year 1914 the powers of the "German Military Mission" were greatly amplified, even to the extent of placing German officers in command of Turkish troops. Soon after his assumption of the duties of War Minister, Jan. 4, 1914, Enver Pasha introduced universal military training, applicable not only to all Moslems but to Christians previously, in great part, exempted from military training and service. There were no exemptions, but those, both Moslem and Christians, who were able to pay a large military tax, were excused from a portion of the full period of military training. The new men and funds secured in this manner were used to fill up the regular organizations which had been greatly depleted by the Balkan War of 1912-13.

Under the new régime service was from the age of 20 to 45, as follows: In the active army, or "Nizam," two years for the infantry, three for the other arms; in the first reserve, "Ihtiat," to the age of 40; in the second reserve or Territorial army, "Mustahfiz," from 40 to 45. Under this scheme, in 1914, the Nizam, or active army, was first filled up with trained men, those remaining forming the nucleus for reserve battalions stationed at training depots to which the untrained men were sent for instruction. From these battalions men were sent to fill the vacancies occurring in the fighting lines. The Kurdish cavalry are tribal militia organizations, service in which exempts from compulsory service in the regular army. This cavalry was called for service with the field army after the outbreak of war.

Turkey, after the Balkan War, was divided into four territorial and inspection districts in which army corps and divisions were located and recruited as follows: First district, Turkey in Europe and western Anatolia, five army corps of three divisions each; second district, Syria, two army corps of three divisions each; third district, Kurdistan and eastern Anatolia, three army corps of three divisions each; fourth district, Mesopotamia, two army corps of two divisions each; besides these, in Yemen, one corps of two divisions; Hejaz, one division; Assir, one division; total, 13 corps and two independent divisions, or 38 divisions in all.

It should be noted that the Turkish division consists of only three regiments of three battalions each, or a total of nine battalions of infantry and from six to nine batteries of field or mountain artillery. A battery has four guns, except when armed with old models, when six guns are assigned. The corps, as shown above, consists of either two or three divisions, to which are attached either a regiment or brigade of cavalry, three howitzer batteries, an engineer battalion, a supply battalion, and a telegraph company. There are 25 regiments of cavalry of five squadrons each in addition to the Kurdish cavalry already mentioned.

Under the reorganization of 1915, the peace strength was estimated at 200,000; initial mobilization at the outbreak of the European War, at 750,000; ultimate war strength of the field armies, 1,000,000. In addition to these forces there are the Gendarmerie, or military police, amounting in all to about 60,000 men, of whom about 16,000 are mounted. During the European War most of this force were called into active service, their places being filled by the older reservists of the *Mustahfiz*. The Lebanon militia is a local police force consisting of two battalions of infantry and one squadron of cavalry.

At the head of the army is a War Minister assisted by a permanent assistant secretary or *Musteshar*, and by the Chief of the General Staff, which, upon mobilization for the European War, contained a number of German military officers. Munition factories are under the direction of an official called the Director General of Military Factories, who presents an independent budget for the consideration of the government.

Infantry are armed with the 7.65 mm. Mauser magazine rifle, of which there was a great shortage after the Balkan War. Field artillery have the 7.5 cm. quick-fire Krupp gun. Of these, too, there was a shortage due to losses in the Balkan War. As soon as practicable after Turkey entered the European War, arms and equipment were supplied by the Teutonic Powers. Germany, in addition to supplying the field armies of Turkey, also greatly strengthened the fortifications at Adrianople, Chatalja, the Bosphorus and Dardanelles, Smyrna, and Erzerum in Armenia.

Navy. See under NAVIES.

Money, Weights, and Measures. The coinage is on the decimal system, with the gold standard. The unit is the piaster, worth 4.4 cents American, with 100 piasters to the pound Turkish. The silver currency is normally depreciated about 5 per cent. Nominal value of the coinage since 1880 is: gold, \$185,342,612.40, and silver, \$46,295,326, besides a copper and nickel currency.

The metric system of weights and measures was adopted in 1882 and is used in the larger cities.

Population. As there has never been a census, figures of the population of the Empire are approximate only. In 1914, Turkey in Europe and Asia had an area of 710,224 square miles and a population of 21,273,900. Besides there was Cyprus, administered by England, and the tributary province of Egypt and the Sudan. After the outbreak of the great war Cyprus was declared annexed to the British Empire and Egypt was declared a British protectorate. Certain Aegean islands, including the Dodecanese,

claimed by Turkey, are now in the possession of Greece and Italy; their legal status is uncertain.

DISTRICT	Area in sq. miles	Population
Turkey in Europe.....	10,882	1,891,000
Turkey in Asia:

Education and Religion. Most of the inhabitants are Moslems and Mohammedanism is the state religion, with the Sultan as Caliph as the head of the religion, and the Sheikh-ul-Islam as the leading ecclesiastic, representing the Church in the cabinet. All religions are

tolerated except idolatry, and the government recognizes 13 non-Mohammedan communities or *Millets*—Roman Catholics, Greek Orthodox, Armenian Gregorians, Armenian Catholics, Protestants, Chaldean Catholics, Nestorians, Syrian Catholics, Syrian Jacobites, Melchites, Jews, Bulgarian Catholics, and Maronites. These communities are ecclesiastically self-governing and their spiritual heads exercise civil functions of considerable importance. To a great extent they control the education of their children through their parochial schools.

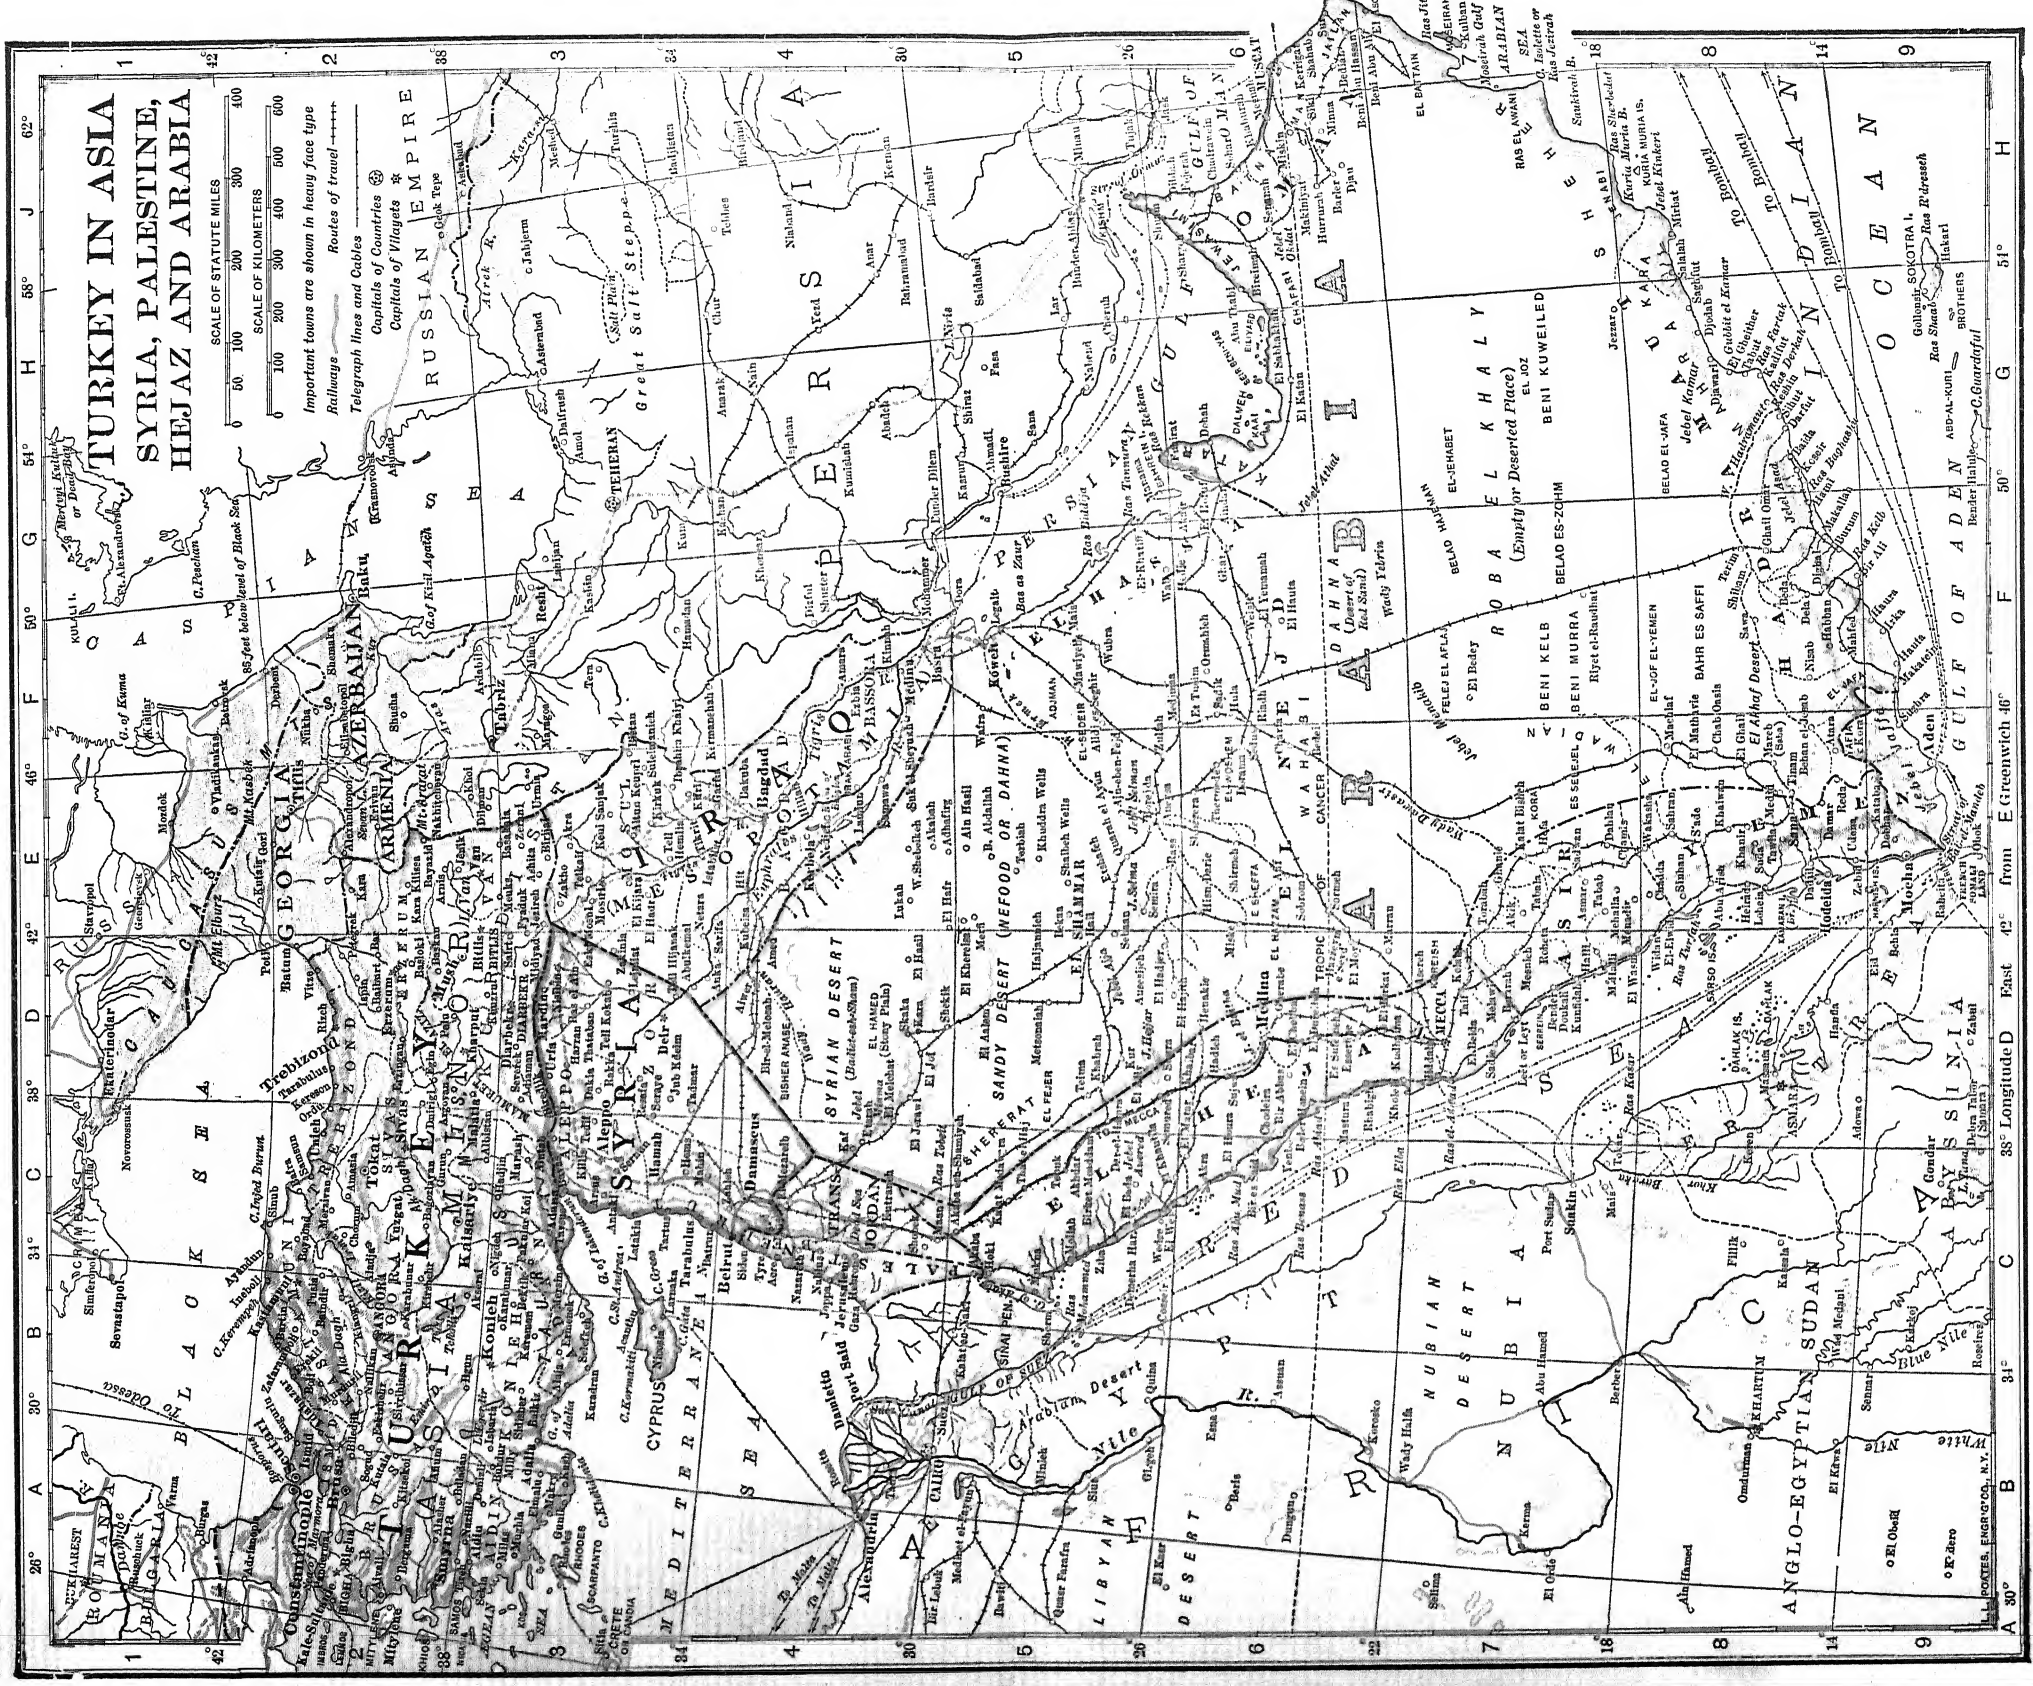

The majority of the Mohammedans belong to the Sunni sect, though other sects are represented.

Education, formerly neglected, is now legally obligatory for children between 7 and 16, in state, parochial, or private schools. Elementary education is free. There are about 36,000 schools in the Empire, with an enrollment of about 1,330,000. The system is of recent development, and probably at least 75 per cent of the population is illiterate.

At Constantinople there is an Imperial University of five faculties—arts, theology, law, medicine, and science. There are also several Greek and Armenian colleges of high standing. Many foreign schools, some of collegiate rank, have been opened under American, English, and French auspices, missionary or philanthropic. The best known of these are Robert College and the American College for Girls at Constantinople, and the Syrian Protestant College at Beirut.

Ethnology. The Turkish Empire presents an extraordinary medley of nationalities. The ruling race, the Osmanli Turks, whose blood is greatly mixed with various foreign elements (Slavic, Greek, and Albanian in European Turkey), constitute a minority of the population even in the regions actually under the rule of the Sultan. The only section of the Empire in which they are numerically dominant is the interior of Asia Minor. The most important peoples in Asiatic Turkey after the Osmanlis are the Arabs (Syria, Mesopotamia, Arabia), Armenians (who are found in large numbers outside of Armenia), and Kurds. The Greeks and Jews (in addition to the Armenians) are important elements in the urban population of a large part of Asiatic Turkey. There are less than 1,000,000 persons of Turko-Tatar blood in Turkey in Europe, and these are chiefly in the portions nearest to Asia. The Turks form a large element in the population of Constantinople and Adrianople, in the interior of Thrace, and in parts of Macedonia. All the remainder of the population of European Turkey, with a small exception, is divided between Slavic peoples and those belonging to the Mediterranean race, chiefly Greeks in the south and east, and Albanians (Shkipetars) on the Adriatic. The Slavs of Turkey are of Serb and Bulgarian stock. There are a number of Wallachs (Rumans) in the southwest, who are known as Tsintsars. The Jews are numerous in Constantinople and Saloniki, and the Armenians are also well represented in the urban population of European Turkey.

History. In the first half of the thirteenth century, at the time of the Mongol invasions under Genghis Khan, a small body of Mohammedan Turks moved westward from their home in Iran and made their way to Asia Minor. Under the lead of Ertogrul, they entered the service of Ala-

ed-Din, the Sultan of Iconium (or of Rum, as the state was known to the Moslems), the last surviving remnant of the great Empire established by the Seljukian Turks in western Asia. Ala-ed-Din granted them some land in Phrygia. The son of Ertogrul, Osman or Othman (1288-1326), laid the foundations of the independent power of his tribe (to which his name became attached) on the ruins of the Seljuk dominion in Asia Minor. Osman's son and successor, Orkhan (1326-59), continued the aggressive policy of his father. He made Brusa, the ancient capital of Bithynia, which had been wrested from the Byzantines, his residence, and gained a foothold in Europe by the taking of Gallipoli (1354). Orkhan was the organizer of the Ottoman Power. He exacted a tribute of children from conquered Christian peoples, and these, reared as Mohammedans and trained under rigid military discipline, were organized into that efficient fighting machine, the Janizaries (q.v.). He was succeeded by Amurath I (1359-89), under whom the Ottoman realm became a European as well as an Asiatic Power. At this time, by the side of the declining Byzantine or Greek Empire, the Kingdom of Serbia had risen to considerable power. Eastward to the Black Sea, south of the Danube, the Bulgarian czars held sway, and beyond the Danube the principalities of Moldavia and Wallachia had been struggling into existence. Venice and Genoa had extended their power and dominion into the eastern Mediterranean. Amurath I conquered Adrianople in 1361 and made it his capital. The Turks began to close in upon the Byzantine Empire, and the dominion of Constantinople was reduced to Thrace, Macedonia, and parts of Greece. Amurath greatly extended the Turkish dominions in Asia Minor, and in 1389 he broke the power of Serbia in the bloody battle of Kossovo. The Sultan was struck down in the moment of victory and was succeeded by his son, Bajazet I (1389-1402). Bajazet began his reign with the conquest of Bulgaria and with a war against the Wallachs. A crusading army of Hungarians, Poles, and French, under the command of Sigismund, King of Hungary, was totally routed at Nicopolis in 1396. In 1402, Timur with his Mongol horde swept over Asia Minor, overthrew Bajazet at Angora, and carried him off a captive. On the fall of Bajazet (who died in 1403) there was a struggle for dominion between his sons, which lasted a decade. Finally, in 1413 the youngest son, Mohammed I, found himself in undisputed possession of the whole Empire. Amurath II (1421-51) extended the Turkish dominion over Macedonia, conquered part of Greece, waged fierce wars with the Hungarians, over whom he finally triumphed, and attacked the Albanians, although without success. The most memorable event of his reign was his victory over the Hungarians under King Ladislas III (q.v.) and Hunyady (q.v.) at Varna in 1444. Mohammed II (1451-81), the son of Amurath II, prepared immediately on his accession to effect the conquest of Constantinople. The city fell on May 29, 1453, and the Byzantine Empire was at an end. An offshoot from the Greek realm, the Empire of Trebizond, was conquered in 1461, and about the same time the Turks completed the conquest of the Morea. The seat of the Ottoman Empire was transferred from Adrianople to Constantinople. The Turks, merciless as they were towards their conquered foes, allowed the Christian churches to maintain their

organization. In 1456 Mohammed II undertook the siege of Belgrade, the key to Hungary, but the city was delivered by the signal victory of Hunyady. A few years later Serbia was incorporated into the Turkish Empire and Bosnia was subdued. In 1470 Negropont (Eubœa) was wrested from the Venetians and in 1475 the Tatar Khan of the Crimea became a vassal of the Ottoman Sultan. Albania, which under the lead of Scanderbeg had long heroically held out against the Turks, was at last subjugated. In 1480 the Knights of St. John successfully defended Rhodes against a Turkish attack. At this time the Turks obtained a momentary foothold in Italy by the conquest of Otranto. The reign of Bajazet II (1481-1512), the successor of Mohammed II, was uneventful, but under Selim I (1512-20) the tide of Ottoman conquest rolled irresistibly eastward and southward. He carried his arms successfully into Persia, conquered Syria (1516), annexed Egypt (1517), and assumed the guardianship of the sanctuary of Mecca, thus proclaiming himself the successor of the caliphs. At this time Moldavia became tributary to the Porte, a position to which the sister principality of Wallachia had been previously reduced.

At the close of Selim's reign the famous corsair Khair-ed-Din (Barbarossa), who ruled Algeria, placed himself under Turkish suzerainty. Under Solymán the Magnificent (1520-66) the Ottoman Empire stood at the height of its power and splendor. Belgrade was taken in 1521 and Rhodes was conquered in the following year. The victory over the army of Louis II of Hungary at Mohács in 1526 broke up the Hungarian realm. It was followed by a succession of campaigns against the Hapsburgs, in one of which (1529) Vienna itself was besieged, and which converted the heart of Hungary (including the capital, Buda) into a Turkish province. (See HUNGARY; SOLYMAN II.) Conquests were also made from Persia. On the Mediterranean Sea the Turks were the undisputed masters. Venice had been gradually stripped of her possessions in the Morea and the Archipelago. Tripoli became subject to Turkey in 1551. Towards the close of Solymán's reign in 1565, a vast Turkish force was beaten back by the heroic defenders of Malta. In the following year the little Hungarian fortress of Szizet long kept at bay the Turkish host which the Sultan had marshaled against the Austrians. Solymán died before the fortress fell. Selim II (1566-74) undertook to wrest Cyprus from the Venetians and this brought about a Holy League between Venice, Spain, and the Pope, whose fleets inflicted a crushing defeat upon the Turks in the battle of Lepanto (1571). Cyprus, nevertheless, was taken by the Turks. In the reign of Selim II the subjugation of Yemen was completed, and about the time of his death the Spaniards were driven from Tunis, which became subject to Turkey.

With the disaster at Lepanto the decline of the Ottoman Power began. Under Amurath III (1574-95) a war with Persia, in which conquests were made in Armenia, was followed by a contest with Austria, which continued under Mohammed III (1595-1603) and extended into the reign of Achmet or Ahmed I (1603-17). At this time Persia rose to a high pitch of power under Abbas the Great, who in 1605 won a great victory over the Turks at Basra, and who wrested large territories from them, even making

himself master of Bagdad (1623). The cruel but able and energetic Amurath IV (1623-40) restored the fortunes of Turkey in the East, retaking Bagdad in 1638. After his death maladministration and internal disorders hastened the decadence of the Empire. In 1656 the Venetians, on whom the Turks had made war for the possession of Crete, appeared in the Dardanelles and defeated the Turkish fleet. The realm was raised for a brief period from this state of depression by the abilities of Mohammed Kiuprili and his son Ahmed (see KIUPRILI), who successively held the position of Grand Vizier during part of the reign of Mohammed IV (1648-87). They infused fresh vigor into the administration and to some extent enabled the Turkish arms to reassert themselves. A war with Austria, in which the Turks finally suffered a great defeat at the hands of Montecuccoli at St. Gotthard, on the banks of the Raab (1664), was terminated by a peace slightly advantageous to Turkey. In 1669 the fortress of Candia fell and Venetian rule in Crete came to an end. In the regions to the north of the Black Sea the Turks fought with varying success against the Poles, and it was in the reign of Mohammed IV that they first came in collision with the rising power of Russia, whose Czar, Feodor II, came off victorious in the conflict. In 1683 the Porte took up the cause of Tökülyi, the leader of the Hungarians in their rising against Leopold I of Austria, and once more the tide of Moslem invasion rolled up to the gates of Vienna. Kara Mustapha (q.v.), the successor of Ahmed Kiuprili, advanced with a vast army and laid siege to the Hapsburg capital. For a moment the fate of central Europe hung in the balance, but after the siege had lasted two months, the chivalry of Poland, led by King John Sobieski, and a German army came to the relief of the city, and on September 12 the Turkish army was put to flight in a great battle before its walls. The blow was a crushing one and ended the rôle of Turkey as a formidable aggressive power. Austria, Poland, and Venice now made a great onslaught upon the Ottoman Empire. The Austrians drove the Turks before them in Hungary, capturing city after city. In 1686 Buda, over whose walls the crescent had been displayed for a century and a half, fell into their hands. At the same time John Sobieski overran Moldavia and Wallachia and the Venetians successfully invaded the Morea. In 1695 Peter the Great took up arms against the Turks and in 1696 he wrested Azov from them. The Austrians, under Prince Eugène (q.v.), annihilated the Turkish army opposed to them at Zenta in 1697. In the Peace of Karlowitz in 1699, Turkey was forced to give up all of Hungary between the Danube and the Theiss, to restore to Poland a great part of the Ukraine, acquired in 1672, and to surrender the Morea to the Venetians. In the course of the seventeenth century Turkey had been gradually tightening her hold on Moldavia and Wallachia, which early in the following century were placed under the rule of Fanariot hospodars, appointed by the Porte.

In 1711 Sultan Achmet III took up arms for Charles XII of Sweden against Peter the Great of Russia, who had triumphed over his rival at Poltava (1709). The Czar invaded Moldavia, where he was hemmed in by the Turks on the banks of the Pruth, and was glad to purchase peace by the surrender of Azov. In 1715 the Turks reconquered the Morea from the Vene-

tians. The struggle with Austria was renewed in 1716. The Austrian forces under Prince Eugène gained a great victory in the same year at Peterwardein and another in 1717 at Belgrade, which they captured. In the Peace of Passarowitz (1718) the Turks were compelled to cede the Banat, part of Serbia (with Belgrade), and parts of Bosnia and Wallachia to Austria. The Morea remained in their hands. In 1736 Russia entered upon her rôle as a great assailant of the Ottoman Empire with the seizing of Azov and the invasion of the Crimea, which were followed by the capture of Otchakov (1737), and a victorious advance into Bessarabia and Moldavia. Austria joined Russia in 1737; but a scheme for the partition of Turkey between the two Powers was foiled by the defeats inflicted upon the Austrian armies by the Turks. In the Peace of Belgrade in 1739 Austria relinquished the Servian and Wallachian territories acquired in 1718, while Russia concluded a peace in which she gained but little. Alarmed at the aggressive intervention of the Empress Catharine II in the affairs of Poland and believing the safety of his realm to be endangered by Russian intrigues, Sultan Mustapha III ventured in 1768 on a war with Russia, which proved disastrous to Turkey. The Russians advanced victoriously through Moldavia and Wallachia, defeated the Tatar Khan of the Crimea (the vassal of the Sultan), won a victory on the Kagal (in Bessarabia), stormed Bender, broke into the Crimea, and in 1773-74 advanced into Bulgaria, where, however, the Turkish fortresses withstood their attacks. In 1770 the Russians burned the Turkish fleet at Tchesme. Peace was concluded at Kutchuk-Kainardji in 1774, Turkey renouncing her suzerainty over the Crimea and other Tatar territories in the region of the Black Sea, and according to Russia a sort of protectorate over Moldavia and Wallachia and the free navigation of the Turkish waters. During this war Turkey was to a certain extent crippled by the revolt of the Mameluke Governor of Egypt, Ali Bey (q.v.). In 1787 Sultan Abdul Hamid I plunged Turkey into a fresh war with Russia. Joseph II of Austria seized the opportunity to make a sudden onslaught on the Turkish territories, and fresh disasters befell the Ottoman arms. Potemkin stormed Otchakov (1788); the allies won a great victory at Fokshani (1789); Belgrade and Bender were captured in the same year; and Ismail was stormed by Suvarov at the close of 1790, the Russians enacting a carnival of blood. Austria, through pressure from Prussia, withdrew from the struggle in 1791 without reaping any benefit from it, and Catharine II in 1792 concluded the Peace of Jassy with Sultan Selim III, which made the Dniester the boundary between the Muscovite and Ottoman dominions. Rent by internal disorders, Turkey was unable to offer resistance when Bonaparte in 1798 suddenly swooped down upon Egypt, which, under its Mameluke beys, was already almost severed from the Empire. In Syria the advance of the French was stayed by the brave defenders of Acre (1799). Bonaparte returned to France, and in 1801 the English drove the French from Egypt. The downtrodden Servians rose in insurrection in 1804 under the leadership of Czerny George.

Selim III, under the influence of French thought, had conceived extensive ideas of reform, which he endeavored to put in operation when he ascended the throne. Many of his innova-

tions were premature and he aroused the anger of the Janizaries by his attempts at military reorganization. A revolt forced Selim to abdicate in 1807, and placed his nephew, Mustapha IV (1807-08), on the throne. Mustapha was soon deposed and Mahmud II (1808-39) was made Sultan. A war begun by Russia in 1806 was terminated by the Treaty of Bucharest in 1812, by which the country between the Dniester and the Pruth was ceded to Russia. The authority of the Sultan was reestablished in Servia, but the people rose again under Milosh Obrenovitch and achieved a partial independence. Greece threw off the Turkish yoke in 1822 and after an heroic struggle secured its independence through the armed intervention of the European Powers in 1827-29. A revolt of the Janizaries in 1825 was successfully met by Mahmud; in 1826 thousands of the famous corps were slain, and the organization was abolished. Russia waged a successful war against Turkey in 1828-29. General Diebitsch advanced as far as Adrianople, and Paskevitch was equally successful in Armenia. In the Peace of Adrianople (1829) Turkey surrendered to Russia the north-eastern coast land of the Black Sea and transferred to her the suzerainty over the tribes of the Caucasus; Russia was accorded a regular protectorate over Wallachia and Moldavia, which for a time were reduced to the position of Russian dependencies. Mehemet Ali, Viceroy of Egypt, who had raised himself to an almost independent position, made war in 1831 on his liege lord, the Sultan. The victories of Ibrahim Pasha (1832) secured to the Egyptian ruler the possession of Syria and Cilicia, while Russia took advantage of the desperate state of Turkey to force upon the Sultan the Treaty of Unkiar Skelessi (1833), which closed the Black Sea to the vessels of war of all nations save Russia. In 1839 Mahmud II made war upon Mehemet Ali. The Turkish army was utterly defeated by Ibrahim Pasha at Nisib (June 24, 1839), and soon after the the Turkish fleet was treacherously delivered up to the Egyptians. Only the intervention of the Quadruple Alliance (q.v.) in 1840 prevented the downfall of the Turkish Power. Mehemet Ali was forced to relinquish Syria and other territories; he was recognized as hereditary, though tributary, ruler of Egypt. Soon after the beginning of this war Mahmud II died (July 1, 1839). His son, Abdul-Medjid (1839-61), continued the reforms commenced in the preceding reign. Russia's truculent attitude brought on a war with Turkey in 1853, in which that country would have suffered severely but for the effective intervention in 1854 of England and France, soon joined by Sardinia, all bent on humbling Russia. The allies of the Sultan made the Crimea the scene of their land operations, and in 1855 Sebastopol fell. (See CRIMEAN WAR.) The Treaty of Paris (1856) restored to Turkey the command of both sides of the lower Danube, excluded the Czar from his assumed protectorate over the Danubian principalities (Wallachia and Moldavia), and closed the Black Sea against all ships of war. Wallachia and Moldavia secured almost complete independence and were soon united into the Principality of Rumania. The Porte, adopted into the family of European nations, made a proclamation of equal civil rights to all races and creeds in the Turkish dominions. A massacre of Christians in the Lebanon and at Damascus (see DRUSES) provoked Western intervention in 1860. Abdul-

Medjid was succeeded by his brother Abdul-Aziz (1861-76).

The Treaty of Paris in 1856 was supposed to have settled the Eastern question (q.v.) by guaranteeing Turkey's integrity, but Russia was merely awaiting an opportunity to press its old policy, and in 1871 the Russian government seized the opportunity of war between Germany and France to declare that it felt itself no longer bound by that provision of the Paris treaty which forbade Russia to have a fleet in the Black Sea. A London conference sanctioned this stroke of Russian diplomacy. An insurrection in Crete in 1866-68 was suppressed with difficulty. Between 1854 and 1871 the Turkish debt had increased by nearly \$600,000,000; and in 1875 the Porte was driven to partial repudiation of its obligations. An insurrection which broke out in Herzegovina in 1875 served to stir up all the neighboring Slavic peoples and was skillfully encouraged by Russian emissaries. In May, 1876, frightful massacres of Christians in Bulgaria took place. At the close of that month Abdul-Aziz was deposed and soon after was found dead. His nephew, Amurath or Murad V, son of Abdul-Medjid, reigned only three months, when he was deposed as an imbecile, and his brother, Abdul-Hamid II, succeeded to the throne. In July, 1876, Servia and Montenegro declared war against the Porte. Before the end of the year the Servians were utterly defeated, in spite of the help of many Russian volunteers. The state of affairs in the Turkish provinces seemed to call for a conference of the Great Powers at Constantinople. The proposals then made for the better government of the Christian subjects of Turkey were rejected by the Grand Council of the Turkish Empire. Simultaneously, however, with the assembly of the conference the Turkish government had taken the extraordinary step of bestowing a parliamentary constitution on the Ottoman Empire. The Parliament assembled in March, 1877, but this ostensible remodeling of the political fabric of the Empire did not get beyond its incipency. Russia took it upon herself to enforce on Turkey the demands made by the Powers, and on April 24, 1877, declared war. (See RUSSO-TURKISH WAR.) The Turks made a brave stand, but at last succumbed, and at the close of January, 1878, the Russians, aided by the Rumanians, were almost before the walls of Constantinople. The Treaty of San Stefano was signed on March 3, but the European Powers intervened and readjusted the whole Eastern question at the Congress of Berlin, Russia being forced to content herself with a much less radical disruption of the Turkish Empire in Europe than she had sought to bring about. See BERLIN, CONGRESS OF.

For a few years under the settlement effected at Berlin, there was comparative quiet in the Ottoman dominions, although in 1883, in consequence of disturbances in Egypt, and the bad condition of the finances in that province, Great Britain established a control there which practically nullified what little was left of the Ottoman sovereignty. Following on a revolutionary movement at Philippopolis in September, 1885, the Prince of Bulgaria proclaimed the annexation of eastern Rumelia, and after a decade the Porte was compelled to recognize the change which thus deprived it of its fairest province. In 1895-96 there were massacres of tens of thousands of Armenian Christians, which were

connived at by the local officials of the Ottoman government. The protests of Europe were of no avail, because Abdul-Hamid knew well how to play off the Powers against one another so as to prevent interference of an effective kind. A rising of the Christians against the Mohammedans in Crete (q.v.) followed in 1896, and was the signal for the outbreak of long-repressed hostilities in Greece, which recklessly entered upon war with Turkey in April, 1897. The campaign of a few weeks showed the utter futility of the Greek preparations. (See GREECE.) Greece was forced to sue for peace, the terms of which provided for the payment to the Ottoman government of an indemnity of \$18,000,000, and the rectification of the Greco-Turkish frontier in favor of Turkey. Crete was taken in charge by Great Britain, Russia, France, and Italy, and a settlement was made in 1898 by which the suzerainty of Turkey was renewed, but the island was given an autonomous government for three years, its executive head being Prince George of Greece, as High Commissioner of the four Powers. This settlement was renewed indefinitely upon its expiration in December, 1901. See CRETE.

The Ottoman Empire in the first decade of the twentieth century seemed on the point of collapse. Arabia was in constant revolt. Anarchy reigned in Albania, where the Sultan's officials found it all but impossible to enforce law or to collect taxes. Worst of all was the ferment in Macedonia, where Greeks, Servians, and Bulgarians were carrying on rival nationalist agitations and with their filibustering exploits were keeping the district in turmoil. An especially vigorous Macedonian upheaval, precipitated by the Bulgarians in 1903 and attended by massacres on the part of the Turks, led to foreign intervention; and the Sultan reluctantly consented to new reform schemes, which, however, were never fully executed. Meanwhile the public debt was steadily increasing; railways, mines, and banks were falling into the hands of foreign capitalists; the Balkan nations and the Great Powers of Europe were greedily regarding the Ottoman provinces.

The "Sick Man of Europe," as Turkey had so often been called, was apparently tottering to his end. At this point, however, appeared the "Young Turks," a group of politicians and patriots, many of whom had studied in the universities of western Europe, who dared dream of rejuvenating their country. The Young Turks would win parliamentary government for their homeland. In education, in science, in industry, Turkey would be transformed into a progressive state, vying with other European nations. Above all, they would induce their compatriots to forget religious differences in a spirit of national patriotism. The Young Turk movement was a counterpart in Turkey to the nationalist agitations which had already created a Greece, a Serbia, a Rumania, and a Bulgaria. Shrewdly enough, the leaders of the movement avoided all violence until they were absolutely sure that the army would support them. Then, on July 23, 1908, their central body, the so-called Committee of Union and Progress, with Enver Pasha at its head, proclaimed at Saloniki the restoration of the constitution of 1876. Two army corps at once threatened to march on Constantinople; and the terrified Abdul-Hamid hastily issued an imperial decree, officially restoring parliamentary government. A few opponents of the coup d'état were assassinated,

the press was emancipated, a Liberal statesman, Kiamil Pasha, was appointed Grand Vizier, and Turkey was a constitutional monarchy. Taking advantage of this disturbance in the Ottoman Empire, Austria-Hungary in October, 1908, formally annexed Bosnia and Herzegovina, and simultaneously Ferdinand of Bulgaria proclaimed the complete independence of his state (including eastern Rumelia) and assumed the title of "king." Helplessly but slowly the new Turkish government acquiesced in what it could not prevent and in 1909, in return for financial indemnities, recognized Bulgarian independence and the Austro-Hungarian annexation of Bosnia-Herzegovina as accomplished facts. To make matters worse for the constitutional government of Kiamil Pasha, Albania became more turbulent in the spring of 1909, mutiny broke out in Arabia, and the quarrels of rival nationalities in Macedonia became more acute. Under these circumstances, a counter revolution against the Young Turks was set on foot in Constantinople and received the approbation of Sultan Abdul-Hamid II. The Committee of Union and Progress, installed in Saloniki, responded promptly by sending an army under Shevket Pasha against Constantinople. After less than a day's fighting Shevket Pasha was in command of the capital (April 25, 1909). At the behest of the triumphant Young Turks, the Parliament, now calling itself a national assembly, deposed Abdul-Hamid, placed him under surveillance near Saloniki, and chose in his stead his brother, Mohammed V.

The new parliamentary régime, under Young Turk influence, proceeded forthwith to make the Turkish language official, to standardize education, to plant Moslem colonies in Macedonia, to utilize violence and bribery in elections, to forbid public meetings, to repress anti-Ottoman agitation, to disarm the Macedonian Christian villagers—in a word, to attempt the "Ottomanizing" of the Turkish Empire. Resentfully the Bulgarians, Greeks, and Servians in Macedonia regarded the new tendency, and, putting aside their own quarrels, they now made common cause against the Turk. Greece, Bulgaria, and Serbia began to draw more closely together with the object of protecting the Christians in Macedonia.

Meanwhile the Turco-Italian War (q.v.) caused discomfiture in Constantinople. On Sept. 28, 1911, Italy announced her intention of seizing Tripoli and Cyrenaica. The war that followed was confined mostly to irregular but fierce hostilities between the Italian expeditionary armies on the one hand, and, on the other, the Turkish garrisons and Arab tribesmen in Africa. During the course of the war, Italy occupied 12 of the Ægean Islands, and, when peace was finally concluded (October, 1912), Italy not only gained the vilayets of Tripoli and Cyrenaica, but in addition acquired the right to hold the 12 Ægean Islands should Turkey fail to grant to their inhabitants full amnesty, local autonomy, and public liberty. During the summer of 1912, while Turkey was still harassed and weakened by the war with Italy, the Balkan states concluded treaties of alliance and began to press more vigorously for radical reforms in Macedonia, and at the same time mutinous outbreaks occurred in Albania. In October, 1912, Bulgaria, Greece, Serbia, and Montenegro mobilized their armies and presented joint ultimatums to the Porte demanding autonomy for Macedonia

under European governors. Despite the efforts of the Great Powers to avert hostilities, the peremptory refusal of the Turkish government to comply with the ultimatums precipitated the war which lasted from October, 1912, to September, 1913. (See BALKAN WAR.) The outcome of the struggle was the loss of all Turkish possessions in Europe except Constantinople, Adrianople, and a little adjacent territory.

In the middle of the nineteenth century Great Britain and France had labored to bolster up the Ottoman Empire and to safeguard it against possible Russian aggression. By the time of the Balkan War, however, British and French interests in the Levant appeared to be menaced less by Russia than by Austria-Hungary and Germany. The latter Powers were working hand in glove: Germans were arming and drilling the Turkish army and securing the major share of new concessions in the Ottoman Empire, notably the Bagdad Railway, while Austria-Hungary was curbing the Servians and increasing her political and economic influence in Macedonia. In the course of the Balkan War, therefore, France and Great Britain, in conjunction with Russia, tended, on the whole, to sympathize with the Balkan states against Turkey: Accordingly, to the student of international politics it was not particularly surprising that soon after the outbreak of the Great War of 1914 between Russia, France, Great Britain, and Serbia on one side, and Austria-Hungary and Germany on the other, the Turkish government should throw in its lot with the latter combination. Undoubtedly the Young Turk leaders believed that if they were quite unable to recover what had recently been wrested from them in Europe they might at least, through Teutonic support, maintain Ottoman sovereignty over Egypt and extend Turkish frontiers into Persia at the eventual expense of Russia and Great Britain. See WAR IN EUROPE.

TURKEY (abbrev. of *Turkey cock*, *Turkey hen*, so called as being supposed to come from Turkey, vaguely applied to Tartary or Asia in general). The turkeys are natives of North and Central America, and the only two species known are the common wild turkey (*Meleagris gallopavo*), divided into five subspecies, and the beautiful Yucatan turkey (*Meleagris ocellatus*). They were once regarded as a distinct family, but are now considered the sole American representatives of the Phasianidae. The wild turkey is like the domesticated one, but more brightly colored. The ocellated turkey of Central America is a smaller and more beautiful species; the plumage is lustrous, and parts of it are ocellated, like the peacock's feathers; the bare head is blue with orange caruncles. This fine species is confined to Yucatan and Central America. The common wild turkey is still found in Mexico, Texas, and Arizona, and in other parts of the West and South, but is scarce east of the Mississippi and north of Virginia or Kentucky, though it formerly ranged well up into New England and as far north as Ontario. The wild turkey nests on the ground, commonly laying about 12 eggs of a creamy-white color. The female rarely raises more than one brood in a season and then only if misfortune has come to the first brood. The young are at the mercy of many enemies and the adults that survive have become nearly exterminated in America.

The domestic turkey, the largest of gallinaceous birds, appears to have been introduced into Europe by the Spaniards early in the sixteenth century and is the descendant of the Mexican wild turkey. The domestic birds vary greatly

in plumage from the tints of the wild species to buff, or brown, or pure white, and occasionally produce a crest. On account of its size and the excellence of its flesh and eggs the turkey is one of the most valued kinds of poultry. The management of turkeys differs little from that of the common fowl. The young are tender for the first few weeks, and require care, particularly to keep them from getting wet by running among the wet grass, or the like; but afterward they are sufficiently hardy. Consult American School of Poultry Husbandry, *Turkeys, Waterfowl, and Guineas* (Mountain Grove, Mo., 1914), and E. A. McIlhenny, *The Wild Turkey and its Hunting* (Garden City, N. Y., 1914). See COLORED PLATE OF PEACOCK, TURKEY, AND GUINEA FOWL.

TURKEY BUZZARD. See VULTURE.

TURKEY GNAT. An insect (*Simulium pictipes*) of the dipterous family Simuliidae, identical with the Southern buffalo gnat, which usually makes its appearance about the time turkeys are setting, and sometimes causes great mortality among those birds. See BLACK FLY; BUFFALO GNAT.

TURKEY GUM. See GUMS.

TURKEY RED. A name applied to one of the most durable and beautiful colors which have been produced on cotton. The process of dyeing cotton Turkey red is said to have been practiced in India from ancient times. The operations are long and tedious, and their effect could scarcely be explained theoretically. Turkey red is one of the colors of alizarin which can be obtained either from the madder root (*Rubia tinctorum*) or by an artificial process of manufacture as a product of coal tar. See ALIZARIN.

TURKEY STONE. A honestone found in Turkey. See HONES.

TURKISH LANGUAGE AND LITERATURE. The language and literature of the Turks in general, and especially of the Osmanli. Within the Ural Altaic family the Turkish group stands somewhat nearer to the Samoyedic and Finno-Ugric than to the Tungusian and Mongolian. While the pronouns, case suffixes, and construction of sentences are very similar to those in the latter groups, not only is there a very marked difference in the vocabulary, but also a more developed system of inflection and a freer use of pronominal suffixes. On the other hand, the Turkish group has a simpler system of cases than the Samoyedic and Finno-Ugric; it does not incorporate, as they do, the pronominal object in the verb, and it inserts, as they do not, the negative after the root of the verb. It is, on the whole, more agglutinative and less inflectional than the Finnish and the Hungarian.

Among the languages or dialects comprised within the Turkish group the Osmanli has the closest affinities to the Anadolli, the Krimmi, the Azerbaijani, and the Turkmani, though the latter two already begin to show characteristic differences. The Jagatai and Taranji, and even more the northern dialects, Kirghiz, Bashkir, Irtysh, and Volga in the West, and Altai, Baraba, Lebed, Tuba, Abakan, Kuarik, Soyon Karagass, and Uighur in the East, have a much broader and harsher vocalization, a very confusing substitution of consonants, as *m* for *b*, *b* for *w*, *j* for *y*, etc., and a preservation of those ancient tense and case words which in Osmanli and some of the other southwestern dialects have become mere arbitrary particles added to the root to indicate tense or case.

TURKISH LANGUAGE

The chief structural characteristics of the Turkish language are four: (1) the root of every word is inviolable; (2) the root is emphasized by making its leading vowel dominate the vowels and to some extent the consonants added for purposes of inflection, subjecting them to change under regular rules of euphonic harmony. (3) Grammatical forms, especially in the conjugation of the verb, are abundant, regular, logical, and efficient. (4) Determining or modifying syllables are placed at the end of the root. The Turkish verb begins in simplicity. For instance, *bak* means look thou, and is the root of the verb *bakmak*, to look. Upon this root a series of new verbs may be built: (1) Causative: *bakdırmak*, to cause or allow to look; (2) reciprocal: *bakışmak*, to look at one another; (3) reflexive: *bakınmak*, to look at one's self, i.e., to be perplexed. From these again a further series of new verbs can be made by inserting in each the causative particle; (4) *bakdırılmak*, to make or let one cause another to look; (5) *bakışdırmak*, to cause or allow one to look at another; (6) *bakındırmak*, to cause or allow one to look at himself, i.e., to be perplexed. All of these new verbs can be conjugated in the positive, the negative, and the impossible form (to look; not to look; and not to be able to look), and, if the sense permits, in all the moods and tenses of the active and passive voices. The same is true of the root of every verb in the language, if the sense permits. It has been computed that, counting all the moods and tenses and numbers and persons, the permutations of which each Turkish verb is capable amounts to over 25,000. Yet so simple and clear are the rules that the memorizing of 44 syllables or particles enables one to build and understand the whole series. The efficiency of the system appears on realizing that Turkish grammar has but one conjugation and no irregular verbs except the auxiliary. The scheme of the verb is that of a form which will fit every root and which is yet so transparent that the root is always visible. The same principle of agglutination to the root is followed in making new verbs from nouns or adjectives and in declining nouns and pronouns. There is no gender for noun, pronoun, or adjective. Adjectives are subjected to no change except for comparison. The Turkish syntax is peculiar. The unit of expression is the paragraph, and there is no punctuation. The subject of the ruling verb is placed as near as possible to the beginning of the paragraph. All subordinate sentences and clauses adding particulars have their verbs in participial form, the sense being thus suspended during the process of building the paragraph, until the chief verb coming in at the very end illuminates the whole.

The earliest form of the alphabet used in writing Turkish dialects is that employed in the inscriptions found on the Yenesei and on the Orkhon River south of Lake Baikal. The letters show a marked similarity to the Aramaic alphabet appearing on the later Arsacid coins. One of these inscriptions is dated in 733 A.D.; but it is not improbable that some of them are still earlier. The Uighur inscriptions are somewhat later; a copy of the poem *Kudatku Bilik*, "The Blessed Knowledge," was made in 1085. These Uighurs used an alphabet of 14 letters derived from the Nestorian Syriac. The same

resemblance to the Estrangelo is also characteristic of the recently discovered Manichæan texts (cf. Le Coq, in *Journal of the Royal Asiatic Society*, London, 1911, pp. 277 ff.), and in a modified form this alphabet seems to have passed to the Tunguses and the Mongolians. As the Turkish tribes became Moslems they adopted the Arabic alphabet, increasing the 28 letters to 33 by the device invented by the Persians of adding dots to five of the Arabic letters. This alphabet is quite unsuited to the Turkish language, owing to the lack of proper vowels. As vowels like ä, ö, ü cannot be expressed, it is sometimes impossible to avoid serious ambiguity or uncertainty as to the meaning. Turkish is occasionally written in Armenian, Greek, or Russian letters.

The onrush of the Turks from the Far East into all civilized lands, including China, which continued from the tenth century to the end of the seventeenth, enlarged the meagre Turkish vocabulary. The tribes which invaded India, now known under the name of Moguls, lost their language; but those which conquered Persia and overthrew the Byzantine Empire came under the literary influence of Persian at first, then of Arabic, and finally of Greek and the European languages. The consequence was that the Ottoman Turkish (Osmanlı), as the Western branch of the language is called, adopted into its literary vocabulary Persian words of poetry and history, Arabic words for religious and legal writings, Greek words for the winds and currents and fishes of the sea, Italian words for all that relates to sailing vessels, and, later, English terms for steam, the steamboat and its manœuvres, and French words for many of the terms of diplomacy.

TURKISH LITERATURE

Turkish literature is a term which at present implies the literature of the Western or Ottoman Turkish language. It may be regarded as falling into three periods: (1) The early period, when writers were from the region of Central Asia, and when the Persian was the model and often the instrument of their highest expression. (2) The middle period, beginning about the middle of the sixteenth century and extending well into the nineteenth, when Arabic dominated the Turkish literary world, having replaced Persian as model except in poetry. (3) The modern period, dating from about the time of the Crimean War (1853-56). In it the tendency of Turkish writers is to copy French, rather than either Persian or Arabian models, and to bring back into the language half-forgotten Turkish expressions.

The earliest literary remains of Turkish writers are the inscriptions mentioned above, deciphered and interpreted by Castrén, Thomsen, Radloff, Donner, and Hirth. One of the earliest books of the early period, celebrated for its pure Turkish, is a genealogical history of the Tatars by Abul Ghazi of Khwarezm, dating from the twelfth century. The judge Burhan el din of Sivas, a descendant of Genghis Khan, an adventurer, ruling over two provinces, who lost his life in trying to conquer another in 1398, has left some poems written in good Turkish, although after the Persian school. Another of the early poets was Suleiman Effendi (died 1410), chaplain to Sultan Bajazet, whom Timur carried off. He wrote a poem in honor of the birth of the Prophet Mohammed which has been

read throughout Turkey on public occasions in each year during nearly 500 years, and still retains its power to move its hearers. Another of the poets of the early period was Amud el din, who wrote under the name Nesimi. Like the others of these early poets, he was under the influence of Sufism (q.v.), and so incensed the more orthodox Moslems that he was flayed alive at Aleppo in 1417. Sheikhî, whose real name was Sinan (died 1420), was a doctor as well as a poet. His fame rests mainly upon his poem, the *Khar-namê*, or Donkey Book, in which he classifies his enemies according to the different types of asses found in the East.

Nevayi, whose real name was Ali Shir (died 1500), is the great representative of Turkish poetry in this period. He was Grand Vizier for a time to Sultan Husain of Herat, but retired early that he might write. He was a master in both Turkish and Persian. The thoroughly human quality of his writings appeared from the fact that one main source of our knowledge of the old eastern Turkish language is a dictionary written by a Persian in order that Persians might profit by Nevayi's writings. The greatest prose writer of this period was Baber, great-grandson of Timur, and "Mogul" conqueror of India in 1526-26. His annals of his campaigns are written in plain Turkish, Arabic and Persian words being used to eke out his vocabulary.

Of the middle period of Turkish literature Saad el din (died 1599) offers a type. He was a warrior of great renown, and afterward Chief Justice of the Turkish Empire (Sheikh al Islam) under Sultan Mohammed III. The work on which his literary fame rests is a history of the Ottoman Empire, called *Taj el Tavarikh*. The style is of the most ornate Persian order and there is hardly any Turkish in the book except those auxiliaries essential to the binding of the sentences. Saad el din followed the principle, which ruled literature throughout the middle period, that Arabic words must be brought into Turkish with all their grammatical rules and appurtenances. The effect is to make the finest Turkish literature of this period quite unintelligible to those who have not enough knowledge of Arabic and Persian to use dictionaries of those languages. Baki (died 1599), rated by Turkish critics as the "king of the poets of Osmanli Turkish," was a contemporary of Saad el din. He was the son of a mosque servant who became one of the Caziaskers, or judges of the supreme court, under Sultan Selim II. His poetry was strongly Persian in flavor, but without slavish imitation. Another great poet of this time was Fuzuli (died 1563), whose real name was Mehemed, of Bagdad. To a foreign taste he offers more of originality than Baki. His poems are warm with the peculiar fire of Sufism, and in both poetry and prose he loved the strong virile Turkish words. The list of Turkish poets is long, but those mentioned are still the greatest names. To them we may add Nedim (died 1725), whose ghazels and kasidas show originality as well as eloquence of diction and humor. The name of Kiani, whose real name was Abu Bekr (died 1791), too, should have a place in the list of notable poets of this period. The simplicity and transparent beauty of his lines are such that had it not been for his inveterate vaggishness he would hold very high rank among the Turkish poets. Another of the great poets of this period was

Nabi (died 1712), whose *Ghazels* are accounted among the finest. His real name was Yusuf of Urfa. One of his longer poems, the *Khairiyè*, has been translated into French by Pavet de Courteille. Sheikh Ghalib (died 1798), whose *Huan-u-ashk* (Beauty and Love) is regarded as a fine allegory, should also be mentioned, as well as the poetess Sherif Hanum, who died in 1809, leaving a *Divan* of some merit.

The historians of the middle period make a long list. But their work is blemished, as a rule, by a difficult, stilted style, and the pettiness of the annalist. Among exceptions in the long series we may select Pechevi Ibrahim, who shows some inkling of what a historian should be; Solak Zadè, who died about 1680, and wrote in the graphic style of an eyewitness; and especially Katib Tchelebi, sometimes called Hajji Khalfah (q.v.). His real name was Mustafa, and he died in 1658, leaving an enormous mass of extremely valuable writings in history, geography, and bibliography.

To the same period probably belong certain writings of value which are passed over in scorn by the Turkish literary critics because they are not in the mongrel language of the pedants. Hence their authors are unknown. Of this class is the *History of the Forty Viziers*, dedicated to Sultan Mustapha I (1617-23). It is a cycle of some 75 stories grouped about an incident of the Joseph and Potiphar order. The book is directed against the idea of trusting the fair sex and winds up, after all wrongs have been righted, with the quaint prayer, "May the Most High bring us all near to the good and to God, and keep us from the tricks of deceitful woman. Amen." Another of these unconsidered classics of Turkish is the *Life of Nasr el din Hoja*, a collection of bulls acted or spoken by a Turk of Asia Minor, who is delightfully humorous. To the same class belongs the story of *Shah Miran*, a collection of fairy tales, religious in purpose, which is remarkable for its pure Turkish diction.

As a fruit of the Crimean War a revolution took place in the educational system of Turkey. The result has been the appearance of the modern school of writers who are yet to change entirely the character of Turkish literature. The heavy scholastic theologians are seeking to arrest the movement by the censorship, and they have persecuted or imprisoned some of the most powerful writers, like Ebuzzia Tewfik, or sent them to die in exile on a barren island like Kemal Bey. The aim of the new school of writers is to free the Turkish language from the incubus of Arabic grammatical purism. The writers who have perhaps done the most towards accomplishing this object are Ahmed Vefik Pasha (died 1893), whose dictionary of Turkish in two volumes was a revelation to multitudes, and Ahmed Mithad Effendi, noted for his novels, essays, and historical studies. Great as is the linguistic value of Ahmed Mithad's writings, they are too close imitations of French works to have permanent literary value. Of far greater weight was Kemal Bey, who died in 1878. Jevdet Pasha, illustrious as an historian, whose works show a steady development towards the simpler Turkish style; Ziya Pasha, a brilliant essayist and poet; and Jevad Pasha, who has written a fine history of the origins of the Turkish military organization, are other examples of this school. Other notable names of this period are Muallim Naji, poet and essayist; Ebuzzia Tewfik, literary critic; Sezayi Bey, Husain, Rahmi, Ahmed Rasim, and Aliyè

Hanum, daughter of the historian Jevdet Pasha, all of whom are novelists, dealing with current life in a realistic style entirely new in Turkish literature. Hamid Bey has made for himself a name as a playwright. The modern period cannot be said to have entirely revealed its qualities while strife with reactionist control continues. But it has at least shown that there is a future before the writers of Turkey, if they ever have freedom to speak and to develop. See ANTHOLOGY.

Bibliography. For analysis of the philosophy of Turkish grammar, consult: Abel Rémusat, *Recherches sur les langues tatares* (Paris, 1820); Shaw, *Sketch of the Turkish Language as Spoken in Eastern Turkestan* (Calcutta, 1878-80); for the Eastern Turkish language: De Courteille, *Dictionnaire turco-oriental* (Paris, 1870); Armin Vámbéry, *Capataische Sprachstudien* (Leipzig, 1867); Wilhelm Radloff, *Proben der Volksliteratur der türkischen Stämme Süd-Siberiens* (St. Petersburg, 1868); id., *Die alttürkischen Inschriften der Mongolei* (ib., 1897); Böttlingk, *Ueber die Sprache der Jakuten* (ib., 1851); Thomsen, *Inscriptions de l'Orkhon déchiffrées* (Helsingfors, 1896); O. Donner, *Sur l'origine de l'alphabet turc* (ib., 1896); J. Marquardt, *Chronologie der alt-türkischen Inschriften* (Berlin, 1898; 6 vols., London, 1900-09). For the Ottoman Turkish language, consult: Charles Wells, *Practical Grammar of the Turkish Language* (London, 1880); Adolf Wahrmund, *Praktisches Handbuch der osmanisch-türkischen Sprache* (2d ed., Giessen, 1884); August Müller, "Türkische Grammatik," in the *Porta Linguarum Orientalium* (Berlin, 1899); R. Yousouf, *Grammaire complète de la langue ottomane* (Constantinople, 1892); Sir J. W. Redhouse, *Lexicon of the Ottoman Turkish Language* (ib., 1884), the most complete Turkish lexicon in existence; id., *English-Turkish Dictionary* (ib., 1861); E. A. Leran, *Turkish-English Conversation Illustrated* (Boston, 1914); Sami, *Dictionnaire turc-français, français-turc* (Constantinople, 1883), is a small but very useful work. For Turkish literature, consult: Georg Jacob, *Türkische Literaturgeschichte in Einzeldarstellungen* (Berlin, 1900); id., *Türkische Volksliteratur* (ib., 1901); E. J. W. Gibb, *History of Ottoman Poetry* (London, 1902-05); Georg Jacob, *Türkische Bibliothek* (Berlin, 1905-06); Wilhelm Radloff, *Versuch eines Wörterbuches der Turk-Dialecte* (Leipzig, 1904-06). "Turkish Literature," in the *World's Great Classics* (London, 1901), is a convenient collection of translations of typical Turkish works; except in the Ottoman poetry translated by Gibb, however, the articles are not taken directly from the Turkish; also: Paul Horn, *Geschichte der türkischen Moderne* (Leipzig, 1902); Sir Edwin Pears, *Turkey and its People* (London, 1911); *Tales from Turkey*, collected and done into English by Allan Ramsay and Francis McCullagh (ib., 1914).

TURKISH MUSIC. See JANIZARY MUSIC.

TURKOMANS. A people whose principal home is in the great plains between the Caspian Sea on the west and the Sea of Aral and the Amu Darya on the east—the western part of Turkestan in the broader sense. Some of them are to be found in Persia, Afghanistan, and other regions. They belong by language, and largely by blood, to the Turkic stock. The Turkomans of Turkestan are under Russian rule. See TURKESTAN.

TURKO-TATARS, tûr'kô-tâ'tarz. A term used by certain ethnologists to designate a group of Ural-Altaic peoples composed of the Turkic and related so-called Tatar tribes and nations. Under Turko-Tatars are included: The Siberian peoples of Turkic stock, such as the Yakuts and Siberian Tatars; the Kirghiz-Cossacks of the Irtysh Caspian steppes; the Kara-Kirghizes of the Tian-Shan; the Ugurs, Sarts, Uzbeks, and Turkomans of Central Asia; the Tatars of the Volga; Bashkirs, Tchuvashes, and Meshtcheriaks, in European Russia; the Tatars of the Crimea and the Caucasus, including the Nogai, Karachai, Kumyks, and Basians; the Azerbaijani; the Yuruks of Anatolia; the Osmanli Turks; the historical nations: the Huns, Petchenegs, Cumans, Avars, and perhaps the ancient Bulgars and Khazars, etc. Many of these peoples, like the Osmanlis, Starts, Turkomans, Uzbeks, Azerbaijani, and the Turks of Turkestan, are largely Aryanized in blood, with often an added Semitic strain. Except the Yakuts, whose religion is Shamanism, and those Tchuvashes who have become Christian, the Turkic peoples profess Islam. The empires founded by Turko-Tataric peoples have had a rather ephemeral existence, and the realm of the Osmanli Turks in Europe owes its perpetuation not a little to the very mixed physical character of that people. Consult: Armin Vămbéry, *Etymologisches Wörterbuch der turko-tatarischen Sprachen* (Leipzig, 1878); id., *Die primitive Kultur des turko-tatarischen Volkes* (ib., 1879); id., *Das Türkenvolk* (ib., 1885); Wilhelm Radloff, *Die Sprachen der Türkischen Stämme* (St. Petersburg, 1866 et seq.); id., *Ethnographische Übersicht der Türkstämme Sibiriens und der Mongolei* (Leipzig, 1883); Ernest Chantre, *Recherches anthropologiques dans l'Asie occidentale* (Lyons, 1895) and the periodical *Revue Orientale* (*Keleti Szemle*).

TURK'S CAP. See LILY.

TURK'S HEAD. A name given to a number of coffee houses in London, among which that on the Strand, frequented by Dr. Johnson and Boswell, was the most noted. Others of the name were situated in Change Alley, in Soho, and in Westminster.

TURKS ISLANDS. A group of small islands in the Bahamas, which, together with the Caicos Islands (q.v.), form a dependency of Jamaica.

TÜRLIN, HEINRICH VON DEM. See HEINRICH VON DEM TÜRLIN.

TURMAIR, tōōr'mîr, JOHANNES. The real name of the German historian best known as Johannes Aventinus (q.v.).

TUR/MERIC (Fr. *terre-mérite*, Neo-Lat. *terra merita*, turmeric, apparently deserved earth, best earth, but probably a corruption of an Oriental name, perhaps of Ar. *kurkum*, from Skt. *kunkuma*, saffron), *Curcuma longa*. A plant of the family Zingiberaceæ, a native of the East Indies, much cultivated both in India and in Cochin-China, for its fleshy roots, more than \$500,000 worth of which are annually exported from India alone. Young roots abound in a kind of arrow-root, but older ones contain a large quantity of a resinous yellow substance called turmeric, which is used mainly for dyeing. The color is not very stable. Some of its other uses are in chemistry as a test for alkalis, their carbonates and phosphates, some of the alkaloids, and boracic acid, which change it to reddish brown, and as a condiment with many kinds of food, especially as a principal ingredient in curry powder. The plant thrives best in a rich, friable

soil, and a situation not liable to be flooded. It is propagated by cuttings of the rootstock, which are planted at distances of 18 inches to 2 feet, in April or May. The crop is gathered in December. This kind of turmeric is sometimes distinguished by the name long turmeric; and the name of round turmeric is given to *Kæmpferia pandurata*, a plant of the same family, also

TURMERIC (*Curcuma longa*).

a native of the East Indies, the roots of which are shorter and rounder, but otherwise of very similar quality. They are especially valued for the preparation of an artificial gold varnish, as they yield a better color than the former kind. The Arabic name of turmeric is *kurkum*, whence *curcuma*. Turmeric is not cultivated commercially in the United States. See CURCUMA.

TURN, tōörn. A town adjoining Teplitz in Bohemia, Austria. It has a magnificent park, bathing establishments, and thriving manufactures of many kinds, particularly porcelain. Pop., 1900, 12,408; 1910, 13,653.

TURNBULL, ROBERT JAMES (1775-1833). An American publicist, born in New Smyrna, Fla. He was educated in England, was admitted to the bar in Charleston in 1794, and practiced there until 1810, when he retired to his plantation. He was active in the Nullification movement, and under the signature of "Brutus" published 31 papers in the Charleston *Mercury*, during 1827, which were afterward collected as the *Crisis*. He was a delegate to the Nullification Convention in 1832, and prepared the address to the people. When the proclamation of President Jackson was read, he was the first to volunteer to resist the general government.

TURNBULL, WILLIAM (1800-1857). An American civil engineer. He was born in Philadelphia; graduated at West Point in 1819, and was commissioned in the artillery. He was engaged largely in topographical work, and was promoted to a captaincy in the topographical engineers in 1831, being brevetted colonel in 1847. In the Mexican War he was with General Scott as chief topographical engineer, and took part at Contreras, Churubusco, and the capture of the city of Mexico. He was superintending topographical engineer on the Potomac Aqueduct for the water supply of Washington, D. C., and in charge of government harbor and other engineering works. The building of the New Orleans

Custom House and the Cape Fear River improvements were under his supervision.

TURNBULL, WILLIAM BARCLAY DAVID DONALD (1811-63). A Scottish antiquary, born at Edinburgh. Educated for the law, he was admitted as advocate at the Scottish bar (1832), but devoted much time to the study of the antiquities and older literature of Great Britain. In 1834 he founded the Abbotsford Club, which did great service by printing works preserved only in manuscripts or old editions. In 1859 he was employed by the Record Commission, and in the next two years published two valuable volumes of calendars of state papers, but on account of his Catholicism he was attacked by the ultra-Protestant party and compelled to resign. He was an industrious and careful editor, and did excellent service by his editions of Middle English and early modern English poetry. His work as genealogist and historical editor was of value. Among his publications may be named: *The Romances of Sir Guy of Warwick and Rembrun his Son* (1840); *The Visions of Tundale* (1843); *Letters of Mary Queen of Scots* (1845); *The Poetical Works of William Drummond of Hawthornden* (1856).

TURNBULL'S BLUE. See HYDROFERRICYANIC ACID.

TURNÈBUS, ADRIANUS (Fr. ADRIEN TURNÈBE) (1512-1565). An eminent French scholar, born at Andelys, famous as one of the leaders of the Renaissance in France. After completing his studies in Paris he became professor in the University of Toulouse. In 1547 he was called to Paris, where he taught Greek and Latin, and later philosophy, until his death. From 1552 he had charge of all Greek books published by the royal press. Under him appeared the first editions of Philo and Synesius; he himself edited Æschylus, Aristotle's *Ethics*, Cicero's *De Legibus*, Horace and Varro's *De Lingua Latina*, and made many translations. Turnebus' influence extended far beyond the limits of France through his writings and pupils, of whom the most famous was J. J. Scaliger (q.v.). After his death his commentaries, translations, and other writings were published in three volumes (Paris, 1564-80). Consult the *Life* prefixed to these volumes; also Mattaire, *Historia Typographorum Aliquot Parisiensium* (London, 1817); and J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

TURNER, CHARLES TENNYSON (1808-79). An English poet, brother of Alfred Tennyson (q.v.). He was born at Somersby, in Lincolnshire. Like his more famous brother he attended the Louth Grammar School, and then studied at home under the direction of his father, the vicar of Somersby. With Alfred, he published *Poems by Two Brothers* (1827; reissued 1893). In 1828 he entered Trinity College, Cambridge, graduating B.A. in 1832. In 1835 he was ordained and became curate of Tealby, in Lincolnshire, and two years later vicar of Grasby, in the same county. On inheriting a small estate from a great-uncle, Samuel Turner, he added Turner to his name. His last years were passed at Cheltenham. After his juvenile verse he published *Sonnets and Fugitive Pieces* (1830), which were appreciated by Coleridge; and similar volumes in 1864, 1868, and 1873. In 1880 Hallam Tennyson brought together all of his uncle's sonnets and lyrics under the title *Collected Sonnets, Old and New*, and introduced them by a biographical sketch.

TURNER, CHARLES YARDLEY (1850-1919). An American mural landscape and figure painter. He was born in Baltimore, and studied at the National Academy and the Art Students' League in New York City, and afterward under Laurens, Munkácsy, and Bonnat in Paris. He at first exhibited large canvases of historical genre, such as the "Bridal Procession" (Metropolitan Museum, New York), but soon turned to mural painting and executed decorations in many public and municipal buildings and hotels. Good examples of his work, which is well composed, carefully drawn, and realistic in character, are: "The Burning of the Peggy Stuart," and "The Barter with the Indians," in the Baltimore Court House; the two lunettes "Washington Watching the Assault on Fort Lee" and "Fulton's Clermont Making its First Trip up the Hudson," in the Hudson County Court House, Jersey City; the panels "Equity" and "Law" in the Appellate Court, New York; "Opening of the Erie Canal" and "Marriage of the Waters" in the DeWitt Clinton High School, New York. From 1881 to 1884 Turner was professor of drawing and painting at the Art Students' League, New York, and he was elected a member of the National Academy of Design in 1886. From 1912 he was director of the Maryland Institute of Art and Design. He made Washington City his residence, but maintained studios in New York and Baltimore.

TURNER, CUTHBERT HAMILTON (1860-). An English theologian, born in London. He was educated at Winchester College and at New College, Oxford, and at Oxford was an assistant lecturer from 1888 to 1901, first Speaker's lecturer in biblical studies in 1906-10, and thenceforth lecturer in early Christian history. From 1899 to 1902 he was the first editor of the *Journal of Theological Studies*. His publications include: *Ecclesiæ Occidentalis Monumenta Iuris Antiquissima* (2 vols., 1899-1913); *The History and Use of Creeds and Anathemas in the Early Centuries of the Church* (1906); "Organization of the Church," in *Cambridge Medieval History* (1911); *Studies in Early Church History* (1912).

TURNER, CYRIL. See TOURNEUR, CYRIL.

TURNER, FREDERICK JACKSON (1861-). An American historian, born at Portage, Wis. He graduated in 1884 at the University of Wisconsin, where (after further study at Johns Hopkins) he was professor of American history from 1892 to 1910. He then accepted a chair of history at Harvard. He became one of the editors of the *American Historical Review*, and in 1910-11 was president of the American Historical Association. He published: *The Character and Influence of the Indian Trade in Wisconsin* (1890); *Policy of France towards the Mississippi Valley in the Period of Washington and Adams* (1906); *Rise of the New West* (1906); *Reuben Gold Thwaites* (1914).

TURNER, HERBERT HALL (1861-). A British astronomer. He studied at Clifton College, and at Trinity College, Cambridge, where he was later fellow. For a time he was chief assistant in the Royal Observatory, Greenwich. In 1893 he was appointed fellow of New College, Oxford, and Savilian professor of astronomy in the university. Turner was president of the Royal Astronomical Society in 1903-04. Besides serving as joint editor of *Bedrock* (a quarterly scientific review), he published *Modern Astronomy* (1901); *Astronomical Discovery*

(1904); *Halley's Comet* (1908; 2d ed., 1910); *The Great Star Map* (1912).

TURNER, JOHN HERBERT (1834-). A Canadian government officer. He was born at Claydon, England, was educated there, and went to Canada in 1856. After a few years in business at Charlottetown, Prince Edward Island, he removed to Victoria, British Columbia, and founded a mercantile house of which he continued to be the head. Entering politics, he was a Conservative member for Victoria in the Provincial Legislature in 1887-1901. He was Provincial Minister of Finance and Agriculture (1887-98; 1899-1901), Premier (1895-98), and in 1901-15 he was agent-general for British Columbia in London.

TURNER, JOSEPH MALLOD WILLIAM (1775-1851). The most celebrated landscape painter of the English school. He was born in Covent Garden, London, April 23, 1775, the son of William Turner, a barber. Almost in his infancy he began to paint and draw. He had little education beyond reading, which he learned from his father, and writing, which was all he acquired at school. He was constantly employed in coloring prints and similar work, his father offering him every possible facility for artistic education. Before 1789 he was placed with Thomas Walton, an architect, to learn perspective, but proved a sorry pupil. Afterward he studied with Thomas Hardwick, on whose advice he entered the Academy Schools in 1789 to study landscape. He was admitted to the studio of Reynolds, under whom he copied portraits and perhaps learned oil technique; but Sir Joshua had little influence upon him.

Turner's first drawing exhibited at the Academy was a view of Lambeth Palace (1790). For some years he was occupied with designs for prints in magazines, which necessitated long sketching tours over England and Wales. He continued his artistic education, however, as one of the coterie of young artists who frequented the hospitable abode of Dr. Thomas Munro, whom Ruskin calls "Turner's real master." Here he found patronage and encouragement; here, too, he met Girtin and Cozens. He was influenced by Girtin, the founder of modern water-color painting, with whom he sketched much and formed a close acquaintance. The success of Girtin's Yorkshire aquarelles moved Turner, in 1797, to make a similar attempt, and his journey in Yorkshire and the north resulted in his forming several important friendships, such as that with Dr. Whitaker, whose works Turner afterward illustrated with some of his best designs. It also had a marked influence upon his artistic career, as is shown by his exhibit at the Academy in 1798, which proclaimed his genius as a painter of poetic landscape, in such pictures as "Morning on the Comston Fells, Cumberland" (National Gallery), and aquarelles like "Norham Castle" (Metropolitan Museum, New York), which Turner esteemed of high importance in his development. In 1799 he exhibited several Welsh subjects, in rivalry with Girtin, and his first picture of a naval engagement, the "Battle of the Nile"—works which secured his choice as associate of the Royal Academy.

With this year ceases what Ruskin calls Turner's period of development, and the period of his first style (1800-20) begins. Dropping topographical subjects he introduced historical and mythological motifs into his pictures, striving

to equal or surpass the masters then most celebrated, William van de Velde, Nicolas and Gaspard Poussin, and Claude Lorraine, in their own subjects. He was especially influenced by Claude, the great painter of light, which Turner also considered the chief problem of painting. In 1802 he paid his first visit to the Continent, the results of which appeared in the exhibition in 1803 of pictures and drawings of the Savoy Alps, most of which are now in the National Gallery, as well as "Calais Pier," and a "Holy Family" of the same year. The same collection possesses his famous "Shipwreck" (1805); his "Garden of the Hesperides" (1806), painted in the classical style in rivalry with Poussin; and the "Sun Rising in the Mist" (1807), one of his best and most individual works. From 1807 to 1819 he was engaged on his *Liber Studiorum* (q.v.), in rivalry with Claude's *Liber Veritatis*. The etchings for these plates, all of which were supervised or executed by Turner himself, show the master at his very best. He now made travels in Devonshire, in the north of England, in Scotland, and on the Continent. Among other important works of this period are: "Apollo and Python" (1811); "Hannibal and his Army Crossing the Alps" (1812); "Crossing the Brook" (1815); and "Dido Building Carthage" (1815), the best of a Carthage series—all in the National Gallery.

With his visit to Italy in 1819 begins his second style (1820-35), the time of his most perfect works, distinguished by lightness and brilliancy of color. Ceasing to imitate the old masters, he nevertheless clung to the classical idea of composition. This mature style is well represented by the first of the series of the wonderful Italian pictures upon which his fame chiefly rests—the "Bay of Baiæ, with Apollo and the Sibyl" (1823); also by "Dido Directing the Equipment of the Fleet" (1828); "Ulysses Deriding Polyphemus" (1829); "Caligula's Palace and Bridge" (1831); and "Childe Harold's Pilgrimage" (1832), all in the National Gallery. During 1833-46 he often visited Venice, which for some time furnished subjects for his art. Of his numerous Venetian subjects the National Gallery possesses a rich collection of water colors, and the "Grand Canal," in the Metropolitan Museum, New York City, is a fine example of the oils. He found time, however, for other subjects, like "Staffa, Fingal's Cave" (1834, New York Public Library); "St. Michael's Mount, Cornwall" (1834), and "The Fighting Téméraire" (National Gallery), the best known and most popular of his works. He was still much occupied with designs for illustrations, like *Rivers of England* and *Ports of England*, in 1824. The drawings for the series *England and Wales* (1827-38), in which several line engravers under Turner's supervision brought this art to a new perfection, are wonderful in color and atmospheric effect. In 1830 appeared the lovely illustrations to Rogers's *Italy*; in 1833 the first of his *Rivers of France*, the drawings for which are among the most perfect of his works. He also illustrated the works of Byron, Scott, Milton, Campbell, Rogers's *Poems*, and Moore's *Epicurean*.

The third period of Turner's art (1835-45) is characterized by the relinquishment of classic composition and a more direct communion with nature, of which he endeavored to render his splendid impressions, foreshadowing the modern Impressionists. Though it tended to become

more dreamlike and unreal, his work was more wonderful in color than ever. To this period belong many great works: the "Slave Ship" (1840, Boston Museum); "The Castle of Indolence" (1841, Metropolitan Museum, New York); "Snow Storm" (1842); "Approach to Venice" (1843); "Rain, Steam, and Speed" (1844)—these last in the National Gallery. Here belongs also a series of attempts to represent vague thoughts in color language, like "War—The Exile" (ib., 1842), and many pictures of Alpine scenery, the grandeur of which he has rendered as no other painter, in works like "The Splügen." After 1845 his mind and sight began to fail; but though his work was incoherent, it was still good in color. He began a new series, "The Whalers," which he did not live to complete, and of which there is a good example in the Metropolitan Museum. He died at Chelsea, Dec. 19, 1851, and was buried in St. Paul's Cathedral. His splendid collection of his own works, 262 oils, 135 water colors, 1757 studies in color, and almost innumerable sketches, was bequeathed to the nation, and is for the most part in the National Gallery. He intended that his fortune, £140,000, should be devoted to the establishment of pensions for indigent English artists, but his will was broken and most of it fell into the hands of the lawyers and relatives. Though very economical, even sordid in his personal habits, he was generous to others. Much evil has been said about his private life and character; but those who knew him best found him gentle and considerate, a kind and dutiful son, and a faithful friend. His brusque manner was but a foil of his retiring disposition, which made him inaccessible to society. It is difficult to reconcile these characteristics and the refinement of Turner's art with the seemingly coarse character of his relation to women.

Turner's life was one continuous course of prosperity, and he fully achieved the fame he so ardently desired; in 1802 he was elected Academician, and in 1808 became professor of perspective at the Academy. He easily eclipsed in the public favor all landscapists of his day. In later life his works were attacked, but to atone for this he found in John Ruskin the most eloquent advocate ever possessed by any artist, though these eulogies have created several wrong ideas about Turner's art. Its chief characteristic does not consist, as Ruskin maintains, in a scrupulous fidelity to Nature. He was indeed one of the profoundest students of Nature; but he idealized her, much as did Byron and Shelley in literature. His master passions in art were the rendition of light, and that subtle quality which Ruskin calls the Turnerian mystery, by which objects are rendered with a certain hazy indistinctness of the highest poetical effect. His chief technical quality is not naturalism, but a splendid and brilliant, though sometimes unreal, color. He was as subtle and refined in drawing as in composition. In range of subject, imagination, and sublimity Turner has never been equaled. Though unsound in oil technique, as is evinced by the ruined state of many of his best works, he was a consummate master of water color (q.v.). He was himself an excellent etcher and engraver, trusting to mezzotint to produce the light and shadows; and his designs for illustrations produced a new school of line engraving in England. His facility of execution and diligence were well-nigh incredible. A number of collections in the United

States, including the Metropolitan Museum with the Vanderbilt and Morgan loans, and the Public Library, New York, possess good examples of his work.

Bibliography. The most brilliant and sympathetic appreciation of Turner is by John Ruskin in *Modern Painters* (London, 1843-60), and many later editions. The passages relating to Turner were published separately by Frederick Wedmore under the title of *Turner and Ruskin* (2 vols., London, 1900). Consult also: G. W. Thornbury, *Life of Turner Founded on Letters . . .* (New York, 1877); P. G. Hamerton, *Life of J. M. W. Turner* (Boston, 1879); W. C. Monkhouse, *The Turner Gallery: A Series of One Hundred and Twenty Engravings with Descriptive Text* (2 vols., New York, 1879); Sir Walter Armstrong, *Life of Turner* (ib., 1901); *Masters in Art*, vol. iii (Boston, 1902), containing a full bibliography; W. L. Wyllie, *J. M. W. Turner* (New York, 1905); W. G. Rawlinson, *Turner's Liber Studiorum: Description and Catalogue* (2d ed., ib., 1907); A. J. Finberg, *Turner's Sketches and Drawings* (ib., 1910); J. E. Phythian, *Turner* (ib., 1911).

TURNER, NAT (c.1800-31). An American negro slave and insurrectionist, who was born and lived in Southampton Co., Va. From his childhood he fancied himself set apart for some great purpose, and claimed to hear voices and see visions. In 1828 he declared he had a command to rise and slay his enemies, when a sign should be given. A peculiar solar appearance on Aug. 13, 1831, signaled the uprising. With four or five companions, he began near Cross Keys, on Sunday night, August 21, by killing five members of his master's family in their beds. The conspirators were recruited till the number reached 53, and killed all, even infants, in every house in the neighborhood. On the next morning the pupils of a school were slain. By noon the news had spread and the band was routed by a party of white men. United States troops from Fortress Monroe and the militia from various counties of Virginia and North Carolina gathered and the conspirators were hunted down. Turner kept himself concealed for six weeks. On being discovered he fled, but was captured near Cross Keys, October 30, tried and convicted at Jerusalem, and on November 11 was there hanged. Seventeen negroes were executed. It was proved that some in the party were there under strong compulsion. Fifty-five whites were slaughtered and more would have been killed but for the faithfulness of slaves, who in several instances defended their masters. More stringent slave codes were passed in many States, free negroes lost their privileges, suspected negroes were killed or mutilated, and the Manumission movement, which had considerable strength, was checked. Consult Weeks, "The Slave Insurrection in Virginia," in *Magazine of American History* (New York, June, 1891), and W. S. Drewry, *The Southampton Insurrection* (Washington, 1900).

TURNER, SAMUEL HULBEART (1790-1861). An American Episcopal theologian. He was born in Philadelphia, and graduated at the University of Pennsylvania in 1807. He was rector of churches in Chestertown, Md., New York, and Brooklyn, and became in 1818 professor of historic theology in the General Theological Seminary, New York, and in 1821 professor of biblical learning and Scripture interpretation. He was also professor of Hebrew in Columbia Col-

*

"THE GRAND CANAL, VENICE," FROM THE PAINTING IN THE METROPOLITAN MUSEUM OF ART, NEW YORK

*

lege after 1830. Among his works are commentaries on Romans (1824 to 1853), Hebrews (1852), Ephesians (1856), and Galatians (1856); *Bibliographical Notices to the Most Distinguished Jewish Rabbis* (1847); *Companion to the Book of Genesis* (1841); *Parallel References of the New Testament* (1848); *Thoughts on Scriptural Prophecy* (1852). Consult his autobiography (New York, 1863).

TURNER, SHARON (1768-1847). An English historian. He was born at Pentonville, and at the age of 15 was articled to an attorney, to whose practice he succeeded six years afterward. He was a successful practitioner until 1829, when he retired. From an early time his entire leisure had been devoted to a study of the Anglo-Saxon period of English history from the hitherto almost unused Anglo-Saxon manuscripts in the British Museum. These studies culminated in his famous *History of the Anglo-Saxons* (London, 1797-1805; 7th ed., 1852). He continued his narrative in subsequent years under various titles to the end of Elizabeth's reign, but with less happy results. These historical works were finally published in a collective edition under the title *History of England from the Earliest Period to the Death of Elizabeth* (London, 1839). He also wrote *Sacred History of the World as Displayed in Creation and Subsequent Events to the Deluge* (ib., 1832; 8th ed., 1848), and other works.

TURNER, SIR WILLIAM (1832-1916). A British anatomist and naturalist, born in Lancaster and educated at St. Bartholomew's Hospital. At Edinburgh University he became a demonstrator (1854), was professor of anatomy (1867-1903), and thereafter till his death was principal and vice chancellor. From 1898 to 1904 he was president of the General Medical Council, and in 1900 was president of the British Association. He was knighted in 1886 and received the K.C.B. in 1901. From 1866 to 1894 he was one of the editors of the *Journal of Anatomy and Physiology*. Turner published numerous memoirs on human and comparative anatomy and prepared several of the reports of the *Challenger* deep-sea scientific expedition.

TURNER, WILLIAM WADDEN (1810-59). An American philologist, born in London. In 1818 he emigrated to New York, and became a printer's apprentice. He was librarian of the University of New York, instructor in Hebrew in Union Theological Seminary, and from 1852 librarian of the United States Patent Office. Besides contributions to learned societies and periodicals, he published with Isaac Nordheimer *A Critical Grammar of the Hebrew Language* (1851), and *Grammar and Dictionary of the Yoruba Language* (1858); and translated, with P. J. Kaufmann, Mackeldey's *Compendium of Modern Civil Law*, and the greater part of Freund's *Latin-German Lexicon*.

TURNHOUT, tur-nout'. A town in the Province of Antwerp, Belgium, 25 miles east by north of the city of Antwerp (Map: Belgium, C 3). It has an old castle, utilized as a court of justice and a prison, and the church of Ouel-Turnhout with noteworthy paintings. Turnhout manufactures lace, cloth, leather, and playing cards. Leech breeding is also an important industry. The town was the scene of a victory of the Dutch, under Maurice of Nassau, over the Spaniards in 1597, and in 1789 the Austrians were defeated here by the Belgians under Van der Mersch. Pop., 1900, 20,945; 1910, 23,067.

TURNING. See METAL-WORKING MACHINERY; WOOD-WORKING MACHINERY.

TURNIP (from *turn* + *nep*, from AS. *næp*, turnip, from Lat. *napus*, sort of turnip), *Brassica campestris* (*rapa* of some botanists). A biennial plant of the family Cruciferae, cultivated in cool climates for its globose, oblong or roundish, fleshy roots, which are used as a vegetable and for stock feeding. It is a native of temperate Europe and Asia, growing in fields and waste places. Garden turnips are sown in early spring or even as late as midsummer; field turnips generally in midsummer, so as to avoid the possibility of developing a flower stem in the year they are planted, a development which impairs the quality and impedes the development of the edible part. The varieties both of garden and field turnips are very numerous. The garden turnips are generally of comparatively small size, rapid in growth, and of delicate flavor. The field varieties are larger, single roots weighing 20 to 25 pounds being found at

COMMON TURNIP (*Brassica campestris* or *rapa*).

times, and the flesh is of coarser texture. The name Swedish turnip or rutabaga is given to a group cultivated in the same manner and used for the same purpose as the common field and garden variety. The cultivated turnip grows best in rich soil. It is not well suited to clay, though it is often grown thereon. Complete pulverization of the soil is requisite before seed sowing. On light soils, a crop of turnips generally succeeds wheat or oats. Seed may be sown either in drills 2-2½ feet apart or broadcast. The young plants are thinned out to stand 8 inches or more apart, and the ground is stirred and carefully kept clean by cultivation and hoeing. The turnip crop is thus of great use in clearing the land of weeds. In many places part of the crop is eaten on the ground by sheep, which are corralled upon small areas in fields perhaps partly harvested.

The ordinary turnip and the rutabaga are used for feeding stock, the former less than the latter. Both are coarse fodder, since they

are bulky in proportion to their nutritive value. Turnips have the following average percentage composition: water, 90.5; protein, 1.1; fat, 0.2; nitrogen-free extract, 6.3; crude fibre, 1.1; and ash, 0.8. Swedish turnip: water, 88.6; protein, 1.2; fat, 0.2; nitrogen-free extract, 7.7; crude fibre, 1.3; and ash, 1.1. Experiments show that 90 per cent of the total dry matter, nitrogen-free extract, and crude fibre of turnips is digested. In Great Britain, northern Europe, and Canada large quantities of turnips are fed, with other roots, replacing grain to a considerable extent. Roots are little fed in the United States, probably because they are less easily cultivated than corn. Turnips are used especially for sheep. Dairy cattle should be milked before being fed turnips, even in limited quantities, to avoid the possibility of tainting the milk. Sheep prefer the Swedish turnip to all other roots. Slicing and pulping are commonly practiced. Consult *New York Cornell Experiment Station, Bulletin 317*. See Plate of CABBAGE AND ALLIES.

TURNIP INSECTS. There are practically no insects specifically attached to the turnip, although this crop frequently suffers from the attacks of several kinds of insects. The foliage is eaten by very many of the insects which are found upon cabbage (see CABBAGE INSECTS), and the cabbage root maggot sometimes affects the turnip tuber. Several of the root-feeding beet insects also attack turnips. See SUGAR-BEET INSECTS.

TURNOUR, CYRIL. See *TOURNEUR, CYRIL*.

TURNPIKE. See *HIGHWAY; ROAD*.

TURN-SEVERIN, or TURNU-SEVERIN, turn'sá'vá-rén'. A town of Rumania on the Danube just below the Iron Gate, about 175 miles west of Bucharest (Map: Balkan Peninsula, D 2). Near it are the remains of Trajan's Bridge, erected 103 A.D. Pop., 1900, 18,626.

TURNSPIT. A dog. See *HOUND*.

TURNSTONE. A shore bird (*Arenaria interpres*), related to the plovers and surf bird (q.v.), and found in almost every part of the globe. It breeds in the Arctic regions, but occurs on the coasts of the eastern United States during migrations. It frequents the seashore, and its name comes from its turning over small stones with its bill in search of food. The eggs, four in number, are laid on lonely rocky coasts where there is sparse vegetation. They vary much in color and markings, and are cunningly concealed. The length of the turnstone is rather more than 9 inches. The plumage varies with the bird's age and the season, but is always pied black and white, with rufous or brownish ash. (See Colored Plate of SHORE BIRDS.) On the coasts of the north Pacific is found a turnstone (*Arenaria melanocephala*) which lacks the rufous or brownish ash. These two are the only known species. The turnstone is also known as calico back, calico bird, and horsefoot snipe.

TUR'NUS. In Roman story, King of the Rutuli (q.v.), with capital at Ardea (q.v.). Before the arrival of Æneas (q.v.), King Latinus (q.v.) had promised his daughter Lavinia in marriage to Turnus. Swayed by certain omens, which the seers interpreted as meaning that his daughter should be wedded rather to a foreigner, Latinus disregarded his promise to Turnus and offered Lavinia to Æneas. Turnus organized a powerful coalition of Italians and Etruscans against Æneas and the Trojans. The resultant

war, described by Vergil in *Æneid*, vii-xii, ended with a single combat between Æneas and Turnus, in which Turnus was slain. In the *Æneid*, Turnus is the foil to Æneas; he and his allies represent the semibarbarous peoples of Italy which are constrained to give way before the higher civilization of Rome.

TURNU-SEVERIN. See *TURN-SEVERIN*.

TUR/PENTINE (OF. *turbentine, terebentine*, ML. *terebintina*, turpentine, from Lat. *terebinthinus*, relating to the terebinth, from *terebinthus*, from Gk. *τερεβινθος*, terebinth). The resinous exudations of various species of coniferous trees. When the viscid exudation is distilled without steam, oil or spirit of turpentine passes over, leaving behind a residue of common resin or colophony. The distillation is carried out in copper stills. The mass is gradually heated to 316° F. (158° C.), which is approximately the boiling temperature of oil of turpentine. Crude turpentine is washed with caustic soda and redistilled, producing a water-white product known as turps. The resin remaining in the still is drawn off while hot. French turpentine is distilled by means of a current of steam, and abietic acid is a constituent of the product. The oil or spirit of turpentine dissolves sulphur, phosphorus, wax, rubber, camphor, resins, and other organic substances and mixes freely with alcohol, ether, and glacial acetic acid, but not with water. It is a thin colorless liquid readily recognized by its characteristic odor. Chemically it is a mixture of several isomeric hydrocarbons (terpenes) represented by the formula $C_{10}H_{16}$ and converted by oxidation into a camphor having the composition $C_{10}H_{16}O$. Oil of turpentine is largely used in medicine as an irritant and counterirritant in chronic inflammations. It is an excellent remedy for ringworm, and is given internally also to stop hemorrhages, and as a remedy for gonorrhœa. The administration of turpentine is attended with some danger, as it is likely to produce inflammation of the kidneys. In the arts oil of turpentine is used for the preparation of varnishes and as a thinner and flattener of oil paints. American turpentine is derived from the *Pinus australis* and the *Pinus taeda*; French turpentine from the *Pinus maritima*; Russian and Swedish turpentine from the *Pinus sylvestris* and the *Pinus ledneri*. Canada turpentine, or Canada balsam, is obtained from the *Abies balsamea*, growing in Canada and the northern United States. The disinfectant "sanitas" is prepared by passing air into a mixture of warm water and Russian turpentine. *Artificial turpentine* is obtained by distilling the wood of pine stumps, and other refuse forms, with steam. The odor is different from that of the natural turpentine and seems to have created a prejudice interfering with its general use. *Turpentine substitute* consists of various mixtures of benzine or similar hydrocarbons with rosin spirit, and is a distinctly inferior article. See *NAVAL STORES*.

TURPENTINE TREE. See *PISTACIA*.

TURPIN, or TULPINUS (?-c.800). A supposed mediæval chronicler, Archbishop of Rheims. He is described as a friend and companion of Charles the Great and an eyewitness of the exploits he relates in a chronicle in Latin prose narrating the expedition of the Frankish Emperor against the Saracens of Spain, and particularly the events that preceded and followed the battle of Roncevalles (q.v.). Turpin's name

became attached to this chronicle, but though there was an Archbishop Tilpin of Rheims (c.754-c.800), he has no claim to the description given above, and internal evidence leads to the conclusion that the chronicle is mainly a work of the twelfth century. It seems to have sprung out of the epic ballads and traditions of the Carolingian heroes, and was taken from a manuscript composed probably at Compostella. The poems were changed considerably in order to further pilgrimages to Compostella. The book soon acquired a great popularity, was translated into French by 1206, and was made use of by divers chroniclers, as the author or authors of the *Chroniques de Saint-Denis*, Vincent of Beauvais, and others. There have been several editions of the chronicle in Latin; the best, by Ferdinand Castets, was published at Paris and Montpellier in 1880. It has been translated into many languages, among others into English by Rodd (London, 1812), and reprinted in *Medieval Tales*, in Morley's Universal Library (London, 1890). For editions and secondary works, consult August Potthast, *Bibliotheca Historica Medii Aevi*, vol. ii (Berlin, 1896), and especially Gaston Paris, *Histoire poétique de Charlemagne* (new ed. by Paul Meyer, Paris, 1905).

TURPIN, RICHARD, commonly called "Dick Turpin" (1706-39). An English highwayman. He was born at Hempstead, Essex, where his father was an innkeeper. He was apprenticed to a butcher, and, detected in cattle stealing, he fled and joined a gang of thieves. They committed several brutal robberies, but disbanded after two of their number had been captured and hanged. Turpin became associated with the highwayman Tom King, whom he fatally shot when trying to prevent King's arrest. Turpin escaped into Yorkshire, where he passed for a gentleman, but was soon suspected, captured with some stolen horses, tried, and executed. Turpin's reputation as a hero, and a man of courage and generosity, together with his marvelous ride from London to York, are fabrications, enhanced by Ainsworth's vivid characterization in the novel *Rookwood* (1834).

TURQUOISE, *tūr-kois'* or *tūr'kois* (OF. *turquoise*, *turques*, Fr. *turquoise*, fem. of *turquois*, Turk., from *Turk*, Turk.). A hydrated aluminium and copper phosphate that is usually found massive. It is opaque, has a waxy lustre, and occurs in various shades of blue to green. The peculiar bluish-green or robin's-egg tint is the preferred color for gems. Turquoise is found in narrow seams and irregular patches in igneous and volcanic rocks. The best specimens come from the vicinity of Nishapur, Persia, but the mineral is found also at various localities in Asia Minor, Turkestan, and Siberia. In the United States, the locality in the Los Cerillos Mountains, near Santa Fe, N. Mex., was worked by the ancient Mexicans, and still yields fine stones. Other localities in the United States are in Colorado, Arizona, Nevada, and California. Among the early Mexicans it was regarded as emblematic of success and was worn to preserve health. The peculiar property of the turquoise, of becoming grayish green in color as it gives up its moisture, led to a belief that its dullness foretold misfortune, and hence the Oriental proverb that the turquoise pales when the well-being of the giver is in danger. It was believed in the Orient to be a remedy for diseases of the head and heart. Bone turquoise or odontolite is fossil bone colored blue by iron phosphate.

Consult Berthold Laufer, "Notes on Turquoise in the East," in Field Museum of Natural History, *Publications: Anthropological Series*, vol. xiii (Chicago, 1913), and J. E. Pogue, *The Turquoise* (Washington, 1915).

TURRECREMATA, *tūr'rā-krā-mā'tā*. See TORQUEMADA.

TURRET (OF. *tourette*, *touret*, little tower, dim. of *tur*, *tour*, Fr. *tour*, tower, from Lat. *turris*, Gk. *ῥύψις*, *tyrsis*, *ῥύππις*, *tyrris*, tower). A revolving tower of circular or oval section in which naval guns are mounted. Fixed towers are commonly called barbette towers or barbettes, as all gun towers of this class on modern ships are designed to have the guns fire over the tops of their walls. In all recent ships these towers are surmounted by revolving turrets which contain the guns.

TURRETIN, *tūr'tān'*, or **TURRETINI**, *tūr'rā-tē'nē*, FRANÇOIS (1623-87). A Swiss Calvinistic theologian. He was born in Geneva; studied theology first in his native city and afterward in Holland and France; was pastor at Geneva, 1647; removed to Leyden, 1650; and was recalled to Geneva as professor of theology, 1653. His principal work, *Institutio Theologiae Elencticae* (1679-85; new ed., Leyden, 1696; reprinted Edinburgh, 1847-48), ranks high among the strictest expositions of Calvinistic theology. He was one of the authors of the Helvetic Consensus (1675) directed against the milder theology of Saumur. (See AMYRAUT.) His complete works were published at Geneva in 1688. His son, JEAN ALPHONSE (1671-1737), was born at Geneva, and was professor there of ecclesiastical history, 1697. He followed the Saumur theology, and endeavored to unite the Reformed and Lutheran churches. His chief work is *Cogitationes et Dissertationes Theologicae* (1711-37). His collected works were published at Leuwarden (1774-76). Consult the lives of the elder and the younger Turretin, as they are commonly called, by E. de Bude (Lausanne, 1871; 1880).

TURTCHANINOV, *tur-chīl-nī'nōf*, PIOTR IVANOVITCH (1779-1856). A Russian composer of Church music. He was born in the Government of Kiev and studied under Sarti and Videl. In 1798 he became chorister at Kiev, and later held similar positions elsewhere. In 1827 he became instructor at the Imperial chapel, and in 1831-41 was a priest of the Imperial church of St. Petersburg. Turtchaninov's special contribution to Church music was his harmonization of ancient melodies contained in the liturgy. His masterly arrangements, published posthumously in four volumes, are characterized by very independent leading of the voices, the assignment of the *cantus firmus* (q.v.) generally to some other voice than the soprano, and the faithful preservation of the original intervals through avoidance of chromatic alterations.

TURTLE (probably a corruption of *tortoise*, or of Sp. *tortuga*, Portug. It. *tartaruga*, Fr. *tortue*, tortoise; in either case ultimately from Lat. *tortus*, twisted, so called on account of the crooked feet; probably influenced by popular etymology with Eng. *turtle*, sort of dove). A shell-incased reptile of the order Chelonia. The word "turtle" is used mainly to indicate the large marine forms, although in the United States it is applied freely to both fresh-water and land forms. "Tortoise" (q.v.), strictly speaking, refers to land forms.

Structure. The body of a turtle is invariably

short and broad, and is protected above and below by somewhat bony shields, with spaces between them in front and behind, into which the head and legs may be drawn. The conical tail is usually bent around against the side of the body when the turtle retracts into the shell, thus covering the circular vent. The armature or "shell" is composed of an upper part, the "carapace," and a lower, the "plastron." The carapace is formed from the ribs, of which there are eight pairs; and from the annular parts of the dorsal vertebræ, expanded into plates, which are joined to each other by dentilated sutures, so that the whole acquires great firmness, and the dorsal vertebræ are rendered immovable. The plastron is formed of pieces which represent the sternum or breastbone, and which are ordinarily nine in number, and have names, as also have the parts of the carapace. The box tortoise has certain plates movable, so as more completely to inclose its body. The turtles and other aquatic chelonians cannot thus withdraw their head, tail, and limbs from danger, but their greater activity of movement compensates for this. The above remarks apply to all turtles (*Thecophora*) except the leatherbacks (*Athecæ*), whose body is jacketed in a continuous leather-like case composed largely of a mosaic of polygonal bony plates; and the vertebræ and ribs are not fused with, but are free from, the carapace. See **LEATHERBACK**.

Externally the entire shell is covered with horny epidermal plates or shields of various forms and ornamentations, but arranged in all families on a regular plan. Each shield grows individually, the rings visible upon many of them indicating each a year's growth—at least in countries where a winter hibernation and consequent suspension of growth take place. These plates may be detached by heat, and in the hawkbill are of the beautiful material called "tortoise shell" (q.v.). The neck, legs, and tail are often provided with a horny scaled armature. A cuticular layer covers the outside of the armature and is shed in fragments from time to time. The skull agrees fundamentally with that of crocodiles, but has several peculiar features, and is very solid. The mouth is bounded by a more or less horny beak like that of birds. The jaw is toothless, and the food is swallowed whole. There is, therefore, no need of a delicate sense of taste, and this sense is degenerate. In the stomach there are no organs of trituration, and the process of digestion is necessarily very slow, and is dependent on the action of the gastric juice. The heart is short, thick, and has but one ventricle. The lungs are large and are capable of containing much air. The air is drawn into the mouth, the passages to the nares are then stopped by the tongue, and the air is gulped down. This way of supplying the lungs is required by the rigidity of the armature, which prevents chest expansion and contraction. Turtles can remain under water for an hour or so without renewing the lung contents. Their eyesight is very keen. The eye is protected by an upper and a lower lid and also by a nictitating membrane, as in birds. The sense of hearing is very acute.

Habits and Habitat. When startled, some turtles, such as the wood turtle, give a loud snakelike hiss. The males of the large Galapagos tortoises, according to Darwin, bellow or roar at the breeding season. The common

painted turtles utter a piping note, particularly in the spring. Turtles are diurnal except at the breeding season. With the exception of sea turtles, the habitat of any individual turtle is very local. Tortoises and terrapins that have been marked have been observed in the same pasture year after year. Sea turtles return to a locality to breed. Those in the temperate region hibernate through cold weather buried in earth or mud. Marine forms have the legs modified into huge paddles, while amphibious forms have leglike limbs only partially webbed. The coloration of those that spend considerable time on land simulates that of the ground. One form (see **MATAMATA**) has a fringed or foliaceous neck of much service in hiding it while seeking prey or avoiding foes. About 250 species of *Chelonia* are known, the most numerous species being found in fresh water, generally in warm climates. The marine species are the largest. Several kinds occur in the Alleghany region at considerable altitudes, but none live in the Rocky Mountains. *Chelonia* are not numerous in species on the California coast, or in Europe, while on the Asiatic coast they are abundant.

Some of the sea turtles, the land tortoises (q.v.), and a part of the fresh-water terrapins (q.v.) are herbivorous, and these are the ones commonly eaten by man. Other sea and fresh-water forms feed entirely or in part on animal food, and are usually ferocious. Fresh-water forms, such as the snapping turtles (q.v.), feed on fish, mussels, earthworms, insect larvæ, young ducks, and the like. The box turtle eats mushrooms and berries, and not infrequently makes raids on tomato gardens. Certain pond forms are practically omnivorous.

Aquatic turtles come on land usually on moonlight nights at breeding time to deposit their eggs. A sandy slope is preferred. Here they dig a hole with the hind feet, let the eggs fall within it, and replace the sand deftly. The female then retreats quickly to the water. Almost any soil will suffice for the American painted turtle, and the same rotten log may be utilized by many musk turtles until it holds hundreds of eggs. These, if not dug up by some animal, are left to hatch by the aid of the sun's heat. The snapping turtle deposits from 18 to 30 eggs in the early morning hours. The wood, painted, and skunk turtles, which lay from three to eight eggs, choose the afternoon for egg laying. The eggs of snapping turtles are usually spherical and about the size of a walnut. The shell is tough and leathery. Certain other turtles lay oval eggs, and a few eggs having a shell of a fine porcelain texture. The eggs hatch slowly, some kinds only after three or more months. As soon as the young hatch they begin to creep about and to travel down inclines until they reach water. All the species are extremely tenacious of life; they are capable of extraordinary abstinence, and of living long after having sustained injuries which would have destroyed almost any other animal. They are remarkable for their longevity, examples of which are mentioned under **TORTOISE**.

Economic Value. The flesh of those which subsist on animal food is musky and unpleasant; that of vegetable feeders is much esteemed. Most of the eggs are excellent. Vast quantities of eggs of the large Amazonian "arrau" (*Podocnemis expansa*) are pressed to obtain oil of

commercial value. The most highly esteemed for food is the green turtle (q.v.), and its relative the "edible" turtle of the East Indies. Many smaller kinds are eaten, including the favorite American terrapin, the snapping turtle, and other fresh-water forms.

Classification. The Chelonia were at first divided according to modifications of the feet. Cope, recognizing the separability of Trionychoidea, also, in 1870, emphasized a division based upon the mode of carrying the neck, one group (Pleurodira) bending it sidewise in withdrawing the head, and the other (Cryptodira) withdrawing it in an S-shaped curve in a vertical plane. A more worthy division is Athecæ for the shell-less Sphargidæ, or leatherbacks, and Thecophora for all other kinds. Boulenger's classification is as follows:

CHELONIA	{	Athecæ.....Sphargidæ.	
		{	Pleurodira { Pelomedusidæ. Chelydridæ. Carettochelydridæ.
	{		{
		Trionychoidea...Trionychidæ.	

The Pelomedusidæ are a small family of African and South American turtles including the large and valuable "arrau." The family Chelydridæ includes the curious matamata (q.v.), certain long-necked Australian types (Chelodonia), and the South American Hydromedusa. The Carettochelydridæ are a family in which is set a strange small turtle of New Guinea, whose "shell" is covered with soft skin instead of horny shields. Of the cryptodirous families, the Chelydridæ are represented by the various snapping or "alligator" turtles (q.v.), and the Dermatemydridæ by a few species of aquatic tortoises of Central America. The Cinosternidæ are the family of the North American "skunk" turtles. (See MUSK TORTOISE.) Platysternidæ includes only a single Siamese water tortoise. The Testudinidæ, on the other hand, are the most populous of Chelonian families and nearly cosmopolitan. The shell in this family is always covered with well-developed horny shields, the plastron has nine bones, and the neck is completely retractile. About 20 genera with more than 130 species are now recognized; but the generic distinctions are not easily recognized by external appearances. Here are classified the North American "mud turtles" of the genus *Chrysemys*, which abound in all still waters, as do the "pond tortoises" (*Emys*) of Europe, the terrapins (q.v.), and the box tortoises (*Cistudo*). The last get their name from the fact that the plastron, which is united with the carapace by ligaments, is divided into two movable lobes, connected by a hinge permitting them to be lifted up against the overhanging carapace, and closing both ends of the shell perfectly after the animal has drawn within its defenses. The common box tortoise of the United States (*Cistudo carolina*) is entirely terrestrial, numerous everywhere, and interesting in its habits. In this family also fall the various land tortoises of the type-genus *Testudo*. Most of the foregoing are terrestrial or fresh-water forms, while the remainder are marine and have the limbs modified into swim-

ming paddles or "flippers." The family Chelonidæ contains many great extinct forms, from the Cretaceous to recent times, and a few existing species, of which the green turtle, hawksbill, and loggerhead (qq.v.) are representatives. The order Trionychoidea contains only the family Trionychidæ, which have no rigid plates on the flat carapace, but a soft leathery skin, and the plastron imperfect. See SOFT-SHELLED TURTLE.

Fossil Turtles. The origin of the Chelonia is uncertain. Otocelus, an armored cotylosaur from the Permian of Texas, has been suggested by Cope as a possible progenitor, but the relationship is doubtful. Certain characters of shoulder-girdle and ventral abdominal ribs in the plesiosaurs indicate that this order may have genetic affinity with the turtles, and the dicynodonts and placodonts of Triassic age resemble turtles remarkably in many structures of the skull and limb bones. (See THEOMORPHA.) All these groups belong to the synapsid division of Reptilia. Little evolution is demonstrable within the chelonian order from its first appearance in the European Upper Trias to the present, except in the degeneration of the carapace and elongation of the digits in the marine forms. The oldest turtle known is *Proganochelys*, from the Keuper (Upper Trias) of Germany. A probably primitive character in this genus is the well-developed row of supra-marginal plates. The Lower Jurassic strata have, as yet, yielded no chelonian remains, but in the Upper Jurassic, Cretaceous, and the Tertiary they are abundant, chiefly in the Northern Hemisphere. The existing suborders Cryptodira and Pleurodira appear to be fully differentiated in the Upper Jurassic, the Trionychia in the Upper Cretaceous of North America. As a rule the known Jurassic turtles have a solidly roofed skull like that of the recent green turtle, and a well-developed carapace. Professor Baur's opinion is that the earliest turtles were swamp turtles, and that the soft-shelled Trionychia and the marine families evolved from these along one line, and the land tortoises along another.

Cryptodira is the suborder most widely represented among fossils, as among recent turtles. Several of the existing families, including the marine Chelonidæ and the "leather turtles," are already differentiated in the Cretaceous, and in the Lower Eocene the highly specialized land tortoises appear. Of the Cretaceous sea turtles some attained enormous size; *Protosphargis* from Italy had a shell nine feet long, and in the North American *Archelon* the skull alone measures three feet. The suborder Pleurodira is widely distributed as fossils in various Mesozoic systems. *Miolania*, from the Pleistocene of Queensland, was a huge creature in which the head was armed with bony "horns." The third suborder, Trionychia, is known from the North American Cretaceous and the Tertiary of both hemispheres.

Bibliography. L. Agassiz, *Contributions to the Natural History of the United States* (Boston, 1857-62); E. G. Boulenger, *Catalogue of Chelonians in British Museum* (London, 1889); Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (ib., 1901); E. G. Boulenger, *Reptiles and Batrachians* (New York, 1914); S. W. Williston, *Water Reptiles of the Past and Present* (Chicago, 1914). Most of the literature on fossil Chelonia consists of special papers in scientific periodicals, especially by

Baur and Fraas in Germany, Boulenger and Gadow in England, and Hay in America. A recent masterly summary is O. P. Hay, *Fossil Turtles of North America* (Washington, 1908). Consult also REPTILE; TORTOISE.

TURTLE CREEK. A borough in Allegheny Co., Pa., 12 miles southeast of Pittsburgh, on the Pennsylvania and the Union railroads. A large electrical manufacturing plant of the Westinghouse Electric and Manufacturing Company, employing 16,000 persons, is situated here. There is a Carnegie library and a technical school. Pop., 1900, 3262; 1910, 4995.

TURTLEDOVE. See DOVE; PIGEON.

TURTON. A cotton-manufacturing town in Lancashire, England, $4\frac{1}{2}$ miles north of Bolton. Pop., 1901, 12,353; 1911, 12,648.

TURVEYDROP, MR. A character in Dickens's *Bleak House*, said to have been modeled on George IV.

TUSCALOOSA. A city and the county seat of Tuscaloosa Co., Ala., 56 miles southwest of Birmingham, on the Black Warrior River, and on the Alabama Great Southern, the Louisville and Nashville, and the Mobile and Ohio railroads (Map: Alabama, B 2). The University of Alabama, opened in 1831, is a mile east of the city. Other educational institutions are the Tuscaloosa Female College (Methodist Episcopal South), opened in 1860; the Alabama Central Female College; Boy's Training School; and Stillman Institute (Presbyterian), a colored theological school, opened in 1870. The State Insane Hospital, the old State Capitol building, the Federal building, and the bridges spanning the Black Warrior also are noteworthy features. The commercial importance of the city has been increased by extensive improvements on the river, adding considerably to the distance-open to navigation. Coal is mined extensively in the vicinity, and at Holt, a suburb, there are a large iron furnace, coke ovens, and a by-product plant. The city is the centre of cotton and lumber interests, and its principal industrial establishments are connected with these. In 1911 the commission form of government was adopted. It was the capital of the State from 1826 to 1846. Pop., 1900, 5094; 1910, 8407; 1915 (U. S. est.), 10,152; 1920, 11,996.

TUSCANY (It. *Toscana*). Formerly a sovereign grand duchy, now a district (compartimento) on the west coast of Italy (Map: Italy, C 3). It comprises the maritime provinces Grosseto, Livorno (Leghorn), Lucca, and Pisa, the inland provinces Arezzo, Florence, and Siena, and the Province of Massa e Carrara, extending from the sea northward between Liguria and the Apennines. The greater part of Tuscany is mountainous, the Apuan Alps reaching 6385 feet and Mount Amiata 5655 feet. The principal rivers are the Arno, Cecina, Ombrone, and Serchio, all flowing into the Mediterranean. Except in the Maremma, a large marshy region on the southern coast, the climate is mild and healthful. The leading mineral deposits include iron, mercury, borax, copper, and salt; there are many mineral and thermal springs. Among the important agricultural products are wheat, maize, the vine, the olive, and tobacco. For population, see section on that topic under ITALY.

Tuscany corresponds nearly to ancient Etruria (q.v.). The Etrurians or Tuscans were the earliest inhabitants known to history. They were conquered by the Romans, by whom in later times the land was called *Tuscia*. During

the period of barbarian migrations Tuscia was possessed in turn by the Ostrogoths, the emperors of Constantinople, and the Lombards. The last were conquered by Charles the Great and a Frankish margrave or duke was established with Lucca as his residence. Tuscia formed a part of the Kingdom of Italy or of the Lombards. In 1030 Boniface II of the house of Canossa became Duke of Tuscany. He was also Count of Modena, Reggio, Mantua, and Ferrara. His granddaughter, the Countess Matilda (q.v.), known as "the Great Countess," was an ardent friend of Pope Gregory VII, and one of the most powerful supporters of the papal party during the investiture struggle. At her death, in 1115, she bequeathed all of her wide dominions to the papacy; but the German emperors claimed the duchy as an Imperial fief, and for more than a century "the property of Matilda" was the cause of constant strife between the popes and the emperors. During this period the principal cities became independent and prosperous. Pisa had risen to independence and power long before this, and was now a great maritime Republic. At the close of the thirteenth century she succumbed to the power of her rival Genoa. For several centuries the history of Florence is to a great extent the history of Tuscany. At the close of the twelfth century she was at the head of the Tuscan league of cities formed to resist the Hohenstaufen. This brought her into close alliance with the papacy, and usually Florence remained a firm adherent of the Guelph party.

In the fourteenth century Dante, Giotto, Petrarch, and Boccaccio made Tuscany preëminent in the revival of letters and arts. The Tuscan dialect became the literary language of Italy. In 1406 Pisa submitted to Florence, and soon after she became mistress of Leghorn. Internal dissensions in Florence led to the establishment of the predominance of the Medici (q.v.). Cosimo de' Medici got control of affairs in 1434 and made the supreme power in Florence the hereditary possession of his house. In 1532, through the instrumentality of the Emperor Charles V, Alessandro de' Medici was made Duke of Florence. He was assassinated in 1537, and Cosimo the Great became Duke. The latter added to the territories of the duchy, especially by receiving Siena from Charles V. This gift bound him more closely to Spain, and for nearly two hundred years Tuscany was generally under the influence of Spain. In 1569 the Florentine dominions were erected into the Grand Duchy of Tuscany. The house of Medici became extinct in the male line in 1737. By the terms of the Treaty of Vienna, which had been concluded in 1735, the grand duchy was given to Francis of Lorraine, the husband of Maria Theresa of Austria. Grand Duke Ferdinand III was dispossessed by the French in 1799. By the Treaty of Madrid between France and Spain, in 1801, Tuscany was erected into the Kingdom of Etruria and given to the son of the Duke of Parma. In 1807 Napoleon took possession of the country, which was united with France. Elisa Baciocchi, the sister of Napoleon, received the title of Grand Duchess of Tuscany. In 1814 Ferdinand III was reinstated and ruled until 1824. His successor, Leopold II, did much to promote the prosperity of Tuscany. In 1847 Lucca was annexed to the grand duchy. In February, 1848, Leopold granted a liberal constitution to his subjects, but the tide of revo-

lution carried everything before it, and early in 1849 the Grand Duke fled from his country. A counter-revolution was soon set on foot by the Moderate Liberal party and in a few months Leopold was restored to his throne. In 1850 he entered into a convention with Austria by which Austrian troops were to occupy Tuscany, and, thus supported, he reinstituted a régime of absolutism. In 1859, in consequence of his pro-Austrian policy, he was obliged to leave his state, which was occupied by the forces of Victor Emmanuel. On March 15, 1860, the people by a plebiscite voted the union of Tuscany with Italy.

Bibliography. For the early history of Tuscany, consult the histories of Florence, Pisa, and Arezzo, especially F. T. Perrens, *Histoire de Florence* (9 vols., Paris, 1877-90); Robert Davidsohn, *Geschichte von Florenz* (4 vols., Berlin, 1896-1912). For the later history, Alfred von Reumont, *Geschichte Toscanas seit dem Ende des florentinischen Freistaates* (3 vols., Gotha, 1876-77). For the nineteenth century, Charles Seignobos, *Political History of Europe since 1814* (trans. by S. M. Macvane, New York, 1900), gives a convenient summary and furnishes an ample bibliography. General description: Edward Hutton, *Siena and Southern Tuscany* (New York, 1910); M. H. Hewlett, *Earthwork out of Tuscany* (ib., 1911); J. W. and A. M. Cruickshank, *Smaller Tuscan Towns* (ib., 1912).

TUSCARORA. An important Southern tribe of Iroquoian stock (q.v.). When first known about the year 1670 they resided along the Neuse River in eastern North Carolina, where in 1700 they occupied fifteen villages with an estimated population of 1200 warriors or about 6000 souls, and held paramount influence over all the smaller tribes of that section. They were hostile to most of the leading Southern tribes, but maintained a close friendship with the Northern Iroquois (q.v.), whom they knew as traditional kinsmen. In consequence of encroachments upon their lands, they rose against the whites in September, 1711. A war of two years ensued, in which both Carolina provinces joined forces, together with a great body of Indian allies, against them. Finally defeated, the Tuscarora abandoned their country and fled north to the Iroquois, who received them as the sixth tribe of their confederacy, henceforth known as the "Six Nations." See IROQUOIS.

TUSCULAN DISPUTATIONS (Lat. *Tusculanae Disputationes*). A philosophical work in five books by Cicero (44 B.C.), dedicated to M. Brutus.

TUSCULUM. An ancient city of Latium, about 15 miles south of Rome, situated on a ridge of hills known as the *Colles Tusculani*, and forming part of the Alban Range. We catch the first certain glimpse of its historical existence towards the close of the regal period at Rome, when it had attained a high degree of prosperity and power. Octavius Mamilius, ruler of Tusculum and the foremost prince in Latium, married a daughter of Tarquin the Proud (see TARQUINUS), and played a conspicuous part in the last of the great struggles made by the banished tyrant to regain his Kingdom. Towards the close of the Republic Tusculum became a famous country residence of the wealthy Romans. As late as the twelfth century the ancient city continued entire; but in 1191 it was stormed by the Romans and razed to the ground. Many fine remains of ancient Tusculum have

been dug up in recent times, among them being the amphitheatre, theatre, and city walls. See FRASCATI.

TUSCUMBIA, tūs-kūm'bī-ā. A city and the county seat of Colbert Co., Ala., 125 miles northwest of Birmingham, on the Tennessee River, on the Southern, the Northern Alabama, and the Louisville and Nashville railroads, and on three steamship lines (Map: Alabama, B 1). There are extensive railroad shops, steel furnaces, stove foundries, cottonseed-oil mills, a pipe plant, and a button factory. Features of interest are the Helen Keller Library, courthouse, a huge spring in the heart of the city, and two public parks. Pop., 1900, 2348; 1910, 3324.

TUSKEGEE, tūs-kē'gē. A city and the county seat of Macon Co., Ala., 44 miles by rail east of Montgomery, on the Tuskegee Railroad (Map: Alabama, D 3). The leading industries are cotton raising and the manufacture of cottonseed oil, meal, and lumber. It is the seat of the Tuskegee Normal and Industrial Institute for negroes. The place was settled about 1800. Pop., 1900, 2170; 1910, 2807.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the education of negroes, founded and conducted by negroes at Tuskegee, Ala., established in 1881 by an Act of the Legislature under the name of Tuskegee State Normal School, with an appropriation of \$2000. It was opened July 4, 1881. In 1884 the appropriation was increased to \$3000, and in 1893 the institution was incorporated under its present name. In 1916 the attendance had grown to 1650. The faculty consists of 185, employed in the administration of the various departments in teaching and in the extension work of the school. The library contains 19,000 volumes. The endowment fund in 1916 was \$1,945,326, including a gift of \$600,000 from Andrew Carnegie. The total value of the school plant, including 107 buildings, land, and equipment, is \$1,567,062. This does not include 19,527 acres of public lands remaining unsold from 25,000 acres granted by Act of Congress in 1899 and valued at \$250,000.

The object of the institute is to give its students a thorough common-school education and at the same time fit them by manual and industrial training to perform successfully some form of skilled labor. The institute also aims, through the Phelps Hall Bible Training School, to fit young men and women for the ministry and other forms of social and religious work. The constant aim is to correlate the literary training with the industrial training and practical interests of the pupils. By this means the work of the students in the trades becomes invested with the character of a demonstration. On the other hand, the principles acquired in the academic studies gain in definiteness, precision, and interest by application to actual situations and to real objects.

Students are admitted on passing an examination in reading, writing, and the fundamental operations of arithmetic. Instruction is given in two sessions. The day school is intended for students able to pay all or the greater part of their expenses in cash. They attend school in the daytime three days each week and are required to work three days each week. The night school is designed for students too poor to pay the small charge made in the day school. Tuition is free. The monthly charge for board

and living expenses is \$10, of which day-school students may work out from \$2 to \$4 a month, while pupils of the night schools are given the opportunity to work out all their board.

In the department of mechanical industries, instruction and practice are given in architectural and mechanical drawing, steam and electrical engineering, blacksmithing, brickmaking, carpentry, founding, harness making, carriage trimming, machining, painting, printing, saw-milling, shoemaking, tinsmithing, tailoring, and wheelwrighting. The industries for girls include sewing, dressmaking, millinery, cooking, laundering, domestic service, mattress making, basketry, and nursing. So far as possible the product of the student work is used in the institute, and the surplus is sold. The printing office furnishes all the printed matter of the school, and issues two weeklies and a monthly newspaper for the institution besides three others for persons outside. The school buildings, including the Carnegie Library, are almost wholly the product of student labor. The aim of the agricultural department is by theoretical instruction in scientific principles, and their application in the field, orchard, dairy, and truck garden, to make its students intelligent and successful farmers. To some of the agricultural courses women are admitted. Extension work is carried on through the Tuskegee Negro Conference, the Short Course in Agriculture, farm demonstration work, and traveling institutes for the benefit of farmers in the South. The Russell Plantation settlement and the mothers' meetings are also a part of the community work the school is seeking to do. Booker T. Washington (q.v.), who had been the principal of the institution since its foundation, died Nov. 14, 1915. Major Robert R. Moton, commandant at Hampton Institute, succeeded him. Consult B. T. Washington, *Up from Slavery* (New York, 1900); id., *Working with the Hands* (ib., 1904); id., *Tuskegee and its Peoples* (ib., 1905).

TUSK SHELL, or **TOOTH SHELL**. A scaphopod mollusk of the genus *Dentalium*, common in the ocean on muddy bottoms at the depth of from 10 to 40 fathoms, as well as in very deep water. The shell is shaped like a gently curved elephant's tusk and is open at each end. The animal has no head, eyes, or heart, though it has a small elongated digging foot. Its genus first appears in the Eocene rocks. These shells were formerly extensively used by the northwest coast Indians as material for making necklaces and adorning clothing, and were circulated as a shell money (q.v.), called hi-quā.

TUSSAUD, tū'sō', MARIE, MADAME (1760-1850). Founder of the London waxworks exhibit in Baker Street. She was born (Gresholtz) at Bern, Switzerland, and learned at Paris the art of wax modeling, in which she subsequently instructed Madame Elisabeth, sister of King Louis XVI. After a three months' imprisonment during the French Revolution, she brought to London her collection, afterward increased to include about 300 figures. There is connected with it a Chamber of Horrors, with relics of criminals and a collection of instruments of torture. Consult F. Herve, *Memoirs of Madame Tussaud* (London, 1878), which, however, is not altogether reliable.

TUSSEH, tūs'se, or **TUS'SER**. See **SILK-WORM**.

TUS'SER, THOMAS (c.1524-80). An English

rhymist. He was born at Rivenhall, near Witham, in Essex, and educated at Eton and at Cambridge. For 10 years he was a musician in the service of Lord Paget of Beaudesert, and thus lived at court. He then settled for a time as farmer in Suffolk, and thereafter moved about from place to place, eventually dying in a debtor's prison at London. He is remembered for *Five Hundreth Poyntes of Good Husbandry United to as Many of Good Huswifery*, a homely proverbial poem, to which is prefixed an autobiography in verse (1573); based upon *Pointes of Husbandrie* (1557) and a *Hundreth Poyntes of Good Husserie* (licensed 1557). Consult the reprints edited by W. Payne and S. J. Hertridge for the English Dialect Society (London, 1878).

TUS'SILA'GO (Lat., coltsfoot). A genus of plants of the family Compositæ. *Tussilago farfara*, sometimes called coltsfoot, is the only species. It has solitary flower heads on scaly scapes, appearing before the leaves in early spring. Both disk and ray flowers are yellow, the leaves heart-shaped, angular, downy beneath, somewhat glutinous and subacid. The leaves of the butter bur (*Petasites vulgaris*), which has been naturalized from Europe, resemble those of *Tussilago*, but are much larger; the pale flesh-colored flowers also appear before the leaves, but are in a dense thyrsus. The flowers of both are much sought after by bees.

TUSSOCK MOTH. Any moth of the family Liparidæ, a name suggested by the tufts of hairs, often bright-colored, upon the caterpillars. The moths are dull-colored, and the females of some species are wingless. Twenty species occur in the United States. The group includes some famous enemies of fruit, shade, and forest trees.

TUSSOCK MOTH.

a, adult male of *Hemerocampa leucostigma*; b, cocoon fastened to the wall and wingless female carrying egg sac; c, caterpillar.

Two imported species, the gypsy moth (q.v.) and the browntail moth (*Euproctis chrysorrhæa*), do great damage in New England. The latter species flies during midsummer, when the female lays from 200 to 300 eggs underneath leaves near the tips of branches and covers them with hair. The larvæ appear in from two to three weeks and skeletonize the leaves. They also feed on apple and pear fruits. In late September they retire into cases formed of leaves, attached to the twigs by silken threads, and remain there until the leaf buds open in

the spring, feeding upon the young foliage, flowers, and fruit until June, when they pupate. The caterpillars when abundant are annoying to human beings from the mechanical irritation to the skin caused by their barbed hairs.

The white-marked tussock moth (*Hemerocampa leucostigma*) is a well-known enemy of shade and fruit trees in the eastern United States. The female is wingless, the male small and inconspicuous. The overwintering eggs are laid in a glistening white frothy mass, attached to the outside of the female's cocoon, which is usually placed on a tree trunk. The young caterpillars hatch in the spring and feed upon the leaves. There are two or three generations each year. Winter pruning and burning of the hibernacula of the former species, and summer spraying the larvæ of the latter with arsenites, have been recommended. Consult W. J. Holland, *The Moth Book* (new ed., New York, 1905).

TUTELO, tōt'el-ō, or **TOTERO**, tōt'ēr-ō. An eastern tribe of Siouan stock, calling themselves Yesaŋ, formerly on the upper Roanoke and Dan rivers in Virginia and North Carolina, and in alliance with the cognate Saponi (q.v.). They were first visited in 1670 by the German traveler John Lederer, who calls them Nahyssan. In 1701 Lawson found them near central North Carolina, preparing to move to the settlements for protection against the Iroquois, who had driven them from villages on the Roanoke. They were much reduced in number and unable any longer to stand against their enemies. The refugee tribes were afterward settled by Governor Spotswood of Virginia near Fort Christanna, in what is now Brunswick Co., Va., where they remained until about 1740, when, finally at peace with the Iroquois, they removed to the north, together with the Saponi, and settled on the Susquehanna at Shamokin, now Sunbury, Pa. Later they were adopted by the Cayuga, thus becoming a component part of the Iroquois League. Their village near Cayuga Lake being destroyed by Sullivan in 1779, they fled to Canada and found their final home with the Iroquois on the Grand River Reservation, in Ontario, locating on Tutelo Heights, near Brantford. They are practically extinct. Consult James Mooney, *Siouan Tribes of the East* (Washington, 1895).

TUT'ICOR'IN. A seaport in the District of Tinneveli, Madras, India, 443 miles by rail south by west of the city of Madras, on the Gulf of Manar (Map: India, D 8). The manufacturing establishments are chiefly connected with the cotton industry. Pearl fishing, formerly the principal industry, has greatly declined in importance. Pop., 1901, 28,048; 1911, 34,758.

TUT'ONITE. See EXPLOSIVES.

TUTTIETT, MARY GLEED. See GRAY, MAXWELL.

TUTTLE, tūt'l, DANIEL SYLVESTER (1837-1923). An American Protestant Episcopal bishop, born at Windham, N. Y. He graduated at Columbia in 1857, and at the General Theological Seminary in 1862, and was ordained a deacon in 1862 and a priest in 1863. He was rector of a church at Morris, N. Y., until 1867, and Missionary Bishop of Montana, Utah, and Idaho until 1886, when he was transferred to the diocese of Missouri. In 1903 he became presiding Bishop of his denomination in the United States. He published *Reminiscences of a Missionary Bishop* (1906).

TUTTLE, HERBERT (1846-94). An Ameri-

can historian, born at Bennington, Vt. He graduated in 1869 at the University of Vermont. From 1880 to 1881 he was a lecturer on international law at the University of Michigan, and in the latter year was appointed to the chair of politics and international law in Cornell University. He was subsequently transferred to the chair of modern European history. He published: *German Political Leaders* (1876); *History of Prussia to the Accession of Frederick the Great* (1884); and a *History of Prussia under Frederick the Great* (1888).

TUTTLINGEN, tōt'ling-en. A town of the Kingdom of Württemberg, Germany, on the right bank of the Danube, 64 miles southeast of Strassburg (Map: Germany, C 5). It has shoe factories, tanneries, and manufactures surgical instruments, cutlery, leather, and woolen goods. Pop., 1900, 13,465; 1910, 15,862. Tuttlingen is historically notable as the scene of a battle in 1643, during the Thirty Years' War, in which an Austro-Bavarian force defeated the French.

TUTUILA, tōt'tō-ē-lā. The principal island of American Samoa, 46 miles southeast of Upolu (Map: Samoan Islands, D 3, 4). Area, 40.2 square miles. Its surface is mountainous and picturesque with luxuriant forests and there are signs of volcanic activity. The climate is subtropical and the rainfall averages about 180 inches annually. The principal articles of import are cotton goods, meats, hardware, breadstuffs, and fish. Copra is practically the only export. It is a government monopoly and a source of revenue which makes the island self supporting. In 1913 the imports were valued at \$133,399 and the exports at \$132,645. Tutuila contains the best harbor of the Samoan group, Pago Pago (q.v.), which is also the seat of government. The island together with the Manua group and a few other islands belonging to the United States is administered by a naval governor. Pop., 1912, 7251. See SAMOAN ISLANDS.

TUXTLA GUTIÉRREZ, tōs'tlā goō'tē-ār-rās. The capital of the State of Chiapas, Mexico, 270 miles southeast of Vera Cruz (Map: Mexico, M 9). The principal building is the government palace. The main industries are tanning, indigo preparations, and general commerce. Pop., 1900, 9395; 1910, 10,239.

TÚY, tōv'ē. A Spanish frontier town of the Province of Pontevedra, in Galicia, on the Miño, 63 miles north of Oporto, Portugal (Map: Spain, A 1). The cathedral is a fortress-like structure. The international iron bridge spanning the Miño is worthy of note. The town is in the midst of the fertile Vega del Oro, celebrated for the culture of fruits, vegetables, and silks. Tanneries and soap factories, with a brisk trade with Portugal, form the chief industries of the town. Pop., 1900, 11,631; 1910, 11,986.

TUY. A town of Luzon, Philippines, in the western part of the Province of Batangas. It lies about 24 miles northwest of Batangas. Pop., 1903, 2430.

TVASHTAR, tvāsh'tār (Skt. *tvastṛ*, creator, from *tvaks*, *taks*, to fashion; connected with Av. *θvamaš*, to create, or *Tvashtṛi*). A divinity of Vedic Hindu mythology of uncertain origin, possessing many of the characteristics of Hephaestus or Vulcan (q.v.). As the divine artificer his chief works are the thunderbolt of Indra (q.v.) and a cup for the soma (q.v.) of

the gods. Similarly he is the deity who fashions all living forms, both of men and of animals, so that in later texts he is said to have produced the whole world, and to have been the ancestor of all mankind. He is also a creator of gods, particularly of Brihaspati (q.v.), Agni (q.v.), Saranyu, wife of Vivasvant, who bore the Asvins (q.v.) and Yama (q.v.) and Yami, the primeval pair, and, probably, Indra, although this god is sometimes said to have killed his sire in order to obtain the soma. He is further connected with the Ribhus (q.v.), who are also skillful artificers. Consult A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897), and L. D. Barnett, *Antiquities of India* (London, 1913).

TVER, tvēr. A government of central Russia. Area, 25,225 square miles (Map: Russia, E 3). The surface is largely an elevated plain intersected by deep river valleys. The northwestern part is hilly. The government is watered chiefly by the upper Volga with its tributaries and the Dvina. The soil is not fertile, and the supply of grain is insufficient to meet the domestic demand. The household industry is well developed, entire sections of the government being engaged in the production of footwear, felt goods, linen, nails, axes, agricultural implements, etc. The local manufactures are chiefly cotton goods, flour, leather, spirits, etc. Pop., 1897, 1,769,135; 1912, 2,250,200.

TVER. The capital of the government of the same name, situated on the Volga, 298 miles southeast of St. Petersburg (Map: Russia, E 3). It is the see of a Greek Catholic bishop, has a thirteenth-century monastery and an Imperial palace occupied by the Governor. Tver is one of the chief cotton-manufacturing centres of Russia. There are also flour mills, wagon factories, saw mills, etc. Pop., 1910, 62,652. Tver dates from 1181 and was the capital of an independent principality from the thirteenth century to the end of the fifteenth, when it was annexed to Moscow.

TWACHTMAN, twōkt'man, JOHN HENRY (1853-1902). An American landscape painter. He was born in Cincinnati, and studied at the Cincinnati School of Design under Frank Duveneck, in Munich under Loefft, and with Boulanger and Lefebvre in Paris. He was most influenced by the Impressionists, and was one of the most consistent exponents of that school among American painters. His landscapes, somewhat unequal in execution, are characterized by a subtle treatment of high-keyed color in delicate tonal effects and by harmony of form and masses. Most of his subjects, apart from the Niagara Falls and Yellowstone series, were taken from the neighborhood of his home in Greenwich, Conn., and among the most charming are some pastel studies. Good examples of his work are to be found in nearly all public collections in America, including the Worcester Art Museum, Metropolitan Museum (New York), Cincinnati Art Museum, Boston Art Museum, Pennsylvania Academy of Fine Arts, etc. In 1913 a comprehensive exhibition of his paintings was held in New York, and in 1915-16 a room was devoted to him at the Panama-Pacific Exposition, San Francisco.

TWAIN, MARK. See CLEMENS, SAMUEL L.

TWAITE. A poor sort of European shad (*Clupea finta*). See ALLICE.

TWANA, twā'nā. See SALISHAN STOCK.

TWEED. A river of southern Scotland. It

risks in Peebles and flows eastward, emptying into the North Sea at Berwick (Map: Scotland, F 4). It is 97 miles long, but unnavigable, and along its banks much of the tweeds of commerce is made. For 18 miles of its lower course it forms the boundary between England and Scotland, and it flows through one of the most historic regions of Great Britain, the celebrated Borders.

TWEED. A twilled fabric (see WEAVING), often woven in two colors, the yarn being dyed before weaving. It is a soft, flexible, durable material, usually of wool, sometimes of cotton and wool. Its name is derived from the locality where it was first manufactured—in villages along the Tweed, in Scotland.

TWEED, WILLIAM MARCY (1823-78). A notorious American politician, leader of the so-called Tweed Ring, born in New York City. He was the son of a chairmaker, received slight education, and early entered politics, becoming an alderman of New York City in 1850, and taking a seat in Congress in 1853. Subsequently he was a school commissioner, became a member of the board of supervisors of New York County, and was president of the board four successive terms. From 1867 to 1871 he was State Senator. Tweed was grand sachem of Tammany in 1869-71. He was appointed deputy street commissioner in 1861, and when in 1870 that department was changed to the department of public works, he was the commissioner at its head, a position which enabled him to initiate, it was believed, the formation of the combination known as the Tammany Ring, or Tweed Ring. The ring elected its candidate for mayor in 1865, and its candidate for Governor in 1868, and so controlled the Legislature as to secure a modification of the city's charter, greatly increasing the power of the offices held by the ring. Legislators and judges were bribed, bills were passed, and decisions rendered in favor of the members of the ring. Gigantic schemes of city improvement were organized and carried out successfully, though accompanied generally with much speculation. Probably no spoliation so great was ever executed in any country. Its exposure was made largely by the New York *Times*, with the help of a disappointed enemy of the ring, in July, 1871; investigation and prosecution were undertaken by a committee of 70 citizens, under the lead of Samuel J. Tilden (q.v.); and Tweed was indicted in 1872 for forgery and grand larceny. Two trials were held, and in 1873 Tweed was convicted, and sentenced to 12 years' confinement in the penitentiary and to pay a fine of \$12,300.18. He was confined on Blackwell's Island from November, 1873, until June, 1875, when he was released by a decision of the Court of Appeals on a legal technicality. He was immediately rearrested on a warrant issued in a civil suit for \$6,198.957.85, and sent to Ludlow Street Jail. Being permitted to ride out with an officer, he escaped, and fled to Spain. He was returned in November, 1876, and placed in Ludlow Street Jail until April 12, 1878, when he died. Consult: G. Myers, *History of Tammany Hall* (New York, 1901); J. K. McGuire, *The Democratic Party of the State of New York* (ib., 1905); Bryce, *The American Commonwealth* (new ed., 2 vols., ib., 1910).

TWEEDDALE. See PEEBLESHIRE.

TWEEDDALE, JOHN HAY, second EARL and

first MARQUIS OF (1626-97). A Scottish soldier and statesman. After serving in the King's army (1642) he fought against Charles at Marston Moor (1644), and, four years later, commanded at Preston in the King's army again. He entered Parliament in 1654, became Privy Councilor on the Restoration and President of the Council in 1663, and (1664) was appointed High Commissioner on Ecclesiastical Affairs. He labored for a more lenient attitude towards Covenanters and was removed from office in 1674 by the influence of Lauderdale. He was restored to some of his posts in 1680 and 1682; held office under James II, but, disliking his Scottish policy, joined the Revolution; and in 1689, became Privy Councilor under William and Mary. He was a commissioner on the Glencoe massacre and was dismissed by the King in 1696 for assenting to the Colonization Act and Paterson's Darien schemes.

TWEEDLEDUM AND TWEEDLEDEE.

An expression denoting an inappreciable difference between unimportant points. It was used by Byron, satirizing the feud between partisans of Handel and Buononcini.

TWEEDMOUTH, twēdmūth, EDWARD MARJORIBANKS, second BARON (1849-1909). A British statesman, born in London. He was educated at Oxford, became a barrister in 1874, and was a Liberal member of Parliament for Berwick in 1880-94. In 1886 he was made Comptroller to the Household, and in 1892-94 he was Parliamentary Secretary to the Treasury. In 1894-95 he was Lord Privy Seal and Chancellor of the Duchy of Lancaster, and in December, 1905, became First Lord of the Admiralty. At this time public opinion in Britain was becoming increasingly excited over German rivalry in naval construction, and in March, 1908, it was reported that Tweedmouth, in a correspondence with the German Emperor, had prematurely disclosed certain details of naval estimates before officially communicating them to the House of Commons. The report was untrue, but it led to his resigning from the cabinet in September, 1908. Consult the Countess of Aberdeen (his sister), *Edward Marjoribanks, Lord Tweedmouth, Notes and Recollections* (London, 1909).

TWEED RING. See TWEED, WM. M.

TWELFTH NIGHT, or WHAT YOU WILL.

1. A comedy by Shakespeare, played at Middle Temple Hall, Twelfth Night, 1602, according to J. Manningham's diary. The principal plot was taken from Bando's tale, perhaps through Belleforest's *Histoires tragiques*, or B. Rich's *Apollonius and Silla*, adapted from Cinthio's *Hecatommithi*. A similar plot is found in two Italian plays, *Gl' Ingannati* (1537) and *Gl' Inganni* (1592). Malvolio, Sir Toby, Sir Andrew, and the clown are all Shakespeare's. 2. A festival 12 days after Christmas. See EPIPHANY.

TWELVE, GOSPEL OF THE. See APOCRYPHA.

TWELVE APOSTLES. See APOSTLES' ISLANDS.

TWELVE TABLES, LAW OF THE. The earlier systematic written statement, or code, of Roman law. According to the Roman tradition, this code was drawn up to appease the plebeians, who complained that the unwritten customary law, as interpreted by patrician priests and applied by patrician judges, gave no adequate protection to their liberties. In 452 B.C. 10 magistrates were elected to write laws (*decem-*

virī legibus scribendis), and before the end of the following year 10 tables of laws were submitted to and accepted by the popular assembly. In 450 B.C. two supplementary tables were similarly adopted. The decemvirs claimed that they had made the law equal for all, high and low; and there is no doubt that the Roman people regarded the XII Tables with great veneration, as a bulwark of personal liberty.

This code seems to have introduced little if any new law, being substantially a restatement of the older custom. Its rules were simple and were tersely and clearly expressed. It contained no constitutional law, and it dealt mainly with the law of family, property, crimes, torts, and civil procedure. It did not state the law fully even in these matters, for (as in other early codes) rules that were so well settled as to be indisputable were not included.

The XII Tables have come down to us in fragments only. In Roman legal, historical, and grammatical writings, a couple of score of passages are directly cited, and it is sometimes stated in which of the tables the rule stood. Other rules are paraphrased or indicated by allusions. Attempts to reconstruct the code have been made by Gothofredus (1616), Dirksen (1824), Schoell (1866), and Voigt (1883). The text commonly given in works on Roman law is that of Schoell, and citations of table and law by number are regularly based on his reconstruction.

The credibility of the Roman tradition concerning the origin of the XII Tables has been energetically attacked by recent writers, who assert that the tradition is of late origin and that the XII Tables are a private compilation made, probably, in the third century B.C.

Consult: M. Voigt, *Geschichte und System des Rechts der XII Tafeln* (Leipzig, 1883); Edouard Lambert, *Le problème de l'origine des Douze Tables* (Lyons, 1902); Charles Appleton, *Le testament romain: la méthode du droit comparé et l'authenticité des Douze Tables* (Paris, 1903). See CIVIL LAW.

TWESTEN, AUGUST DETLEV CHRISTIAN (1789-1876). A German Protestant theologian. He was born at Glückstadt, studied at Kiel and Berlin, and became professor of theology at Kiel, 1814. In 1835 he succeeded Schleiermacher, whose views he had adopted, at Berlin. He was very influential in the formation of the United Evangelical church of Prussia and was a member of its supreme council until his death. He published *Vorlesungen über die Dogmatik der evangelisch-lutherischen Kirche* (1826-37); *Grundriss der analytischen Logik* (1834); *Matthias Placius Ilyricus* (1844); and edited Schleiermacher's *Ethik* (1841). Consult G. Heinrici, *August Twesten nach Tagebüchern und Briefen* (Berlin, 1889).

TWICK'ELL, JOSEPH HOPKINS (1838-1918). An American Congregational clergyman, born at Southington, Conn. He graduated at Yale in 1859, was chaplain of the 71st Regiment, New York State Volunteers, during the Civil War, and in 1865 became pastor of the Asylum Hill Congregational Church, at Hartford, Conn. He was one of Mark Twain's most intimate friends. His writings include *John Winthrop* (1891); *Some Old Puritan Love Letters* (1893); *History of the Minisink Country* (1912). Consult, passim, A. B. Paine, *Mark Twain: A Biography* (3 vols., New York, 1912).

TWICKENHAM, twik'n-am. A town in

Middlesex, England, on the Thames, connected with Richmond, on the opposite bank, by a substantial bridge, 10 miles southwest of St. Paul's, London (Map: London, F 4). It has interesting historic dwellings, and is a residential district for Londoners. It contains the great church of St. Stephen's, completed in 1874; the estate of Alexander Pope, where the grotto is all that remains (Pope's monument is in the church); Walpole's villa, called Strawberry Hill; and Orleans House, temporarily occupied by Louis Philippe, and still owned by his descendants. Pop., 1901, 21,000; 1911, 29,367. Consult Cobbett, *Memorials of Twickenham* (London, 1872).

TWIG GIRDLER. See GIRDLER.

TWIGGS, DAVID EMANUEL (1790-1862). An American soldier, born in Richmond Co., Ga. In 1812 he was appointed captain in the Eighth Infantry. He served in the War of 1812, and was promoted major in 1814. He later fought against the Seminoles, and then in the Black Hawk War, and was commissioned colonel of the Second Dragoons in June, 1838. For services at Palo Alto and Resaca de la Palma, where he commanded the right wing of General Taylor's army, he was brevetted brigadier general. In the attack on Monterey he commanded a division, was brevetted a major general, and after a short term as Governor of Monterey was sent to join General Scott at Vera Cruz. In the advance on the City of Mexico he commanded the Second Division, led the main attack at Cerro Gordo, and performed important services at Contreras and Churubusco and in the attack on the gates of Mexico. After the war ended he was for some years in charge of the Department of the West and then of that of Texas. On the outbreak of the Civil War he surrendered, without resistance, the United States property under his charge to the Confederates. He was made a major general in the Confederate service and commanded in Louisiana, but age and infirmities led him to leave the service late in 1861.

TWIG PRUNER. Any of several species of longicorn beetles of the genus *Elaphidion*, the females of which lay their eggs in the twigs of several kinds of trees. The eggs hatch and the larva when nearly full grown severs its twig, transforming to pupa within the twig after it has fallen. The common oak pruner (*Elaphidion villosum*) is a slender long-horned beetle, dark brown in color, and covered with grayish pubescence. It feeds in twigs of oak, hickory, chestnut, maple, apple, plum, peach, and other trees. The purpose of the amputation of the twig by the larva seems not primarily to make the twig fall, but to penetrate the wood to the bark for an easy exit. *Elaphidion subpubescens* works in the same way in shoots of white oak, while *Elaphidion mucronatum* is found in twigs of live oak and other trees. The larva of *Elaphidion unicolor* amputates the twigs of the redbud (*Cercis canadensis*). A few other insects have similar habits. For example, certain horntails, notably the willow-shoot horn-tail (*Phyllocolpa integer*), live, in the larval stage, in twigs of willow, which they cause to wilt and break.

TWILIGHT (from *twi*-, combining form of *two* + *light*). The diffused illumination of the sky which immediately precedes sunrise and follows sunset. When the sun sets below our horizon, we are not at once plunged into

the darkness of night. There is an intermediate period of partial and slowly increasing darkness which we call twilight. It is caused by the reflection of the sunlight by dust and particles of water vapor in the upper atmosphere. The same phenomenon occurs just before sunrise, and, to distinguish it from the evening twilight, is called dawn. Dawn begins and twilight ends when the sun is about 18° below the horizon, and consequently their duration varies with the latitude and with the season of the year. The higher the latitude the smaller the angle at which the sun's path meets the horizon, and hence the longer it takes the sun to sink to a distance of 18° below the horizon. In the tropics twilight rarely lasts longer than 30 minutes, while in the latitude of the north of Scotland it lasts so long that about midsummer there are several nights on which it fills the entire interval between sunset and sunrise.

TWILIGHT SLEEP. A method of producing amnesia and analgesia (abolition of memory and pain) during childbirth, originating at Freiburg, with Kroenig and Gauss, who developed an exact technique founded on the experiments of Von Steinbuchel, published in 1902. Gauss reported the results of his first 300 cases in 1906, and applied the term *Dämmerschlaf* to this method. The Freiburg technique consists in administering at the beginning of labor an injection of $\frac{1}{4}$ grain morphine hydrochloride, and $\frac{1}{10}$ grain of scopolamine hydrobromide. At succeeding intervals, depending on the indications, doses of $\frac{1}{10}$ grain of scopolamine alone are given, the intervals between doses being regulated so as to keep the patient in a condition of amnesia. From the first dose the mother must be watched closely as to her pulse, the progress of labor, and the signs of returning memory, and the fetal heart frequently auscultated. When the technique is closely followed by one skilled in its use and in quiet surroundings, it is asserted that it is successful in 75 per cent of the cases; that no harm results to the mother; and that the usual complications of childbirth are not increased. But judging from various reports the method is often ineffective, the mother suffers subsequently from delirium and headache, and the fetus is frequently born in an asphyxiated condition, the terms indicating the various degrees of asphyxia being oligopnea, apnea, and asphyxia.

Several modifications of the procedure have been introduced, perhaps the most notable of which is that of Siegel, an assistant of Kroenig in the Freiburg Frauenklinik. The modification consists in the substitution of narcophine for morphine, narcophine being a combination of morphine with narcotine, through the agency of meconic acid. The drug is supposed to be less dangerous than morphine. In 220 successive cases Siegel reports 88 per cent of complete amnesia, 10 per cent of partial amnesia, and 2 per cent unaffected; 67.6 per cent of the children oligopneic; 1.7 per cent apneic; 1.7 per cent breathed spontaneously; 27.7 per cent were born asphyxiated, half of the latter dying; 1.3 per cent were stillborn. It was noted that it sometimes took 30 minutes to revive some of the partially asphyxiated infants.

Since the discovery of anesthetics, ether, chloroform, cocaine, laudanum, and many other drugs have been tried for the purpose of ameliorating the sufferings incident to child-

birth. Disregarding general anæsthetics, which are always indicated for brief periods during the most difficult stages of labor, a few other methods may be mentioned. In 1896, Savitsky, a Russian physician, said that he had used, with complete success and absence of harm, antipyrine given by rectum. In 1914, Dessaignes, of the French Academy of Medicine, recommended a drug called *antalgésine obstétrique*. This drug was supposedly obtained by the action of chlorhydrate of morphine on living ferments resembling yeast. The drug has been since condemned, and has even been said to consist of nothing more than morphine in solution. Pantopon, a morphine derivative, is extolled by other observers.

In 1914 twilight sleep was popularly exploited in several lay journals and magazines. The accounts were highly colored, and exaggerated the benefits of twilight sleep on the one hand, while magnifying the pain of ordinary parturition on the other. It was even made to appear that children born during twilight sleep were more vigorous, mentally and physically, than their brothers and sisters born under ordinary conditions. The movement among certain classes of women attained almost to the proportions of hysteria, and the medical profession was openly accused of being too indolent and callous to apply the method. The consensus of opinion at present is that twilight sleep is practicable in about 80 per cent of carefully selected cases, that it should be applied only in hospital surroundings or in well-regulated households, and that a physician skilled in its use should be in constant attendance. Its miscellaneous application is bound to result in a large amount of complications, both to mother and child. Consult A. M. Hellman, *Twilight Sleep* (New York, 1915).

TWINFLOWER (*Linnaea borealis*).

TWILLER, WOUTER VAN. See VAN TWILLER, WOUTER.

TWIL'LINGATE or **TOULINGUET**, twi-lân'gâ'. A port of entry on the Twillingate Islands in Notre Dame Bay, on the northeast coast of Newfoundland, 232 miles by steamer from St. John's (Map: Newfoundland, F 3). It is a prosperous fishing centre. Pop., 1901, 3542; 1911, 3348.

TWIN FALLS. A city and the county seat of Twin Falls Co., Ida., 35 miles south of Shoshone, on the Oregon Short Line Railway

(Map: Idaho, D 7). The chief industrial establishments are vulcanizing works, flour and planing mills, creameries, sash and door works, lumber yards, a sheet-metal shop, and manufactories of candy, harness, and vinegar. Abundant water power is provided by the Shoshone Falls, 5 miles distant. Pop., 1910, 5258.

TWINFLOWER. A hardy, trailing evergreen plant of the family Caprifoliaceae. *Linnaea borealis*, the only species, is a favorite in rockeries on account of its dainty, bell-shaped, nodding, pink or white, fragrant flowers, which appear during midsummer in pairs upon erect, slender stems. It thrives best in open, peaty soil and in shade. In the woods it may be found as far south as Maryland and the mountains of California, but is more common northward, being circumpolar and alpine in its distribution.

TWINFLOWER. See PARTRIDGE BERRY.

TWINING PLANTS. Plants whose axes are coiled about slender supports, as common morning-glory and hop. In most cases the support must be slender (less than 15 centimeters in diameter), though some tropical plants coil about thick tree trunks, and others climb somewhat similarly by partial twining. (See LIANAS.) The direction of twining varies with different plants, being either clockwise or counterclockwise. While the direction of twining is usually constant in the same species, some twiners coil in either direction. The direction is not constant, however, among members of the same family, nor even among different species of the same genus.

The cause of twining has long been a difficult problem. The most satisfactory explanation seems to be that twining stems are endowed with a sensitiveness to the action of gravity, which may be distinguished as lateral geotropism (q.v.). The stem at first grows erect (on account of negative geotropism), but through unequal growth, causing nutation (q.v.), soon inclines to one side. At this period of development the flanks (the sides of the stem now on the right and left as distinguished from the upper and lower) are sensitive to their changed relation to gravity (on account of the new horizontal position), which thus becomes a stimulus. The response of the stem to this stimulus is an accelerated growth on one flank, the right or left, as the case may be. The acceleration of growth there swings the horizontal tip towards a new point of the compass, and at the same time, from mechanical necessity, partially rotates the stem on its longitudinal axis, so that a new side is brought into the flank position and therefore under stimulation. It then responds likewise with accelerated growth; this swings the tip still farther around, and again brings a new region under stimulation. By this continued action each side of the stem is successively stimulated, and the tip is therefore swung in a circle. At the same time it is elongating. If, in course of twining, the nearly horizontal tip strikes a support, only the part beyond the support continues to swing, and therefore begins to wrap around the support, forming coils which are at first low and loose. Later negative geotropism again asserts itself in this part of the stem, which grows so that it straightens, if possible, the actual effect being to steepen the coils and make them clasp the support more closely. The slenderer the support, as a rule, the steeper are the completed

coils. This explanation receives its strongest support from the fact that when the action of gravity is equalized, as by rotating a seedling twiner on a clinostat (q.v.), no coiling takes place. There are various phenomena of twining, experimentally induced, of which no full explanation can yet be given. There is, however, no mere mechanical stoppage of the swinging tip which permits coiling, because it has no momentum, and because many twiners will coil about a loose cord. It is further probable that twiners are susceptible to the continued contact and pressure of the support, and that this plays some part in the method of climbing which they have adopted.

Twining plants are characterized by unusually long growing regions, and by the retarded development of foliage leaves. Thus, while in erect stems from 10 to 20 centimeters of the apex are still capable of elongation, in twining plants the elongating region is 30 to 50 centimeters long, or in some cases as much as 80 centimeters. The slow development of the foliage leaves seems both to be correlated with this long maintenance of the power of growth, and to be necessary for twining, because the presence of fully developed foliage would interfere seriously with the free movements of the tip.

TWISS, SIR TRAVERS (1809-97). An English jurist and scholar. He was born in Marylebone, London, graduated from University College, Oxford, with distinction, and published in 1836 his *Epitome of Niebuhr's History of Rome*. In 1840 he was called to the bar. From 1842 to 1847 he was professor of political economy at Oxford, from 1852 to 1855 professor of international law at King's College, London, and from 1855 to 1870 held the regius professorship of civil law at Oxford. He also held several ecclesiastic legal positions, and in 1858 he became chancellor of the diocese of London, the same year having been created Queen's counsel. In 1867 he was appointed Queen's Advocate-General and was knighted. Owing to a scandalous libel of which he and his wife were the victims, in 1872 he retired to private life and devoted himself to juridical science and literature. In 1884 he drafted for the King of Belgium a constitution for the Congo Free State, and in 1884-85 was counsel extraordinary to the British Embassy during the Berlin Conference. His chief works are: *View of the Progress of Political Economy in Europe since the Sixteenth Century* (London, 1847); *The Oregon Territory: Its History and Discovery* (New York, 1846); but his fame rests principally on his treatise, *The Law of Nations* (1861-63).

TWITTER. A peculiar deformation of carnation plants, produced possibly by several kinds of insects: a plant louse or green fly of the genus *Siphonophora*, a true thrips and possibly the larva of some anthomyiid fly. Carnation twitter may be produced by any cause which checks the growth of the plant; hence any one of several insects may be involved.

TWO GENTLEMEN OF VERONA, THE. A comedy by Shakespeare, probably produced in the original form in 1591, and in the present form in 1595; first printed in the folio of 1623.

TWO HARBORS. A city and the county seat of Lake Co., Minn., 28 miles northeast of Duluth, on Lake Superior, and on the Duluth and Iron Range Railroad (Map: Minnesota, F 3). It is one of the largest of the iron-

ore shipping points, and also makes large shipments of lumber and pulp wood. Pop., 1900, 3278; 1910, 4990.

TWO NOBLE KINSMEN. A play produced in 1625 and published in 1634 as the work of Fletcher and Shakespeare. It was probably written by Massinger and Fletcher with Rowley.

TWO RIVERS. A city in Manitowoc Co., Wis., 7 miles northeast of Manitowoc, on Lake Michigan, and on the Chicago and Northwestern Railroad (Map: Wisconsin, F 4). The leading manufactures are dentists' and printers' cabinets, wood type cases, office furniture, aluminium novelties, gasoline engines, tubs, pails, veneer goods, and knitted goods. Pop., 1900, 3784; 1910, 4850.

TWO-SEED-IN-THE-SPIRIT BAPTISTS. See BAPTISTS.

TWO SICILIES, KINGDOM OF THE. The name commonly given to a former kingdom embracing Sicily and southern Italy, and known often as the Kingdom of Naples. In the Middle Ages the southern part of the Italian mainland came to be known as "Sicily on this side of the Faro" (the Strait of Messina). From the earliest times both island and mainland were subject to settlement and conquest by peoples of widely different stock, producing a complicated admixture of races. At the dawn of history the Phœnicians had trading settlements there. In the eighth century B.C. numerous Greek colonies were founded in both Sicily and southern Italy and became powerful and wealthy states. A new Phœnician element was introduced when Carthage disputed the supremacy of Sicily with the Greeks. The Roman conquest followed. In the middle of the fifth century, at the time of the fall of the Roman Empire, Sicily was ravaged by the Vandals. Towards the close of the century the Ostrogoths made themselves masters of Italy and Sicily. In the sixth century their realm was conquered by the Byzantines. Soon after the Lombards established their sway over part of southern Italy. The Lombard Duchy of Benevento was founded, out of which in the ninth century arose the three principalities of Benevento, Salerno, and Capua. By the side of these was the Duchy of Naples, a Byzantine creation. Apulia and Calabria were held by the Byzantines until the eleventh century. In the years from 827 to 878 the island of Sicily was conquered by the Saracens, and they also obtained a foothold on the mainland.

About 1037 the sons of a Norman knight, Tancred de Hauteville, setting out with a few followers, entered southern Italy in the service of the Byzantine Governor, but soon seized and divided Apulia and were able to hold the country against every effort of the Greeks to dislodge them. Robert Guiscard, one of these brothers, became Count of Apulia in 1057, and in 1059 he was recognized by Pope Nicholas II as Duke of Apulia and Calabria. In 1061 his younger brother, Roger, with a few hundred Norman knights, began the conquest of the island of Sicily, which became a county and a fief of Robert's duchy, though the total subjugation of the island was not accomplished till 1090, after Robert's death. In 1127 Roger II, son of the first Roger, united Apulia, Calabria, and Sicily, and in 1130 assumed the title of King of Sicily. He ruled over the Abruzzi, made himself master of Capua, and received the submission of Naples. The marriage of Frederick Barbarossa's son, the later Emperor

Henry VI, to Constance, heiress of the Two Sicilies, in 1186, united the destinies of the Norman Kingdom with those of the house of Hohenstaufen, whose rule began in 1194. The child of this marriage, the Emperor Frederick II (q.v.), was the most remarkable prince in the Europe of his day. He reorganized the government of the Sicilian Kingdom on essentially modern lines, founded the University of Naples, and made his court a brilliant centre of high culture and learning. His death in 1250 was followed by the downfall of the Hohenstaufens. In 1266 Charles of Anjou, brother of Louis IX of France, at the instance of the Pope, undertook the conquest of the Two Sicilies. He vanquished Manfred, son of Frederick II, at Benevento, and in 1268 captured and executed Conradin, the last of the Hohenstaufens. Charles of Anjou made Naples his residence.

The year 1282 witnessed the fearful popular uprising against the French in Sicily known as the Sicilian Vespers (q.v.). The people shook off the yoke of Anjou and placed their island under the rule of Pedro III of Aragon. The house of Anjou continued to rule in south Italy, which thus became the Kingdom of Naples. In 1296 Sicily was separated from Aragon, but continued under the rule of the Aragonese house, and in 1412 was reunited with that kingdom. Robert I of Naples (1309-43) made himself the champion of the Guelph party and extended his influence throughout Italy. He was succeeded by his granddaughter Joanna I (q.v.), and an anarchic period began and continued for many years, the heirs of the elder Neapolitan line, which had also acquired the throne of Hungary, contending with new aspirants from Anjou. In 1399 the Neapolitan line triumphed in the person of the crafty and unprincipled Ladislas (q.v.). He died in 1414, leaving the kingdom to his sister, Joanna II (q.v.). She was given up to sensuality, and disorder was renewed. After her death in 1435 Alfonso V, King of Aragon and Sicily, undertook the conquest of Naples, of which he secured possession in 1442, reigning until his death in 1458. He left Aragon and Sicily to his eldest son, John, and Naples to his illegitimate son, Ferdinand, under whose rapacious and cruel rule new troubles arose. In 1495 Charles VIII of France invaded Naples, and although he was compelled to withdraw in the same year, his successor, Louis XII, jointly with Ferdinand of Spain, conquered the country in 1501. Two years afterward the Spaniards under Gonsalvo de Córdoba (q.v.) drove out the French and made Naples a Spanish province.

The country was now subjected to the oppression of Spanish viceroys. Rebellion at Naples broke out in 1647 under Masaniello (q.v.). In 1707 the Neapolitan dominions were wrested from Spain by Austria during the War of the Spanish Succession. (See SUCCESSION WARS.) Naples was confirmed to Austria by the Treaty of Utrecht (1713) and Sicily was given to Savoy. In 1720 Sicily was transferred by Savoy to Austria in exchange for Sardinia. In 1734 Don Carlos, second son of Philip V of Spain, of the house of Bourbon, and Elizabeth Farnese invaded the Two Sicilies, and in 1735 he was crowned and was recognized by the Treaty of Vienna as King Charles III. (See CHARLES III, King of Spain.) After the Peace of Aix-la-Chapelle (1748) Italy enjoyed nearly a half century of peace, and these years witnessed in

the Two Sicilies progress along many lines, but the upheaval of the French Revolution brought new troubles. The coalition against the French Republic was joined by Ferdinand, the second Bourbon King of the Two Sicilies. (See FERDINAND I.) In December, 1798, the Neapolitans attempted to drive the French out of the Papal States. They were thrown back, Naples was taken (January, 1799), and the Parthenopean Republic was created. In the same year Ferdinand was reinstated with the assistance of the English fleet. In 1806 Napoleon conquered the Kingdom of Naples and placed his brother Joseph Bonaparte on the throne, Ferdinand continuing to reign in Sicily. In 1808 Joseph was succeeded by Joachim Murat (q.v.). After the fall of Murat in 1815 Ferdinand was restored in Naples. At the close of 1816 Ferdinand united the kingdoms of Naples and Sicily into the single kingdom of the Two Sicilies and changed his title from Ferdinand IV to Ferdinand I.

In 1820 there was a military rising in the Neapolitan dominions, joined by the Carbonari (q.v.), under the leadership of General Pepe, to secure a constitutional government. The King yielded to the demand, notwithstanding his agreement with Austria to make no constitutional concessions. At the same time a revolutionary movement aiming at autonomy for the island took place in Sicily. The congress of the Great Powers at Laibach (1821) charged Austria with the restoration of Ferdinand's absolute power. The patriots made an ineffectual resistance and Ferdinand resumed his tyrannical sway under the protection of Austrian bayonets. Ferdinand died in 1825 and was succeeded by his son, Francis I (q.v.), who in 1830 was succeeded by his son Ferdinand II (q.v.). The change of rulers brought about no change in the despotic policy of the government. After 1843 the republican propaganda of Mazzini took a strong hold in southern Italy. At the beginning of 1848 Sicily rose in insurrection to secure an autonomous and constitutional government. Ferdinand II was forced to grant a representative constitution to his subjects. This did not satisfy the Sicilians. The deposition of Ferdinand was declared, a provisional government organized, and the Duke of Genoa, son of the King of Sardinia, was elected King of the Sicilians (June, 1848), a dignity which he declined. In his Neapolitan dominions Ferdinand, with the aid of reactionary elements, was enabled successfully to combat the revolutionary movement now sweeping through Italy. In September, 1848, his forces entered upon a Sicilian campaign. In May, 1849, Palermo capitulated and the revolution in the island ended. Ferdinand, once more the despot, wreaked a fearful vengeance upon the champions of liberty in his dominions. His atrocities were finally checked by the intervention of England. In 1859 Ferdinand II was succeeded by his son, Francis II. The emancipation of northern Italy (except Venetia) from the rule of Austria and the tyrants upheld by her (1859-60) was speedily followed by the liberation of the Two Sicilies from the Bourbons, accomplished through the efforts of Garibaldi, and by their incorporation in the new Kingdom of Italy (1860-61). See GARIBALDI; ITALY; VICTOR EMMANUEL II.

TY. See **TYR.**

TY'ANA, APOLLONIUS OF. See APOLLONIUS OF TYANA.

TYBEE (tí'bè) ISLAND. An island at the mouth of the Savannah River, Georgia (Map: Georgia, F 4). It is historically noted as the site of the batteries erected by General Gillmore in 1861 for the reduction of Fort Pulaski, which capitulated April 11, 1862. At the north end of the island stands a lighthouse of the first order, 144 feet high, lighting the Tybee Roads, from which a channel protected by jetties leads up to Savannah.

TY'BURN. The chief place of execution in London prior to 1783, frequently mentioned in English history and literature. It was near the northeast corner of Hyde Park, at the western extremity of Oxford Street, and about where the Edgeware and Uxbridge roads unite, near the present Marble Arch. It was named from a small stream which ran from Hampstead to the Thames through St. James's Park. Wooden galleries were erected near the gallows for the accommodation of spectators. The criminal was conveyed from Newgate (q.v.) to Tyburn (about 2 miles) by Holborn and the Tyburn Road, now Oxford Street. As Oxford Street and London spread westward, the long procession became inconvenient, and the place of execution was, in 1783, removed to the Old Bailey, or Newgate. Under parliamentary statute prosecutors who secured a capital conviction against a criminal were exempted from all manner of parish and ward "offices within the parish in which the felony had been committed," and obtained what was called a Tyburn ticket, which was enrolled with the clerk of the peace, and sold like any other property. The privileges the tickets conferred were greatly valued, as they sold at a high price. Consult Alfred Marks, *Tyburn Tree: Its History and Annals* (London, 1908).

TYCHE, tí'kè. See FORTUNA.

TYCHO BRAHE, tē'kō brā'è or brä. See BRAHE.

TYCHO'NIUS, or **TICHONIUS** (?-c.400). A Donatist writer. He was born in Africa, headed a party among the Donatists, and defended their position. Of his writings those of most interest are his biblical works, a commentary on the Revelation and especially his *Liber Regularum*. The latter has been edited by F. C. Burkitt, *The Book of Rules of Tychonius* (Cambridge, 1894), and has great interest as the first attempt at a system of hermeneutics.

TYCHSEN, tík'zen, OLAUS GERHARD (1734-

1815). A German Semitic scholar. He was born at Tondern, Schleswig, studied at Halle, and taught in the orphan asylum there. In 1759-60 he traveled through Germany and Denmark as a missionary to the Jews. In 1760 he went to the newly founded University of Bützow, where he was professor of Oriental languages from 1763 till the university was closed in 1789. He then became librarian at Rostock. Tychsen is especially noted for his knowledge of Rabbinic literature and Jewish history and for his work in Arabic paleography; he also attempted to decipher the cuneiform inscriptions. He published *Bützowische Nebenstunden* (1766-69); *Physiologia Syrus* (1795); *Historia Monetæ Arabicæ* (1797); and *Tractatus de Legalibus Arabum Ponderibus ac Mensuris* (1800), the treatise of Makrizi. For his biography, consult A. T. Hartmann (Bremen, 1818-20).

TYCOON, or **TAIKUN**, tí'kōōn' (Jap. *taikun*, great prince, from Chin. *ta*, great + *kun*, prince). A title formerly applied to the Shogun of Japan by foreigners. It dates from the early days of Occidental intercourse with the Japanese people.

TYDEUS (Lat., from Gk. *Τυδεΐς*). In Greek mythology, son of Cneus and Peribœa. As a result of a murder he was forced to flee from his father's Kingdom of Calydon and married Deipyle, daughter of Adrastus (q.v.), King of Argos. He went with Adrastus against Thebes, where he slew Melanippus, who had wounded him. When Athena came to him with a remedy which would have made him immortal, Amphiarus (q.v.) brought him the head of Melanippus. Tydeus devoured a part of it, and the goddess, in disgust, abandoned him.

TYE, CHRISTOPHER (c.1497-1572). An English organist and composer of considerable note in the sixteenth century. He became a chorister, and in 1536 a gentleman of the Chapel Royal. Under Elizabeth he was organist of the Chapel Royal, and produced many services and anthems, some of which continue to be sung in England. Some of them show a marked originality and variety of treatment. He also translated the first half of the Acts of the Apostles into English verse, and then set it to music of generally excellent quality. He seems to have taken orders and to have held two or three parishes in the neighborhood of Cambridge.

TY'ERMAN, LUKE (1820-89). An English Wesleyan minister and biographer. He was born at Osmotherly, Yorkshire, entered the ministry in 1842, and continued to preach until 1864, when he retired and devoted himself to literary work. He published: *The Life and Times of Rev. Samuel Wesley* (1866); *The Life and Times of Rev. John Wesley* (1870-71); *The Oxford Methodists* (1873); *The Life of Rev. George Whitefield* (1876); *Wesley's Designated Successor: The Life, Letters, and Literary Labors of Rev. John William Fletcher* (1883).

TYGH, tí'g. See WARM SPRINGS.

TYLDESLEY (tílz'li) WITH SHAKERLEY, shāk'ér-li. A town in Lancashire, England, 10 miles northwest of Manchester. Its modern growth is due to its cotton manufactures and neighboring collieries. Pop., 1901, 14,843; 1911, 15,582.

TYLER. A city and the county seat of Smith Co., Tex., 105 miles by rail east by south of Dallas, on the St. Louis Southwestern and the International and Great Northern rail-

roads (Map: Texas, E 3). It has Tyler College, a commercial and literary institution, and Texas College (Methodist) for colored youths. Noteworthy also are the city hall, the Carnegie library, the Federal court and post-office building, the Court of Criminal Appeals building, and the St. Louis Southwestern Railroad Hospital. There are two parks—Bellevue and Lakewood. Tyler derives considerable importance from its situation in a fertile region producing large quantities of fruit, vegetables, and cotton. A box and crate factory, an oil mill, a compress, mattress and overall factories, a fruit and vegetable cannery, a pottery, and railway shops are the leading industrial establishments. In 1914 the city adopted the commission form of government. Tyler was settled about 1844, and was first incorporated about 1850. Pop., 1900, 8069; 1910, 10,400; 1915, 11,629; 1920, 12,085.

TYLER, BENNET (1783-1858). An American Congregational minister and educator. He was born at Middlebury, Conn., graduated at Yale College (1804), and was pastor at South Britain, Conn., president of Dartmouth College (1822-28), pastor at Portland, Me., and from 1834 till his death was first president and professor of theology in a theological seminary at East Windsor Hill, Conn. (This was removed to Hartford in 1865 and was thereafter known as Hartford Theological Seminary.) He published: *History of the New Haven Theology* (1837); *Treatise on the Sufferings of Christ* (1845); *A Treatise on New England Revivals* (1846); *Letters to Dr. H. Bushnell on Christian Nurture* (2 series, 1847-48); *Lectures on Theology* (posthumous, with memoirs by his son-in-law, Rev. Dr. Nahum Gale, Boston, 1859). Consult Williston Walker, *New England Leaders* (New York, 1901). See NEW ENGLAND THEOLOGY.

TYLER, DANIEL (1799-1882). An American engineer and soldier, born at Brooklyn, Conn. He graduated in 1819 at West Point, and in 1824-26 served at the Fortress Monroe School of Artillery Practice. In 1828-29 he was in France, studying artillery methods, in 1830-34 was on ordnance duty, and in the latter year resigned. He was contracting engineer and president of several railways until the Civil War, when he became colonel of the First Connecticut Volunteers, and was soon afterward commissioned brigadier general. Having been mustered out, he was in 1862 reappointed with rank of brigadier general, and participated in the Mississippi campaign and also in the siege of Corinth. In 1863 General Tyler commanded the Union forces at Harper's Ferry and Maryland Heights.

TYLER, JOHN (1790-1862). The tenth President of the United States. He was born at Greenway, Charles City Co., Va., March 29, 1790, the son of Judge John Tyler, who was Speaker of the Virginia House of Delegates, Governor of Virginia, and a judge of State and Federal courts. The son graduated at William and Mary College in 1807; was admitted to the bar in 1809; and became a member of the Legislature in 1811, where he acted with the Republicans and supported the war with Great Britain. He was elected to the Legislature five times in succession until 1816, when he went to Congress. In the House of Representatives, during the Fourteenth and Fifteenth Congresses, he acted with the States-Rights Republicans, condemned General Jackson's course in Florida,

and opposed the United States Bank and the Missouri Compromise. In 1823 he was again a member of the Virginia Legislature. In 1825 he was elected Governor of Virginia by the Legislature, and was unanimously reelected the following year. At the close of his second term as Governor he was elected over John Randolph to the United States Senate, in which he opposed the tariff measures of 1828 and 1832, opposed nullification, but condemned Jackson's nullification proclamation, although he supported Jackson for the presidency in 1832 and stood alone among the Senators in voting against the Force Bill of 1833. He was chosen for a second term in the Senate, and in 1834 made a report censuring President Jackson for removing the deposits from the United States Bank, and voted for Clay's resolution of censure. Having subsequently been instructed by the Legislature of Virginia to vote for the expunging of the resolution of censure, he refused to obey, and in February, 1836, resigned his seat and retired to private life. Tyler was a leading member of the new Whig party, and an unsuccessful candidate for the vice presidency in 1836. In 1840 he was elected Vice President on the Whig ticket with General W. H. Harrison (q.v.). President Harrison died April 4, 1841, one month after his inauguration, and was succeeded by Tyler, who completely broke with the party that had elected him. He vetoed the bill to recharter the Bank of the United States, and when it was modified partly in accordance with his suggestions and repassed he vetoed it again. The bill to revise the tariff met a similar fate. Thereupon, on Sept. 11, 1841, all the members of the cabinet except Webster, who was then engaged in negotiations with Great Britain concerning the boundary between the United States and Canada, resigned, and a year later Webster followed. Shortly thereafter some of the leading Whigs issued a public address declaring that "all political connection with them and John Tyler was at an end from that day henceforth." The chief events of Tyler's administration were the conclusion of the Webster-Ashburton Treaty (q.v.) with Great Britain and the annexation of Texas. In 1845 he retired to his estate in Charles City Co., Va., where he remained until 1861, when he was called to preside over the Peace Convention at Washington. Failing in his efforts at compromise, he gave his adhesion to the Confederate cause, voted for secession in the Virginia convention, served in the Confederate Provisional Congress, and was elected to the Confederate House of Representatives, but died at Richmond, Jan. 18, 1862, before he could take his seat. Consult: L. G. Tyler, *The Letters and Times of the Tylers* (3 vols., Richmond, 1884-96); J. F. Rhodes, *History of the United States* (New York, 1910); J. G. Wilson, *Presidents of the United States*, vol. ii (ib., 1914). For a more detailed account of the events of his administration, see the section on *History* in the article UNITED STATES.

TYLER, JOHN MASON (1851-). An American biologist and author. He was born at Amherst, Mass., graduated in 1873 from Amherst College, and after studying at Union Theological Seminary and at Göttingen and Leipzig, returned to his Alma Mater as instructor, becoming Stone professor of biology in 1882. His publications include: *The Whence and the Whither of Man* (1897); *Growth and Education*

(1907); *Man in the Light of Evolution* (1908); *The Place of the Church in Evolution* (1914).

TYLER, LYON GARDINER (1853-). An American educator, son of President Tyler, born at Sherwood Forest, Va. He graduated in 1875 at the University of Virginia, studied law, and in 1877-78 was professor of belles-lettres at William and Mary College. In 1878-82 he was principal of Memphis Institute, in 1882-88 practiced law at Richmond, Va., and in 1887 was a member of the Virginia House of Delegates. In 1888 he became president of William and Mary College. His publications include: *The Letters and Times of the Tylers* (3 vols., 1885-96); *Parties and Patronage in the United States* (1891); *The Cradle of the Republic* (1900; 2d ed., 1906); *England in America* (1904); *Williamsburg, the Old Colonial Capital* (1907); *The Cavalier in America* (1913). He edited the *Narratives of Early Virginia, 1606-1625* (1907) and *Encyclopedia of Virginia Biography* (5 vols., 1915).

TYLER, MOSES CORR (1835-1900). An American literary historian and educator, born at Griswold, Conn. His parents removed to Michigan, where he began his education. He graduated at Yale in 1857 and, after studying theology there and at Andover, had Congregational pastorates at Owego and Poughkeepsie, N. Y. He resigned the latter charge in 1862, from ill health, and went to England, where he spent four years of rest, studying, lecturing, and writing. In 1867 he became professor of English at the University of Michigan, and in 1881 was called to the chair of American history at Cornell, holding this until his death. In 1881 he was ordained deacon in the Protestant Episcopal church and was advanced to the priesthood in 1883. He published his *History of American Literature during the Colonial Time* (2 vols.) in 1878, and won a wide reputation for scholarship. This history, which was continued in the two volumes entitled *A Literary History of the American Revolution* (1897) and, in a measure, in the essays entitled *Three Men of Letters* (Bishop Berkeley, President Dwight, and Joel Barlow, 1895), constitutes Professor Tyler's chief claim to remembrance. It hardly carries the story of American literature beyond the year 1783, but within its limits is characterized by such accuracy and breadth of scholarship that it is not likely to be superseded, and fully entitles its author to a high place among literary historians. It is somewhat diffuse and fails to apply standards rigorously. Besides this history, Tyler's most important work is a biography of Patrick Henry in the *American Statesmen Series* (1888). He also published *The Brawnville Papers* (1868), devoted to the claims of physical culture; a revision of H. Morley's *Manual of English Literature* (1879); *Memorial of E. K. Apgar* (privately printed, 1886); and *Glimpses of England* (1898), a collection of letters from England. Consult W. P. Trent in the *Forum* (New York, August, 1901), and G. L. Burr in *Report of the American Historical Association*, vol. i (ib., 1901), and *Moses Coit Tyler: Selections from his Letters and Diaries*, edited by J. T. Austen (Garden City, N. Y., 1911).

TYLER, RANSOM HEBBARD (1813-81). An American legal author, born in Leyden, Mass. He studied law, and was admitted to the New York bar. He was elected district attorney and county judge for Oswego County. An ex-

tensive traveler, he was also editor of the *Oswego Gazette* and contributed to periodicals. He published *The Bible and Social Reform* (1863), and important legal works, among them: *American Ecclesiastical Law* (1866); *Usury, Pawns or Pledges, and Maritime Loans* (1873); *Piatures* (1877); *Infancy and Coverture* (2d ed., 1882).

TYLER, ROYALL (1757-1826). An American jurist and author, born in Boston. He graduated at Harvard College in 1776, studied law under John Adams, and was for a time aide to General Benjamin Lincoln, serving in the Revolution and in Shays's Rebellion in 1786. In 1790 he removed to Vermont, became a judge of the Supreme Court in 1794, and was Chief Justice from 1800 to 1806. His chief legal work was *Reports of Cases in the Supreme Court of Vermont* (1809-10). He wrote several clever and successful plays, of which one, *The Contrast*, a comedy partly in Yankee dialect, presented in New York in 1786, was the first American comedy produced by a professional dramatic company. Other plays were *May Day* and *The Georgia Spec*. He also contributed light, witty verse to periodicals. Tyler's *Contrast* was published in 1790 and reissued in 1887 by the Dunlap Society, with an introduction by T. J. McKee. Some of his work may be found in *The Spirit of the Farmer's Museum* (1801), for he helped Joseph Dennie (q.v.) to make *The Farmer's Museum* a success, and also in Dennie's late newspaper, *The Portfolio*, of which Tyler's literary criticism was a feature.

TYLER, WAT (?-1381). The principal leader of the English social revolt of 1381. Owing to the fact that he was captain of the Kentish insurgents, he is generally supposed to have been a Kentishman; but he was from Colchester in Essex. He should not be confounded with his colleague, Jack Straw, captain of Essex. The usual supposition drawn from his name, that he was a tiler by trade, is not certain, since a surname of the fourteenth century does not necessarily indicate trade. Nothing is known of his life previous to the revolt. Unfavorable estimates of his character are based upon the hostile and unreliable testimony of Walsingham and Froissart. Even hostile sources are agreed as to his ability. His part in the organization of the revolt was second only to that of John Ball, and he was certainly the chief factor in conducting it. The peasants' levies were summoned in his name, and important questions were submitted to his personal decision. On special occasions he acted as spokesman of the insurgents, presenting their demand to the King. The extent of his importance as a leader is shown by the entire collapse of the revolt after his murder at Smithfield. See **TYLER'S REBELLION**.

TYLER'S REBELLION. The name usually applied to the English social revolt in 1381, from Wat Tyler, its chief leader. It had been prepared for years by the teaching of a priest, John Ball (q.v.), in southern and eastern England, and from his home at Colchester it was silently organized throughout Essex, and thence in the adjoining counties, especially Middlesex, Sussex, and Kent. The determination of the government to punish those who by false returns had attempted to avoid payment of an oppressive poll tax greatly incensed the people and gave occasion for the outbreak in Essex in the early part of June, 1381. The country

was soon aflame, and a division under Wat Tyler and Jack Straw crossed the Thames at Erith. After capturing the castle of Dartford, where Tyler was chosen leader, and securing the allegiance of the mayor and council of Canterbury, they marched on London. On June 12 they camped at Blackheath, a southeastern suburb, while the Essex men, under Jack Straw, gathered at Mile End. Bands of insurgents, from near and distant counties, marched on London, Corpus Christi (June 13) being the day chosen.

Disappointed in a promised conference at Blackheath with the young Richard II, whom the Council would not permit to land from his barge in the Thames, the insurgents on June 13 marched on London. The London populace and the powerful Fishmongers' Company sided with them, and both the southern and northern armies were admitted into the city. The former straightway invested the Tower of London, in which the King, his Council, and many of the nobility had taken refuge. In vain did Richard try to calm them from a turret; yielding to their threats, the Council agreed to the King's meeting them on the following morning at Mile End.

The traditional account of this conference, based on Froissart, represents the boy King by courage calming the insurgents and inducing them to disperse. In reality it was a conference between the timid lad and the leaders, with Tyler as spokesman, in presence of the entire rebel army. The King listened to Tyler's harangues, graciously granted all their demands, and then retired to the Tower Royal, another London fortress. The insurgents' demands included the abolition of serfdom, a maximum rent of fourpence the acre for lands thus freed, the right to buy and sell free of toll all over England, and the abolition of the Statutes of Laborers, by which wages had been fixed in the interests of the landlords and master craftsmen. The King also agreed to let them execute his ministers, and promised in future to choose his councilors from among the insurgents.

By virtue of this grant, the commons marched straightway to the Tower, seized and beheaded such of the ministers as they could secure—Simon Sudbury, who was Archbishop of Canterbury and Chancellor, and Sir Robert Hales, the Treasurer, besides a few others, among whom were four collectors of the poll tax. Meanwhile a large number of the insurgents returned home, satisfied with the abolition of villeinage. But the most formidable division, under Tyler, Straw, and Ball, remained, demanding further economic concessions, and above all the reformation of the Church, in accordance with Ball's ideals. The King agreed to meet them at Smithfield at vespers of June 15. Here, too, the traditional account has given glamour to the heroism of Walworth, Mayor of London, and the boy King. In reality, Tyler was lured out of sight of his men, and, granting his demands, a pretext was found to arrest him, in resisting which he was dispatched by Walworth and other royal retainers. Their demands having been satisfied, the rebels were induced to go to St. John's Field, as they supposed, at Tyler's command. When they learned the truth, and saw the royal forces approaching, they were glad to disperse, retaining the charters of freedom granted at Mile End.

The demands of the insurgents at Smithfield
VOL. XXII.—39

include two legal requirements directed especially against the Statute of Laborers, one against serfdom, and a fourth demanding free use of woods, hunting and fishing to all tenants of manors. Their demands for the reformation of the Church differ from others of a later period in that the confiscation of Church property accrues to the benefit of the common people, instead of King or nobility, by enfranchising the tenants of clerical domains and decreasing clerical taxes. The reforms were the most democratic ever demanded.

Though the political and economic aspirations of the peasantry formed the backbone of the revolt of 1381, there were other important factors. The lower classes of the towns sympathized with the insurgents. In some cases the city governments, like Canterbury and Bridgewater in the south and York, Scarborough, and Beverley in the north, were implicated. A very important factor was a general uprising against the monasteries, both of tenants and especially of mesne towns. At St. Albans, both townsmen and peasants extorted charters of liberties. There were movements at Reading, Dunstable, and other smaller foundations; at Cambridge there was an uprising against the university. In Sussex matters centred in a fierce revolt against Abbey St. Edmunds, the prior of which was beheaded. John Wrawe, the captain of the county, was a priest, as were others of the leaders. In Norfolk the plundering was especially severe; under the leadership of Geoffrey Lister and Sir Roger Bacon, ambassadors with a large sum of money were sent to the King to obtain the liberties desired. All of these local outbreaks were connected with the central movement. There was less plundering than might have been expected, and violence was usually directed against persons connected with the government or local oppressions, and especially those known as adherents of John of Gaunt. After the rebels had retired, the remnants of the revolt were stamped out with great severity; the liberties granted were everywhere revoked, and the reaction was far bloodier than the revolt. The effect of the movement was to abolish for the time the poll taxes, to do away practically with the Statute of Laborers, and to hasten the general tendency towards the abolition of villeinage.

Consult: George Kriehn, in *American Historical Review*, vol. vii (New York, 1902); Edgar Powell, *The Rising in East Anglia in 1381* (Cambridge, 1896); André Réville, *Soulèvement des travailleurs d'Angleterre en 1381* (Paris, 1898); G. M. Trevelyan, *England in the Age of Wycliffe* (London, 1899); id., *The Peasant Rising and the Lollards* (ib., 1899); Charles Oman, *The Great Revolt of 1381* (Oxford, 1906).

TYLOP'ODA. (Neo-Lat. nom. pl., from Gk. *τύλος*, *tylos*, knob, knot, callus + *πούς*, *pous*, foot). A section of the Ruminantia, which embraces the Camelidæ, distinguished by the padded character of the soles of the feet. See CAMELIDÆ.

TYLOR. SIR EDWARD BURNETT (1832-1917). An English anthropologist, born in London. After a year's travel in the United States, he went to Mexico in 1856 with Henry Christy and in 1859 published his observations in *Anahuac, or Mexico and the Mexicans*, notable for accuracy of description. In 1865 *Researches into the Early History of Mankind* appeared; in 1871

he published *Primitive Culture*, in 1881 *Anthropology*, and in 1900 *The Natural History of Religion*. These works exerted a profound influence on the development of anthropological science. Tylor's most important scientific contribution is his treatment and development of the doctrine of animism as the fundamental and universal factor in primitive religions. (See ANIMISM; RELIGION, COMPARATIVE.) From 1896 till his retirement he was the first professor of anthropology at Oxford. He was knighted in 1912.

TYLO'SIS (from Gk. *τύλος*, *tylos*, knob, knot, callus). A protusion of a living cell through a pit in a large pitted vessel, due to the pressure in the cell. Often the nucleus and some of the protoplasm passes through the pit into the tylosis, and in this case cell division may take place until the cavity of the vessel is entirely filled with the growing tissue. Sections of the stem of the Virginia creeper (*Ampelopsis quinquefolia*) show tyloses in which cell division has taken place until the cavities of the vessels are nearly closed.

TYMMS, T. VINCENT (1842-). An English Baptist clergyman. He was born in London, and studied at Regent's Park College in that city. From 1869 to 1891 he served as minister of the Downs Chapel, Clapton, London, and thereafter until 1904 was president of the Baptist College, Rawdon, Leeds, holding also the chair of theology. He served as president of the Baptist Union of Great Britain in 1896. In 1903 he was Angus lecturer at Regent's Park College. His publications include: *The Christian Idea of Atonement* (1904); *The Private Relationships of Christ* (1907); *The Evolution of Infant Baptism and Related Ideas* (1912); *The Cameroons (West Africa): A Historical Review* (1915).

TYMPANITES, tim'pan-ī'tēz. A disease of horses and cattle. See BLOAT and HORSE.

TYMPANUM (Lat., from Gk. *τύμπανον*, drum). In anatomy, the middle ear. (See EAR.) In architecture, (a) the flat space inclosed within the sloping and horizontal cornices of a pediment; usually in 'classic and neoclassic examples, filled with sculpture. (b) The flat space inclosed between the spring and intrados of a recessed arch, or between the arch and lintel of a door or window set within or under it. In mediæval architecture it was often adorned with mosaic, inlay, or relief sculpture.

TY'NAN, KATHARINE. See HINKSON, MRS. KATHARINE.

TYNDALE, tin'dal, WILLIAM (?-1536). An English translator of the Bible. He was born on the borders of Wales, between 1490 and 1495, and was educated at Oxford and Cambridge. After leaving Cambridge (about 1522) he became tutor and chaplain in the home of Sir John Walsh, a knight of Gloucestershire. He preached frequently and, his opinions differing from those of the clergy of the neighborhood, he became involved in religious dispute, and an accusation was made against him before William of Malvern, chancellor of the diocese, who censured him for his boldness and indiscretion. As a result of his experience, Tyndale became determined to translate the New Testament into English. He went to London in 1523, but, failing to obtain help, he retired to Germany the following year. The New Testament was printed at Worms in 1525 and carried to England, and, though denounced by the government, several

reprints were produced within the next few years. Tyndale remained on the Continent writing tracts in advocacy of the reformed doctrines. His chief original work, *The Obedience of a Christian Man and How Christian Rulers Ought to Govern*, appeared in 1528. In 1530 he published a translation of the Pentateuch, and in 1531 one of the Prophet Jonah. During this period Tyndale associated with Luther, John Frith, Patrick Hamilton, John Rogers (qq.v.), and other leading reformers. He adopted the Zwinglian doctrine of the Lord's Supper, and separated himself from the other English reformers by opposing the divorce of Henry VIII from Catharine of Aragon. He was the subject of much annoyance from the authorities and changed his abode from time to time. In 1535 he was treacherously arrested at Antwerp, and, after a confinement of sixteen months in the Castle of Vilvorde, near Brussels, the State prison of the Low Countries, he was publicly strangled and burned as a heretic Aug. 6, 1536. Tyndale was a man of both learning and talent; his translations were made directly from the Hebrew and Greek, and furnished the basis for the authorized version. His New Testament has been frequently reprinted (in facsimile by Francis Fry, London, 1862); his Pentateuch was edited by Mombert (New York, 1884); and his miscellaneous writings were published by the Parker Society (London, 1848-50). Consult: F. L. Clarke, *Life of William Tyndale* (London, 1883); C. E. Heisch, *William Tyndale* (ib., 1884); R. Demaus, *William Tyndale* (2d ed., ib., 1886); G. B. Smith, *William Tyndale and his Translation of the English Bible* (ib., 1896); I. M. Price, *The Ancestry of our English Bible* (Philadelphia, 1907).

TYNDALL, tin'dal, JOHN (1820-93). An English physicist, born at Leighlin Bridge, County Carlow, Ireland. Having only a school education, he found employment at first in one of the subordinate grades of the Ordnance Survey, in Ireland and later in England. After working a few years as a railroad engineer he was appointed teacher of mathematics and surveying at Queenwood College, Stockbridge, in 1847. He then went to Marburg, where he studied for two years, returning to Queenwood in 1851 with the degree of Ph. D. In January, 1853, Tyndall communicated his first paper to the Royal Society, *On Molecular Influences—Transmission of Heat Through Organic Structures*. In the following month a lecture *On the Influence of Material Aggregation upon the Manifestations of Force*, before the Royal Institution, inaugurated his reputation as a brilliant lecturer. In May of the same year he was appointed professor of natural philosophy in the Royal Institution, thus becoming a colleague of Faraday, succeeding as director on the latter's death in 1867. Tyndall early undertook researches on diamagnetism at Marburg in conjunction with Knoblauch, which resulted in a publication entitled *On the Magneto-optic Properties of Crystals and the Relation of Magnetism and Diamagnetism to Molecular Arrangement*. These and later researches were published under the title of *Researches on Diamagnetism and Magneto-crystalline Action, Including the Question of Diamagnetic Polarity* (1870). Tyndall spent much time in the Alps, where he combined mountain-climbing with scientific research, making numerous careful observations on the great Swiss glaciers. These were published in popu-

lar form and in scientific contributions to the *Philosophical Transactions*. In connection with his study of the glaciers, Tyndall became interested in atmospheric phenomena, particularly the study of vapors. This led to researches on radiant heat and its transmission, radiation, and absorption by vapors and gases. These investigations involved a controversy with Magnus, but Tyndall was able to demonstrate the correctness of his views. These researches were later collected and published under the title *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872). In his study of radiant energy Tyndall analyzed various kinds of light in order to determine the proportion of luminous and nonluminous rays and their effect on various substances. He also discovered that in "optically pure air," that is, air free from dust or other particles, a luminous beam is invisible. These discoveries led to improved methods of sterilization, which are described in his *Essays on Floating Matter of the Air in Relation to Putrefaction and Infection*.

The British government availed itself of Tyndall's scientific ability and in 1866 he succeeded Faraday as a scientific adviser to Trinity House (in charge of the lighthouse service) and the Board of Trade. Tyndall achieved a universal reputation as a lecturer and did much valuable work in the popularizing of science. Few scientific lecturers have been able to present the principles and facts of physics to the general public so successfully as Tyndall. He visited the United States in 1872-73, on a lecture tour that was most successful, and a few years afterward gave the proceeds to forward the cause of original research in the United States. He wrote many popular treatises on scientific subjects, which have been printed in repeated editions and have been translated into foreign languages. Among his works are: *Heat Considered as a Mode of Motion* (1863); *On Sound* (1867); *Faraday as a Discoverer* (1868); *Fragments of Science for Unscientific People* (1871); *The Forms of Water in Clouds and Rivers, Ice and Glaciers* (1872); *Six Lectures on Light Delivered in America in 1872-73* (1873); *New Fragments* (1892 and 1897); *Notes on Light* (1870); *Notes on Electrical Phenomena and Theories* (1870). His works on the glaciers and the Alps include *The Glaciers of the Alps* (1860 and 1896); *Mountaineering in 1861* (1862); and *Hours of Exercise in the Alps* (1871).

TYNDAREUS, tîn-dă'rê-ûs (Lat., from Gk. Τυνδάρεως). A King of Sparta. Having been driven out by his half-brother, Hippocoön, he fled to Ætolia and became an ally of Thestius, whose daughter Leda he married. Hercules restored him to Sparta. Leda bore him Castor and Clytemnestra, and at the same time by Zeus became the mother of Pollux and Helen. After the death of Castor and Pollux and their reception among the gods, Tyndareus surrendered the kingship of Sparta to Menelaus.

TYNE, tîn. A river of north England (Map: England, E 2), formed by the North and the South Tyne in Northumberland Hills. It flows to the east partly on the boundary between Northumberland and Durham, and empties into the North Sea at Tynemouth. One of the principal coal-mining and manufacturing regions of England, and the cities of Newcastle, Gateshead, and South Shields lie on its banks. Length, 80 miles; navigable to Blaydon, about 18 miles.

The Tyne ports were second among English ports in the exports of coal in 1912 and fourth in tonnage of vessels arrived and departed. Consult: Guthrie, *The River Tyne* (Newcastle-upon-Tyne, 1880); Palmer, *The Tyne and its Tributaries* (London, 1881).

TYNEMOUTH, tîn'müth or tîn'. A market town and seaport, the chief watering place of Northumberland, England, at the mouth of the Tyne, 8 miles east of Newcastle (Map: England, E 1). It includes the townships of North Shields, Chirton, Preston, and Cullercoats. Ship-building is carried on and there are rope and sail works, besides important fisheries. The sands, about a mile in length, are overlooked by picturesque cliffs. Noteworthy are the gateway of the old castle, the fine ruins of a priory and lady chapel, the master mariner's asylum, the aquarium, and assembly rooms. The municipal borough buildings are in North Shields. Tynemouth was a Saxon fortress. Pop., 1901, 51,514; 1911, 58,822. Consult Adamson, "Tyne-mouth Priory and Castle," in *Archæologia Æliana*, vol. xxiii (London, 1901).

TYNG, tîng, STEPHEN HIGGINSON (1800-85). An American Protestant Episcopal clergyman. He was born at Newburyport, Mass., graduated at Harvard in 1817, and was ordained in 1821. After holding several less important charges, he was rector successively of St. Paul's Church and the Church of the Epiphany, Philadelphia, and of St. George's Church, New York (1845-78). Dr. Tyng was a pronounced evangelical and low churchman and a leading opponent of ritualism. He was widely noted for his fervid eloquence as a preacher, and he zealously advocated total abstinence and other reforms. He published, aside from discourses and memoirs, *Recollections of England* (1847); *Forty Years' Experience in Sunday-Schools* (1860); *The Prayer Book Illustrated by Scriptures* (8 vols., 1863-67); and *The Office and Duty of the Christian Pastor* (1874). He was editor of the *Episcopal Recorder*, the *Theological Repository*, and the *Protestant Churchman*. Consult his *Life* by his son, C. R. Tyng (New York, 1890).

TYPE (Lat. *typus*, from Gk. τύπος, type, figure, impress, blow, from τύπτειν, *typtein*, to strike). In zoölogy: (1) The name applied by De Blainville to the four branches of Cuvier. These "types" were founded on what were then considered as four fundamental "plans" of organization. (See CLASSIFICATION OF ANIMALS.) Cuvier and his successors, notably Von Bael and L. Agassiz, taught that these types existed, as it were, side by side, the Vertebrata the highest, but with no genetic connection, and that each type was characterized by a distinct plan of structure—a view now superseded by that of the doctrine of descent. See EVOLUTION; PHYLOGENY.

(2) The "type" or "typical species" of a genus is the one first described, or regarded as the most typical, and about which the other species were clustered. A "type specimen" is that individual, or the several individuals, which served as the basis for the description of a new species. The careful preservation of an author's type specimen is all-important in systematic zoölogy and botany, as it is the ultimate source of appeal in unraveling complicated cases of synonymy.

TYPE. In theology, an image or representation of some object which is called the antitype (q.v.). It is applied to Old Testament objects and persons, taken to prefigure ideas in the

Christian history or theology; and earthly things supposed to represent heavenly things. The idea of types appears in Paul and the writer of Hebrews, and came originally from the Greek allegorizing of Homeric tales.

TYPE FOUNDRY. The art of founding or casting printers' types. (See PRINTING.) In the early times printers made their own type, but about the middle of the sixteenth century the necessity arose for a division of labor and type founding became a business distinct from printing. The art was first developed in France and from that country spread to Italy, Germany, England, and the United States. The first successful type founder in America appears to have been Christopher Sauer, who established a type foundry in Germantown, Pa., in 1772. In 1796 the Scotch type founders Binny and Ronaldson started a type foundry in Philadelphia, Pa., which after many struggles succeeded. Between 1772 and 1796 several persons, among whom was Benjamin Franklin, attempted to found type, but they all failed to make a business success of their attempts. In 1810 Elihu White established a successful type-founding business in New York, and his successors are still making and selling type although under another firm name. These early type founders all cast their type by hand, after much the same methods, probably, as had been practiced since metal types were first used. Indeed, it was well on towards the middle of the nineteenth century before type was successfully founded by machine to any considerable extent.

Hand Founding. The first step in the process of type founding by hand is the cutting of the counterpunch from the design of the letter, this counterpunch being an engraving in steel of the hollow part of the letter to be made, that is, of the part of that letter which is to appear white where printed. The counterpunch is then impressed to the proper depth in a short bar of soft steel which becomes the punch, or die, with the letter reversed, from which the type is to be made. The outer edges are then cut away until all the lines of the letter are perfect, and then this die is struck into a piece of copper about an inch and a quarter long, one-eighth of an inch deep, and of a width proportionate to the size of the type to be cast. This copper, being so impressed with the representation of the letter, requires to be adjusted to the mold, so that the "face" or impression of the punch (in the copper) may be brought into such relation with the metal which forms the "body" or stalk of the type, that when the types are "set up" they may stand at the proper distance from each other, and be in "line" or range, and also square to the page; this work is termed "justifying," and the copper is now a "matrix." The matrix is now fixed into a small instrument or frame of polished steel, called the mold, which is composed of two parts, with a space between to be filled with the melted metal that forms the type. The space within is of the size of the required body of the letter, and is made exactly true. The melted metal, being poured into this space, sinks down to the bottom in the matrix, and, instantly cooling, the mold is opened, and the type is cast out by the workman. This process of casting types is executed with great celerity. Of course, every separate letter in the alphabet, every figure, point, or mark, must have

its own punch and matrix. After being cast the types have to be dressed, and this work is performed by hand. It consists first in removing the projection or jet of superfluous metal that clings to the end which is towards the top of the mold while the type is being cast; second, in rubbing off the burrs, or sharp edges of metal, and smoothing the sides of the types on gritstones; and, finally in cutting a groove in the foot of each type so that each piece may rest securely on its feet, and examining the type with a magnifying glass to discover imperfections. Considering the nature of the operation, type casting by hand is performed, by an expert, with remarkable rapidity, from 3000 to 4000 types per day being produced ready for the finishing process by the experienced workman.

Machine Founding. Various attempts were made during the early part of the nineteenth century to cast types by machinery. The first successful machine for this purpose was devised by David Bruce, Jr., of New York, and was patented in 1838. As subsequently improved, this machine was extensively used in American type foundries and was introduced into Europe. Briefly described, the Bruce type-casting machine consists, first, of a small melting pot, which contains the molten metal, and is placed over a small furnace. In the interior of the pot is arranged a forcing pump and valve for admitting the metal under the piston, and also for preventing the return of the metal into the mass in the pot when the piston is depressed. Every revolution of a crank gives this piston a sudden thrust which injects enough of the melted metal to fill the mold and the matrix. After receiving this metal the mold opens, as a door on its hinges, and at the same instant the matrix springs backward. The type, which is held by a blunt pin, is then hit and released, the mold closes automatically, and the piston injects a new supply of molten metal. A blast of cold air directed upon each mold keeps it cool, so that the machine can do its work rapidly, a rate of one hundred per minute not being uncommon in the smaller sizes. The larger types, however, are more slowly cast as they cool less quickly.

The weakness of the Bruce machine lay in the fact that types produced by it had to be dressed by hand, and although Mr. Bruce in 1868 invented an apparatus for dressing the type mechanically which could be applied to his casting machine, neither it nor the inventions of several men abroad were adopted by type founders generally. Bruce's improved machine was followed by one designed by Henry Barth, of Cincinnati, Ohio, in 1888, which casts the types and finishes them. This machine, which has a much larger output than the earlier ones, retains the general principles of a divided mold which opens to discharge the types, although its construction and processes differ radically from the Bruce machine. In the Barth type caster one-half of the mold is upright and immovable, while the other half slides back and forth at a rapid rate, releasing the types as made and closing again before the next spurt of hot metal is forced in. It breaks off the jet, rubs down the edges, forms the feet, and delivers the types ready for inspection. Type is now produced at the rate of from ten to two hundred per minute, but mention should be made of a rotary type-casting machine developed in England, which

produces type ready for printing without inspection or treatment at the rate of 1000 per minute. In conclusion, mention should also be made of the type punch cutting machine, invented by L. B. Benton, of Milwaukee, Wis., which operates on the principle of the pantograph and produces from one pattern letters of any size desired.

TYPES, THEORY OF. See CHEMISTRY.

TYPESETTING. See PRINTING.

TYPESETTING MACHINES. Machines devised to set or compose printers' types automatically and mechanically. In hand composition the types are picked one at a time from a wooden case and then set one after another in the proper order to form the words which it is desired to print. After the set types have been printed from, or molded to form plates, they are distributed—returned to their proper compartments in the case. (See PRINTING.) Composition and distribution by hand are tedious and expensive, and from early times efforts have been made to devise a machine which would perform these tasks speedily and economically. Until within recent years these attempts were not commercially successful. Perhaps the first serious attempt to design a machine to do away with hand composition was made by Dr. William Church, whose device was patented in England in 1822. His machine was designed to cast types and leave them in reservoirs, and they were set from these reservoirs by pressing keys arranged much like piano keys. After use the types were remelted, the inventor in this way avoiding distribution. Evidently Church was a man ahead of his times, for it was not till 20 years had elapsed that the issuing of patents for typesetting machines began to be frequent. In 1840 James H. Young, of England, completed a machine, which is said to have set types at the rate of 13,000 per hour, but the types had to be arranged in lines, distributed, and, presumably, placed in the magazines by hand, which required three persons besides the operator. The first distributing machine patented in America was invented by Frederick Rosenberg, in 1843, and the first English patent on a distributor was taken out by Etienne Robert Gaudens, in 1840. After this among prominent American inventors follow the names of Mitchell, Alden, Felt, Brown, Westcott, Kastenbein, Paige, Richards, Burr, and in more recent years Thorne, MacMillan, and Mergenthaler. Among the prominent foreign inventors who achieved some success were Hattersley, Mackie, Fraser, and Wicks, in England; Sørensen, of Denmark; Fischer and Von Langen, of Germany; and Delcambre, of France. At present only the Thorne, MacMillan, Mergenthaler, and Lanston machines are much used (the Lanston is a nondistributing machine), but the commercial success reached by some of the earlier machines was remarkable. The Alden machine was at one time used in the New York *Tribune* office. Ten of the Mitchell machines, invented in 1853, are said to have been used at one time in a single office. In 1869 the London *Times* began to use the Kastenbein machines, and set the whole paper by them. In 1880 the Burr machine was tried by the New York *Tribune*, and

that paper used three of these machines for some years. In 1884 the Fischer and Von Langen machine was used by the *Cologne Gazette*. All these successes, however, have been far outdone by the Thorne, MacMillan, Mergenthaler, and Lanston machines.

The Thorne machine, a combined setting and distributing machine, which was exhibited in the Paris Exposition of 1878, consists of an upright cylinder with vertical channels around a periphery, each channel holding a column of types—one channel *a*'s, another *b*'s, etc. The lower half of the cylinder is stationary, and its channels contain the distributed types. The upper half of the cylinder turns with a step by step motion, and its channels contain lines of type to be distributed. The motion of the upper cylinder brings its channels opposite those of the lower, when an instant's pause occurs, permitting any type whose projections correspond to the lower channel's nicks to drop. The upper cylinder then revolves one step, bringing the channels again in coincidence. The type is set from the lower channels, the lowest type being pressed out radially when the operator depresses the key which governs it. A rapidly revolving plate below whirls the type around into an endless belt, which carries it to a setting-up mechanism. Here it is turned upright and joins the continuous line of types slowly pushed along towards the justifier, which divides it into lines of column or page measure. A later machine, called the Simplex, closely resembles the Thorne machine. In the MacMillan machine the setting and the distributing are done by separate machines. The magazines of the setting machine are removable, being exchanged for full ones as fast as they become empty. The operator ejects the types from the magazines by pressing suitable keys, and they are set up in long lines to be justified by hand. The distributor consists of a horizontal wheel with radial channels, in which the types to be distributed are placed. The frame surrounding the wheel contains other radial channels having projections corresponding to the nicks in the types. The movable magazines are placed radially in connection with these outer channels. When the wheel slowly revolves, the types pass from the channels of the wheel into the outer channels whenever a type comes opposite one whose projections correspond to its nicks. The Paige machine might be mentioned for its wonderful mechanism, its 18,000 parts composing, justifying, and distributing the types. Its cost of construction and the excessive expense incurred in running it, however, were too great to make it practicable. Both the Thorne and the MacMillan machines set types which are previously made by the regular type-founding process. (See TYPE FOUNDRY.) This should be noted before proceeding further, since the Mergenthaler and Lanston machines, instead of composing previously cast types, themselves cast the types as they are desired by the operator.

The Mergenthaler Linotype machine was invented by Ottmar Mergenthaler, and the first machine was completed in 1884. This machine takes its name from the fact that it sets up a line of molds, and casts a line of type (lin'o'-type), or rather a solid metal bar with raised letters on one edge, which is known as a "slug," and is the same as if a line of types were fused solid. The molds or matrices are small pieces of brass, each with a letter impressed on its edge,

as shown in Fig. 1. They are placed in magazine tubes, as shown in the illustration, Fig. 2, all the *a*'s in one tube, all the *b*'s in another, and so on, the tubes being arranged vertically in a continuous line. The machine has a keyboard like a typewriter, and the depression of a key, as *D*, connected by a rod, *C*, with the escapement, *B*, causes a matrix to drop into an inclined channel, *E*, down which it falls to the inclined traveling belt, *F*, by which it is carried to the assembler, or stick, *G*, where it takes its place in line. The spaces, *I*, between words are simply duplex wedges, dropped into position from a box, *H*, in the same way as the matrices when the finger key, *J*, is pressed. When the compositor has set all that will go into a line, the duplex wedges are slid one upon another, thus "spacing out" the line, and the line so formed is carried over in front of a slot on the wheel, *K*, where automatically the line of type is cast with metal from the reservoir, *M*, shown in detail in Fig. 3, and its sides and base planed, after which the mold wheel, *K*, makes a quarter of a revolution and the slug is deposited on a galley. The matrices meanwhile are released and passed overhead to the bar, *R*, where thin teeth engage on its horizontal ribs. This bar rises as shown by the dotted line, and the matrices are carried up to the distributor, *T*, whence they find their way to the appropriate magazine tubes, each matrix being released at the proper point. A speed of 4000 ems an hour is the average rate of a good Linotype operator, while those unusually expert attain as high a speed as 5000 to 6000 ems. The advantages of this machine are,

FIG. 1. MATRIX FOR MERGENTHALER MACHINE.

is another and a very decided advantage. The Linotype machine in its latest form performs successfully the most intricate kinds of composition, including tabular matter and the use of

several classes of characters, and has been perfected to such an extent that the movement of a hand can bring into use a double magazine containing 360 type characters, a triple magazine with 540 characters, or even a quadruple magazine, thus making use of two to four sizes or fonts in one piece of work.

The Lanston Monotype machine, like the Mergenthaler Linotype, is primarily a type-casting machine, but with the radical distinction that it casts separately each letter, point, and sign, including the spaces. The machine is constructed in two parts, a keyboard and a type-

FIG. 2. MERGENTHALER LINOTYPE MACHINE SHOWING ESSENTIAL PARTS.

among others, that it gives constantly a new type face to print from, and also that there is no distributing to be done, the slugs being remelted after use. The "spacing-out" device

FIG. 4. MOLD WHEEL OF LINOTYPE MACHINE.

casting machine. The function of the keyboard, which resembles a typewriter and which carries 257 keys corresponding to all of the characters used in a font of type and a few additions representing movements to be performed by the casting machine, is to punch a series of holes in a moving strip or ribbon of paper, which is unwound from one spool to another, passing under a series of punches in its journey, the

motive power being compressed air. These punches are operated by striking the keys on the keyboard. The result of the keyboard operation is, therefore, a narrow roll of perforated paper. This strip, when fed to the casting machine, initiates and controls the movements of the matrix case over the mold. The matrices, which are made of bronze, are carried in a matrix case about three inches square, and any character is brought opposite the casting point by the matrix carrier. After the matrix is in position the sizing of the type is accurately determined by an automatic wedge, the pump mechanism operates, filling the mold and matrix, and a single type is made. The matrix is then lifted from the type which is delivered into the channel blocks where the line is assembled. While this is being done the matrix for the next character is being placed in position over the mold for the next type cast, these operations following one another at the rate of 140 finished types per minute. Justified lines are composed on this machine in sizes from 5 to 18 point, while type for the cases may be cast as high as 36 point, or ornaments, leads, slugs, and rules up to 12 point. Consult T. L. De Vinne, *Modern Methods of Book Composition* (New York, 1904), and J. S. Thompson, *History of Composing Machines* (ib., 1904). See PRINTING.

TYPEWRITERS. Machines for producing legible characters without the aid of movable type.

History. The first typewriter of which we have any record was patented in England in 1714. In 1829 the first American typewriter, called a typographer, was patented by W. A. Burt. About 1833 a typewriter was produced in France, having a separate key lever for each letter. In 1844 and in 1846 typewriting machines were invented in England, which, like many of the early machines, were designed primarily for the use of the blind and so produced embossed characters. Between 1840 and 1860 Sir Charles Wheatstone invented several typewriters which are now in the South Kensington Museum.

Among early American inventors were Charles Thurber and A. E. Beach. The Thurber machine (1843) is simply a set of type bars in a vertical position around a horizontal brass wheel, 16 inches across, which revolves about a central post, the characters being brought into position by hand from either direction. Common types are inserted in the lower ends of the type bars. In 1856 A. E. Beach, who, as early as 1847, had constructed a fairly successful but never perfected typewriter, took out a patent for a machine intended to print embossed letters for the blind. This is worthy of record, because it covered a principle afterward developed into the modern typewriter—viz., a basket of levers arranged in a circle, delivering their impressions on a common centre. In order to make raised letters there were two sets of bars, one coming up and the other down, one having a raised letter and the other its mate, a sunken letter. The strip of paper passed between the two.

Beach was followed by S. W. Francis. To the Beach principle of a circle of type bars Francis added the pianoforte action. Another early inventor was Thomas Hall, who was carrying on independent experiments about the same time as Beach and Francis. Although his machine embodied the principle of a circle of type bars,

yet their movement, instead of being from below upward, was from above downward, converging at a common centre, an inked ribbon intervening between type and paper. But Hall was compelled to abandon his efforts without realizing his expectations, and only a few of his typewriters were made. In 1881 he took out a patent on a typewriter made on an entirely different plan. It had a perforated dial plate, two inches square, containing seventy-five characters. Underneath this dial plate in his latest machine, called the Century, patented in 1889, was a rubber-faced cylinder with letters on its surface corresponding to those on the dial plate. When the stylus is brought to any perforation in this dial plate, the cylinder beneath is turned to present the corresponding letter to the paper, and the stylus being pressed into the hole the letter is printed. The under cylinder revolves against an inked pad.

About 1867 Charles Latham Sholes, Samuel W. Soule, and Carlos Glidden, of Milwaukee, Wis., began to experiment on the construction of a typewriter, and from this the Remington typewriter had its origin. The first crude model was completed early in 1868. Soule dropped out of the enterprise almost immediately and Glidden finally disposed of his interest also. Sholes, encouraged by suggestions and financial aid from James Densmore, of Meadville, Pa., who early purchased an interest in the machine, continued his experiments. Several models were built and were tested under conditions of service by practical stenographers, until in 1873 the inventors considered the machine sufficiently perfected to warrant manufacture upon a large scale. A successful effort was made to interest the gun manufacturers, E. Remington & Son, of Ilion, N. Y., in the manufacture of the machine. After more than a year of patient work by the skilled mechanics at Ilion, a complete remodeling of the crude device of the inventors resulted. The first model was put upon the market in 1874. It retained only the principles of the original construction. As many of its elements are fundamental, it may be briefly described as follows: Pivoted about a horizontal ring were type bars, some 38 in number, with steel types inserted in their lower ends, and so arranged as to rise vertically to a common centre. The short arms of these levers were connected by wire rods with the levers proceeding from the keyboard. The paper to be printed passed around a rubber cylinder, and the lower side of this cylinder received the impact of the types. An inked ribbon intervened between type and the paper. This ribbon, in the operation of the machine, was gradually unwound from a spool at one side of the machine to another on the other side, and when the spool was exhausted the motion was reversed. With each release of a key by the finger of the operator, a ratchet movement at the back of the cylinder allowed the carriage to move along one space, thus making room for the next letter. The tension was kept on the carriage by a coiled spring and strap. At the end of a line the carriage was drawn back to the starting point by means of an arm depending in front, and the same movement turned the cylinder, and carried the paper to make ready for the following line.

In 1877 an improvement was introduced, whereby each type bar in the circle was made to carry two characters, adjusted to separate

common centres. By depressing a shift key the carriage is thrown backward to the second centre, which is adjusted to receive all the capital letters and many other characters placed in relation thereto.

In 1894 an improved model, having a lighter and stronger paper carriage, was placed upon the market. The shifting movement was accomplished by a new mechanism, and improvements in the spacing mechanism, greatly increasing the speed of the machine, thus making it more acceptable to expert operators, were adopted. An automatic ribbon reverse was later included, and, in addition to increasing the number of characters and the width of the carriage for holding wide sheets of paper, many minor points of improvement have been from time to time adopted by the manufacturers.

The Remington was the pioneer machine, and its first competitor was the Caligraph, promoted by George W. N. Yost. The Caligraph had the basket of type bars, but had a polygonal impression cylinder, the impressions being received on the flat faces. It resembled the Remington, but had a double set of keys, thus obviating the use of a shift from capital to small letters, and the horizontal keys were hinged at the front. This machine was for a time the most important of those machines where there was a separate key for each type character, but its manufacture was discontinued. Mr. Yost left the Caligraph and brought out the Yost typewriter, which does not use the inked ribbon, but its type, when at rest, bears against a circular inking pad.

Unlike the foregoing was the Hammond machine, invented by James B. Hammond in 1880-83. Its central principle was the type wheel, a favorite device of John Pratt, who labored long, but unsuccessfully, to make his invention a success. The arrangement of the original keyboard of the Hammond differed materially from that of the Remington, being almost semicircular. In 1890 a new model, the Universal Hammond, was introduced, having a keyboard with three banks of keys, like other standard machines. Still later, a light rubber shell or shuttle, supported by a metal backing, was substituted for the wheel. In this machine 90 types are cast in true alignment upon a curved plate of vulcanite, called the "shuttle," in the form of an arc of a circle. The backing for the shuttle is a heavy cast-iron ring called "anvil," and may be compared to a wheel having a slot in the centre of its face in which the steel web of the shuttle slides. This forms a guide for the shuttle in its horizontal movements. The anvil is stationary and firmly fixed to a vertical shaft by which it may be raised to bring either of three rows of type into the printing position. The depression of a key controlling the character to be printed brings that character on the shuttle into position by means of a shuttle arm and a series of index pins, each one of which corresponds to the angular distance of any character from the normal position. The impression of the hammer is at that moment received by means of a lever, which releases the hammer spring and the carriage and forces the paper against the type on the face of the shuttle. As these shuttles are interchangeable, it is possible for the one machine to produce any number of different alphabets or styles of type.

The Smith-Premier was placed on the market

in 1889. This, like the Remington, is a type-bar machine, but has a large keyboard with a key for each character as in the Caligraph. A novel feature of this machine is a round brush which can be revolved to clean the type. Another improvement of the Smith-Premier was a three-colored ribbon so arranged that a change from one color to either of the others can be made by simply pushing a lever.

In 1892 the Blickensderfer machine, having a type wheel which rotated so as to bring the appropriate characters in position to strike the paper, was introduced, and attained great popularity on account of its simplicity and low cost. Its makers later developed an electric typewriter where an electric motor supplied the power and rendered the manipulation much easier for the operator, and eventually took up also the making of type-bar machines of the conventional type.

During the closing decade of the nineteenth century, by which time the use of the typewriter had become almost universal, many new machines were brought upon the market, so that at its close there were over 100 different machines, on which nearly 1700 patents have been granted. Various new models were developed, most of which were along conventional and established lines. With few exceptions cheap typewriters have never proved durable and successful, though latterly several small and portable machines have been placed on the market. The demand for such machines undoubtedly exists, particularly for school and domestic use in addition to traveling.

Perhaps the most noted of the successful machines brought out at the later stage was the Underwood typewriter, first put on the market in 1896, but which soon came into widespread use. This is a type-bar machine, but instead of the usual upright basket, making a practically complete circle of type bars, the letters are contained in a segment of a circle, and this partial basket is laid upon its side and moves as a whole when the shift key is operated. The advantage of this arrangement is that the type strikes on the front of the impression cylinder, instead of on the bottom, thus keeping the work entirely in sight. As early as 1891 visible writing had been produced on the Williams, using an inked pad, and about the same time in the Brooks, a ribbon machine. The same advantage was also secured in the L. C. Smith machine, where ball bearings were employed to secure easy running and light touch. This machine also enjoyed wide popularity, while the demand for visible writing led to a remodeling of the Remington to secure that end, and the Monarch machine carried out the idea of the shifting segment. In the Oliver machine there is a double instead of a single shift key for which advantages are claimed.

An important development in typewriters was a machine which served for writing letters, writing on flat cards, on the page of a bound book, writing bills, tabulating, and adding one or more columns of figures as they are written by the machine. The Elliott-Fisher billing and adding machine, patented May 15, 1906, one of the first of these machines, was a development of the Elliott & Hatch book typewriter. In this machine the sheet which was being written was held stationary on a flat platen, while the machine proper, consisting of frame, type levers, etc., moved either forward and backward

or sideways. Later came modifications of ordinary typewriters whereby tabulating and adding mechanism were supplied so that not only billing but all commercial bookkeeping could be done on the machine used for ordinary correspondence. The Remington adding and subtracting typewriter was brought out in 1907, and in 1915 a most elaborate machine was perfected. The Underwood Company and other makers also brought out bookkeeping and adding typewriters, each of which possesses certain advantages and conveniences. In fact these machines have completely revolutionized bookkeeping and accounting, for they are able to list the items and to add, subtract, or cross add.

Manifolding. Reprints may be secured by the ordinary copy press, copying ink being used on the typewriter ribbon or pad. By the use of carbon paper alternately between thin sheets of ordinary paper, the typewriter itself can be made to produce several copies at a time. Thus in modern business operation as referred to above by the use of loose leaf books of account, the original order, the invoice, the bill for goods, and the posting in the ledger can be effected at one operation, or other modifications of the system made. By the use of a special kind of paper on a sheet of cloth, stencils may be made for the mimeograph. See COPYING MACHINE.

The rapid growth of the use of the typewriter to a point where it has become indispensable in all lines of business and many other forms of activity, is noteworthy. It was placed on the market about 1875 and its usefulness was soon appreciated by courts of law, business houses, and governmental departments. In the early eighties its use became general in all departments of the United States government except the Department of State. It was first employed for instructions to diplomatic and consular officers in 1895 and the official communications of the department to diplomatic officers of foreign countries were first executed upon the typewriter in 1897. Now it is even customary for armies in the field to have typewriters as part of the headquarters equipment for issuing orders and reports. That the typewriter is found everywhere in business to the practical exclusion of handwriting has long been evident, for the gain in time for transcribing and for reading correspondence and records was early appreciated. An average operator can write on the machine some 60 words a minute or at a rate about three times as fast as that of the average penman, while in competition experts maintain a speed well in excess of 100 words a minute. Furthermore, the addition of various mechanical adjuncts for spacing, addressing, tabulating, etc., reduces to a minimum the time and facilitates the entire operation. The use of ribbons of more than one color, readily interchangeable, now a feature of most machines, adds to the effectiveness of the printing, giving emphasis as desired.

Once the services of a stenographer were required for correspondence, but now by the use of phonographs or dictating machines any qualified typist with sound tubes at her ears is able to transcribe letters or other spoken communications when the sound is reproduced. In most newspaper offices reporters and other writers are required to prepare their manuscript on typewriters. Aside from its mechanical considerations the typewriter must be considered

as an important element in the social revolution caused by the entrance of women into commercial life. It was found that the light labor involved in copying and transcribing notes could be performed readily by women of fair education and general aptitude as well if not better than by men and, once their success was established, women's position in business life was assured, so that, in the census year 1910, of the 593,224 women engaged in clerical operations 263,315 were stenographers and typewriters, as compared with 53,378 males.

Typewriters are now an essential part of the equipment of telegraph and cable offices, for so rapidly can messages be transcribed that the receiving operator can not only keep pace with the sender, but can maintain speed so great as to bring about the abbreviation of the telegraph code. In the modern use of the typewriter the so-called touch system is extensively practiced. There the typist is taught to locate the positions of the various keys so that she can strike them at will without looking at the designation of the characters. In this way increased speed and comfort to the operator are secured and even a blind person may use a typewriter. It may be remarked that in all makes of typewriters the arrangement of keys is the same, the so-called universal keyboard being employed with but few and slight modifications. This is arranged so that the letters most used come in the centre and in convenient proximity.

Attention had been directed to the production of power typewriters, in which the operator has merely to touch a key with sufficient force to release latent mechanism, whereupon power from some external source completes the impression. In electrical typewriters, of which several have been patented, the impression mechanism is operated by magnets, the operator closing the circuit when he touches the key, but these never have been widely used.

Statistics. According to the thirteenth United States census (1910) there were in 1909 in the United States 89 factories devoted to the manufacture of typewriters and supplies, in which a combined capital of \$26,308,688 was invested. These factories produced in 1909 typewriters and supplies valued at \$19,718,767. Of the total product \$6,899,069 worth, or over one-third of the total number, were exported, and this figure had grown to \$11,532,364 in 1913, declining to \$5,315,134 in 1915. The enormous growth of the industry is shown by the fact that in 1889 there were only 30 factories, having a capital of \$1,421,783, and producing an output valued at \$3,630,126.

TYPHA (Neo-Lat., from Gk. *τύφη*, *typhē*, cat-tail). A genus of widely distributed marsh plants of the family Typhaceæ. Two species are American, *Typha latifolia* and *Typha angustifolia*, and are popularly known as cat-tail or reed mace. The former, which is the commoner, is sometimes called bulrush. It grows to the height of 5 or 6 feet. The astringent rootstocks are rich in starch, and the young shoots of both species are much eaten by the Cossacks of the Don, and are sometimes used in England under the name of Cossack asparagus. The pollen of *Typha* is inflammable, like that of *Lycopodium*, for which it is used as a substitute. *Typha angustifolia* and *Typha elephantina* are employed in India and Europe for making mats and baskets, chair bottoms, etc. The leaves of *Typha* are commonly used in

the United States in cooperation to place between the staves and in the seams of barrel heads. See Plate of AQUATIC PLANTS.

CAT-TAIL (*Typha latifolia*).

TYPHLOPIDÆ. See BLINDWORM (2).

TYPHOEUS. See GÆA.

TYPHOID EXTRACT. See ORGANOTHERAPY.

TYPHOID FEVER (from Gk. *τυφώδης*, *typhōdēs*, delirious, from *τύφος*, *typhos*, stupor, mist, vapor, smoke, from *τύφειν*, *typhēin*, to smoke; connected with Skt. *dhūpa*, smoke), or ENTERIC FEVER, TYPHUS ABDOMINALIS, ABDOMINAL TYPHUS. A specific disease, infectious chiefly or entirely through the excretions, having a febrile period of about three weeks, and characterized by ulceration of the intestinal lymph follicles, swelling of spleen and mesenteric glands, and parenchymatous changes in many organs.

Typhoid fever is due to a specific microorganism known as the typhoid bacillus, a small bacillus with rounded ends, about two micromillimeters in length and about one-third as broad. It is motile and grows at room temperature on the ordinary culture media, preferably in the presence of air or oxygen, but capable of life without. (See Plate of DISEASE GERMS.) During an attack of typhoid fever the bacillus is found regularly in the intestinal and mesenteric lymph nodes and as a rule in the spleen. In the early stage of the disease, when the nodes are simply enlarged, few or no bacilli are present in the bowel evacuations. Later,

when ulceration of the nodules has occurred, the bacilli are usually found in the stools. In urine and bile it is quite common to find the typhoid bacillus, and in these secretions they may persist long after recovery, thus furnishing possible sources of infection long after the danger is supposed to have passed. Typhoid bacilli have also been reported in the blood, lungs, pleura, liver, kidney, uterus, and in other organs in which typhoid lesions occur; also in typhoid serous exudates and in the heart in typhoid endocarditis.

Contraction of typhoid fever is caused by taking the bacilli into the mouth and thence into the intestine. Food and drink are usually the vehicles which serve for the entrance of the bacillus, water and milk being probably the most frequent sources of infection. The latter is especially dangerous from the fact that the typhoid bacillus not only lives but multiplies in it. Water and milk, however, are only dangerous when they actually contain the typhoid bacilli which have entered into them from the excretions of typhoid patients or carriers.

The typhoid carrier is a person who harbors and excretes the bacilli in large numbers, although in normal health and generally unaware of his infection. Cooks and dairymen are most dangerous in this respect to the community and to them have been traced many scattered epidemics. Flies having access to the excreta of typhoid patients are capable of contaminating food and spreading the disease. Other minor sources of infection are fresh vegetables and oysters.

The initial seat of activity of the typhoid bacillus is undoubtedly in the intestines. Here the bacillus first sets up a catarrhal inflammation of the mucous membrane. This is followed by the characteristic lesion of typhoid, viz., inflammation of the intestinal lymph nodes. Both solitary nodules and Peyer's patches are affected, although it is in the latter that the changes are usually most marked. These nodules may undergo resolution, or may break down, forming the typical typhoid ulcer, which may erode blood vessels, thus setting up hemorrhage; or perforate into the peritoneal cavity, giving rise to peritonitis. Ulcers are formed in Peyer's patches, gradually increasing in size, and discharging into the intestines. Changes in the liver and spleen are of common occurrence in typhoid fever. Of the two the spleen is most frequently affected. The changes consist of congestion with proliferation of the cellular elements of the spleen and consequent increase in the size of the organ.

Typhoid fever is widely distributed throughout the world, but is especially prevalent in the temperate zones. From its prevalence during the autumn it has been called autumnal fever. Young adults are usually attacked, the affection being comparatively rare among children and old persons. Hot and dry weather are favorable for its development. Its distribution is largely due to a contaminated water supply. Cities which drain their sewage into the rivers or lakes whence they derive their drinking water suffer most severely. In 1914 to 1915, the death rate in several large cities of the United States per 100,000 population was: New York, 6.2; Detroit, 13; Baltimore, 22.4; Birmingham, Ala., 40.2; Nashville, Tenn., 47.3.

The incubation period of enteric fever lasts from 8 to 14 days, or longer. The onset is
